SUBJECT: T10/03-087r0, ADC Data Transfer Device Status Masking
This is a brief summary of how a SCSI command could be used to implement the sense data masking function. It has not been completely rendered into proper standards terminology.

### 1.1 MASK UNMASK SENSE Command

The ADC device server implements MASK UNMASK SENSE command (opcode TBD). Bit 0 of byte 4 is the Mask field, which when set turns on sense data masking; when cleared, it turns off masking.

Table x - MASK UNMASK SENSE Command

| Bit <br> Byte | $\mathbf{7}$ | $\mathbf{6}$ | $\mathbf{5}$ | $\mathbf{4}$ | $\mathbf{3}$ | $\mathbf{2}$ | $\mathbf{1}$ | $\mathbf{0}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | OPERATION CODE (TBD) |  |  |  |  |  |  |  |
| 1 | Reserved |  |  |  |  |  |  |  |
| 2 | Reserved |  |  |  |  |  |  |  |
| 3 | Reserved |  |  |  |  |  |  |  |
| 4 | Reserved |  |  |  |  |  |  |  |
| 5 | CONTROL |  |  |  |  |  |  |  |

When MASK is set to one, the data transfer device server shall report a status of CHECK CONDITION, sense key of NOT READY, and additional sense code of LOGICAL UNIT IS IN PROCESS OF BECOMING READY to all initiators connected via a primary interface port. When MASK is set to zero, the data transfer device server shall report the status, sense key, and additional sense code appropriate to its condition.

### 1.2 Masked Mode Operation

While in sense data masked mode:

- The drive will continue to report 02/04/01 to in response to commands received via a primary interface port.
- The drive will remain in this mode across multiple insertions and removals by the automation, until exited as described below.
- The automation will see the unfiltered stream of statuses and SK/ASC/ASCQs.

### 1.3 Usage

- SMC device server receives MOVE MEDIUM command via SCSI/FC interface.
- Automation issues MASK UNMASK SENSE (Mask bit = 1) command to data transfer device.
- Automation inserts medium.
- Automation monitors data transfer device status until cartridge loading has either succeeded or failed.
- If automation abandons the load because of repeated failures, it either removes or leaves cartridge, issues MASK UNMASK SENSE (Mask bit $=0$ ) to drive, and returns error status for MOVE MEDIUM.
