

Summary of Comments on Serial Attached SCSI 1.1 (SAS-1.1) Standard

Page: i

Author: mevans_mxo

Subject: Note

Date: 4/19/2005 1:42:36 PM

 Global: There are hundreds of occurrences of unclear pronoun references in this document. While reviewing the document for letter ballot, I only had time to comment on the ones that I thought were the most unclear. The general rule for pronoun usage is: there shall be no other noun forms (noun, pronoun, gerund, etc.) between a pronoun and the noun to which it is referring. The editor should correct any unclear pronoun references by replacing the unclear pronoun with the correct noun as he discovers the occurrences. Hint: one could start this process by searching on "it", then move on by searching on "they".

 ACCEPT - DONE

To help alleviate some Seagate comments, add:
attached SAS address: The SAS address (see 3.1.165) of the attached phy (e.g., received by a physical phy in the incoming IDENTIFY address frame during the initialization sequence (see 4.1.2)), or the SAS address of the STP target port in an STP/SATA bridge (see 4.6.2).

Author: mevans_mxo
Subject: Highlight
Date: 5/22/2005 10:40:46 AM

 ACCEPT - DONE (SAS points to ATA/ATAPI-7 not ATA/ATAPI-8, so we're not necessarily bound by T13's evolving architecture spec.

SAS needs to account for SATA port selectors (of various levels of complexity) and should account for SATA port multipliers, even if T13 chooses to ignore them.

SAS needs to support advanced STP/SATA bridges and native STP targets which can recognize multiple STP initiators and provide separate task file register sets for each of them. The limited access model supported by affiliations is not required.

The May WG recommended using "ATA domain" only in the limited sense suggested by Maxtor, and add "STP domain" as the name for the set of STP initiators and STP targets. However, there seems to be no need for the latter term, so it is omitted. STP/SATA bridges simply bridge between a SAS domain and an ATA domain. STP initiators and STP targets, although similar to ATA hosts and ATA devices, are outside the scope of the ATA architecture, and are only defined by SAS.)

3.1.11: Change to: an I/O subsystem that is made up of one host, one or more devices, and a service delivery subsystem. [as defined by the T13 Technical Committee.]

 ACCEPT - DONE (Changed to "The ability of the receiver device to recover transmitted bits in an incoming data stream with maximum jitter and minimum amplitude. See MJSQ")

3.1.202 signal tolerance:

None of this belongs in the glossary and should in placed in the main body of the standard possibly in a jitter section. << Signal tolerance is measured by the amount of jitter required to produce a specified bit error ratio at a specified signal amplitude and other signal properties. The signal tolerance performance depends on the frequency content of the jitter and on the amplitude of the signal. Since detection of bit errors is required to determine the signal tolerance, receiver circuits embedded in a SAS protocol chips require that the protocol chip be capable of reporting bit errors. For receiver circuits that are not embedded in a SAS protocol chip the bit error detection and reporting may be accomplished by instrumentation attached to the output of the receiver circuit. Signal tolerance is measured using the minimum allowed applied signal eye opening for both horizontal and vertical directions unless otherwise specified. >>

 ACCEPT - DONE (added ", inherited from the SAS port (see 4.1.3) or expander device (see 4.1.5)".

In the SAS port case, the phy is actually the real owner of it, but the port is the logical owner of it. The phy uses its outgoing SAS address before it determines which port it needs to join based on the incoming SAS address. Nevertheless, from the class diagram view, it just inherits the SAS address from the port to which it is eventually assigned.

Since these attributes are inherited, they don't show up in the class diagram for phy derivatives, although they are really present.)

Seagate #6
PDF page 76
First instance of list item a)

This states that a phy has a SAS address associated with it. I recall that the SAS address is associated with the port, which will associate the SAS address with a particular phy identifier. I'm not sure that a SAS address should be a required attribute of a phy. See also comment #7. Also figure 15 associates the SAS address attribute with the port.

 ACCEPT - DONE

Need to define the phrase "attached SAS address" because it is widely used.

Replace the paragraph containing "... Each phy also receives an IDENTIFY address frame containing those values from its attached phy during the identification sequence."

with lengthier text that introduces all the terms:

"During the identification sequence (see 7.9), a phy:

- a) transmits an IDENTIFY address frame including the device type (i.e., end device, edge expander device, or fanout expander device) of the device containing the phy, the SAS address of the SAS port or expander device containing the phy, phy identifier, SSP initiator phy capability, STP initiator phy capability, SMP initiator phy capability, SSP target phy capability, STP target phy capability, and SMP target phy capability.
 - b) receives an IDENTIFY address frame containing the same set of information from the attached phy, including the attached device type, attached SAS address, attached phy identifier, attached SSP initiator phy capability, attached STP initiator phy capability, attached SMP initiator phy capability, attached SSP target phy capability, attached STP target phy capability, and attached SMP target phy capability.
-

 ACCEPT - DONE (

4.2.4 Device names. Replace 2nd sentence with "A SAS address used as a device name shall not be used as any other name or identifier (e.g., a device name, port name, port identifier, or logical unit name (see SAM-3))."

4.2.6 Port identifiers. Replace 2nd sentence with "A SAS address used as a port identifier shall not be used as any other name or identifier (e.g., a device name, port name, or logical unit name (see SAM-3)) but may be used as a port identifier in one or more other SAS domains (see 4.1.3)."

4.2.6 Port identifiers

Comment received from Doug Gilbert (linux):

Section 4.2.6 on Port identifiers says: "Each SAS initiator port, target port and target/initiator port shall include a SAS address (see 4.2.2) as its port identifier. The selected SAS address shall be used for no other name or identifier."

Current HBAs (4 or 8 phy) can have multiple initiator ports in different SAS domains each with the same SAS port identifier. IMO that doesn't sit well with the second sentence from draft shown above (namely the unqualified "... or identifier" part.

Or perhaps I am misunderstanding what a SAS HBA should publish as its port identifier for its second and subsequent ports?

My initial reply: Good point. The initiator device certainly is allowed to use that port identifier in another domain (causing another port to be created). It's trying to ensure that the identifier is not used as (for targets or initiators) a device name or (for targets) a logical unit name.

REVIEW

Change "If the port is an STP port, the ATA device shall perform the actions defined for power-on or hardware reset in ATA."

to:
"If the port processing the hard reset is an STP port in an STP/SATA bridge, the SATA host port shall originate a link reset sequence.

If the port processing the hard reset is an STP port that is not in an STP/SATA bridge, the STP target device shall perform the actions defined for power-on or hardware reset in ATA/ATAPI-7 V1."

The first sentence covers non-expander based STP/SATA bridges (in an expander, it's an expander port that receives the hard reset, so nothing happens to the STP/SATA bridges. They are only reset with the SMP HARD RESET function specifying the phy they own).

The second sentence covers native STP target ports. Based on Maxtor's ATA domain comment, we no longer claim an STP target port is an "ATA device" (since ATA devices only comprehend one host) - it's a more wordly entity that borrow from the ATA architecture.

 ACCEPT - DONE (it was trying to show that both end devices (not in expanders) and SAS devices in expanders are visited. However, it's true that those end devices are also SAS devices, so "SAS device" can be used in each case (not "end device". So, will change to that.)

REVIEW

Seagate #14

PDF page 122

Figure 45 – Level order traversal example

Most of the "end device" boxes are labeled as end devices, but two are labeled "SAS device". For purposes of this figure, all should be labeled as "end device". I do see wording in following paragraphs that talk about a "SAS device", but the wording seems to treat all end devices as a SAS device that could have SSP, STP bridge, or SMP characteristics. I believe this use of SAS device should change to end device also.

 REJECT (unnecessary verbosity)

4.7.2, fourth paragraph: Change, "...it shall disable the expander route entry...", to, "...the management application client shall disable the expander route entry...".

Author: rlsheffi_intc

Subject: Highlight

Date: 5/7/2005 3:15:02 PM

 ACCEPT - TODO (any expander that is between two others is obviously attached to two other expanders, but that doesn't mean it needs to be disabled in one of them. Fix the wording.)

4.7.2 Allowed topologies

Fifth paragraph

This doesn't say what's intended. If the port of the expander device being configured is a subtractive decode port, and the expander device attached to that port has two or more ports with table-routing phys attached to other expanders, then the management application will find the SAS address of the port being configured in the ports of the other expander devices which connect to the same expander device, but it is not a routing loop.

from:

"If the management application client detects a port with a SAS address it has already found attached to

another expander device, it has found a routing loop and may break the loop by using the SMP PHY

CONTROL function (see 10.4.3.10) to disable all the expander phys attached to that SAS address except for phys in the expander device with the lowest SAS address."

Subject: Highlight

Date: 4/28/2005 1:32:48 PM

T ACCEPT - DONE (incorporated throughout the section. Includes new rule on when the test function begins on SMP - after the connection is closed - which is not currently defined.

New wording:

"The optional Protocol-Specific diagnostic page for SAS (see 10.2.9.1) provide methods for an application client to enable and disable a phy test function (e.g., transmission of the CJTPAT) for a selected phy in a SAS target device with an SSP target port. The optional SMP PHY TEST FUNCTION function (see 10.4.3.11) provides similar methods for SAS target devices with SMP target ports.

The application client sends a SEND DIAGNOSTIC command with the Protocol-Specific diagnostic page or an SMP PHY TEST FUNCTION function specifying the phy in the SAS target device that is to perform the phy test function and the phy test function to be performed. If the phy test function requires a specific phy test pattern and/or phy test pattern physical link rate, then it also specifies the phy test pattern and phy test pattern physical link rate.

The SEND DIAGNOSTIC command may be sent through any SSP target port to any logical unit in the SAS target device that contains the phy that is to perform the phy test function.

For the SEND DIAGNOSTIC command, the phy shall begin the specified phy test function after the SSP target port receives an ACK for the RESPONSE frame transmitted in response to the SEND DIAGNOSTIC command that requested the phy test function. For the SMP PHY TEST FUNCTION function, the phy shall begin the specified phy test function after the SMP target port transmits the SMP response frame.

Once a SAS phy has begun performing a phy test function, it shall ignore its receiver. To stop a SAS phy from performing a phy test function, an application client sends a SEND DIAGNOSTIC command or an SMP PHY TEST FUNCTION function to a SAS phy in the SAS target device that is not performing a phy test function requesting a phy test function of 00h (i.e., STOP). If no such phy is available, the phy test function only stops on power loss.)
REVIEW

this section should also discuss Phy test functionality provided by the SMP PHY TEST FUNCTION

 REVIEW

Table 23 - SAS internal connector pin assignments

Except for some poorly worded text below this table, SAS does not explain that this table is from the drive's perspective. For example, S2/S3 are labeled RP+/RP-, meaning they are the receive signals for the drive. Whatever is attached to the drive (backplane receptacle or a cable receptacle) needs to deliver transmit signals TP+/TP- on those pins.

For cables, there are separate connector pin assignments and cable definitions. If the other side of the cable is a SATA-style host receptacle, the pin assignments are defined by SATA, where S2/S3 is labeled T+/T-. The SAS cable assembly figures show how S2/S3 on the SATA-style host receptacle (T+/T-) routes to S2/S3 on the SAS Drive cable receptacle (RP+/RP-).

For backplanes, there might not be a cable involved, and it is not well-stated that a backplane containing a SAS device or expander device must use S2/S3 for TP+/TP-. If the backplane is just a passthrough from a SAS 4i or Mini SAS 4i connector, however, it would still want to call them R+/R- (because the SAS 4i or Mini SAS 4i pinouts and cable assembly construction swap the T and R). It would probably be confusing to provide figures showing backplanes constructed with every combination of on-board devices and connectors, though.

Suggestions:

1. Label the current pin assignment column "SAS Drive plug and SAS Drive cable receptacle"
 2. Add a "SAS Drive backplane receptacle" column showing T and R signals swapped, so S2/S3 carry TX+/- . This is really only true for a backplane containing a SAS device/expander device but is not true for a backplane just routing from another connector. Ignore the latter situation since a note explaining this is probably more confusing than saying nothing.
 3. Add footnote on the power segment: "Backplane receptacle connectors and SAS Drive cable receptacle connectors provide V₃₃, V₅, and V₁₂. SAS Device plug connectors receive V₃₃, V₅, and V₁₂."

 ACCEPT - DONE (05-139r0 not incorporated as written. Kept tables for connectors, made figures for each cable only show the cable itself and not the boards attached to it. Added "36 circuit" wording in the internal connector definitions (and 26 in the external).)

Reject proposed changes in T10/05-139r0 unless modified to change:

1. If using Alternate Table 26Z -- Controller SAS internal pin assignments and physical link usage - does not define pin assignments, only signal usage for link widths.

2. In the statement "The use of the sideband signals by a backplane is vendor-specific. One implementation of the sideband signals by a backplane is an SGPIO target interface (see SFF-8485). Other implementations shall be compatible with the signal levels defined in SFF-8485." - SFF-8485 does not currently define a mapping for the external compact version of the cable, and because there are 8 sidebands, the mapping is not obvious. Additionally, I question the "shall be compatible with the signal levels", because the mapping of the signals to sidebands in SFF-8485 is in an informative section.

3. If removing the tables defining the signal to pin mapping and relying on the cabling diagrams, then the external cable should use the same delivery style, i.e. remove table and add diagram of cabling.

4. Add that the internal compact wide cable plug connector uses the 36 pin version of SFF-8086 and the circuit board layout is common, and not the circuit board.

5. Add that the internal compact wide receptacle connector uses the 36 pin version of SFF-8086 and the the receptacle mating interface layout is common, and not the receptacle mating interface.

REVIEW

5.2.3.4.5 SAS internal compact wide cable plug connector

SFF-8086 define 4 different circuit board layout sizes (26,36,50,68). No where in the SAS external compact cable plug or receptacle sections does it indicate that the 36 ckt version is used. It can only be inferred by looking at table 28, adding up A1-A18 and B1-B18. Need to add that it uses 36 ckt version in 8086.

ACCEPT - DONE (switched to weird SIDEBAND numbering scheme based on hybrid cables)

5.2.4.3.2 SAS internal wide symmetric cables
Figure 76 - controller to backplane cable

The left side (controller) has SIDEBAND0 on A8, while table 29 has it on B8.

Author: RElliott
Subject: Note
Date: 5/10/2005 12:29:50 PM

REJECT (went with weird signal assignments based on hybrid cable; kept SIDEBAND0-7 nomenclature)

8484 controller connector has:
SIDEBAND0 on pin 14 (next to channel 1)
...
SIDEBAND5 on pin 19 (next to channel 2)

8087 controller: Backplane:

A8	SIDEBANDY0	SIDEBANDZ0
A9	SIDEBANDY1	SIDEBANDZ1
A10	SIDEBANDY2	SIDEBANDZ2
A11	SIDEBANDY3	SIDEBANDZ3

B8	SIDEBANDZ0	SIDEBANDY0
B9	SIDEBANDZ1	SIDEBANDY1
B10	SIDEBANDZ2	SIDEBANDY2
B11	SIDEBANDZ3	SIDEBANDY3

Hybrid cable connects these electrically:

8484 side (e.g. controller)	8087 side (e.g. backplane)
pin 14 (e.g. SIDEBAND0)	A8 (e.g. SIDEBANDZ0)
pin 15 (e.g. SIDEBAND1)	A9 (e.g. SIDEBANDY0)
pin 16 (e.g. SIDEBAND2)	A10 (e.g. SIDEBANDZ1)
pin 17 (e.g. SIDEBAND3)	A11 (e.g. SIDEBANDY1)
pin 18 (e.g. SIDEBAND4)	B8 (e.g. SIDEBANDZ2)
pin 19 (e.g. SIDEBAND5)	B9 (e.g. SIDEBANDY2)
<none>	B10 (e.g. SIDEBANDZ3)
<none>	B11 (e.g. SIDEBANDY3)

8087 side (e.g. controller)	8484 side (e.g. backplane)
B8 (e.g. SIDEBAND0)	pin 19 (e.g. SIDEBAND 0)
A8 (e.g. SIDEBAND1)	pin 18
B9 (e.g. SIDEBAND2)	pin 17
A9 (e.g. SIDEBAND3)	pin 16
B10 (e.g. SIDEBAND4)	pin 15
A10 (e.g. SIDEBAND5)	pin 14
B11 (e.g. SIDEBAND6)	<none>
A11 (e.g. SIDEBAND7)	<none>

Author: bbissonne_intc

Whether the sidebands are correct or not, the text for the sideband should be in black and not in italic.

Author: bbissone_intc
Subject: Note
Date: 5/10/2005 12:42:54 PM

 REJECT (changed external instead. This connector has a benefit in that lane numbers don't change.)

5.2.4.3.1 SAS internal wide cables overview, figure 77:

This figure is not correct: Signal/pin assignments on both connectors must be the same (controller version of pinout) and RX0 lane attaches to TX3 lane, etc. Pin sequence on right-hand connector should be changed to sequence used on left hand connector (only from top to bottom). Once TX signal polarities get fixed, the interconnect lines will straighten out.

Should look like the wide 4x internal connector (controller to controller) Tx0<->Rx3, Tx1<->Rx2,....

 REJECT (label them "signal return" rather than "ground" instead, with text describing that they might be connected together. Shown unconnected in hybrid/fanout cables, or connected to peers in symmetric non-hybrid cables.)

5.2.3.4.2 SAS internal wide symmetric cables
(general comment on all cable figures)

The depiction of the grounds is misleading in these cable figures.

Show grounds going into a cylinder with dotted lines. Show paddle boards for the crossovers of the signals where needed rather than just crossing the lines in space.

Alternatively, just show the grounds going into circles at each end (not full cylinders) labeled "twinaxial dual drain shield" and don't show them connected from one side to the other.

REVIEW

#2) Table 31 and Table 32: Maximum Crosstalk

Comments: the descriptions of the requirements are not clear

Suggest: change description to match how the measurement should take place, such as how many aggressor at one time and how many victim lines should be considered and their position. If more than one victim line is measured, the spec requirement is a total sum?

Author: relliott
Subject: Note
Date: 5/21/2005 12:00:36 PM
 ACCEPT - TODO (Molex will provide suggested parameters and values by Friday)

Table 31 Media requirements for external cables
Maximum near-end crosstalk rows

These pair choices are not appropriate for the external using external compact (SFF-8088) connectors. They are based on the odd SFF-8470 signal assignments with all the RX on one end and TX on the other end.

Also, there are two dimensions to consider (e.g. A0 to B0 as well as A0 to A1)

Author: relliott_hpq

Subject: Highlight

Date: 5/10/2005 7:39:31 PM

 ACCEPT - DONE (increase to 50 ps; see Tyco comment)

5.2.6 Impedance and media specifications

Table 31 external cables

The specification of:

Maximum intra-pair skew (h, k): 20 ps

is barely achievable by commodity cables and may not be that important (it causes the corners of the eye diagram to become rounded off). See 05-098. Either raise the number or eliminate it.

Author: afan_tyco

Subject: Note

Date: 5/20/2005 6:42:20 PM

 ACCEPT - DONE (Raised to 50 ps. The budget from transmitter to receiver is 15 ps to 75 ps, with a difference of 60 ps. Ashlie says 60 ps is fine and 50 ps is acceptable. The May SAS phy WG felt it prudent to leave 10 ps of slop in the number.

The WG also discussed adding a footnote mentioning that common mode emissions play into this - e.g. the common mode voltage shall not be greater than 150 mV. Deferred to SAS-2.

A better way to specify this would be to specify a full set of s parameters for the cables, including maximum common mode emissions (Scd). Deferred to SAS-2.)

#1

Table 31 (for External Cables), page 131:

Maximum Intra-pair skew: 20ps

Comments: Compare to Table 32 (For Internal Wide Cables), 20ps is not practically possible. External cable is expected to be several times longer than internal cables, but the skew budget is not.

Suggest: Need to propose a reasonable budget or leave it off the spec until a reasonable budget is determined.

Subject: Highlight

Date: 5/10/2005 8:13:42 PM

TACCEPT - DONE (per May SAS phy WG, replaced entire paragraph with "Signal characteristics for compliance points are measured at physical positions called probe points in a test load (see 5.3.2). Measurements at the probe points in a test load approximate measurements at the compliance point in the actual TxRx connection. Some components in the test load may be de-embedded as described in B.4."

The remaining text will be left in 5.3.2 (where a copy of it already is anyway: "Probe points identify the position in the test load where the signal properties are measured but do not imply that physical probing is used for the measurement. Physical probing may be disruptive to the signals and should not be used unless verified to be non-disruptive.")

5.3.1 Compliance points

Second paragraph:

"Signal compliance is measured at physical positions denoted as probe points inside a test load (see 5.3.2)."

s/b

"Signal compliance is measured at physical positions in a test load that approximate compliance points defined in a functional configuration (see 5.3.2)."

Note: This paragraph should concisely define the relationship between a compliance point and a probe point (making it clear that a measurement made at a probe point constitutes an acceptable value to compare against the compliance values called out in the tables. Subsequently, probe points should be discussed in reference to figures to show measurements points, but not discussed in relation to the tables which specify the compliance values.

1. Barry will change to be flat after 3 GHz
2. maybe add a note saying "The low-loss TCTF is designed for 3 Gbps SATA applications and ..."
3. Equation as written has a lot more loss than the graph. The graph represents what was intended. Barry will provide corrected equation.
)

PMC #2 PDF Page 184 Section 5.3.2.4 Low-loss TCTF test load Fourth Paragraph

The equation for this TCTF are specified differently than either of the other two TCTF's, in that it specifies a smooth line from 50MHz to 5,0GHz while the other two equations specify kinks at 3,0GHz (3Gbps operation) or 1,5GHz (1.5Gbps operation).

1. Should the Low-loss TCTF be similarly specified with kinks at 1,5GHz and 3,0GHz?
 2. As it stands with the current definition, the Low Loss TCTF actually allows more loss above 2,7GHz than the 1.5Gbit/s Internal TCTF, and it allows slightly more loss at 5,0GHz than the 3.0Gbit/s Internal TCTF, which makes the term "Low Loss" somewhat inaccurate.
 3. Although probably not relevant to this discussion, this TCTF also allows more loss than that allowed by the corresponding SATA2 cable specification.

Reworded quite a bit of text to make sense of this. This originated in T11 proposal 00-051v0 for FC-PI).

"With impedance measured using amplitude in units of r (i.e., the reflection coefficient, a dimensionless unit) and duration in units of time, the area of the impedance dip caused by this input capacitance is the receiver termination time constant. The receiver termination time constant shall not be greater than the values shown in this table.

An approximate value for the receiver termination time constant is given by the product of the amplitude of the dip in units of r and the width of the dip in units of time, as measured at the half amplitude point. The amplitude is defined as the difference in the reflection coefficient between the reflection coefficient at the nominal impedance and the reflection coefficient at the minimum impedance point.")

5.3.3 General electrical characteristics

This << impedance dip (amplitude as ρ , the reflection coefficient, and duration in time) caused >> should be << impedance dip (i.e., amplitude as ρ , the reflection coefficient, and duration in time) caused >>

"...0) dwords (see SATAII-PHY)."

Author: bbissonne_intc

Subject: Comment on Text

Date: 5/22/2005 3:57:19 PM

 ACCEPT - DONE (Agree that since SATA II doesn't allow 3 Gbps ALIGNs, then a SAS phy supporting attachment to SATA devices must not be allowed to transmit them. This rule needs to also be stated in 6.6 (comment added there).

Also, a SAS phy would never transmit D24.3 characters since that breaks its SAS rule (we assume that SAS never discusses phys that ONLY attach to SATA). So, D24.3 also needs to be removed.

Result: Footnote g) is 1.5 Gbps ALIGN (0)s only.)

REVIEW

5.3.7.3, Table 38:

 REJECT (SATA IO will define a SAS level OOB burst as a transient that their devices must tolerate. Bill Bissonette (Intel) to work that through SATA IO. Since SAS receivers only require 240 mV (although SATA receivers tolerate 225 mV) there is a 15 mV window where SAS receivers might need more signal level than SATA, thus toggling could help. Wording changes noted in additional comments.)

5.3.7.5 Transmitter device signal output levels for OOB signals

The toggling algorithm is bogus and should not be used if SATA device attachment is supported. It leads to overdriving signals into the SATA device, which might have a 600 - 700 mV maximum expectation.

Instead, a SAS phy supporting SATA device attachment needs to always use SATA compatible levels for COMINIT, only switching to SAS levels if it receives a COMSAS. A

SAS receiver (if a SAS drive is attached) should have no problem receiving the lower levels - no more of a problem than a SATA device in that same position. If it cannot work with lower levels, then a SATA device would not be able to work either and it's not really an attachment point that supports SATA device attachment.

SAS phys not concerned with SATA device attachment (e.g. phys attached to external cable connectors) need to use their normal SAS levels.

Proposals discussing this topic include 05-019 and 05-077.

REVIEW

Section reworded as:

Transmitter devices supporting SATA shall use SATA Gen1i or Gen2i signal levels (see SATAII-PHY) during the first OOB sequence (see 6.7) after a power on or hard reset. If the phy does not receive COMINIT within a hot-plug timeout (see 6.7.5), the transmitter device shall increase its transmit levels to the SAS signal levels specified in table 45 (see 5.3.6) and table 46 (see 5.3.6.3) and perform the OOB sequence again. If no COMINIT is received within a hot-plug timeout of the second OOB sequence, the transmitter device shall initiate another OOB sequence using SATA Gen1i or Gen 2i signal levels. The transmitter device shall continue alternating between transmitting COMINIT using SATA Gen1i or Gen 2i signal levels and transmitting COMINIT with SAS signal levels until the phy receives COMINIT.

If the phy both transmits and receives COMSAS (i.e., a SAS phy or expander phy is attached), the transmitter device shall set its transmit levels to the SAS signal levels. If it had been using SATA Gen1i or Gen2i signal levels, this mode transition (i.e., output voltage change) may result in a transient (see 5.3.4) during the idle time between COMSAS and the SAS speed negotiation sequence (see 6.7.4.2).

If the transmitter device is using SAS signal levels and the phy does not receive COMSAS (i.e., a SATA phy is attached), the transmitter device shall set its transmit levels to the SATA Gen1i or Gen 2i signal levels and restart the OOB sequence.

Transmitter devices that do not support SATA shall transmit OOB signals using SAS signal levels.

REVIEW

A SAS phy supporting being attached to SATA devices must not send OOB bursts with G2 or later ALIGNs - SATAII-PHY only allows G1 ALIGNs (or D24.3s, which a SAS phy won't send because a SAS phy receiver device doesn't necessarily accept it).

After also applying Maxtor's comment on this paragraph, results in:

"When transmitting an OOB burst, if the phy supports being attached to SATA devices, the transmitter device shall transmit ALIGN (0) primitives at G1. If the phy does not support being attached to SATA devices, the transmitter device:
should transmit ALIGN (0) primitives at G1;
may transmit ALIGN (0) primitives at its lowest supported physical link rate if it is not able to transmit at G1; and
shall not transmit ALIGN (0) primitives at a physical link rate faster than its lowest supported physical link rate."

REVIEW
6.7.1
In the list of "shall originate a phy reset sequence after" reasons:
"losing dword synchronization (see 6.8.4.9);"

has two problems:
1. It does not mention that SP may choose to re-acquire rather than jump right back to phy reset sequence.
2. The cross reference only points to SAS_PHY_Ready, but the rule is also true in SATA_PHY_Ready.

Change to:
"losing dword synchronization and not attempting to re-acquire dword synchronization (see 6.8.4.9 and 6.8.5.8)"

Add SP25 and SP26 into the list of states in SP.

Author: gop_ibm
Date: 4/30/2005 8:11:11 AM

ACCEPT - DONE (but with "set to zero" not "set to one" in the last sentence - "The SP state machine shall maintain a MgmtReset state machine variable to indicate whether a Management Reset request has been received. Any SP state that receives a Management Reset request shall set the MgmtReset state machine variable to one before making a transition to the SP7:OOB_AwaitCOMSAS state (see 6.8.3.2). Any SP state that receives a power on, or a hard reset shall set the MgmtReset state machine variable to zero before making the transition to the SP7:OOB_AwaitCOMSAS state.")
REVIEW

6.8.1 SP state machine overview

This is a mess << The SP state machine shall maintain a MgmtReset state machine variable to indicate whether SP0:OOB_COMINIT was last entered due to a Management Reset, or a defined transition from another state (see 6.8.3.2.1). If SP0:OOB_COMINIT was last entered due to a Management Reset, it shall set the MgmtReset state machine variable to one. If SP0:OOB_COMINIT was last entered by a defined transition from another state, it shall set the MgmtReset state machine variable to zero. >>. I think it should be restated like this

<< The SP state machine shall maintain a MgmtReset state machine variable to indicate whether when Management Reset request is received. Any SP state that receives a Management Reset request shall set the MgmtReset state machine variable to one before making the transition to the SP7:OOB_AwaitCOMSAS state. Any SP state that receives a power on, or a hard reset shall set the MgmtReset state machine variable to one the transition to the SP7:OOB_AwaitCOMSAS state. >> Note that the other cases that case the MgmtRest variable to be set to zero are not global and therefore have to be handled in the state were the action occurs in the description of the transition.

Author: mevans_mxo
Subject: Highlight
Date: 4/30/2005 8:08:43 AM

REJECT (used IBM suggestion instead: The SP state machine shall maintain a MgmtReset state machine variable to indicate whether a Management Reset request has been received. Any SP state that receives a Management Reset request shall set the MgmtReset state machine variable to one before making a transition to the SP7:OOB_AwaitCOMSAS state (see 6.8.3.2). Any SP state that receives a power on, or a hard reset shall set the MgmtReset state machine variable to zero before making the transition to the SP7:OOB_AwaitCOMSAS state.)

6.8.1. fourth paragraph: Change to:

The SP state machine shall maintain a MgmtReset state machine variable to determine whether SP0:OOB_COMINIT was last entered as the result of a Management Reset or a transition from another state (see 6.8.3.2.1). If SP0:OOB_COMINIT was last entered as the result of a Management Reset, then the SP state machine shall set the MgmtReset state machine variable to one. If SP0:OOB_COMINIT was last entered as the result of a transition from another state, then the SP state machine shall set the MgmtReset state machine variable to zero. Any transition from SP7:OOB_AwaitCOMSAS shall cause the SP state machine to set the MgmtReset state machine variable to zero.

REVIEW

Addressing Dell comment on pg 297:

add a Disable Phy request from upper layers that sends any state back to SP0:OOB_COMINIT.

Once in SP0:OOB_COMINIT for that reason, transitions out of SP0 are prevented until a power on, hard reset, or Management Reset occurs. Also don't do the "upon entry" stuff.

Maybe add a SP27:Disabled state, left when one of those happens.

 ACCEPT - DONE (fixed the colon and removed SATA Spinup Hold confirmation)

6.8.3.9.5 Transition SP7:OOB_AwaitCOMSAS to SP26:SATA_SpinupHold

1st Paragraph, 1st Sentence

Change
"This state shall send a SATA Spinup Hold confirmation to the link layer and perform this transition if."
to
"This transition shall occur if:"

The SATA Spinup Hold confirmation to the link layer belongs in the entry in to SP26:SATA_SpinupHold.

If this is not accepted, need a colon after if.

Author: RElliott

Subject: Cross-Out

Date: 5/30/2005 1:20:03 PM

 ACCEPT - DONE

Delete "this phy is in an expander device;" and just say "the phy implements SATA spinup hold" in item d). SAS phys supporting SATA might also implement some form of spinup hold; there is no need to tie expanders into it here. (only expanders define the SATA Spinup Hold confirmation going to the link layer, but that doesn't mean non-expander SP state machines cannot walk through the same states)

 ACCEPT - DONE (per May phy WG, add a SHOULD rule that OOB detection should not run unless dword sync has been lost. As:

"This transition shall occur after:

- a) receiving a DWS Lost message, if this state does not send a Start DWS message; or
- b) receiving a DWS Lost message followed by a COMINIT Detected message, if this state does not send a Start DWS message; or
- c) receiving a DWS Reset message.

This transition may but should not occur after receiving a COMINIT Detected message before receiving a DWS Lost message, or after receiving a COMINIT Detected message after sending a Start DWS message (i.e., the SP state machine should ignore COMINIT Detected messages unless the SP_DWS state machine has indicated loss of dword synchronization).")

REVIEW

6.8.4.9 SP15:SAS_PHY_Ready and
6.8.5.8 SP22:SATA_PHY_Ready

need to clarify how COMINIT Detected works in SP15 and SP22 (and maybe other states). If the differential voltage level drops below 120 mV multiple times meeting COMINIT timing, is that enough? Or is the voltage drop ignored until dword sync is declared lost by SP_DWS? DWS Reset Timeout is 1 ms; COMINIT idle time is 525 ns. So, COMINIT Detected will be seen before DWS is declared lost.

6.8.6.1 State description

This section is not properly formatted and as such is different that any other state description section is SAS. This has be fixed.

a) For one thing there should only be one state shown. The SPx representation is not correct.

b) The SMP Phy Control request should be handled lke the Power on or hard reset or Management Reset request. And it should be placed in all the SP state machine figures not just this one.

c) There is no description of the transmitter and receiver signals.

d) The SPx to SP25 transition should not be here. It should be handled in the same fashion as the Power on or hard reset or Management Reset request.

e) There are other points that I have not described that also need fixing. In general make it look like it belongs in SAS.

 ACCEPT - DONE (delete the destination phy list. Put the expander list in 7.12.4.1. Also see 7.12.5.2, 7.12.5.3 which have some OPEN_REJECT rules. Rewrite some of those rules in terms of Arb Reject rather than OPEN_REJECT.)

7.2.5.1 OPEN_REJECT

For SAS phys (not expander phys), consider dropping the priority list in favor of the 1)2)3) list in the SL_CC:Selected state, the only one that uses it.

For expander phys, the decision is not made by XL (in XL4:Open_Reject), it's made by the ECM (choosing which Arb Reject to send). I don't know if there's a better place for the list than its current location since we don't define ECM state machines.

There are two candidates:

- a) 4.6.6.3 defines the Arb Rejects.
- b) 7.12.4.1 has the arbitration rules, but does not have an ordered list right now enforcing the priority.

Author: bday_lsi

Subject: Comment on Text

Date: 5/21/2005 6:56:39 PM

 ACCEPT - DONE (It should be item 3 alone. STP RESOURCES BUSY comes from the STP target phy and its SL_CC state machine, not the expander phy/XL state machine. So, it doesn't belong in this list at all.

This list is being deleted anyway in favor of changing the list of Arb Reject reasons in 7.12 from an unordered to an ordered list.)

Should this be an item 4) instead of combined together with item 3)?

Change transmitter to phy

Author: goulder_seg
Subject: Note
Date: 5/21/2005 8:19:09 PM

 ACCEPT - DONE (after sending DONE (CREDIT TIMEOUT), the phy enters a mode where it must keep receiving frames (assuming it has sent RRDY credit) or it will BREAK the connection.

Rewritten as "The SSP state machine (see 7.16.7) timed out waiting for an RRDY or received a CREDIT BLOCKED, and the phy is going to transmit BREAK if it provides transmit frame credit for 1 ms without receiving a frame or a DONE."

PDF page 272

Table 76 – Done primitives

Done(credit-timeout) description is unclear. It should be reworded.

It currently says "The SSP state machine (see 7.16.7) timed out waiting for an RRDY or received a CREDIT BLOCKED and the transmitter is going to transmit BREAK if credit is extended for 1 ms without receiving a frame or a DONE."

Perhaps the last part of the sentence should read "...transmit BREAK in 1 ms unless credit is extended, a frame is received, or DONE is received within 1 ms of transmitting the DONE(CREDIT_TIMEOUT)."

I also don't understand how "credit is extended" because a later paragraph (under table 78) prohibits sending RRDY after a CREDIT_BLOCKED has been sent. Perhaps this phrase should be stricken.

 ACCEPT - DONE (just changed "in SAS" to "in STP" rather than duplicate a paragraph)
REVIEW

7.10 Power management

The 1st Paragraph, 1st Sentence "SATA interface power management is not supported in SAS." seems to contradict section 6.8.5.1 SATA host emulation states overview, which states that SATA PM may be used on SAS initiators directly connect to SATA devices.

From 6.8.5.1

"The power management states defined in this standard are for SAS initiator devices that support being attached to SATA devices; expander devices attached to SATA devices do not support power management in this standard."

Add paragraph from 6.8.5.1 to 7.10.

REVIEW

7.12.8 Breaking a connection

"a connection is considered broken due to loss of dword synchronization (see 6.9)."

This is only intended to be true for loss of dword sync resulting in a phy reset sequence. If an expander phy detects several invalid dwords but then reacquires sync, it neither forwards BREAK to tear down the connection through the ECR, nor transmits BREAK itself. The phy just gets a bunch of receive errors (the other direction might be fine). If it fails to reacquire and redoes the phy reset sequence, then BREAK is forwarded through the ECR (and the local physical link is in OOB, so BREAK is not needed).

Change to: "a connection is considered broken due to loss of dword synchronization (see 6.9) that results in a new link reset sequence (i.e., the SP state machine transitioned from SP15:SAS_PHY_Ready or SP22:SATA_PHY_Ready to SP0:OOB_COMINIT (see 6.8))"

7.15.3 XL0:Idle state

Comment from Expert I/O (in 05-141r0):

Expander – Backoff Reverse Path

Problem

Expander Port 0 forwards an open to Expander Port 1, which causes Expander Port 0 to transition to XL3:Open_Confirm_Wait. Expander Port 1 receives an open address frame from the device it is connected. The received open address frame wins according to arbitration rules and thus causes Expander Port 1 to issue a Backoff Reverse Path message destined to Expander Port 0. The specification indicates that upon reception of the backoff reverse path message, Expander Port 0 should transition to XL5:Forward_Open. The specification goes on to say upon entry into XL5:Forward_Open, the expander port should transmit an open address frame based on the arguments of the oaf coincident with the state transition. However, in the case of the backoff reverse path message, there is no mechanism detailed to provide the Expander Port with the open address frame arguments along with the message.

Solution

This problem could be solved by having the expander port that received the backoff reverse path message transition to XL0:Idle rather than XL5:Forward Open. This will enable the expander port to be ready to accept the forward open message that will follow the backoff reverse path message and proceed as described in the specification.

Alternatively, the backoff reverse path message could include the arguments for the open address frame along with the message. However, this option seems more intrusive than the first option

Author: relliott_hpq
Subject: Note
Date: 5/2/2005 5:19:17 PM
 REFER PROTOCOL WG
7.15.4 XL1:Request_Path state

Comment from Expert I/O in 05-141r0:

Expander – Request Path Handling
Problem

The specification should clarify what should occur in the following condition: Expander Port 1 issues a request path message which will route to Expander Port 0 resources. Expander Port 1 wins arbitration and proceeds to issue a forward open message that will go to Expander Port 0. Coincidentally (or any time up to receiving the forward open message from Expander Port 1), an open address frame is received by Expander Port 0.

This causes Expander Port 0 to transition to XL1:Request_Path. While Expander Port 0 is in XL1:Request_Path the forward open message is received. It is not clear what the expander link should do from this point forward. If the open address frame received by Expander Port 0 is greater, ultimately a backoff retry or backoff reverse path message should be issued to Expander Port 1. If the open address frame received by the forward open message is greater, the request path message to the ECM should be negated. Neither of these methods is explained.

Solution

A possible solution requires modification in both the XL1:Request_Path section of the specification and the request path handling in the ECM. In the XL1:Request_Path section, the contents of the received open address frame could be kept. Upon receiving a forward open message while in XL1:Request_Path, the expander link uses arbitration rules to determine if a backoff retry message or backoff reverse path message should be issued while remaining in the same state. If either of these messages is issued, then no further modifications are necessary since the request path message from Expander Port 0 will control the state operation of Expander Port 0. If the forward open message wins arbitration over the received open address frame by Expander Port 0, the state transition to XL5:Forward_Open would take place as described. The only modification in this case would be that the ECM would ignore the request path message already issued by Expander Port 0.

As a note, the cases are covered if the open address frame is received while Expander Port 0 is in XL5:Forward_Open and XL6:Open_Confirm_Wait. The only case missing in the specification is the case described

7.15.4.5 Transition XL1:Request_Path to XL5:Forward_Open
Comment by ExpertIO in 05-141r1:

Problem:

The specification indicates that if a forward open message is received after an arbitrating (NORMAL) message has been received, the forward open message is ignored. We believe there is a flaw in the statement or perhaps overall in the expander function handling. It is illustrated in the following case.

Expander Port 2 wins arbitration to open Expander Port 0. Expander Port 1 receives an Open Address Frame (OAF) to Open Expander Port 2 but has to hold off as it waits for the connection to try to open between 2 and 0. The expander function sends an arbitrating (NORMAL) message to expander Port 1 to acknowledge the receipt of the request path message. Expander Port 0 transmits an OAF at the same time an OAF resolving to port 1 is received from the device connected to Expander Port 0. The OAF received by expander Port 0 wins over the outgoing OAF by arbitration rules. Expander Port 0 sends a backoff retry message to Expander Port 2 and also a request path message to the expander function requesting a connection to port 1. The request path message from Expander Port 0 wins by arbitration rules, that is, it is more significant than the outstanding request message by Expander Port 1. As a result, Expander Port 0 issues a forward open message to Expander Port 1. However, since Expander Port 1 had already received an arbitrating (NORMAL) message while in the XL1:Request_Path state, the forward open message is ignored and a stall occurs.

Solution

Removing the restriction of transitioning to XL5:Forward_Open if an Arbitrating (Normal) message has been seen alleviates the problem. There are two cases to consider in determining that this is a valid solution. Following the example described above:

The first case is that the OAF that is forwarded to Expander Port 1 wins via arbitration rules over the OAF received by Expander Port 1. The second case being the OAF that is forwarded to Expander Port 1 loses via arbitration rules over the OAF received by Expander Port 1.

In the case that the forwarded OAF wins, with the restriction removed, the OAF will be received by the port connected and will discard the OAF it sent. This mechanism is already described in both the expander and link layer specification.

The second case can not occur because a forward open message will not be generated by Expander Port 0 destined for Expander Port 1 since Expander Port 0 did not win arbitration in the Expander Function.

 REFER PROTOCOL WG

Qlogic Corp #002 PDF page 328
7.15.4.5 Transition XL1:Request_Path to XL5:Forward_Open
7.15.4.6 Transition XL1:Request_Path to XL9:Break

The following changes ensure that the Forward Open indication takes precedence over a simultaneous BREAK Received message. In the first sentence of 7.15.4.5, strike-through ", a BREAK Received message has not been received,". Add the following as the last sentence in this section. "If a BREAK Received message is received, this state

shall include a BREAK Received argument with the transition." In 7.15.4.6, replace "after receiving a BREAK Received message" with "if a BREAK Received message is received and a Forward Open indication has not been received".

7.16.13, fourth paragraph: Change to: The transport layer (see 9.2.4) either retries sending SSP frames that encounter a link layer error (e.g., are NAKed or create an ACK/NAK timeout), or the application layer aborts the SCSI command associated with the SSP frame that encountered a link layer error.

Author: kmarks_dell

Subject: Highlight

Date: 4/25/2005 5:48:09 PM

1 REJECT (interlocking does mix the layers. ACK/NAK vs. credit timing is link layer material, while frame types (e.g. COMMAND, DATA references) and tags are transport layer material. Since it will have out-of-place material no matter where it is located, the link layer seems as good a home as any.)
REVIEW

7.16.5 Interlocked frames

I question why the Interlock Frames section is in the link layer material, when the SSP link layer state machines do not seem to directly deal with "interlocked-ness" other than ACK/NAK balance issues. The Transport Layer would seem more appropriate for the material, since this is where it seems to enforce it along with the PL_OC.

 ACCEPT - DONE (more drastic changes needed to agree with other Maxtor comments. Reword this whole state machine in terms of a Number Of Frames Transmitted counter and a Number Of ACKs/NAKs Received counter. Both start at zero and increment, then are set to zero when the connection closes.

New text:

"This state machine monitors the number of frames transmitted with a Number Of Frames Transmitted counter and monitors the number of ACKs and NAKs received with a Number Of ACKs/NAKs Received counter. This state machine ensures that an ACK or NAK is received for each frame transmitted and reports an ACK/NAK timeout if they are not.

When the Number Of Frames Transmitted counter equals the Number Of ACKs/NAKs Received counter, the ACK/NAK count is balanced and this state machine shall send the Tx Balance Status (Balanced) message to the SSP_TF2:Tx_Wait state. When the Number Of Frames Transmitted counter does not equal the Number Of ACKs/NAKs Received counter, the ACK/NAK count is not balanced and this state machine shall send the Tx Balance Status (Not Balanced) message to the SSP_TF2:Tx_Wait state.

Each time a Frame Transmitted message is received, this state machine shall increment the Number Of Frames Transmitted counter.

If the ACK/NAK count is not balanced, each time an ACK Received message is received, this state machine shall:

- a) increment the Number Of ACKs/NAKs Received counter; and
- b) send an ACK Received confirmation to the port layer.

If the ACK/NAK count is not balanced, each time a NAK Received message is received, this state machine shall:

- a) increment the Number Of ACKs/NAKs Received counter; and
- b) send an NAK Received confirmation to the port layer.

)

REVIEW

7.16.7.3, fourth paragraph: Change to: When the number of Frame Transmitted messages received equals the number of ACK Received messages plus the number of NAK Received messages received, then the ACK/NAK count is balanced, and this state machine shall send a Tx Balance Status (Balanced) message to the SSP_TF2:Tx_Wait state. When the number of Frame Transmitted messages received does not equal the number of ACK Received messages plus the number of NAK Received messages received, then this the ACK/NAK count is not balanced and this state machine shall send a Tx Balance Status (Not Balanced) message to the SSP_TF2:Tx_Wait state.

 ACCEPT - TODO (Frame Transmitted from the link layer needs to make its way back to PL_OC and used to throttle between every Tx Frame message. This is better than adding a queue between PL_PM and SSP_TF)

9.2.3.4 PL_PM3 Connected state

Comment from Expert I/O in 05-141r0:

Port Layer – Frame Transmitted Handshake
Problem

Due to the architectural freedom of having multiple SSP Transports running concurrently on top of a single Port Layer, multiple frames with different tags may be queued to the port layer. The port layer section of the specification does not describe any restriction for issuing multiple transmit frame messages to the link layer as long as the protocol, connection rate, and destination address match. However, the SSP Link Layer state machine is specified such that it can only accept one transmit frame message at a time. This creates an environment where a frame could be implicitly dropped if the transmit frame message is issued by the Port Layer while the SSP Link Layer is not in a state that recognizes the message.

Solution

The description of a handshake should be added to the Port Layer section of the specification. Specifically in the PL_PM3:Connected state should specify that a new transmit frame message can only be issued if there are no outstanding frame transmitted confirmations from the SSP Link Layer.

 9.2.4.2 COMMAND frame - handling of link layer errors
6th Paragraph, 1st Sentence

"An SSP initiator port should retransmit each COMMAND frame that does not receive an ACK at least one time." - seems to contradict the statements above in section 9.2.4.2, in that if the SSP initiator port receives a XFER_RDY, showing that the command was received, why would it re-send the command and cause an overlapped condition? A better statement may be

"If the SSP initiator port does not receive an ACK, XFER_RDY frame or RESPONSE frame for a COMMAND frame sent, it should retry the COMMAND frame at least once."

T 9.2.4.5.3 DATA frame without transport layer retries

Last sentence

Change

"If an SSP initiator port transmits a write DATA frame and receives a NAK for that frame, the device server aborts the command (see 10.2.2)."

to

"If an SSP initiator port transmits a write DATA frame and receives a NAK for that frame, the application client aborts the command (see 10.2.2)."

"Device server" contradicts 10.2.2, which says that SSP initiator port will abort the command with an ABORT TASK when a NAK is received. Unless the reference to 10.2.2 should be 10.2.3 (device server error handling), but this does not seem to make sense, because the write data could be for another command's XFER_RDY, so the device server does not know which command to abort and is discarded in the link layer. The application client should abort the task with ABORT TASK.

9.2.5.2 SSP initiator port error handling summary

More reason that "data offset that was not expected" needs to be more specific.

Comment from Rich Deglin, Vitesse:

Initiator	Target
<=== DATA frame	
<=== DATA frame w/CRC error	
<=== DATA frame CHANGING DATA POINTERS=0	
...	
	ACK ==>
	NAK ==>
	ACK ==>
...	
<=== DATA frame CHANGING DATA POINTERS=1	

Due to the non-interlocked nature of data transfer, the target may have continued to transmit DATA frames for some time before it discovers that one of them was NAK'ed. Meanwhile the initiator has seen an "unexpected" data offset, but CHANGING DATA POINTERS=0. I believe the initiator is compelled to abort the command at this point.

 9.2.6 ST (transport layer for SSP ports) state machines

During review of SAS 1.1 transport layer state machine descriptions it became apparent that the frame level retry description in the state machines was not complete and that the states in state machines that contained more than one state were not passing arguments. There appeared to be an assumption that a state would always have the information it wanted without regard as to where the information came from.

This proposal 05-143 addresses both those problems.

The comments included with these comments, for the most part, are not included in 05-143 and should be treated as independent of 05-143.

 9.2.6.2.1 ST_I state machines

Comment from ExpertIO in 05-141r0:

SSP Transport Layer – Ack Transmitted Confirmation Needs TagArgument

Problem

When an ack transmitted confirmation is received by the SSP Transport layer, it is not known for which frame the ack transmitted confirmation is associated. For instance, in the case of a wide link where a single transport layer is servicing commands for multiple tags simultaneously, the ST layer needs to know which ack transmitted confirmation is associated with which received frame.

Solution

The port layer has access to the information regarding which tag is associated with which confirmation. The specification should detail that the transmission status and the ack transmitted message should include an argument of the tag associated with the confirmation.

T Need to add the retries case to not conflict with last sentence of 9.2.4.2.
"The Transmit Frame request was for a COMMAND frame, and the vendor-specific number of retries has been reached."

Author: bday_lsi
Subject: Comment on Text
Date: 4/19/2005 1:41:37 PM

T I think this sentence conflicts with 9.2.4.2 and 10.2.2. After a command transmission gets an ACK/NAK timeout, application layer is running a QUERY TASK. At ACK/NAK Timeout, the ST_ITS sent up the Transmission Complete(Command Failed, Connection Failed). IF XFER_RDY now comes in before the response for the QUERY TASK, it is supposed to be valid.

 9.2.6.2.3.6 ST_ITS5:Prepare_Data_Out

Comment from Expert I/O in 05-141r0:

SSP Transport Layer – Balance Counter
Problem

The specification is very detailed in the description of the ITS state transitions. A section particularly describes how the ITS cannot transition out of PREPARE_DATA_OUT until it has received as many ack received confirmations as data frames it has sent out. This wording implies a counter that is not explained.

Solution

The specification should describe a balance counter (similar to ones described in the Link Layer) that increments on every frame transmitted transmission status confirmation and decrements on every ack received transmission status confirmation

REFER PROTOCOL WG (05-143)

9.2.6.3.3.4.1 State description

In looking at the error recovery, I have noticed a few inconsistencies in the document. It appears that when sections 9.2.4 and 9.2.5 were added, the state diagrams were not updated to match. Proposal 05-143 contains the fixes for this problem.

9.2.6.3.3.5.1 states:

i) TARGET PORT TRANSFER TAG field set to a vendor-specific value, unless otherwise specified in this subclause;
and

If this state is entered after the ST_TTS2:Target_Send_Frame state received a Transmission Status (Frame Transmitted) confirmation and a confirmation other than Transmission Status (ACK Received) for which a Transmission Complete message was not sent to the ST_TFR state machine (i.e., to retry transmitting a frame), then this state shall construct a new XFER_RDY frame using the values from the previous XFER_RDY frame except:

- a) the RETRANSMIT bit shall be set to one; and
- b) the value in the TARGET PORT TRANSFER TAG field shall be set to a different value than the value in the previous XFER_RDY frame. The new target port transfer tag value shall not conflict with any other target port transfer tag currently in use. If write data is received for a subsequent XFER_RDY frame for a command, then all target port transfer tags used for previous XFER_RDY frames for the command are no longer in use.

but the above does not match with

9.2.4.1 states:

If the TRANSPORT LAYER RETRIES bit is set to one, the logical unit:
d) selects a different value for the TARGET PORT TRANSFER TAG field in each XFER_RDY frame than that used in the previous XFER_RDY frame for that I_T_L_Q nexus;

 REFER PROTOCOL WG (05-143)

9.2.6.3.3.6.1 State description

In looking at the error recovery, I have noticed a few inconsistencies in the document. It appears that when sections 9.2.4 and 9.2.5 were added, the state diagrams were not updated to match. Proposal 05-143 contains the fixes for this problem.

9.2.6.3.3.6.1 states:
1) If the data offset was not expected (i.e., the CHANGING DATA POINTER bit is set to one and the value in the DATA OFFSET field is not set to the data offset associated with the XFER_RDY frame, or the CHANGING DATA POINTER bit is set to zero and the value in the DATA OFFSET field is not set to the value in the DATA OFFSET FIELD in the previous write DATA information unit plus the number of bytes in that information unit), then this state shall send a Reception Complete (Data Offset Error) message to the ST_TFR state machine;

and then 9.2.6.3.2 table 124 states that
Reception Complete (Data Offset Error)
translates to a SCSI application layer:
Data-Out Received with the Delivery Result
argument set to DELIVERY FAILURE - DATA OFFSET ERROR
Which will prohibit any recovery.

So, if recovery is possible, then 9.2.6.3.3.6.1 cannot send the Reception Complete (Data Offset Error) message until recovery has been exhausted. However, 9.2.6.3.3.6.1 does not mention recovery at all.

as 9.4.3 is proposed for removal below.

Author: kmarks_dell
Subject: Cross-Out
Date: 5/21/2005 5:11:39 PM

 REJECT (This is the main response for a slew of related comments about reorganizing the SMP frame definitions in the transport/application layers.

The frame definitions in SAS have other layer-to-layer duplication of fields. For example, the CRC field is shown in both the SSP frame format and the SMP frame format defined in the transport layer, even though it is essentially owned (probably generated and definitely checked) by the link layer.

In SMP, since the transport layer header is only one byte long (not even a full dword), we chose to duplicate it in the application layer and avoid confusing everyone with byte numbers that are just one byte off. There is a sentence in the application layer where SMP FRAME TYPE is first mentioned that describes this - "The smp frame type field is included in each frame format defined in this clause, although that field is parsed by the SMP transport layer (see 9.4)"

SSP is less confusing since the header is significantly longer and is a multiple of dwords - 24 bytes (8 dwords).
)

Remove Section 9.4.2 - SMP_REQUEST FRAME as it is redundant with 10.4.3.1

The removal of this section may cause a global change to SMP_REQUEST to SMP REQUEST.

TREJECT (10.2.4 covers SCSI Command Received () with a tag already in use by a task management function, not already in use by a command. So, it doesn't apply. SAM-3 covers commands conflicting with other commands (and has commands be aborted), but does not worry about commands colliding with task management functions, so does not say that task management functions also need to be aborted. Thus, this rule is unique to SAS and must remain in this section.)

10.2.3 Device server error handling

This

<< If the SCSI target device performs tag checking and an SSP target port calls SCSI Command Received () with a tag already in use by another SCSI command (i.e., an overlapped command) in any logical unit, the task router and device server(s) shall abort all task management functions received on that I_T nexus and shall respond to the overlapped command as defined in SAM-3. >>

should be changed to

<< If the SCSI target device performs tag checking and an SSP target port calls SCSI Command Received () with a tag already in use by another SCSI command (i.e., an overlapped command) in any logical unit, the task router and device server(s) shall respond to the overlapped command as defined in SAM-3. >>

as there are more specific rules on aborting below in the second a.b.c list in section 10.2.4.

Author: kmarks_dell

Subject: Cross-Out

Date: 4/28/2005 7:05:27 PM

TREJECT (this is indeed the intent. SAS describes aborting task management functions, which SAM doesn't contemplate. SAM-3 only discusses aborting commands.)

10.2.3 Device server error handling

1st Paragraph, 1st Sentence

Remove

"management functions"

from

"...device server(s) shall abort all task management functions received on that I_T nexus..."

Author: kmarks_dell

Author: kmarks_dell

Subject: Highlight

Date: 4/20/2005 5:09:35 PM

TACCEPT - DONE

10.2.4 Task router and task manager error handling

1st Paragraph, b) in first a,b list

Remove extra "calls" in sentence.

"b) an SSP target port calls calls Task Management Request Received () with a tag already in use by a SCSI command or SCSI task management function in any logical unit,"

Author: kmarks_dell

Subject: Highlight

Date: 4/20/2005 5:13:13 PM

TREJECT (When the proposal changing this was added, the committee decided that if a command conflicts with a task management function, the task management function is the one that the RESPONSE frame is for, no matter which one arrived first. This simplifies the interaction with the SAM-3 rules (which handle command/command problems).)

10.2.4 Task router and task manager error handling

1st Paragraph c) in second a,b,c list

Change

"c) call Task Management Function Executed () with the Service Response set to FUNCTION REJECTED - Overlapped Tag Attempted (i.e., requesting that the target port set the DATAPRES field to RESPONSE_DATA and the RESPONSE CODE field to OVERLAPPED TAG ATTEMPTED)."

to

"

c) call Send Command Complete () with a with the Service Response set to SERVICE DELIVERY OR TARGET FAILURE (i.e., requesting that the target port set the DATAPRES field to RESPONSE_DATA and the RESPONSE CODE field to OVERLAPPED TAG ATTEMPTED) if the SCSI command received caused the overlapped tag condition; or

call Task Management Function Executed () with the Service Response set to FUNCTION REJECTED - Overlapped Tag Attempted (i.e., requesting that the target port set the DATAPRES field to RESPONSE_DATA and the RESPONSE CODE field to OVERLAPPED TAG ATTEMPTED) if the SCSI task management function received caused the

overlapped tag condition"

Seems that if it was a command that was received last, that cause the overlapped tag condition, that the response would be for that command, and not the task management function that was already in the task set.

T ACCEPT - TODO (PL_OC should be modeled as not being required to close connections when it has no more frames. It should only be recommended to close them at that time. See new comment added there. See new comment on DONE Received in PL_PM3. See comment in PL_PM3 about when the Bus Inactivity Timer starts (to be rejected))

I think values for anything 1 ms or greater may conflict with the port and link layer state machines.

For connections that the target establishes, in section 8.2.2.3.5, the PL_OC will close the connection, essentially bypassing the bus inactivity timer.

For connections that the initiator establishes:

- 1) the initiator may have sent DONE, and is running the DONE Timeout timer. Not closing within 1ms results in BREAK.
 - 2) The timer may never be started in this connection in section 8.2.3.4 PL_PM3, if the target doesn't have a frame to transmit.

REVIEW

This paragraph is confusing. It should be symmetrical with the ATTACHED SAS ADDRESS paragraph. It should refer to the IDENTIFY address frame and its field name.

Change:

"The SAS ADDRESS field contains the SAS address (see 4.2.2) transmitted by this phy during an identification sequence. If the phy is an expander phy, the SAS ADDRESS field contains the SAS address of the expander device. If the phy is a SAS phy, the SAS ADDRESS field contains the SAS address of the SAS port."

to:

"The sas address field contains the value of the sas address field transmitted in the IDENTIFY address frame during the identification sequence. If the phy is an expander phy, the sas address field contains the SAS address of the expander device (see 4.2.4). If the phy is a SAS phy, the sas address field contains the SAS address of the SAS port (see 4.2.6)."

Author: relliott
Subject: Highlight
Date: 4/25/2005 2:54:08 PM
 ACCEPT - DONE
REVIEW

This paragraph is confusing. Refer to IDENTIFY address frame and its field name, and add cross references to where SAS address usage by expander devices, SAS ports, and STP/SATA bridges are defined.

Change:

"The ATTACHED SAS ADDRESS field contains the SAS address (see 4.2.2) received by this phy during the identification sequence, which is either:

- a) the SAS address of the attached SAS port if the attached port is a SAS port;
- b) the SAS address of the attached expander device if the attached port is an expander port; or
- c) the SAS address provided for the attached port if the attached port is a SATA device port."

to:
"The attached sas address field contains the value of the the sas address field received in the IDENTIFY address frame during the identification sequence. If the attached port is an expander port, the attached sas address field contains the SAS address of the attached expander device (see 4.2.4). If the attached port is a SAS port, the attached sas address field contains SAS address of the attached SAS port (see 4.2.6). If the attached port is a SATA device port, the attached sas address field contains the SAS address of the STP/ SATA bridge (see 4.6.2)."

Date: 4/25/2005 4:38:25 PM

 REJECT (the intention is that only loss of dword sync resulting in a new phy reset sequence is counted. Otherwise, this counter increments many times during unplugs. Will expand the wording to make this clearer with SP state references, though - see new comment)
REVIEW

10.4.3.6 REPORT PHY ERROR LOG function

6th Paragraph after Table 184 - REPORT PHY ERROR LOG response

"The LOSS OF DWORD SYNCHRONIZATION COUNT field indicates the number of times the phy has lost dword synchronization and restarted the link reset sequence (see 6.8) of phy reset sequences. The count shall stop at the maximum value."

Is the LOS SYNC COUNT only incremented if a the link reset sequence happens? Several SP states allow for a Start DWS message to prevent a link reset sequence, such as SP15:SAS_PHY_Ready. If this LOS is defined as DWS Loss, then remove "and restarted the link reset sequence (see 6.8) of phy reset sequences."

Author: relliott
Subject: Note
Date: 4/28/2005 6:26:42 PM

 ACCEPT - DONE
REVIEW

Rewrite "has lost dword synchronization and restarted the link reset sequence (see 6.8) of phy reset sequences."

First of all, "of phy reset sequences" is bogus.

Second, it should refer to specific SP state transitions to emphasize that just plain dword sync does not increment the count.

Third, "and" could be constructed as incrementing on loss of dword sync and also incrementing on link reset sequence; really, a "because" relationship is intended.

New wording:

"has restarted the link reset sequence because it lost dword synchronization (see 6.9) (i.e., the SP state machine transitioned from SP15:SAS_PHY_Ready or SP22:SATA_PHY_Ready to SP0:OOB_COMINIT (see 6.8))"

1 ACCEPT - DONE (downgraded all "shall"s in this section. Updated terminology in the figures to be consistent with each other. Added a few cross references into chapter 5 (and there back to here) for the figures applicable to this standard (signal output at transmitter device and signal tolerance at the receiver device).)

Annex B
"(normative)" s/b "(informative)"

There are many problems with this being a normative annex:

1) The terms are different. Nowhere is it evident the relationship between CT, CR, IT, and IR compliance points in clause 5 and the Transmit and Receive interoperability points identified in the annex, and what the relationship might be to probe points described in clause-5.

2) Annex B describes a method for "de-embedding" a test fixture, presumably to mitigate the effects of the test load on the compliance measurement. But there is nothing to correlate the compliance values described in clause 5 with specific measurements described in Annex B.

The information in Annex B is quality information, but without appropriate changes to correlate the measurement techniques described in Annex B to the compliance values called out in clause 5. I.M.H.O., the bulk of LB comments that would be needed to reconcile the two would constitute a very substantive change, and might represent just cause to hold another LB to resolve. So I recommend making the annex informative for now, and fix it in SAS-2.

ACCEPT - DONE (reduce this to a short note just warning that some SATA devices don't return their initial register FIS in all cases, and that forcing a HARD RESET or LINK RESET is the way to get them to do so. As:
"SATA device not transmitting initial Register Device-to-Host FIS
Some SATA devices do not return the initial Register Device-to-Host FIS after a link reset sequence if they did not detect the COMINIT during the link reset sequence (e.g., if the SATA device originated the link reset sequence). While waiting for the initial Register Device-to-Host FIS, an STP/SATA bridge returns:
In the SMP DISCOVER response (see 10.4.3.5):
the attached device type field is set to 000b;
the negotiated physical link rate field is set to 8h or 9h;
the attached sata device bit is set to one; and
the attached sas address field is set to the SAS address of the STP target port of the STP/SATA bridge;
and
OPEN_REJECT (NO DESTINATION) for connection requests to the SAS address of the STP target port.
If an STP initiator port detects this situation for a vendor-specific amount of time, an SMP application client should send an SMP PHY CONTROL function requesting a phy operation of LINK RESET or HARD RESET to originate a new link reset sequence. The SATA device is expected to detect...)

Annex G:

Add annex G.5 as follows:

G.5 Discovery of a SATA device

An expander phy with STP/SATA bridge in the SATA Spinup Hold state is indicated in the DISCOVER response NEGOTIATED PHYSICAL LINK RATE field (a value of 3h indicates the phy is enabled and a SATA device has been detected, but it's in the spinup-hold state). An expander device generates a BROADCAST (CHANGE) for the following conditions:

- the phy loses DWS sync and the SP state machine transitions to the SP0:OOB_COMINIT state;
- the phy detects the removal or insertion of a SATA port selector;
- the phy sequences to the SATA Spinup Hold state;
- the phy initialization sequence completes (completes SATA speed negotiation);
- the phy receives an initial Register - Device to Host FIS.

Anytime the SMP management client detects a BROADCAST (CHANGE) from a phy with a STP/SATA bridge, the SMP management client should issue a DISCOVER command to determine the ATTACHED DEVICE TYPE, ATTACHED SAS ADDRESS, and the NEGOTIATED PHYSICAL LINK RATE.

If the NEGOTIATED PHYSICAL LINK RATE is 3h, the phy is in the SATA Spinup Hold state, and the SMP management client should issue an SMP PHY CONTROL command with a PHY CONTROL FUNCTION OF HARD RESET or LINK RESET to cause link initialization to happen again - this time bypassing the SATA Spinup Hold state.

After finding the NEGOTIATED PHYSICAL LINK RATE field set to 8h or 9h (indicating that speed negotiation has completed at 1.5 Gbps or 3.0 Gbps, respectively), the SMP management client may issue the SMP REPORT PHY SATA command to see if there's a signature FIS there yet or not.

If the expander doesn't support the SATA SPINUP HOLD state, then the NEGOTIATED PHYSICAL LINK rate field will sequence all the way to 8h or 9h - indicating speed negotiation has completed and the link is ready.

The "ATTACHED SATA DEVICE" bit in the DISCOVER response byte 15 indicates if the attached device is a SATA device - determined by having transitioned to the SATA speed negotiation states rather than to the SAS speed negotiation states (which it did because it got a COMSAS timeout). If the initial FIS is not yet present, the SMP management client should wait for the next BROADCAST (CHANGE) from the STP/SATA bridge indicating receipt of the initial FIS, and then reissue the DISCOVER and SMP REPORT PHY SATA command.

In some hot-plug cases, a SATA device may not send an initial Register - Device to Host FIS (due to timing where the device does not see the initial COMINIT). In this case the STP/SATA bridge will complete speed negotiation, but will not receive an initial FIS. If this occurs, the SMP management client should time-out after a vendor-specific interval of time and then, after sending a SMP REPORT PHY SATA command that does not report a received initial FIS, the SMP management client should send an SMP PHY CONTROL command specifying a HARD RESET or LINK RESET. This will send a COMINIT to the SATA device, and will cause the SATA device to send the initial Register - Device to Host FIS following link initialization.

So - at anytime following the link initialization sequence, it is possible via DISCOVER and REPORT PHY SATA SMP commands to determine:

If there is a device attached

Whether the device is SATA or SAS

Whether the SP state machine is in the SPINUP HOLD state

Whether the SATA device has returned an initial REGISTER DEVICE TO HOST FIS

Using this information, it should be possible for the SMP management client to force the device to transmit the initial FIS if need be through sending an SMP PHY CONTROL command with a function code specifying HARD RESET or LINK RESET.
