Data

- Many environments
 - 87 Cases of Backplanes with various supplied cables
 - 100 % required no precomp or AAF
 - 4% had increased margin with 25% cutback
 - 0% had increased margin with 50% cutback
 - First Pulse data – Graph showing histogram of amount of precomp required
 - Statistical data – Graphs showing # of standard deviations from threshold

T10/01 - 136r0

Goal is 6 sigma

- Sigma (standard deviation) is a measure of the 'narrowness' of the distribution
- 6 Sigma is 3+ failures in 1,000,000,000

Engineering Judgment

- Given a distribution an engineer picks the value which best satisfies the broadest range of cases
- Of all the cases measured which are actual systems being shipped, none could be found that requires 50% cutback
- Let us not be myopic and set a level for all cases to that required by one which appears by supposition only, at the detriment of the 99+% of the cases.

T10/01 - 136r0

Other Issues to Consider

- Power is an issue – Power (heat) relates to reliability
- With 50% cutback, the primary driver is at an extremely high level – even for minimum drive strength.
- Should we risk lowering reliability for the sake of covering a academic case? – NO!

T10/01 – 136r0

SCSI T10/01-136r0 20
A.B.M. 4/19/01

Information the way you want it™

How much ISI is compensated for?

- Table 37 - SCSI Fast-160 timing budget template states:
“ISI Compensation | 2,0 ns | Assumes 50% of ISI is compensated”
- 50% cutback compensates for 100+% of the ISI

T10/01 - 136r0

25% Cutback Proposal

- Change Paragraph **A.2.1 Driver requirements overview** in Annex A to read:

“If precompensation is enabled, the weak driver amplitude shall be a minimum of ~~50~~ 60% to a maximum of ~~66~~ 75% of the strong driver amplitude after the first bit of a series of adjacent ones or adjacent zeros.”

T10/01 – 136r0

Proposal (cont.)

- Change NOTE 49 to read:
- “If a weak driver is driving with the minimum amplitude specified in table A.2, then the 370 mV weak driver translates to a strong driver of ~~560~~ 493 mV for the ~~66~~ 75 % case ranging up to ~~740~~ 616 mV for the ~~50~~ 60 %case.”

T10/01 – 136r0

Conclusion

- 25% cutback gives superior performance to 50% cutback
- 50% cutback increases power
- One would be better off (if more power is acceptable) to use 25% cutback and increase average voltage. This increases the mean but keeps standard deviation the same (i.e. increases # of sigmas from mean to specification limit)

T10/01 - 136r0
