Document: T10/03-227r0  
Subject: Add additional sense code value to SPC-3 for ADC.

## 1. Revision History

Revision 0:  
Posted to the T10 web site 25 June 2003.

## 2. General

The ADI Working Group would like a new additional sense code value assigned to specifically indicate the a MODE SELECT parameter value is not acceptable because it is attempting to change the operating characteristics of a port that is in the enabled state. Such an action is prohibited by the ADC standard. Several existing additional sense code values were considered, but a more specific value is desired.

## 3. Proposal

Add the following additional sense code value to SPC-3 in Table 28 and Table C.1:

ASC/ASCQ value:	26h / 0Eh
Definition:	INVALID PARAMETER WHILE PORT IS ENABLED
Device types:	all
