Summary of Comments on Serial Attached SCSI 1.1 (SAS-1.1) Standard ■

Page: i

Author: mevans_mxo Subject: Note Date: 4/19/2005 1:42:36 PM

Global: There are hundreds of occurrences of unclear pronoun references in this document. While reviewing the document for letter ballot, I only had time to comment on the ones that I thought were the most unclear. The general rule for pronoun usage is: there shall be no other noun forms (noun, pronoun, gerund, etc.) between a pronoun and the noun to which it is referring. The editor should correct any unclear pronoun references by replacing the unclear pronoun with the correct noun as he discovers the occurrences. Hint: one could start this process by searching on "it", then move on by searching on "they".

Date: 4/22/2005 9:21:17 AM

TREJECT (UML 2.0 is splitting into 4 separate documents, none of which are officially released. The part that SAS would have to reference - the Superstructure document - is in the worst shape.)

2.4 Other references

This << OMG Unified Modeling Language (UML) Specification. Version 1.5, March 2003. >> should be << OMG Unified Modeling Language (UML) Specification. Version 2.0, October 2004. >>

Author: mevans_mxo Subject: Highlight

Date: 5/1/2005 9:39:28 PM

REFER PROTOCOL WG (SAS points to ATA/ATAPI-7 not ATA/ATAPI-8, so we're not necessarily bound by T13's evolving architecture spec.

SAS needs to account for SATA port selectors (of various levels of complexity) and should account for SATA port multipliers, even if T13 chooses to ignore them.

SAS needs to support advanced STP/SATA bridges and native STP targets which can recognize multiple STP initiators and provide separate task file register sets for each of them. The limited access model supported by affiliations is not required.)

3.1.11: Change to: an I/O subsystem that is made up of one host, one or more devices, and a service delivery subsystem. [as defined by the T13 Technical Committee.]

Author: relliott Subject: Highlight Date: 5/1/2005 9:39:36 PM

> 3.1.18 burst time "ALIGN primitives"

SATA2 also allows non-ALIGN primitives. This should be made more generic - change to "OOB burst"

Author: kmarks_dell Subject: Highlight Date: 4/19/2005 8:12:06 PM TACCEPT - DONE (as "The function provided by the receiver circuit responsible for producing a regular clock signal (i.e., the recovered clock) from the received signal ")

3.1.23 clock data recovery (CDR) change"The function is provided by the receiver circuit ..." to"A function provided by the receiver circuit ..."

Author: mevans_mxo

Subject: Highlight

Date: 4/22/2005 10:12:26 AM

TREJECT (the current word "message" is a defined term, no need to change it to the less precise "information". The part of the current sentence about "sometimes relaying a response from a peer higher layer state machine" is also useful and matches similar wording in the indication definition about its relationship to "request")

3.1.28: Change to: Information passed from a lower layer state machine to a higher layer state machine, usually responding to a request (see 3.1.153) from that higher layer state machine. See 3.6.

Author: kmarks_dell Subject: Cross-Out Date: 4/28/2005 3:35:07 PM

3.131 connector

Remove

"Connectors may introduce physical disturbances to the transmission path due to impedance mismatch, crosstalk, etc. These disturbances may introduce jitter and other forms of signal degradation under certain conditions."

Although true, does not belong in the definition of connector...

Author: rlsheffi_intc Subject: Highlight Date: 5/1/2005 10:40:24 PM REFER PHY WG

3.1.35 cumulative distribution function (CDF):

This may not be the correct definition - even as it applies to jitter measurements. It is not cumulative over time, but rather cumulative over a population of jitter measurement samples. Jitter samples are measured as intervals of time, but this definition sounds like it's based on absolute time, not sampled intervals. Suggest:

"The integral of the PDF (see 3.1.143) with limits from negative infinity to a specified jitter value, or from a specified jitter value to positive infinity."

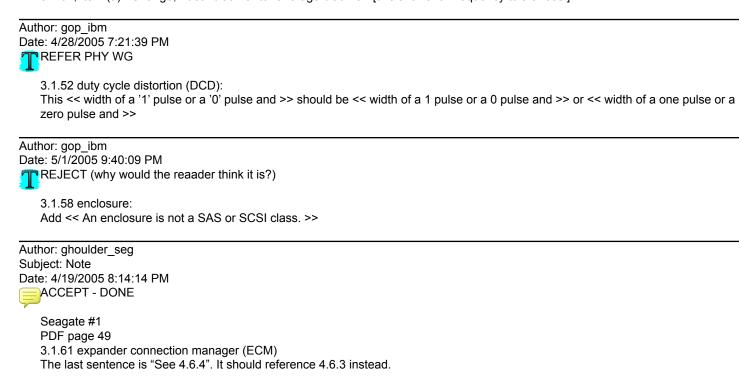

Author: relliott Subject: Note Date: 4/20/2005 12:07:05 PM ACCEPT - DONE

3.1.37 D.C. idle

Add mention that it is "used during the idle time (see 3.1.90) of an OOB signal (see 3.1.131)".

Author: mevans_mxo Subject: Highlight Date: 4/28/2005 4:37:33 PM REFER PHY WG

3.1.52, item (a): Change, "ideal bit time" to "average bit time". [this allows for frequency tolerances.]

Author: mevans_mxo Subject: Highlight Date: 4/19/2005 1:42:36 PM 3.1.66: Change to: An object within an expander device that contains one or more phys and interfaces to the service delivery subsystem and to SAS ports in other devices (see x.x).

Author: mevans_mxo Subject: Highlight Date: 4/19/2005 1:42:36 PM 3.1.67: Define "routed SAS address".

Author: mevans_mxo Subject: Highlight Date: 4/23/2005 4:18:52 PM ACCEPT - DONE 3.1.71: Change "vs." to "versus".

Author: mevans_mxo Subject: Highlight Date: 4/28/2005 4:41:08 PM TREFER PHY WG

3.1.71, second sentence: Change to: Comparison of the measured eye contour to the jitter eye masks determines if a jitter eye mask violation has occurred (see 5.3.6).

Author: mevans_mxo Subject: Note Date: 4/19/2005 1:42:36 PM 3.1.73: Add "(See x.x)" where x.x is the number of the clause where this device is described in detail.

Author: mevans_mxo Subject: Highlight Date: 4/19/2005 8:15:31 PM TACCEPT - DONE

3.1.75: Change "e.g." to "i.e." in two places.

Author: mevans_mxo Subject: Note Date: 4/19/2005 8:16:04 PM ACCEPT - DONE (as "See SAM-3.")

3.1.84: Add "(See SAM-3)".

Author: mevans_mxo Subject: Note Date: 4/19/2005 8:16:15 PM ACCEPT - DONE (as "See SAM-3.")

3.1.86: Add "(See SAM-3)".

Author: mevans_mxo Subject: Note Date: 4/19/2005 8:16:10 PM ACCEPT - DONE (as "See SAM-3.")

3.1.87: Add "(See SAM-3)".

Author: kmarks_dell Subject: Highlight Date: 4/19/2005 8:19:45 PM CCEPT - DONE (7.9)

3.1.88 identification sequence

change "See 4.4." to "See 4.1.2" or "See 7.9"

This is where the identification sequence is first talked about.

Author: ghoulder_seg Subject: Note Date: 4/19/2005 8:19:53 PM ACCEPT - DONE

> Seagate #2 PDF page 51 3.1.88 identification sequence: This definition refers to clause 4.4, but a better reference to understand what an identification sequence is would be clause 7.9.

Author: kmarks_dell Subject: Highlight Date: 4/28/2005 7:22:52 PM TREJECT (in SAS-1.0 letter ballot comment resolution, adjective use was changed to "vendor-specific" and noun use was changed to "vendor specific". We could add both to the keywords list if that would help)

3.1.98 idle dword

change (Global) "vendor-specific" to "vendor specific"

vendor specific is a keyword and does not contain a dash. Through out draft the dash is used.

Author: mevans_mxo Subject: Highlight Date: 4/22/2005 10:07:55 AM TREJECT (the current word "message" is a defined term, no need to change it to the less precise "information".)

3.1.91: Change to: Information passed from a lower layer state machine to a higher layer state machine, usually relaying a request (see 3.1.153) from a peer layer state machine. See 3.6.

Comments from page 11 continued on next page

The glossary is not the place to define everything there is to know about jitter. It should only have a short definition of relevant terms. The details should be in a section of the standard that describes jitter. It is a bad sign when a term is only used in the glossary section and nowhere else.

Author: gop_ibm Date: 4/28/2005 7:23:48 PM PREFER PHY WG

> 3.1.100 jitter, data dependent (DDJ): This << (one ISI mechanism). >> should be << (i.e., one ISI mechanism). >>

Author: gop_ibm Date: 4/28/2005 7:23:28 PM REFER PHY WG

3.1.100 jitter, data dependent (DDJ):

This << For example, when using media that attenuates the peak amplitude of the bit sequence consisting of repeating 0101b patterns more than peak amplitude of the bit sequence consisting of repeating 00001111b patterns, the time required to reach the receiver threshold with the 0101b patterns is less than required from the 00001111b patterns. The run length of 4 produces a higher amplitude that takes more time to overcome when changing bit values and therefore produces a time difference compared to the run length of 1 bit sequence. >> should be << (e.g., when using media that attenuates the peak amplitude of the bit sequence consisting of repeating 0101b patterns, the time required to reach the receiver threshold with the 0101b patterns more than peak amplitude of the bit sequence consisting of repeating 00001111b patterns, the time required to reach the receiver threshold with the 0101b patterns is less than required from the 00001111b patterns. The run length of four produces a higher amplitude that takes more time to overcome when changing bit values and therefore produces and therefore produces a higher amplitude that takes more time to overcome when changing bit values and therefore produces a time difference compared to the run length of four produces a higher amplitude that takes more time to overcome when changing bit values and therefore produces a time difference compared to the run length of one bit sequence). >>

Author: gop_ibm Date: 4/28/2005 7:23:53 PM REFER PHY WG

3.1.100 jitter, data dependent (DDJ):

This glossary entry has way too much information for a glossary entry. Also the only place where DDJ is used in other glossary entries. Everything after the first sentence should be in a section in the body of the standard.

Author: gop_ibm Date: 4/28/2005 7:24:01 PM REFER PHY WG

3.1.100 jitter, data dependent (DDJ):

This << mechanisms such as reflections, and transfer functions of coupling circuits and other mechanisms such as ground bounce. >> should be <<mechanisms (e.g., reflections, transfer functions of coupling circuits, and ground bounce). >>

Author: gop_ibm Date: 4/28/2005 7:24:06 PM REFER PHY WG

3.1.106 jitter, random, (RJ):

This << distribution and is unbounded. Examples of mechanisms that can cause RJ include PLL jitter in transmitter devices, electronic switching noise, and analog amplifiers. >> should be << distribution and is unbounded (e.g., may be caused by PLL jitter in transmitter devices, electronic switching noise, and analog amplifiers). >>

Author: gop_ibm Date: 4/28/2005 7:24:12 PM REFER PHY WG

3.1.107 jitter, total (TJ):

It is not clear what this statement << (1 - jitter eye opening) >> relates to or what information it is trying to convey. This needs to be fixed.

Author: gop_ibm Date: 4/28/2005 7:24:19 PM REFER PHY WG

3.1.109 jitter tolerance at transmit device compliance points:Just about everything after the first sentence should not be in a glossary but should be included in a section on jitter.

3.1.109 jitter tolerance at transmit device compliance points: This << See also signal tolerance. >> is not a valid cross reference and needs to be fixed.

Author: gop_ibm Date: 4/28/2005 7:24:31 PM REFER PHY WG

> 3.1.110 jitter tolerance for receiver devices: Just about everything after the first sentence should not be in a glossary but should be included in a section on jitter.

Author: gop_ibm Date: 5/1/2005 9:41:57 PM REFER PHY WG (agree this must change)

3.1.110 jitter tolerance for receiver devices: This << See also signal tolerance. >> is not a valid cross reference and needs to be fixed.

Author: kmarks_dell Subject: Highlight Date: 4/19/2005 1:42:54 PM

> Change "...part of connectors." to "...part of connectors or a plural of medium."

Because the word media is used multiple times in the power conditions state machine, .i.e. rotating media. This may additionally add a definition for medium as

"medium: The material on which data is stored (e.g., a magnetic disk)."

Author: afan_tyco Subject: Note Date: 5/1/2005 10:47:41 PM REFER PHY WG 3) General comments: Cable, Media, Cable Assembly

Comments: Cable, Media and Cable Assembly have been used in this document. They cause confusions

Suggest: Need more clarification about these terms: does 'cable' mean 'cable assembly'?does 'media' mean cable/backplane without connector and termination? etc

Author: mevans_mxo Subject: Highlight Date: 4/19/2005 8:25:51 PM

3.1.24: Change "after" to "as the result of".

Author: gop_ibm Date: 5/1/2005 9:45:03 PM ACCEPT - DONE

> 3.1.127 object diagram: This << ; a special case of a class diagram >> should be deleted as it is not really accurate. The remaining is good enough.

Author: relliott Subject: Note Date: 4/20/2005 12:07:52 PM ACCEPT - DONE

Add "3.1.xx OOB burst: The transmission of signal transitions for a burst time (see 3.1.18). See 6.6.1."

Author: relliott Subject: Highlight Date: 4/19/2005 8:34:17 PM ACCEPT - DONE 3.1.128 OOB sequence

To match two similar Seagate comments on identification sequence and speed negotiation sequence, change "See 4.4" to "see

Comments from page 13 continued on next page

Author: relliott Subject: Highlight Date: 4/20/2005 9:13:48 AM CCEPT - DONE

3.1.129 OOB signal

"ALIGNs and idle time" s/b "idle time (see 3.1.90) and burst time (see 3.1.18)" since SATA2 allows non-ALIGNs to be used, and burst time and idle time are both defined times which provide that level of detail.

Author: relliott Subject: Note Date: 4/20/2005 12:09:02 PM ACCEPT - DONE

Add "3.1.xx OOB interval: The time basis for burst times (see 3.1.18) and idle times (see 3.1.90) used to create OOB signals (see 3.1.131). See 6.6.1."

This supports the OOBI acronym added per a Seagate comment.

Author: thoglund_lsi Subject: Highlight Date: 5/1/2005 9:45:47 PM REFER PROTOCOL WG

definition does not strictly match 4.1.9 text. Also partial pathway should include case where an OPEN address frame has reached a SAS endpoint but no response has been given (yet).

Author: mevans_mxo Subject: Cross-Out Date: 4/28/2005 7:24:59 PM

3.1.143: Change to: A mathematical representation of the likelihood of occurrence of various events. When applied to a jitter event population, it describes the histograph of measured jitter values.

Author: bbissone_intc Subject: Note Date: 5/1/2005 10:47:09 PM REFER PHY WG (test load)

> 3.1 Definitions, symbols, abbreviations Add definition for 'probe point'. Could read something like, "Physical positions in the test load where the signal properties are measured. See Section 5.3.2.1."

Change"

3.1.188 SCSI port: A SCSI initiator port or a SCSI target port. See SAM-3."

to

"3.1.188 SCSI port: A SCSI initiator port, a SCSI target port or a SCSI target/initiator port. See SAM-3."

Author: relliott Subject: Note Date: 5/1/2005 9:55:26 PM

In the definitions for STP, SMP, and SSP, add "See 7.xx and 9.xx." pointing to their link layer and transport layer subclauses.

Author: kmarks_dell Subject: Highlight Date: 5/1/2005 9:49:49 PM ACCEPT - DONE (but without "for the purpose of communicating management information")

3.1.196 Serial Management Protocol (SMP)

Change

"... used by SAS devices to communicate management information with other SAS devices in a SAS domain."

to

".. used by SMP initiator ports to communicate with SMP target ports for the purpose of communicating management information in a SAS domain."

Author: relliott Subject: Highlight Date: 5/1/2005 9:54:43 PM

To match Dell comment on SMP, change "SCSI initiator ports to communicate with SCSI target ports" to "SSP initiator ports to communication with SSP target ports"

Author: gop_ibm Date: 4/28/2005 7:25:31 PM REFER PHY WG

3.1.202 signal tolerance:

None of this belongs in the glossary and should in placed in the main body of the standard possibly in a jitter section. << Signal tolerance is measured by the amount of jitter required to produce a specified bit error ratio at a specified signal amplitude and other signal properties. The signal tolerance performance depends on the frequency content of the jitter and on the amplitude of the signal. Since detection of bit errors is required to determine the signal tolerance, receiver circuits embedded in a SAS protocol chips require that the protocol chip be capable of reporting bit errors. For receiver circuits that are not embedded in a SAS protocol chip the bit error detection and reporting may be accomplished by instrumentation attached to the output of the receiver circuit. Signal tolerance is measured using the minimum allowed applied signal eye opening for both horizontal and vertical directions unless otherwise specified. >>

Author: ghoulder_seg Subject: Note Date: 4/19/2005 8:30:41 PM ACCEPT - DONE (6.7.2.2 and 6.7.4.2, to also cover SATA speed negotiation)

Seagate #3 PDF page 58 3.1.211 speed negotiation sequence: This definition refers to clause 4.4, but a better reference to understand the speed negotiation sequence would be 6.7.4.2.

Author: gop_ibm

Date: 5/1/2005 10:03:26 PM

REFER PROTOCOL WG ("need not" is a keyword supported by ISO/IEC Directives, Part 2, 2004 Table H.3 - Permission (along with "may").

Changing to "is not required to", one of the "equivalent expressions, violates this ISO rule 6.6.1.3: "The equivalent expressions given in the second column shall be used only in exceptional cases when the form given in the first column cannot be used for linguistic reasons."

I also suggest adding "can" and "cannot" too, from Table H.4 - Possibility and Capability. They must be used correctly (not confused with "may") but do have a different meaning (may means the device complying with the standard has permission to do something, while can means the device must tolerate the specified behavior.

3.3.6 need not:

This should not be a keyword. It should be deleted and all usages replaced with. << is not required to >>

Author: gop_ibm

Date: 5/1/2005 10:08:36 PM

REFER PROTOCOL WG (this parallels the equivalent phrase provided for "should".

Т

I would prefer to include all the ISO "equivalent" phrases for all the ISO keywords - may/need not/should/should not/shall/shall not/ can/can not

)

3.3.11 shall:

This << (equivalent to "is required to"). >> should be deleted as it adds nothing and is not used in other standards when defining the shall keyword.

REFER PROTOCOL WG (I often put horizontal bars across each section, which would help here. What are the "many [other] instances" that bother you, though?)

3.5: Figure 3 is the first of many instances where it is difficult to determine what all is included in the figure. In these cases it would be helpful to put a box around all of the items in the figures, or somehow group them in some other way.

Author: kmarks_dell Subject: Note Date: 5/1/2005 10:10:14 PM REFER PROTOCOL WG (state diagrams)

Figure 9 - State machine conventions

Many of the state machines in the standard contain only a single state. When the State designator:State_Name format is used, the text never references this state, and a search for this State designator:State_Name would only hit the state machine state on the figure.

I propose that for state machines that only have a single state, that the state name be left off and a sentence that follows be added to the paragraph after Figure 9. "For state machines that only contain a single state, only the state designator may be used."

4.2.6 Port identifiers

Comment received from Doug Gilbert (linux):

Section 4.2.6 on Port identifiers says: "Each SAS initiator port, target port and target/initiator port shall include a SAS address (see 4.2.2) as its port identifier. The selected SAS address shall be used for no other name or identifier."

Current HBAs (4 or 8 phy) can have multiple initiator ports in different SAS domains each with the same SAS port identifier. IMO that doesn't sit well with the second sentence from draft shown above (namely the unqualified "... or identifier" part.

Or perhaps I am misunderstanding what a SAS HBA should publish as its port identifier for its second and subsequent ports?

My reply: Good point. The initiator device certainly is allowed to use that port identifier in another domain (causing another port to be created).

It's trying to ensure that the identifier is not used as (for targets or initiators) a device name or (for targets) a logical unit name.

4.7.2, fourth paragraph: Change, "...it shall disable the expander route entry...", to, "...the management application client shall disable the expander route entry...".

Author: rlsheffi_intc Subject: Highlight Date: 5/1/2005 10:41:55 PM

4.7.2 Allowed topologies

Fifth paragraph

This doesn't say what's intended. If the port of the expander device being configured is a subtractive decode port, and the expander device attached to that port has two or more ports with table-routing phys attached to other expanders, then the management application will find the SAS address of the port being configured in the ports of the other expander devices which connect to the same expander device, but it is not a routing loop.

CACCEPT - DONE (incorporated throughout the section. Includes new rule on when the test function begins on SMP - after the connection is closed - which is not currently defined.

New wording:

"The optional Protocol-Specific diagnostic page for SAS (see 10.2.9.1) provide methods for an application client to enable and disable a phy test function (e.g., transmission of the CJTPAT) for a selected phy in a SAS target device with an SSP target port. The optional SMP PHY TEST FUNCTION function (see 10.4.3.11) provides similar methods for SAS target devices with SMP target ports.

The application client sends a SEND DIAGNOSTIC command with the Protocol-Specific diagnostic page or an SMP PHY TEST FUNCTION function specifying the phy in the SAS target device that is to perform the phy test function and the phy test function to be performed. If the phy test function requires a specific phy test pattern and/or phy test pattern physical link rate, then it also specifies the phy test pattern and phy test pattern physical link rate.

The SEND DIAGNOSTIC command may be sent through any SSP target port to any logical unit in the SAS target device that contains the phy that is to perform the phy test function.

For the SEND DIAGNOSTIC command, the phy shall begin the specified phy test function after the SSP target port receives an ACK for the RESPONSE frame transmitted in response to the SEND DIAGNOSTIC command that requested the phy test function. For the SMP PHY TEST FUNCTION function, the phy shall begin the specified phy test function after the SMP target port transmits the SMP response frame.

Once a SAS phy has begun performing a phy test function, it shall ignore its receiver. To stop a SAS phy from performing a phy test function, an application client sends a SEND DIAGNOSTIC command or an SMP PHY TEST FUNCTION function to a SAS phy in the SAS target device that is not performing a phy test function requesting a phy test function of 00h (i.e., STOP). If no such phy is available, the phy test function only stops on power loss.") REVIEW

this section should also discuss Phy test functionality provided by the SMP PHY TEST FUNCTION

Author: relliott Subject: Highlight Date: 4/28/2005 1:32:31 PM CACCEPT - DONE REVIEW

4.8 Phy test functions

"The phy shall begin... after receiving an ACK" implies the phy running the function is the one receiving the ACK. Really, it's the phy receiving the SEND DIAGNOSTIC command.

Change to:

The phy shall begin the specified phy test function after the SSP target port receives an ACK for the RESPONSE frame transmitted in response to the SEND DIAGNOSTIC command that requested the phy test function.

5.1 Physical layer overview

"Within this standard, reference to connector gender use the terms plug and receptacle as equivalent to the terms free and fixed, respectively, that may be used in the references that define the connectors."

This makes no sense. Free should mean cable, fixed should backplane. With SFF-8484, the cable has a receptacle on it; for the others, the cable has a plug. All of the the cable connectors should be called the "free" connectors.

REFER PHY WG (pinout)

Reject proposed changes in T10/05-139r0 unless modified to change:

1. If using Alternate Table 26Z -- Controller SAS internal pin assignments and physical link usage - does not define pin assignments, only signal usage for link widths.

2. In the statement "The use of the sideband signals by a backplane is vendor-specific. One implementation of the sideband signals by a backplane is an SGPIO target interface (see SFF-8485). Other implementations shall be compatible with the signal levels defined in SFF-8485." - SFF-8485 does not currently define a mapping for the external compact version of the cable, and because there are 8 sidebands, the mapping is not obvious. Additionally, I question the "shall be compatible with the signal levels", because the mapping of the signals to sidebands in SFF-8485 is in an informative section.

3. If removing the tables defining the signal to pin mapping and relying on the cabling diagrams, then the external cable should use the same delivery style, i.e. remove table and add diagram of cabling.

4. Add that the internal compact wide cable plug connector uses the 36 pin version of SFF-8086 and the circuit board layout is common, and not the circuit board.

5. Add that the internal compact wide receptacle connector uses the 36 pin version of SFF-8086 and the the receptacle mating interface layout is common, and not the receptacle mating interface.

5.2.4.3.1 SAS internal wide cables overview, figure 77:

This figure is not correct: Signal/pin assignments on both connectors must be the same (controller version of pinout) and RX0 lane attaches to TX3 lane, etc. Pin sequence on right-hand connector should be changed to sequence used on left hand connector (only from top to bottom). Once TX signal polarities get fixed, the interconnect lines will straighten out. Should look like the wide 4x internal connector (controller to controller) Tx0<->Rx3, Tx1<->Rx2,....

5.2.3.4.2 SAS internal wide symmetric cables (general comment on all cable figures)

The depiction of the grounds is misleading in these cable figures.

Show grounds going into a cylinder with dotted lines. Show paddle boards for the crossovers of the signals where needed rather than just crossing the lines in space.

Alternatively, just show the grounds going into circles at each end (not full cylinders) labeled "twinaxial dual drain shield" and don't show them connected from one side to the other.

Table 31/32 Impedance media requirements

Table 31 uses "aggressor pair" to mean a signal pair like Tx0+/Tx0- affecting an unnamed signal pair

Table 32 uses "signal pair" to mean signal pair Tx0+/Tx0- to signal pair Rx0+/Rx0-

Should table 31 says "aggressor signal pair" rather than "aggressor pair"?

Should table 32 mention that each signal pair takes turns being the aggressor?

Author: afan_tyco Subject: Note Date: 4/25/2005 7:29:57 PM ACCEPT - DONE (In table 31, changed to "from any single aggressor pair". In table 32, changed to "on any of the following signal pairs") REVIEW

2) Table 31 and Table 32: Maximum Crosstalk

Comments: the descriptions of the requirements are not clear

Suggest: change description to match how the measurement should take place, such as how many aggressor at one time and how many victim lines should be considered and their position. If more than one victim line is measured, the spec requirement is a total sum?

Author: relliott Subject: Note Date: 4/25/2005 7:35:48 PM REFER PHY WG

Table 31 Media requirements for external cables Maximum near-end crosstalk rows

These pair choices are not appropriate for the external using external compact (SFF-8088) connectors. They are based on the odd SFF-8470 signal assignments with all the RX on one end and TX on the other end.

Also, there are two dimensions to consider (e.g. A0 to B0 as well as A0 to A1)

Author: relliott_hpq Subject: Highlight Date: 4/25/2005 6:52:29 PM TREFER PHY WG 5.2.6 Impedance and media specifications Table 31 external cables

The specification of: Maximum intra-pair skew (h, k): 20 ps

Comments from page 131 continued on next page

is barely achievable by commodity cables and may not be that important (it causes the corners of the eye diagram to become rounded off). See 05-098. Either raise the number or eliminate it.

Author: afan_tyco Subject: Note Date: 4/28/2005 3:42:03 PM REFER PHY WG (cable skew)

> Table 31 (for External Cables), page 131: Maximum Intra-pair skew: 20ps

Comments: Compare to Table 32 (For Internal Wide Cables), 20ps is not practically possible. External cable is expected to be several times longer than internal cables, but the skew budget is not.

Suggest: Need to propose a reasonable budget or leave it off the spec until a reasonable budget is determined.

Author: relliott Subject: Note Date: 4/28/2005 6:17:03 PM REFER PHY WG

Table 32 Media requirements for internal wide cables

Maximum near-end crosstalk rows

These pair choices are not appropriate for the internal wide cable using internal compact wide (SFF-8087) connectors. There are now two dimensions to consider (e.g. A0 to B0, A0 to A1).

Author: relliott_hpq Subject: Highlight Date: 4/25/2005 6:51:55 PM

5.2.6 Impedance and media specifications Table 32 - internal wide cables

The number: Maximum intra-pair skew: 10 ps

may not be needed (see comment on table 31 for external cables).

If this row remains, then footnotes h and k from table 31 which describe the measurement techniques should be copied here.

Author: blye_pmcs Subject: Note Date: 4/28/2005 3:38:18 PM REFER PHY WG (TECHNICAL ISSUE)

PMC #2 PDF Page 184 Section 5.3.2.4 Low-loss TCTF test load Fourth Paragraph

The equation for this TCTF are specified differently than either of the other two TCTF's, in that it specifies a smooth line from 50MHz to 5,0GHz while the other two equations specify kinks at 3,0GHz (3Gbps operation) or 1,5GHz (1.5Gbps operation).

Should the Low-loss TCTF be similarly specified with kinks at 1,5GHz and 3,0GHz?

As it stands with the current definition, the Low Loss TCTF actually allows more loss above 2,7GHz than the 1.5Gbit/s Internal TCTF, and it allows slightly more loss at 5,0GHz than the 3.0Gbit/s Internal TCTF, which makes the term "Low Loss" somewhat inaccurate.

Although probably not relevant to this discussion, this TCTF also allows more loss than that allowed by the corresponding SATA2 cable specification.

Author: bbissone_intc Subject: Comment on Text Date: 4/24/2005 12:26:12 PM

CCEPT - DONE (Agree that since SATA II doesn't allow 3 Gbps ALIGNs, then a SAS phy supporting attachment to SATA devices must not be allowed to transmit them. This rule needs to also be stated in 6.6 (comment added there).

Also, a SAS phy would never transmit D24.3 characters since that breaks its SAS rule (we assume that SAS never discusses phys that ONLY attach to SATA). So, D24.3 also needs to be removed.

Result: Footnote g) is 1.5 Gbps ALIGN (0)s only.) REVIEW

5.3.7.3, Table 38: Table footnote (g) SATA does not allow 3,0 Gbps aligns in OOB. It DOES allow 1.5 Gbps OOB w/ 3,0 Gbps edge rates. Delete ", or 3.0 Gbps ALIGN (0) dwords"

5.3.7.5 Transmitter device signal output levels for OOB signals

1st sentence. change "...signal levels (see SATA2-PHY) during..." to "...signal levels (see SATAII-PHY) during..."

Author: relliott_hpq Subject: Note Date: 4/25/2005 8:03:54 PM REFER PHY WG

5.3.7.5 Transmitter device signal output levels for OOB signals

The toggling algorithm is bogus and should not be used if SATA device attachment is supported. It leads to overdriving signals into the SATA device, which might have a 600 - 700 mV maximum expectation.

Comments from page 154 continued on next page

Instead, a SAS phy supporting SATA device attachment needs to always use SATA compatible levels for COMINIT, only switching to SAS levels if it receives a COMSAS. A SAS receiver (if a SAS drive is attached) should have no problem receiving the lower levels - no more of a problem than a SATA device in that same position. If it cannot work with lower levels, then a SATA device would not be able to work either and it's not really an attachment point that supports SATA device attachment.

SAS phys not concerned with SATA device attachment (e.g. phys attached to external cable connectors) need to use their normal SAS levels.

Proposals discussing this topic include 05-019 and 05-077.

Author: mevans_mxo Subject: Highlight Date: 4/24/2005 12:14:16 PM

CCEPT - DONE (as "When transmitting an OOB burst, A SAS transmitter device:

a) should transmit ALIGNs at the G1 physical link rate;

b) may transmit ALIGNs at its lowest supported physical link rate if it is not able to transmit at the G1 physical link rate; and

c) shall not transmit ALIGNs at a physical link rate faster than its lowest supported physical link rate.

")

6.6.2, sixth paragraph: Change to: A SAS transmitter device:

a) should transmit ALIGNs at the G1 physical link rate to create the burst portion of the OOB signal;

b) may transmit ALIGNs at the lowest physical link rate supported by the SAS transmitter device if it is not able to transmit at the G1 physical link rate; and

c) shall not transmit ALIGNs at a physical link rate faster than the lowest physical link rate supported by the SAS transmitter device.

Author: relliott Subject: Note Date: 4/24/2005 12:17:17 PM ACCEPT - DONE REVIEW

A SAS phy supporting being attached to SATA devices must not send OOB bursts with G2 or later ALIGNs - SATAII-PHY only allows G1 ALIGNs (or D24.3s, which a SAS phy won't send because a SAS phy receiver device doesn't necessarily accept it).

After also applying Maxtor's comment on this paragraph, results in:

"When transmitting an OOB burst, if the phy supports being attached to SATA devices, the transmitter device shall transmit ALIGN (0) primitives at G1. If thea phy does not support being attached to SATA devices, the transmitter device: should transmit ALIGN (0) primitives at G1;

may transmit ALIGN (0) primitives at its lowest supported physical link rate if it is not able to transmit at G1; and

Comments from page 172 continued on next page

shall not transmit ALIGN (0) primitives at a physical link rate faster than its lowest supported physical link rate."

Date: 4/30/2005 8:11:11 AM

ACCEPT - DONE (but with "set to zero" not "set to one" in the last sentence - "The SP state machine shall maintain a MgmtReset state machine variable to indicate whether a Management Reset request has been received. Any SP state that receives a Management Reset request shall set the MgmtReset state machine variable to one before making a transition to the SP7: OOB_AwaitCOMSAS state (see 6.8.3.2). Any SP state that receives a power on, or a hard reset shall set the MgmtReset state machine variable to zero before making the transition to the SP7:OOB_AwaitCOMSAS state.") REVIEW

6.8.1 SP state machine overview

This is a mess << The SP state machine shall maintain a MgmtReset state machine variable to indicate whether SP0: OOB_COMINIT was last entered due to a Management Reset, or a defined transition from another state (see 6.8.3.2.1). If SP0: OOB_COMINIT was last entered due to a Management Reset, it shall set the MgmtReset state machine variable to one. If SP0: OOB_COMINIT was last entered by a defined transition from another state, it shall set the MgmtReset state machine variable to zero. >>. I think it should be restated like this

<< The SP state machine shall maintain a MgmtReset state machine variable to indicate whether when Management Reset request is received. Any SP state that receives a Management Reset request shall set the MgmtReset state machine variable to one before making the transition to the SP7:OOB_AwaitCOMSAS state. Any SP state that receives a power on, or a hard reset shall set the MgmtReset state machine variable to one the transition to the SP7:OOB_AwaitCOMSAS state. >> Note that the other cases that case the MgmtRest variable to be set to zero are not global and therefore have to be handled in the state were the action occurs in the description of the transition.

Author: mevans_mxo Subject: Highlight

Date: 4/30/2005 8:08:43 AM

REJECT (used IBM suggestion instead: The SP state machine shall maintain a MgmtReset state machine variable to indicate whether a Management Reset request has been received. Any SP state that receives a Management Reset request shall set the MgmtReset state machine variable to one before making a transition to the SP7:OOB_AwaitCOMSAS state (see 6.8.3.2). Any SP state that receives a power on, or a hard reset shall set the MgmtReset state machine variable to zero before making the transition to the SP7:OOB_AwaitCOMSAS state.)

6.8.1. fourth paragraph: Change to:

The SP state machine shall maintain a MgmtReset state machine variable to determine whether SP0:OOB_COMINIT was last entered as the result of a Management Reset or a transition from another state (see 6.8.3.2.1). If SP0:OOB_COMINIT was last entered as the result of a Management Reset, then the SP state machine shall set the MgmtReset state machine variable to one. If SP0:OOB_COMINIT was last entered as the result of a transition from another state, then the SP state machine shall set the MgmtReset state machine shall set the MgmtReset state machine variable to zero. Any transition from SP7:OOB_AwaitCOMSAS shall cause the SP state machine to set the MgmtReset state machine variable to zero.

Author: gop_ibm Date: 4/30/2005 8:09:56 AM ACCEPT - DONE

6.8.1 SP state machine overview

This << Any transition out of SP7:OOB_AwaitCOMSAS shall set the MgmtReset state machine variable to zero. >> seems to contradict when is currently in SP0 and implies that the MgntResedt is always set to zero when SP0 is exited. This seems to nullify it usefulness. I think the sentence should be deleted.

Author: mevans_mxo Subject: Highlight Date: 5/1/2005 12:02:41 AM TACCEPT - DONE (as "If the phy supports SATA port selectors, the SP state machine shall maintain a COMWAKE_Received state machine variable to indicate whether a COMWAKE detected message was received in the SP0:OOB_COMINIT state or the SP1:

Comments from page 187 continued on next page

") REVIEW

6.8.1. fifth paragraph: Change to:

If the phy supports attachment to a SATA device (i.e., the phy is [contained in, vs. attached to] an STP/SATA bridge), and [the phy] supports attachment to a SATA port selector, then the SP state machine shall maintain a COMWAKE_Received state machine variable to [determine vs. indicate] whether a COMWAKE detected message was received in SP0:OOB_COMINIT or SP1: OOB_AwaitCOMX since the last time SP0:OOB_COMINIT was entered. [ibm says delete the rest:] A COMWAKE Detected message received in SP0:OOB_COMINIT or SP1:OOB_AwaitCOMX shall [cause the SP state machine to] set the COMWAKE_Received state machine variable to one. Any transition to SP0:OOB_COMINIT shall [cause the SP state machine to] set the COMWAKE_Received state machine variable to zero.

6.8.4.9 SP15:SAS_PHY_Ready and 6.8.5.8 SP22:SATA_PHY_Ready

need to clarify how COMINIT Detected works in SP15 and SP22 (and maybe other states). If the differential voltage level drops below 120 mV multiple times meeting COMINIT timing, is that enough? Or is the voltage drop ignored until dword sync is declared lost by SP_DWS? DWS Reset Timeout is 1 ms; COMINIT idle time is 525 ns. So, COMINIT Detected will be seen before DWS is declared lost.

7.2.5.1 OPEN_REJECT

For SAS phys (not expander phys), consider dropping the priority list in favor of the 1)2)3) list in the SL_CC:Selected state, the only one that uses it.

For expander phys, the decision is not made by XL (in XL4:Open_Reject), it's made by the ECM (choosing which Arb Reject to send). I don't know if there's a better place for the list than its current location since we don't define ECM state machines.

There are two candidates:

a) 4.6.6.3 defines the Arb Rejects.

b) 7.12.4.1 has the arbitration rules, but does not have an ordered list right now enforcing the priority.

Author: bday_lsi Subject: Comment on Text Date: 5/1/2005 10:44:58 PM REFER PROTOCOL WG (might move this list based on hpq comment)

Should this be an item 4) instead of combined together with item 3)?

Author: ghoulder_seg Subject: Note Date: 4/19/2005 2:56:08 PM

Table 76 – Done primitives

Done(credit-timeout) description is unclear. It should be reworded.

It currently says "The SSP state machine (see 7.16.7) timed out waiting for an RRDY or received a CREDIT BLOCKED and the transmitter is going to transmit BREAK if credit is extended for 1 ms without receiving a frame or a DONE."

Perhaps the last part of the sentence should read "...transmit BREAK in 1 ms unless credit is extended, a frame is received, or DONE is received within 1 ms of transmitting the DONE(CREDIT_TIMEOUT)."

I also don't understand how "credit is extended" because a later paragraph (under table 78) prohibits sending RRDY after a CREDIT_BLOCKED has been sent. Perhaps this phrase should be stricken.

Author: relliott Subject: Highlight Date: 4/25/2005 4:36:35 PM CACCEPT - DONE REVIEW

7.12.8 Breaking a connection

"a connection is considered broken due to loss of dword synchronization (see 6.9)."

This is only intended to be true for loss of dword sync resulting in a phy reset sequence. If an expander phy detects several invalid dwords but then reacquires sync, it neither forwards BREAK to tear down the connection through the ECR, nor transmits BREAK itself. The phy just gets a bunch of receive errors (the other direction might be fine). If it fails to reacquire and redoes the phy reset sequence, then BREAK is forwarded through the ECR (and the local physical link is in OOB, so BREAK is not needed).

Change to: "a connection is considered broken due to loss of dword synchronization (see 6.9) that results in a new link reset sequence (i.e., the SP state machine transitioned from SP15:SAS_PHY_Ready or SP22:SATA_PHY_Ready to SP0: OOB_COMINIT (see 6.8))"

Author: mevans_mxo Subject: Highlight Date: 4/25/2005 5:08:00 PM TREJECT (we aren't trying to dictate whether an "ALIGN dword" or a "dword ALIGN" pattern is used. Thus, the vague "starting with". "after" would imply the second option is mandatory)

Author: relliott_hpq Subject: Note Date: 5/1/2005 9:47:11 AM REFER PROTOCOL WG 7.15.3 XL0:Idle state

Comment from Expert I/O (in 05-141r0):

Expander – Backoff Reverse Path Problem

Froblem

Expander Port 0 forwards an open to Expander Port 1, which causes Expander Port 0 to transition to XL3:Open_Confirm_Wait. Expander Port 1 receives an open address frame from the device it is connected. The received open address frame wins according to arbitration rules and thus causes Expander Port 1 to issue a Backoff Reverse Path message destined to Expander Port 0. The specification indicates that upon reception of the backoff reverse path message, Expander Port 0 should transition to XL5: Forward_Open. The specification goes on to say upon entry into XL5:Forward_Open, the expander port should transmit an open address frame based on the arguments of the oaf coincident with the state transition. However, in the case of the backoff reverse path message, there is no mechanism detailed to provide the Expander Port with the open address frame arguments along with the message.

Solution

This problem could be solved by having the expander port that received the backoff reverse path message transition to XL0:Idle rather than XL5:Forward Open. This will enable the expander port to be ready to accept the forward open message that will follow the backoff reverse path message and proceed as described in the specification.

Alternatively, the backoff reverse path message could include the arguments for the open address frame along with the message. However, this option seems more intrusive than the first option

Author: relliott_hpq Subject: Note Date: 5/1/2005 9:47:34 AM REFER PROTOCOL WG 7.15.4 XL1:Request_Path state

Comment from Expert I/O in 05-141r0:

Expander – Request Path Handling Problem

The specification should clarify what should occur in the following condition: Expander Port 1 issues a request path message which will route to Expander Port 0 resources. Expander Port 1 wins arbitration and proceeds to issue a forward open message that will go to Expander Port 0. Coincidentally (or any time up to receiving the forward open message from Expander Port 1), an open address frame is received by Expander Port 0.

This causes Expander Port 0 to transition to XL1:Request_Path. While Expander Port 0 is in XL1:Request_Path the forward open message is received. It is not clear what the expander link should do from this point forward. If the open address frame received by Expander Port 0 is greater, ultimately a backoff retry or backoff reverse path message should be issued to Expander Port 1. If the open address frame received by the forward open message is greater, the request path message to the ECM should be negated. Neither of these methods is explained.

Solution

A possible solution requires modification in both the XL1:Request_Path section of the specification and the request path handling in the ECM. In the XL1:Request_Path section, the contents of the received open address frame could be kept. Upon receiving a forward open message while in XL1:Request_Path, the expander link uses arbitration rules to determine if a backoff retry message or backoff reverse path message should be issued while remaining in the same state. If either of these messages is issued, then no further modifications are necessary since the request path message from Expander Port 0 will control the state operation of Expander Port 0. If the forward open message wins arbitration over the received open address frame by Expander Port 0, the state transition to XL5:Forward_Open would take place as described. The only modification in this case would be that the ECM would ignore the request path message already issued by Expander Port 0.

As a note, the cases are covered if the open address frame is received while Expander Port 0 is in XL5:Forward_Open and XL6: Open_Confirm_Wait. The only case missing in the specification is the case described

7.15.4.5 Transition XL1:Request_Path to XL5:Forward_Open Comment by ExpertIO in 05-141r1:

Problem:

The specification indicates that if a forward open message is received after an arbitrating (NORMAL) message has been received, the forward open message is ignored. We believe there is a flaw in the statement or perhaps overall in the expander function handling. It is illustrated in the following case.

Expander Port 2 wins arbitration to open Expander Port 0. Expander Port 1 receives an Open Address Frame (OAF) to Open Expander Port 2 but has to hold off as it waits for the connection to try to open between 2 and 0. The expander function sends an arbitrating (NORMAL) message to expander Port 1 to acknowledge the receipt of the request path message. Expander Port 0 transmits an OAF at the same time an OAF

resolving to port 1 is received from the device connected to Expander Port 0. The OAF received by expander Port 0 wins over the outgoing OAF by arbitration rules. Expander Port 0 sends a backoff retry message to Expander Port 2 and also a request path message

to the expander function requesting a connection to port 1. The request path message from Expander Port 0 wins by arbitration rules, that is, it is more significant than the outstanding request message by Expander Port 1. As a result, Expander Port 0 issues a forward open message to Expander Port 1. However, since Expander Port 1 had already received an arbitrating (NORMAL) message while in the XL1:Request_Path state, the forward open message is ignored and a stall occurs.

Solution

Removing the restriction of transitioning to XL5:Forward_Open if an Arbitrating (Normal) message has been seen alleviates the problem. There are two cases to consider in determining that this is a valid solution. Following the example described above:

The first case is that the OAF that is forwarded to Expander Port 1 wins via arbitration rules over the OAF received by Expander Port 1. The second case being the OAF that is forwarded to Expander Port 1 loses via arbitration rules over the OAF received by Expander Port 1.

In the case that the forwarded OAF wins, with the restriction removed, the OAF will be received by the port connected and will discard the OAF it sent. This mechanism is already described in both the expander and link layer specification.

The second case can not occur because a forward open message will not be generated by Expander Port 0 destined for Expander Port 1 since Expander Port 0 did not win arbitration in the Expander Function.

Qlogic Corp #001 PDF page 328 7.15.4.5 Transition XL1:Request_Path to XL5:Forward_Open

Comments from page 288 continued on next page

The following changes eliminate confusion regarding the arguments associated with the OPEN Address Frame received message. In the last sentence of this section, "This transition shall include an OPEN Address Frame Received argument containing the arguments received in the Forward Open indication.", replace "transition" with "state" and replace the end of the sentence beginning with "containing the arguments ..." with "with the transition.".

Author: ccarlson_qlgc Subject: Note Date: 4/25/2005 5:22:45 PM REFER PROTOCOL WG

> Qlogic Corp #002 PDF page 328 7.15.4.5 Transition XL1:Request_Path to XL5:Forward_Open 7.15.4.6 Transition XL1:Request_Path to XL9:Break

The following changes ensure that the Forward Open indication takes precedence over a simultaneous BREAK Received message. In the first sentence of 7.15.4.5, strike-through ", a BREAK Received message has not been received,". Add the following as the last sentence in this section. "If a BREAK Received message is received, this state shall include a BREAK Received argument with the transition." In 7.15.4.6, replace "after receiving a BREAK Received message" with "if a BREAK Received message is received and a Forward Open indication has not been received".

Author: thoglund_lsi Subject: Highlight Date: 5/1/2005 9:46:45 AM

...shall occur if:

a) a Forward_Open indication has not been received; and

b) a BREAK Received message is received

Author: gop_ibm

Date: 4/25/2005 5:23:26 PM

REJECT (the state description gives all the details about where it is sent)

7.15.6.6 Transition XL3:Open_Confirm_Wait to XL9:Break

This << This transition shall occur after sending a Forward Break request. >> should be << This transition shall occur after sending a Forward Break request to the ????. >>

Author: gop_ibm

Date: 4/19/2005 1:38:20 PM

77.15.7.2 Transition XL4:Open_Reject to XL0:Idle

This << This transition shall occur after OPEN_REJECT has been transmitted. >> should be << This transition shall occur after the OPEN_REJECT message has been sent to the XL transmitter. >>. Note that there is no response from the XL transmitter in the XL state machine figure. So if you really want to want until the OPEN_REJECT is transmitted then that will have to be added into the figure and the XL transmitter section.

7.16.13, fourth paragraph: Change to: The transport layer (see 9.2.4) either retries sending SSP frames that encounter a link layer error (e.g., are NAKed or create an ACK/NAK timeout), or the application layer aborts the SCSI command associated with the SSP frame that encountered a link layer error.

Author: kmarks_dell Subject: Highlight Date: 4/25/2005 5:48:09 PM

REJECT (interlocking does mix the layers. ACK/NAK vs. credit timing is link layer material, while frame types (e.g. COMMAND, DATA references) and tags are transport layer material. Since it will have out-of-place material no matter where it is located, the link layer seems as good a home as any.) REVIEW

7.16.5 Interlocked frames

I question why the Interlock Frames section is in the link layer material, when the SSP link layer state machines do not seem to directly deal with "interlocked-ness" other than ACK/NAK balance issues. The Transport Layer would seem more appropriate for the material, since this is where it seems to enforce it along with the PL OC.

Comment from Expert I/O in 05-141r0:

Port Layer – Frame Transmitted Handshake

Problem

Due to the architectural freedom of having multiple SSP Transports running concurrently on top of a single Port Layer, multiple frames with different tags may be queued to the port layer. The port layer section of the specification does not describe any restriction for issuing multiple transmit frame messages to the link layer as long as the protocol, connection rate, and destination address match. However, the SSP Link Layer state machine is specified such that it can only accept one transmit frame message at a time. This creates an environment where a frame could be implicitly dropped if the transmit frame message is issued by the Port Layer while the SSP Link Layer is not in a state that recognizes the message. Solution

The description of a handshake should be added to the Port Layer section of the specification. Specifically in the PL_PM3: Connected state should specify that a new transmit frame message can only be issued if there are no outstanding frame transmitted confirmations from the SSP Link Layer.

9.2.4.5.3 DATA frame without transport layer retries

2nd to last paragraph

Change

"2) the device server aborts the command (see 10.2.2)."

to

"2) the application client aborts the command (see 10.2.2)."

Since it is Write Data, the ACK could have been lost forcing ACK/NAK Timeout. The application client should abort the command on the next connection, not the device, as it has no knowledge of the lost ACK.

Comments from page 360 continued on next page

"If an SSP initiator port transmits a write DATA frame and receives a NAK for that frame, the device server aborts the command (see 10.2.2)."

to

"If an SSP initiator port transmits a write DATA frame and receives a NAK for that frame, the application client aborts the command (see 10.2.2)."

"Device server" contradicts 10.2.2, which says that SSP initiator port will abort the command with an ABORT TASK when a NAK is received. Unless the reference to 10.2.2 should be 10.2.3 (device server error handling), but this does not seem to make sense, because the write data could be for another command's XFER_RDY, so the device server does not know which command to abort and is discarded in the link layer The application client should abort the task with ABORT TASK.

Explain "data offset that was not expected" in more detail.

DATA OFFSET field not sequential in the normal case, or not earlier that the current value if CHANGING DATA POINTERS is set to 1.

Author: gop_ibm

Date: 4/19/2005 1:38:20 PM

9.2.5.2 SSP initiator port error handling summary

This << If an SSP initiator port receives a read DATA frame with a data offset that was not expected, the ST_ITS state machine discards that frame and any subsequent read DATA frames received for that command >> would be clearer if changed to << If an SSP initiator port receives a read DATA frame with a data offset that was not expected (see 9.2.6.2.3.7.1), the ST_ITS state machine discards that frame and any subsequent read DATA frames received for that command >> would be clearer if changed to << If an SSP initiator port receives a read DATA frame with a data offset that was not expected (see 9.2.6.2.3.7.1), the ST_ITS state machine discards that frame and any subsequent read DATA frames received for that command >>

Author: relliott_hpq Subject: Note Date: 4/19/2005 1:40:54 PM 9.2.5.2 SSP initiator port error handling summary

More reason that "data offset that was not expected" needs to be more specific.

Comment from Rich Deglin, Vitesse: Initiator

Target

<=== DATA frame <=== DATA frame w/CRC error <=== DATA frame CHANGING DATA POINTERS=0

> ACK ===> NAK ===>

Comments from page 361 continued on next page

<=== DATA frame CHANGING DATA POINTERS=1

Due to the non-interlocked nature of data transfer, the target may have continued to transmit DATA frames for some time before it discovers that one of them was NAK'ed. Meanwhile the initiator has seen an "unexpected" data offset, but CHANGING DATA POINTERS=0. I believe the initiator is compelled to abort the command at this point.

9.2.5.3, add the following as a last paragraph: If an ST_TFR state machine receives any subsequent write DATA frames for a command that has been aborted, then the ST_TFR state machine discards those frames (see 9.2.6.3.2).

Author: gop_ibm

Date: 4/19/2005 1:38:20 PM 9.2.6 ST (transport layer for SSP ports) state machines

During review of SAS 1.1 transport layer state machine descriptions it became apparent that the frame level retry description in the state machines was not complete and that the states in state machines that contained more than one state were not passing arguments. There appeared to be an assumption that a state would always have the information it wanted without regard as to where the information came from.

This proposal 05-143 addresses both those problems.

The comments included with these comments, for the most part, are not included in 05-143 and should be treated as independent of 05-143.

Comment from ExpertIO in 05-141r0:

SSP Transport Layer – Ack Transmitted Confirmation Needs Tag Argument

Problem

When an ack transmitted confirmation is received by the SSP Transport layer, it is not known for which frame the ack transmitted confirmation is associated. For instance, in the case of a wide link where a single transport layer is servicing commands for multiple tags simultaneously, the ST layer needs to know which ack transmitted confirmation is associated with which received frame. Solution

The port layer has access to the information regarding which tag is associated with which confirmation. The specification should detail that the transmission status and the ack transmitted message should include an argument of the tag associated with the confirmation.

T think this sentence conflicts with 9.2.4.2 and 10.2.2. After a command transmission gets an ACK/NAK timeout, application layer is running a QUERY TASK. At ACK/NAK Timeout, the ST_ITS sent up the Transmission Complete(Command Failed, Connection Failed). IF XFER_RDY now comes in before the response for the QUERY TASK, it is supposed to be valid.

Comment from Expert I/O in 05-141r0:

SSP Transport Layer – Balance Counter Problem

The specification is very detailed in the description of the ITS state transitions. A section particularly describes how the ITS cannot transition out of PREPARE_DATA_OUT until it has received as many ack received confirmations as data frames it has sent out. This wording implies a counter that is not explained.

Solution

The specification should describe a balance counter (similar to ones described in the Link Layer) that increments on every frame transmitted transmission status confirmation and decrements on every ack received transmission status confirmation

9.2.6.3.3.4.1 State description

In looking at the error recovery, I have noticed a few inconsistencies in the document. It appears that when sections 9.2.4 and 9.2.5 were added, the state diagrams were not updated to match. Proposal 05-143 contains the fixes for this problem.

9.2.6.3.3.5.1 states:

i) TARGET PORT TRANSFER TAG field set to a vendor-specific value, unless otherwise specified in this subclause; and

If this state is entered after the ST_TTS2:Target_Send_Frame state received a Transmission Status (Frame Transmitted) confirmation and a confirmation other than Transmission Status (ACK Received) for which a

Transmission Complete message was not sent to the ST_TFR state machine (i.e., to retry transmitting a frame), then this state shall construct a new XFER_RDY frame using the values from the previous XFER_RDY frame except:

a) the RETRANSMIT bit shall be set to one; and

b) the value in the TARGET PORT TRANSFER TAG field shall be set to a different value than the value in the previous XFER_RDY frame. The new target port transfer tag value shall not conflict with any other

target port transfer tag currently in use. If write data is received for a subsequent XFER_RDY frame for a command, then all target port transfer tags used for previous XFER_RDY frames for the

command are no longer in use.

but the above does not match with

9.2.4.1 states:

If the TRANSPORT LAYER RETRIES bit is set to one, the logical unit:

d) selects a different value for the TARGET PORT TRANSFER TAG field in each XFER_RDY frame than that used in the previous XFER_RDY frame for that I_T_L_Q nexus;

Author: gop_ibm Date: 4/20/2005 4:19:28 PM CCEPT - DONE

> 9.2.6.3.3.5.1 State description This << j) DATA OFFSET field set to zero; and >> should be << j) DATA OFFSET field set to zero; >>

Author: gop_ibm Date: 4/19/2005 1:38:20 PM 9.2.6.3.3.6.1 State description The 1,2,3 list does not appear to require ordering so it should be changed to an a,b,c list.

Author: relliott_hpq Subject: Highlight Date: 4/19/2005 1:40:54 PM 9.2.6.3.3.6.1 ST_TTS5:Receive_Data_Out

Regarding:

"data offset was not expected (i.e., the CHANGING DATA POINTER bit is set to one and the value in the DATA OFFSET field is not set to the data offset associated with the XFER_RDY frame, or the CHANGING DATA POINTER bit is set to zero and the value in the DATA OFFSET field is not set to the value in the DATA OFFSET FIELD in the previous write DATA information unit plus the number of bytes in that information unit)"

The i.e. list in 1) is incomplete. If an initiator violates the NUMBER OF FILL BYTES rules, it could send a DATA OFFSET that is a) not a multiple of 4 - violating the alignment rule; or

b) is a multiple of 4 - leaving a gap and violating another rule.

Change to e.g. and discuss the alignment rule too.

9.2.6.3.3.6.1 State description

In looking at the error recovery, I have noticed a few inconsistencies in the document. It appears that when sections 9.2.4 and 9.2.5 were added, the state diagrams were not updated to match. Proposal 05-143 contains the fixes for this problem.

9.2.6.3.3.6.1 states:

1) If the data offset was not expected (i.e., the CHANGING DATA POINTER bit is set to one and the value in the DATA OFFSET field is not set to the data offset associated with the XFER_RDY frame, or the CHANGING DATA POINTER bit is set to zero and the value in the DATA OFFSET field is not set to the value in the DATA OFFSET FIELD in the previous write DATA information unit plus the number of bytes in that

information unit), then this state shall send a Reception Complete (Data Offset Error) message to the ST TFR state machine;

and then 9.2.6.3.2 table 124 states that Reception Complete (Data Offset Error) translates to a SCSI application layer: Data-Out Received with the Delivery Result argument set to DELIVERY FAILURE - DATA OFFSET ERROR Which will prohibit any recovery.

So, if recovery is possible, then 9.2.6.3.3.6.1 cannot send the Reception Complete (Data Offset Error) message until recovery has been exhausted.

Comments from page 387 continued on next page

However, 9.2.6.3.3.6.1 does not mention recovery at all.

"delivers" s/b "returns"

Author: gop_ibm Date: 4/20/2005 4:40:51 PM TACCEPT - DONE (as "then the application client shall abort the command...") REVIEW

10.2.2 Application client error handling

This << it shall abort the command (e.g., by sending an ABORT TASK task management function). >> should be << then the SSP initiator port shall abort the command (e.g., by sending an ABORT TASK task management function). >>

Author: gop_ibm

Date: 4/20/2005 4:46:56 PM

REJECT (10.2.4 covers SCSI Command Received () with a tag already in use by a task management function, not already in use by a command. So, it doesn't apply. SAM-3 covers commands conflicting with other commands (and has commands be aborted), but does not worry about commands colliding with task management functions, so does not say that task management functions also need to be aborted. Thus, this rule is unique to SAS and must remain in this section.)

10.2.3 Device server error handling

This

<< If the SCSI target device performs tag checking and an SSP target port calls SCSI Command Received () with a tag already in use by another SCSI command (i.e., an overlapped command) in any logical unit, the task router and device server(s) shall abort all task management functions received on that I_T nexus and shall respond to the overlapped command as defined in SAM-3. >>

should be changed to

<< If the SCSI target device performs tag checking and an SSP target port calls SCSI Command Received () with a tag already in use by another SCSI command (i.e., an overlapped command) in any logical unit, the task router and device server(s) shall respond to the overlapped command as defined in SAM-3. >>

as there are more specific rules on aborting below in the second a.b.c list in section 10.2.4.

Author: kmarks_dell Subject: Cross-Out Date: 4/28/2005 7:05:27 PM **TREJECT** (this is indeed the intent. SAS describes aborting task management functions, which SAM doesn't contemplate. **SAM-3** only discusses aborting commands.)

10.2.3 Device server error handling 1st Paragraph, 1st Sentence

Remove "management functions"

from

"...device server(s) shall abort all task management functions received on that I_T nexus..."

Author: kmarks_dell Subject: Highlight Date: 4/20/2005 4:49:06 PM TACCEPT - DONE ("If an SSP target port calls Data-Out Received () with a Delivery Result set to a value in table 147, the device server shall...")

10.2.3 Device server error handling 2nd Paragraph, 1st Sentence

Should Receive Data-Out () be Data-Out Received ()?

Author: kmarks_dell Subject: Highlight Date: 4/20/2005 5:09:35 PM

10.2.4 Task router and task manager error handling 1st Paragraph, b) in first a,b list

Comments from page 409 continued on next page

Remove extra "calls" in sentence.

"b) an SSP target port calls calls Task Management Request Received () with a tag already in use by a SCSI command or SCSI task management function in any logical unit,"

Author: kmarks_dell

Subject: Highlight Date: 4/20/2005 5:13:13 PM

REJECT (When the proposal changing this was added, the committee decided that if a command conflicts with a task management function, the task management function is the one that the RESPONSE frame is for, no matter which one arrived first. This simplifies the interaction with the SAM-3 rules (which handle command/command problems).)

10.2.4 Task router and task manager error handling 1st Paragraph c) in second a,b,c list

Change

"c) call Task Management Function Executed () with the Service Response set to FUNCTION REJECTED - Overlapped Tag Attempted (i.e., requesting that the target port set the DATAPRES field to RESPONSE_DATA and the RESPONSE CODE field to OVERLAPPED TAG ATTEMPTED)."

to

c) call Send Command Complete () with a with the Service Response set to SERVICE DELIVERY OR TARGET FAILURE (i.e., requesting that the target port set the DATAPRES field to RESPONSE_DATA and the RESPONSE CODE field to OVERLAPPED TAG ATTEMPTED) if the SCSI command received caused the overlapped tag condition; or

call Task Management Function Executed () with the Service Response set to FUNCTION REJECTED - Overlapped Tag Attempted (i.e., requesting that the target port set the DATAPRES field to RESPONSE_DATA and the RESPONSE CODE field to OVERLAPPED TAG ATTEMPTED) if the SCSI task management function received caused the overlapped tag condition"

Seems that if it was a command that was received last, that cause the overlapped tag condition, that the response would be for that command, and not the task management function that was already in the task set.

It is also incorrect in SPC-3 for Disconnect-Reconnect mode page.

Author: bday_lsi Subject: Comment on Text Date: 4/28/2005 7:05:55 PM

REFER PROTOCOL WG (PL_OC should be modeled as not being required to close connections when it has no more frames. It should only be recommended to close them at that time. The same for SSP sending DONE - it's advisable but not absolutely required)

I think values for anything 1 ms or greater may conflict with the port and link layer state machines.

For connections that the target establishes, in section 8.2.2.3.5, the PL_OC will close the connection, essentially bypassing the bus inactivity timer.

For connections that the initiator establishes:

1) the initiator may have sent DONE, and is running the DONE Timeout timer. Not closing within 1ms results in BREAK.

2) The timer may never be started in this connection in section 8.2.3.4 PL_PM3, if the target doesn't have a frame to transmit.

10.2.11 SCSI VPD

"The SAS target device shall use different identifiers for each logical unit name, each target port identifier, and the target device name."

Section 4.2.4 device names says "The selected SAS address shall be used by no other name or identifier".

Section 4.2.6 port identifiers says "The selected SAS address shall be used for no other name or identifier".

So, this rule is already stated. Section 4.2 doesn't explicitly mention logical unit names as a possible conflicting use, though. And, 4.2 and this rule ignore the fact that a port identifier might be appear in more than one domain - is that considered "used for another identifier"? (see Dell comments)

Author: kmarks_dell Subject: Highlight Date: 4/20/2005 7:01:54 PM

REJECT (Target device names are still required per 4.2.4 but discussion of that was lost in this section. Additional letter comment has been added to cover the underlying issue.)

10.2.11 SCSI vital product data (VPD)

2nd Paragraph after Table 165 - Device Identification VPD page required identification descriptors

"Logical units may include additional identification descriptors than those required by this standard (e.g., SCSI target devices with SCSI target ports using other SCSI transport protocols may return additional target device names for those other SCSI transport protocols)."

Sentence seems to be an artifact from SAS-1, when the SCSI device name was required. Propose removing everything following with the e.g..

REFER PHY WG

REFER PROTOCOL WG (I don't think there should be a requirement that they be cleared on power on either in the log page or in SMP. It is always incumbent on software to read the starting values.)

10.4.3.6 REPORT PHY ERROR LOG function

It appears that the counters defined in the log function are never reset to zero. This does not seem like a good idea. At a minimum there should be a statement that the counters are all reset on a power on.

Author: kmarks_dell Subject: Highlight Date: 4/25/2005 4:38:25 PM

REJECT (the intention is that only loss of dword sync resulting in a new phy reset sequence is counted. Otherwise, this counter increments many times during unplugs. Will expand the wording to make this clearer with SP state references, though - see new comment) REVIEW

10.4.3.6 REPORT PHY ERROR LOG function

6th Paragraph after Table 184 - REPORT PHY ERROR LOG response

"The LOSS OF DWORD SYNCHRONIZATION COUNT field indicates the number of times the phy has lost dword synchronization and restarted the link reset sequence (see 6.8) of phy reset sequences. The count shall stop at the maximum value."

Is the LOS SYNC COUNT only incremented if a the link reset sequence happens? Several SP states allow for a Start DWS message to prevent a link reset sequence, such as SP15:SAS_PHY_Ready. If this LOS is defined as DWS Loss, then remove "and restarted the link reset sequence (see 6.8) of phy reset sequences."

Author: relliott Subject: Note Date: 4/28/2005 6:26:42 PM ACCEPT - DONE REVIEW

Rewrite "has lost dword synchronization and restarted the link reset sequence (see 6.8) of phy reset sequences."

First of all, "of phy reset sequences" is bogus.

Second, it should refer to specific SP state transitions to emphasize that just plain dword sync does not increment the count.

Third, "and" could be constructed as incrementing on loss of dword sync and also incrementing on link reset sequence; really, a "because" relationship is intended.

New wording:

"has restarted the link reset sequence because it lost dword synchronization (see 6.9) (i.e., the SP state machine transitioned from SP15:SAS_PHY_Ready or SP22:SATA_PHY_Ready to SP0:OOB_COMINIT (see 6.8))"

Author: relliott Subject: Highlight Date: 4/23/2005 2:45:59 PM ACCEPT - DONE

Change "during the final speed negotiation window during a phy reset sequence" to "during the final SAS speed negotiation window"

to emphasize that it is only counting SAS, not SATA, events, and to better describe exactly what is being counted

Author: rlsheffi_intc Subject: Highlight Date: 4/25/2005 11:03:32 AM TREFER PHY WG Annex B "(normative)" s/b "(informative)" There are many problems with this being a normative annex:

1) The terms are different. Nowhere is it evident the relationship between CT, CR, IT, and IR compliance points in clause 5 and the Transmit and Receive interoperability points identified in the annex, and what the relationship might be to probe points described in clause-5.

2) Annex B describes a method for "de-embedding" a test fixture, presumably to mitigate the effects of the test load on the compliance measurement. But there is nothing to correlate the compliance values described in clause 5 with specific measurements described in Annex B.

The information in Annex B is quality information, but without appropriate changes to correlate the measurement techniques described in Annex B to the compliance values called out in clause 5. I.M.H.O., the bulk of LB comments that would be needed to reconcile the two would constitute a very substantive change, and might represent just cause to hold another LB to resolve. So I recommend making the annex informative for now, and fix it in SAS-2.

G.4 SATA port selector considerations 1st paragraph,1st sentence

change "...SATA port selector (see SATA2-PS) in a SAS..." to

"...SATA port selector (see SATAII-PS) in a SAS..."

Author: rlsheffi_intc Subject: Note Date: 5/1/2005 10:41:43 PM **EFER PROTOCOL WG (this uses many terms like "will" which will draw complaints from IBM. Editors notes in [])**

Annex G: Add annex G.5 as follows: G.5 Discovery of a SATA device

An expander phy with [an] STP/SATA bridge in the SATA Spinup Hold [no caps, or a full SP state name] state is indicated in the DISCOVER response NEGOTIATED PHYSICAL LINK RATE field ([needs e.g. or i.e.] a value of 3h indicates the phy is enabled and a SATA device has been detected, but it's [it's won't be accepted] in the spinup-hold state). An expander device generates a BROADCAST (CHANGE) for the following conditions:

a) the phy loses DWS sync and the SP state machine transitions to the SP0:OOB_COMINIT state;

b) the phy detects the removal or insertion of a SATA port selector;

c) the phy sequences to the SATA Spinup Hold state;

d) the phy initialization sequence completes (completes SATA speed negotiation);

e) the phy receives an initial Register - Device to Host FIS.

[seems like this list will easily lose sync with the main text]

Anytime [not a word] the SMP management client detects a BROADCAST (CHANGE) from a phy with a STP/SATA bridge, the SMP management client should issue a DISCOVER command to determine the ATTACHED DEVICE TYPE, ATTACHED SAS ADDRESS, and the NEGOTIATED PHYSICAL LINK RATE. [cannot refer to them with caps that way. CAPITAL field or lowercase for what the field pertains to]

If the NEGOTIATED PHYSICAL LINK RATE is 3h, the phy is in the SATA Spinup Hold state, and the SMP management client should issue an SMP PHY CONTROL command with a PHY CONTROL FUNCTION of HARD RESET or LINK RESET to cause link initialization to happen again - this time bypassing the SATA Spinup Hold [no caps] state.

After finding the NEGOTIATED PHYSICAL LINK RATE field set to 8h or 9h (indicating that speed negotiation has completed at 1.5 Gbps or 3.0 Gbps, respectively), the SMP management client may issue the SMP REPORT PHY SATA command to see if there's a signature FIS there yet or not. [too conversational]

If the expander doesn't [generally avoid conjunctions] support the SATA SPINUP HOLD state, then the NEGOTIATED PHYSICAL LINK rate field will [no will] sequence all the way [too informal] to 8h or 9h [this will break in SAS-2] - indicating speed negotiation has completed and the link is ready.

The "ATTACHED SATA DEVICE" [no quotes] bit in the DISCOVER response byte 15 [usually don't refer to byte numbers; field name suffices] indicates if the attached device is a SATA device - determined by having transitioned to the SATA speed negotiation states rather than to the SAS speed negotiation states (which it did because it got a COMSAS timeout). If the initial FIS is not yet present, the SMP management client should wait for the next BROADCAST (CHANGE) from the STP/SATA bridge indicating receipt of the initial FIS, and then reissue the DISCOVER and SMP REPORT PHY SATA

Comments from page 503 continued on next page

command [functions not command singular].

In some hot-plug cases, a SATA device may not send an initial Register - Device to Host FIS ([needs e.g.] due to timing where the device does not see the initial COMINIT). [I know there are some devices that misbehave in this manner. I don't think they are following the SATA spec in doing so.] In this case the STP/SATA bridge will complete speed negotiation, but will not receive an initial FIS. If this occurs, the SMP management client should time-out after a vendor-specific interval of time and then, after sending a SMP REPORT PHY SATA command that does not report a received initial FIS, the SMP management client should send an SMP PHY CONTROL command specifying a HARD RESET or LINK RESET. This will send a COMINIT to the SATA device, and will cause the SATA device to send the initial Register - Device to Host FIS following link initialization.

So - [too conversational, and dash is unusual] at anytime [not a word] following the link initialization sequence, it is possible via DISCOVER and REPORT PHY SATA SMP commands to determine:

If there is a device attached Whether the device is SATA or SAS Whether the SP state machine is in the SPINUP HOLD state Whether the SATA device has returned an initial REGISTER DEVICE TO HOST FIS

Using this information, it should be possible for the SMP management client to force the device to transmit the initial FIS if need be through sending an SMP PHY CONTROL command with a function code specifying HARD RESET or LINK RESET.
