LTO Drive / Tape Library Interface

- Agenda
 - Design Goals
 - Features
 - Encapsulated SCSI Protocol
 - Summary

Design Goals

Design Goals

- Library queries drive
- Library controls drive
- Drive alerts library to errors
- Drive accepts LUN 1 commands and passes to library

Features

- SCSI commands transmitted in serial packets
- Information in standard and custom pages
- Commands from library not affected by reservations
- Asynchronous RS-422 at various rates

Encapsulated SCSI (ESP) Command Set

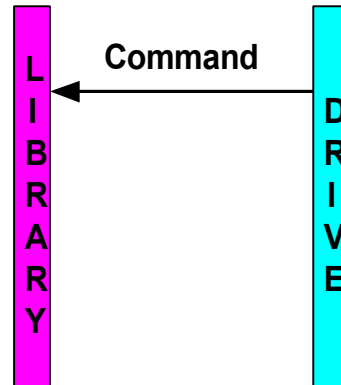

- All supported commands are available to library
 - Library mainly uses Inquiry/Mode/Log Sense/Select
 - Should not do Read or Write commands over serial link
- Vendor-specific pages
 - Status summary
 - Interface control (SCSI bus address, serial baud rate, reset)
- Alert functions:
 - Unit attention, deferred errors, Tape Alert
 - May never be implemented

ESP Architecture

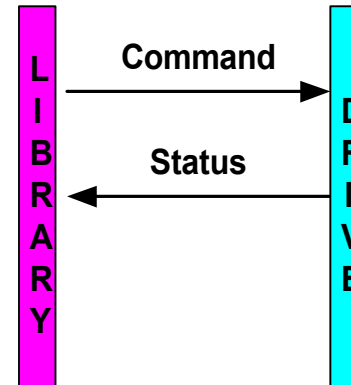

- Serial packet protocol encapsulates:
 - SCSI commands, including task management
 - SCSI data
 - SCSI status
 - Alerts
- Library interface task forwards commands and data to SCSI task for execution
- SCSI task sends data, status, and alerts to library task

ESP Information Over Serial Link

Alert Transaction

Non-Data Transaction

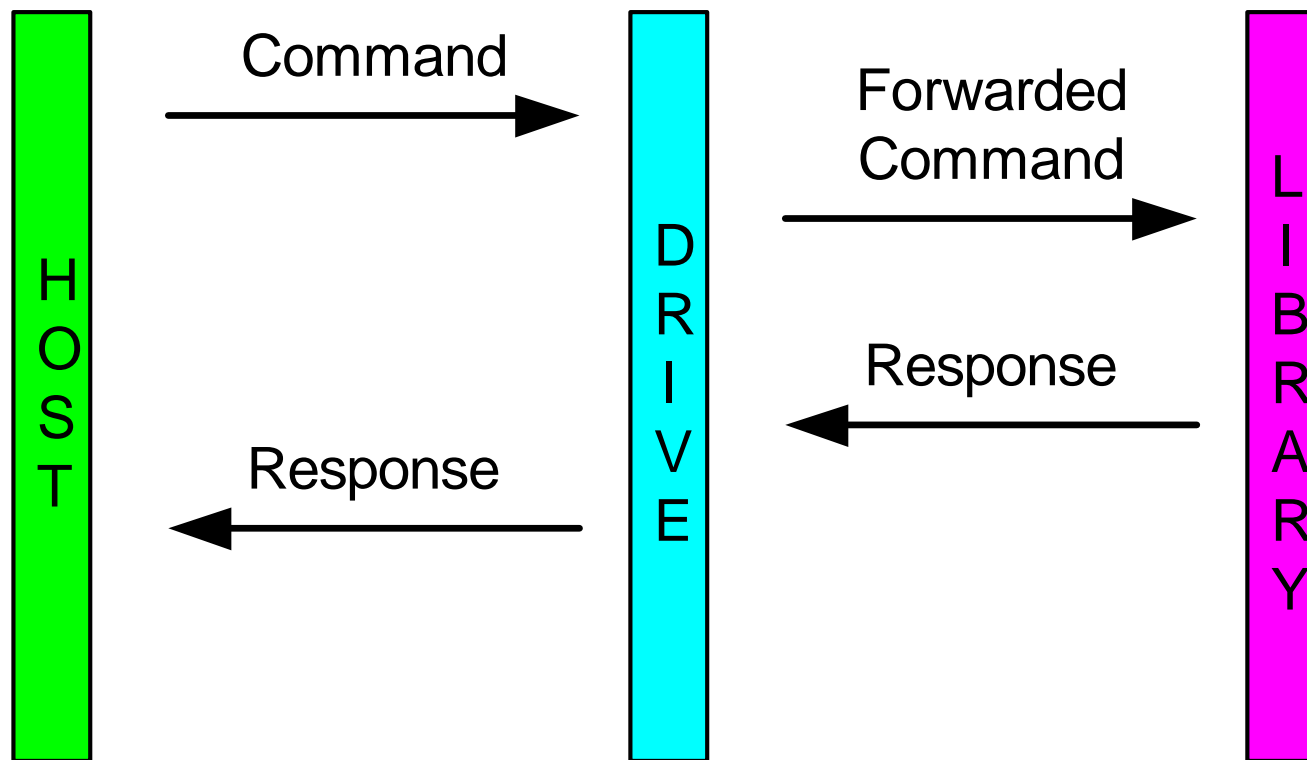

Read Transaction

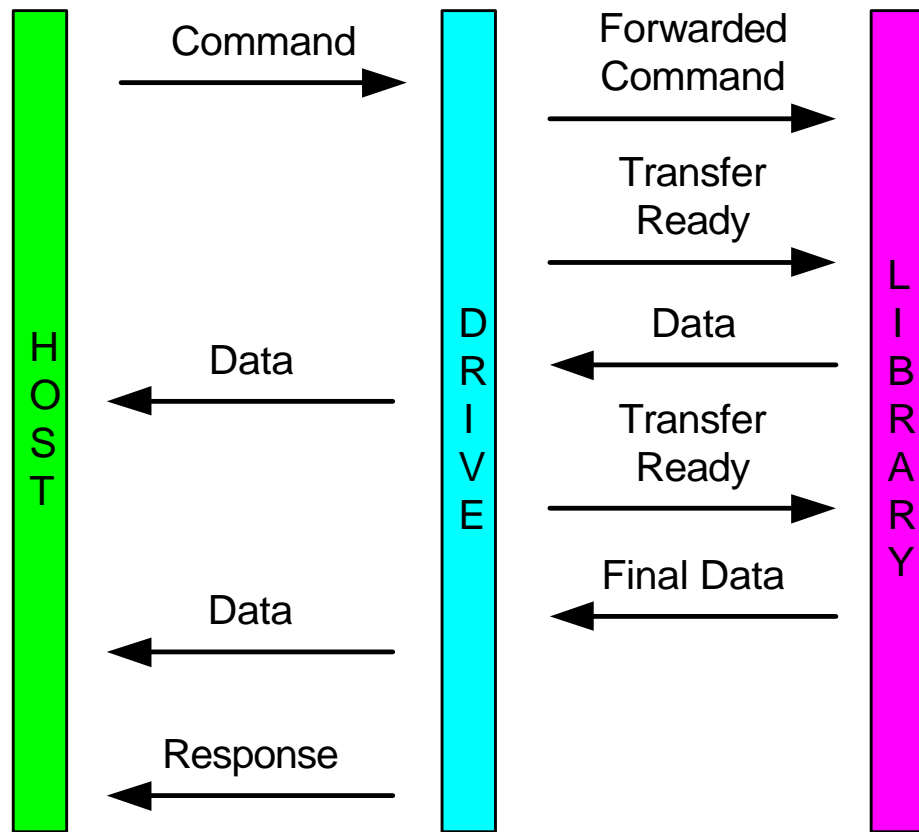

Write Transaction

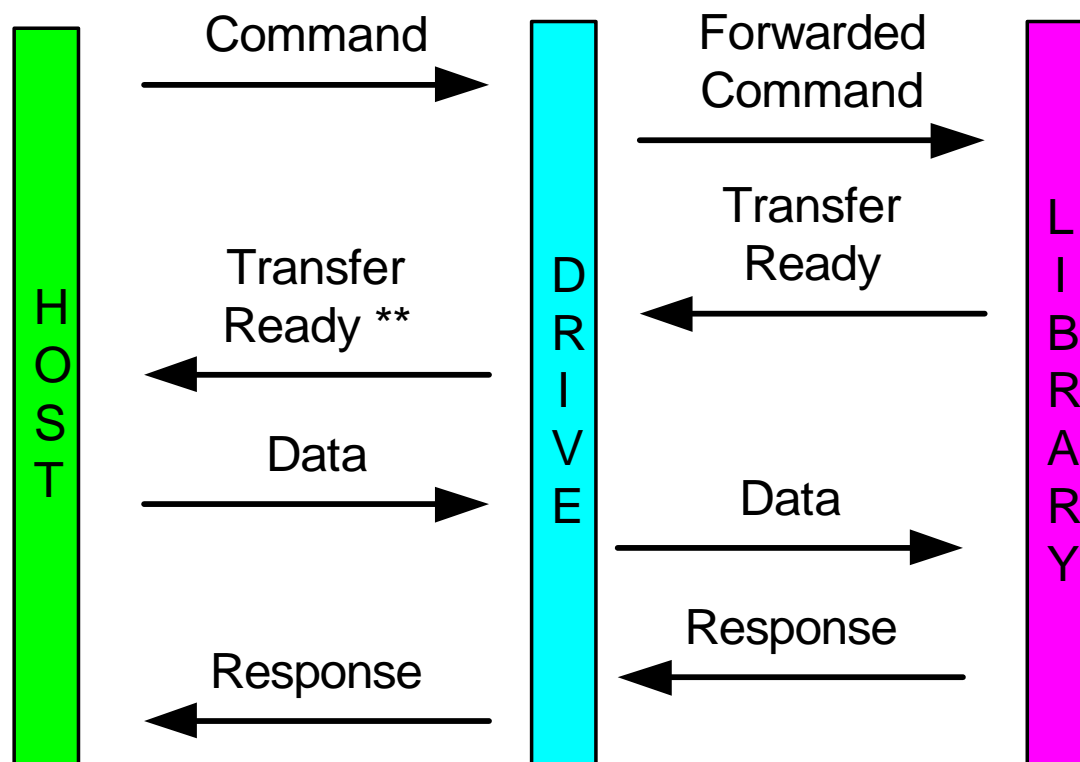

Command Forwarding (non-data)

Command Forwarding (data-in)

Command Forwarding (data-out)

** Fibre Channel drives only

ESP Error Checking

- Link layer:
 - Packet header
 - Length
 - Checksum
 - Acknowledgement
- Transaction layer:
 - Packet loss
 - Data overrun/underrun
- Application layer:
 - Command validity

Command Forwarding

- One drive in a library will accept commands at LUN 1
- Each command is sent to the library
- Library sends read data and command status to drive
- Drive returns data and status to host
- SCSI disconnect after command out

Summary

- Commands, alerts, and data over RS-422
- Reliable delivery
- Additional information via vendor-unique pages
- Accessible via serial port or SCSI bus
- Command forwarding
