To: INCITS T10 Committee  
From: Michael Banther, HP  
Subject: SMC-3: DTE Prevented Medium Removal  
Date: 10 January 2005

Revision History
Revision 0 – Initial proposal.
Revision 1 – Corrected ‘Data Transport element’ to ‘Data Transfer element’

Background
At present a standard additional sense code does not exist to explain the failure of a MOVE MEDIUM command when:
1. The MOVE MEDIUM command specifies a Data Transfer element in the SOURCE ADDRESS; and
2. The Data Transfer element will not eject the medium due to prior execution of a PREVENT ALLOW MEDIUM REMOVAL command with the PREVENT field set to 01b or 11b.

HP knows of four different additional sense codes used in this situation in existing media changer products:

a. MEDIA LOAD OR EJECT FAILED which customers generally interpret as a stuck tape;
b. UNLOAD TAPE FAILURE which customers generally interpret as a stuck tape;
c. MEDIUM REMOVAL PREVENTED which customers generally interpret as the library not allowing removal; and
d. A vendor-specific code.

To encourage standard reporting of this situation, HP proposes adding a DATA TRANSFER ELEMENT PREVENTED MEDIUM REMOVAL additional sense code to SMC-3 and SPC-4. The proposal also includes some clean-up of existing, but inconsistent, text.

Changes to SMC-3

6.4 EXCHANGE MEDIUM command
The SOURCE ADDRESS, the FIRST DESTINATION ADDRESS, and the SECOND DESTINATION ADDRESS fields may represent a storage element, an import/export element, a data transfer element, or a medium transport element. If the element address specified has not been assigned to a specific element of the media changer, the device server shall return CHECK CONDITION status. The sense key shall be ILLEGAL REQUEST and the additional sense code INVALID ELEMENT ADDRESS.

If the SOURCE ADDRESS or the FIRST DESTINATION ADDRESS of an EXCHANGE MEDIUM command represents a data transfer element and removal of the medium from the corresponding data transfer device (see 5.3.5) does not occur due to a prevention of medium removal condition (see SPC-3) within the data transfer device, the device server shall return CHECK CONDITION status and shall set the sense key to ILLEGAL REQUEST and the additional sense code to DATA TRANSFER ELEMENT PREVENTED MEDIUM REMOVAL.

An INV1 bit of one specifies that the volume shall be inverted prior to depositing the volume into the FIRST DESTINATION ADDRESS element. Support for this bit set to one is optional.

6.7 MOVE MEDIUM commands
The SOURCE ADDRESS and the DESTINATION ADDRESS fields may represent a storage element, an import/export element, a data transfer element, or a medium transport element. If the address specified has not been assigned to a specific element of the media changer, the device server shall return CHECK CONDITION status. The sense key shall be ILLEGAL REQUEST and the additional sense code INVALID ELEMENT ADDRESS.

If the SOURCE ADDRESS of a MOVE MEDIUM command represents a data transfer element and removal of the medium from the corresponding data transfer device (see 5.3.5) does not occur due to a prevention of medium removal condition (see SPC-3) within the data transfer device, the device server shall return CHECK CONDITION status and shall set the sense key to ILLEGAL REQUEST and the additional sense code to DATA TRANSFER ELEMENT PREVENTED MEDIUM REMOVAL.

The Device Capabilities mode page (see 7.3.2), provides a matrix with the supported source element or destination element combinations for the MOVE MEDIUM and MOVE MEDIUM ATTACHED commands.
Proposed Changes to SPC-4
