Change all references to ATA/ATAPI-7 to ATA8-ACS, ATA8-APT, ATA8-AST, or ATA8-AAM.
DONE: Create notes for each change and record in LB comment resolution.
Per SAT LB meeting 3/20/06
Will set completed on individual instances as they are done.

CONFIRM: with Kevin marks after completing changes. Need clarification. SAT does address block-storage devices. Don't want to preclude other device types in future versions of the standard though.
Curtis [WD] echoes this thought and suggests deleting clause-13. AR: Confirm with Kevin Marks.

Comment: Global:
5. The standard, in parts, seem to imply (with shall) that only direct-access block devices are supported, but other areas leave it open. Example is the mode page block descriptor section.
DISCUSS suggested resolution: Global - find everywhere in main clauses allowing flexibility for non block devices and restrict it to block devices (i.e., specify field values that have to apply for block devices).
TO DO: create comments and review with SAT WG.
RESOLUTION: See 06-216

American National Standards for Information Systems -

SCSI / ATA Translation (SAT)

Secretariat
National Committee for Information Technology Standards

Approved mm dd yy

American National Standards Institute, Inc.

Abstract

2 This standard specifies elements of translation between SCSI and ATA protocol for storage controllers that emulate SCSI capabilities using ATA/ATAPI devices, and a translation layer to provide capabilities defined by other SCSI standards, particularly those defined in SCSI Block Commands (SBC-2) and SCSI Primary Commands (SPC-3). For the purposes of this standard, ATA/ATAPI device capabilities are defined by ATA/ATAPI-7.

Accepted per Feb 28 WG
This standard specifies a translation layer between SCSI and ATA protocols. This translation layer is used by storage controllers to emulate objects in a SCSI logical unit using an ATA device, providing capabilities defined by SCSI standards (e.g., the SCSI Block Commands (SBC-2) and SCSI Primary Commands (SPC-3) standards). For the purposes of this standard, ATA/ATAPI device capabilities are defined by ATA/ATAPI-7.

RESOLUTION: change to
"This standard specifies a translation layer between SCSI and ATA protocols. This translation layer is used by storage controllers to emulate objects in a SCSI logical unit using an ATA device, providing capabilities defined by SCSI standards (e.g., the SCSI Block Commands (SBC-2) and SCSI Primary Commands (SPC-3) standards). For the purposes of this standard, ATA device capabilities are defined by ATA8-AAM, ATA8-ACS, ATA8-AST, and ATA8-APT."

American National Standard

Approval of an American National Standard requires verification by ANSI that the requirements for due process, consensus, and other criteria for approval have been met by the standards developer. Consensus is established when, in the judgment of the ANSI Board of Standards Review, substantial agreement has been reached by directly and materially affected interests. Substantial agreement means much more than a simple majority, but not necessarily unanimity. Consensus requires that all views and objections be considered and that effort be made toward their resolution.

The use of American National Standards is completely voluntary; their existence does not in any respect preclude anyone, whether he or she has approved the standards or not, from manufacturing, marketing, purchasing, or using products, processes, or procedures not confirming to the standards.

The American National Standards Institute does not develop standards and shall in no circumstances give interpretation on any American National Standard in the name of the American National Standards Institute. Requests for interpretations should be addressed to the secretariat or sponsor whose name appears on the title page of this standard.

CAUTION NOTICE: This American National Standard may be revised or withdrawn at any time. The procedures of the American National Standards Institute require that action be taken periodically to reaffirm, revise, or withdraw this standard. Purchasers of American National Standards may receive current information on all standards by calling or writing the American National Standards Institute.

CAUTION: The developers of this standard have requested that holders of patents that may be required for the implementation of the standard, disclose such patents to the publisher. However, neither the developers nor the publisher have undertaken a patent search in order to identify which, if any, patents may apply to this standard. As of the date of publication of this standard, following calls for the identification of patents that may be required for the implementation of the standard, notice of one or more claims has been received. By publication of this standard, no position is taken with respect to the validity of this claim or of any rights in connection therewith. The known patent holder(s) has (have), however, filed a statement of willingness to grant a license under these rights on reasonable and nondiscriminatory terms and conditions to applicants desiring to obtain such a license. Details may be obtained from the publisher. No further patent search is conducted by the developer or the publisher in respect to any standard it processes. No representation is made or implied that licenses are not required to avoid infringement in the use of this standard.

Revision Information

R.x T10/04-136r0 (27 June 2004)

First prerelease of SAT. Substantive content copied from T10/04-136r0, “SCSI to ATA Command Translations”, written by Samantha Ranaweera and Stephen Johnson of LSI Logic Corporation.

R.0 SAT-r00 (26 August 2004)

Incorporated feedback from previous SAT SG and WG meetings regarding scope, elements covered, command queuing and task management.

R.1 SAT-r01 (22 September 2004)

Incorporated changes per the August 2004 SAT WG (04-276r0), the September 2004 SAT WG (04-286r0), and the September 2004 T10 plenary (04-289r0):

a) 04-260r2 SAT Command Mapping Format (Curtis Stevens, WD),
b) 04-219r3 SAT SPC-3 ATA Information VPD page (Rob Elliott and Wayne Bellamy, HP).

Incorporated miscellaneous changes identified during review of the SAT working draft at the August and September SAT working groups.

R.1a SAT-r01a (28 November 2004)

Incorporated changes identified during review of the draft from the October 14, 2004 SAT WG Teleconference, the October 22 SAT WG meeting, and the November 9 SAT WG meeting.

a) Changed the DESC bit in the REQUEST SENSE CDB from “U” to “E” specifying that it is implemented according to SAM-3.
b) Allowed for READ CAPACITY command to return less than the maximum ATA medium capacity.
c) Added optional support for PERSISTENT RESERVE IN and PERSISTENT RESERVE OUT.
d) Allowed the SATL to support the descriptor format sense data.
e) Extended WRITE BUFFER to support download microcode and download microcode and save modes.
f) Various changes to FORMAT UNIT including referencing SBC-2 for FMTPINFO, added optional support for device certification (DCRT = 0 caused READ VERIFY / WRITE of media), and added optional support for initialization pattern (IP = 1 causes WRITE commands to establish media initialization per SBC-2). Clarified conditions for returning immediate completion status.
g) Referred to SBC-2 for the handling of commands received while a FORMAT UNIT is in progress.
h) Added SATA documents to normative references: “Serial ATA 1.0 Design Guides”, “Serial ATA II: Extensions to Serial ATA 1.0a. Revision 1.2”, and “Serial ATA II: Port Selector. Revision 1.0. 28 July 2003“.
i) Added the terms, “SATA IIe” and “SATA IIps” to the glossary.
j) Added criteria for and use of READ DMA QUEUED, READ DMA QUEUED EXTENDED, and READ FPDMA QUEUED commands in the translation of SCSI READ commands.
k) Added support of FUA for READ(10,12) commands using either READ FPDMA QUEUED or READ VERIFY followed by read.
l) Added subclause 5.2 to explain UNIT ATTENTION handling.
m) Removed references to Data Protection from READ (10) and READ (12) and added reference to SBC-2 in place.
n) Modified READ CAPACITY to accommodate ATA logical sector sizes other than 512-bytes in a vendor-specific manner, and to allow reporting a SCSI returned logical block address less than the capacity of the attached ATA device.
o) Added a subclause for REASSIGN BLOCKS with an editor’s note that a proposal is needed to detail the translation. The note suggests using a READ VERIFY READ, WRITE, READ VERIFY type sequence to force the ATA disk to assign an alternate block.
p) Modified START STOP UNIT translation to use STANDBY, IDLE, and READ VERIFY commands, and to define use of the ATA Standby timer to emulate the SCSI STANDBY CONDITION TIMER.
q) Added criteria for and use of WRITE DMA QUEUED, WRITE DMA QUEUED EXTENDED, and WRITE FPDMA QUEUED commands in the translation of SCSI WRITE commands.

R.2 SAT-r02 (18 February 2005)

Incorporated changes identified during review of the draft from SAT WG meetings and teleconferences December 2, 2004; December 16-17, 2004; January 18, 2004; and February 8, 2004; and integrated proposals as follows:

a) Integrated 04-218r8: SAT Inquiry contents
b) Added notation conventions to represent non-printable and white space ASCII characters in strings.
c) Added FPDMA and NCQ to the acronyms list, added corresponding glossary entries.
d) Moved “ATA” and “ATAPI” to the acronym list and replaced the glossary entries with the spelled-out versions.
e) Added SATL to the acronyms list and replaced the glossary entry with “SCSI / ATA translation layer”.
f) Added the definition of “one” to the glossary.
g) Changed the definition of ATA domain to refer to “an ATA host” rather than multiple ATA hosts. Added an editor’s note to highlight that final resolution to the issue is still pending.
h) Changed all occurrences of “ATA device” to “non-packet device” to be consistent with the definition and usage throughout the document.
i) Modified the definition of hard reset to use the definition in SAM-3.
j) Added a paragraph to the “General” clause (clause-4) to say anything optional in SPC-3 or SBC-2 is optional in SAT, and any optional behaviors implemented shall be implemented per SAT.
k) In FORMAT UNIT, specified that DEFECT LIST FORMATS of 000b (mandatory) and 110b (vendor-specific) mean the DEFECT LIST LENGTH is zero, and other values terminate the command with error.
l) Fixed the OPERATION CODE description in the FORMAT CDB to specify no commands are issued with no defect header or DCRT = 1, and referred to a sub-clause if DCRT = 0.
m) Added an editor’s note regarding use of PIO commands in READ translation (reminder for the WG to discuss the issue again).
n) Changed “Overlapped” features to “Queued” features in the READ command summary (table 40) because Overlapped commands are being obsoleted.
o) Added an editor’s note in REASSIGN BLOCKS that there is a proposal in process (listed in 04-391) to formally define the REASSIGN BLOCKS command.
p) In the Start Stop Unit command operation code description, replaced the list of ATA commands issued with a paragraph reference.
q) In the START STOP UNIT command, added a parenthetical statement that the need to issue an ATA READ VERIFY command is only needed if the device is configured to startup in STANDBY mode, and otherwise the device goes to the ACTIVE state.
r) Made miscellaneous editorial changes and added editor’s comments where more clarification may be needed.
s) Corrected the sense of the IMMED bit in the description of START STOP UNIT when POWER CONDITION, LOEJ and START are all zero.

R.3 SAT-r03 (8 April 2005)

Incorporated changes identified during review of the draft from SAT WG meetings and teleconferences February 24-25 2005,... as follows:

a) Incorporated 04-262r8: ATA Command Pass-Through [Stevens];
b) Incorporated 04-397r3: Control Mode Page Proposal [Overby];
c) Added several terms to the definitions;
d) Added several items to the acronyms list which already had corresponding definitions in the glossary;
e) Deleted the placeholder subclause 7.2 SCSI ATA Passthrough command as subclause 13.2 has already been added for this command;
f) Deleted text in the subclause defining conventions for character strings (3.4.3) that describes the representation of non-printable ASCII characters; and replaced it with a statement on using the ‘¬’ character to represent a space in a string;
g) Replace the word “execute” (and variants) with the word “process” (or appropriate variant) wherever it refers to the processing of a command or task;
h) Qualified text in the clause 7.1, Translated and emulated commands, to clarify that optional commands in SPC-3 and SBC-2 are optional in SAT, and that the translation for unlisted commands is vendor-specific;

This page contains no comments

i) Added Table-4 commands summary entries for 16-byte block access commands, READ (16), READ CAPACITY (16), SYNCHRONIZE CACHE (16), VERIFY (16), WRITE (16), WRITE AND VERIFY (16), and WRITE SAME (16) - appropriate clauses will be entered when proposals are submitted;
j) Added Table-4 commands summary entries for VERIFY (12), WRITE AND VERIFY (12), and WRITE SAME (10) commands - appropriate clauses will be entered when proposals are submitted;
k) Added the FLUSH CACHE EXT command as one of the ATA commands used to implement the SCSI SYNCHRONIZE CACHE command;
l) Modified the description of the DEXCPT field in the Informational Exceptions Control Mode Page (table 68);
m) Clarified the description of the REQUEST SENSE command; and
n) Made miscellaneous editorial changes.

R.4 SAT-r04 (12 May 2005)

Incorporated SAT WG proposals approved in the May plenary as follows:

a) 05-109r0 REQUEST SENSE Correction Proposal [Overby] (with notes from draft review 3 May 2005); and
b) 05-137r1 Standard INQUIRY - PRODUCT REVISION LEVEL [Bellamy].

Incorporated changes identified during review of the draft from SAT WG meetings and teleconferences in April and May 2005 as follows:

a) deleted template text from clause 10;
b) added autosense to definitions;
c) made “should” and “shall” keyword definitions consistent with SAS;
d) clarified definition of the “unspecified” keyword;
e) simplified Table-1 to better show the use of the “implemented”, “emulated”, and “unspecified” keywords;
f) deleted text and editor’s note in 8.3.1 MODE SELECT (6) command overview that discussed sharing mode page header and block descriptor;
g) made significant changes to WRITE BUFFER download microcode modes - supporting modes 5h, 6h, and 7h, and specifying that the SATL issues MICROCODE DOWNLOAD only on the first WRITE BUFFER, and continues the data transfer with subsequent WRITE BUFFER commands;
h) Removed the “Is NCQ enabled”, “Is Queuing enabled”, and “and SCSI OP Codes” columns in the write command summary table 58, modified the last two rows and table footnotes to clarify the use of NCQ and the non-packet device Overlapped feature set;
i) Clarified the transfer length for the WRITE (12) command, adding that multiple ATA commands may be sent to satisfy the specified transfer length;
j) Deleted the Format Device and Rigid Disk Geometry pages from the list of commonly used SCSI mode pages in Table 62 (because SBC-2 made them obsolete);
k) Moved the INQUIRY VPD pages subclause from the primary commands clause (8) to the device parameters clause (10), and modified the heading levels to match;
l) Added a glossary entry for ATA queued commands and used it in the commands overview clause (7) in the description of the requirement for a SATL to queue internally any commands that are not ATA queued commands;
m) Miscellaneous editorial changes; and
n) Added table-50 listing the mode page translations defined in the SAT standard.

R.5 SAT-r05 (8 August 2005)

Incorporated SAT WG proposals approved in the July 2005 plenary as follows:

a) 05-136r2 SAT - REASSIGN BLOCKS command [Bellamy]
b) 05-177r2 Write Same Translation [Stevens]
c) 05-239r1 Caching mode page [Bellamy]
d) 05-229r0 Remove Persistent Reservation Commands [Lohmeyer]
e) 05-227r2 READ MEDIA SERIAL NUMBER proposal [Overby]
f) 05-233r3 ATA to SCSI Errors [Bellamy]
g) 05-238r2 Informational Exceptions Mode Page [Bellamy]
h) 05-241r2 Read-Write Error Recovery Page [Bellamy]

This page contains no comments

i) 05-280r1 SAT: COMRESET Notification [Overby]
j) 05-253r1 PACKET / non-PACKET Device Definition [Overby]

Made the following changes based on notes taken during review of the working draft:

a) Clarified text in subclause 11.3 discussing host notification of SMART conditions, and in particular, changed the returned additional sense code from GENERAL HARDWARE FAILURE (specified as 05h/10h which isn't defined in SPC-3), to HARDWARE IMPENDING FAILURE GENERAL HARD DRIVE FAILURE.
b) Added a "Changeable" column to the table describing the Caching mode page for consistency with 05-238r2.
c) Added a "mantra" statement to the Scope stating that SAT is, as much as possible, consistent with SAM-3, SPC-3, and SBC-2.
d) Added the T13 technical report, 1701DT Smart Command Transfer (SCT), to the list of normative references to support the WRITE SAME command translation (05-177r2).
e) Under 6.3.1 ABORT TASK, deleted unordered list item (e) which attempted to define a response to a failed attempt by the SATL to abort a command. But SCSI defines no such response.
f) Added a statement at the beginning of the scope subclause (copied from SPC-3) to allow flexibility in implementation so long as it satisfies the requirement for interoperability.
g) Deleted subclause 8.2.1 describing the page code under the LOG SENSE command and replaced text in the page code field in the command overview table with a reference to subclause 10.2 LOG PAGES.
h) Removed WRITE BUFFER download microcode modes 4, 6, and 7 from table-30 and accompanying text, and added a table footnote explaining why only mode-5 is defined by SAT with a suggestion to use of ATA PASS-THROUGH; as was recommended by a SAT WG vote on July 12, 2005.
i) Modified the list of common mode pages in subclause 10.1.3 to show all pages except the Read-Write Error Recovery, Caching, and Informational Exceptions Control mode pages as SATType "U" (unspecified) since there are no proposals yet to define translations for any of the other mode pages.
j) Removed all instances of "See SPC-3" from tables showing translations marked as SATType "U", and having no additional description provided. This was per a straw-poll vote taken at the July 12, 2005 SAT WG.
k) Modified several definitions in subclause 3.1.
l) Deleted several definitions in subclause 3.1 that are not referenced anywhere in the body of the standard.
m) Moved the definitions of "emulated", "implemented", and "unspecified" from the keywords subclause into the general definitions subclause, and modified the definitions to reflect that they are not keywords and for clarification identified in the July 2005 SAT WG.
n) Modified table 4 in the commands summary (clause 7) to indicate ATA command mnemonics instead of opcodes and to make it consistent with command descriptions in other subclauses.
o) Added ATA PASS-THROUGH commands to clause-7, summary of SAT command mappings.
p) General cleanup of tables, references, and editorial changes.
q) Removed the subclause describing VERIFY (6) since the command is not defined for block storage devices.

R.6 SAT-r06 (21 September 2005)

Incorporated SAT WG proposals approved in the September 2005 plenary as follows:

a) 05-142r4 SAT - LOG SENSE command and SMART [Bellamy]
b) 05-247r3 SAT: Add 16-byte CDBs and PIO modes [Sheffield]
c) 05-226r3 SAT, START STOP UNIT command mapping [Evans]
d) 05-108r3 SAT Task Management [Johnson]
e) Incorporated editorial changes from the September 15, 2005 SAT editing session.

This page contains no comments

R.7 SAT-r07 (17 November 2005)

Incorporated SAT WG proposals approved in the November 2005 plenary as follows:

a) 05-364r1 SAT comparison of SCSI and ATA queuing [Weber];
b) 05-359r2 SAT: Control mode page translation [Overby];
c) 05-385r1 SAT - MOST RECENT TEMPERATURE READING for Informational Exceptions Log Page [Bellamy].

Made miscellaneous other modifications resulting from draft review and editing sessions, including:

a) Modified the IP disclaimer to account for a letter of assurance T10 received regarding a SAT-related patent;
b) Extended definition of ATA hard reset to include parallel-ATA resets;
c) Added logical block address (LBA) to definitions and acronyms;
d) Removed REPORT LUNS subclause;
e) Added conventions for terms referenced from ATA standards;
f) Added a subclause with a brief description of the FOV bit in the defect list header;
g) Added a table to decode defect list header bit combinations;
h) Reformatted READ command and WRITE command subclauses so that common information is together at the beginning of each command type;
i) Reformatted table decoding WRITE BUFFER CDB fields to pull IMMED bit handling out into a separate subclause;
j) Added a table to show the settings of MWDMA bits in the Parallel ATA Control mode page;
k) Made many editorial changes resulting from review of the working draft and editing sessions.

R.7a SAT-r07a (3 January 2006) - provisional from 12 December 2005 WG meeting

Incorporated (provisionally) SAT WG proposals recommended to the T10 plenary in the 12 December 2005 WG meeting, including:

a) 05-245r4: SAT - SEND DIAGNOSTIC command and Self-Test Results [Bellamy];
b) 06-001r1: SAT - I_T Nexus Loss [Sheffield];
c) 06-020r1: Clarify error handling for PIO data-in commands [Elliott/Weber]; and
d) 06-022r0 Rewrite TEST UNIT READY rewrite [Sheffield].

Incorporated changes identified during SAT draft review:

a) Removed the reserved field from the table describing the MODE SENSE Block Descriptor fields;
b) Modified footnote (b) in table-33 Read and write type command translation selection to identify the CHECK CONDITION status the SATL should return if it doesn't support 48-bit addressing and receives a command requesting access to an LBA beyond (2^{28}-1);
c) Simplified the text in 5.2 explaining unit attention conditions according to draft review;
d) made various editorial changes; and
e) removed all but one editor's note (a reminder to update normative references - i.e., check SATA references).

Foreword

This foreword is not part of American National Standard NCITS.***:200x.

This standard provides a common set of definitions and requirements to establish common behavior among implementations that emulate SCSI device behavior through the combined use of ATA devices and a SCSI / ATA translation layer (SATL). The SATL may reside in a host-based driver, or it may reside in a separate component (e.g., a host bus adapter or external controller) with a separate processing unit to effect the translation. A SATL and ATA device combination may provide a functional subset of common SCSI capabilities. There is also a range of optional emulated SCSI capabilities that may be supported or not, depending on the capabilities of the SATL.

This standard defines SATL capabilities in terms of SCSI capabilities as defined by the applicable SCSI standards and working drafts, and defines the elements and use of ATA protocol to provide those SCSI capabilities and services in a consistent manner among SAT implementations that implement according to this standard.

With any technical document there may arise questions of interpretation as new products are implemented. INCITS has established procedures to issue technical opinions concerning the standards developed by INCITS. These procedures may result in SCSI Technical Information Bulletins being published by INCITS.

These Bulletins, while reflecting the opinion of the Technical Committee that developed the standard, are intended solely as supplementary information to other users of the standard. This standard, ANSI NCITS.***:200x, as approved through the publication and voting procedures of the American National Standards Institute, is not altered by these bulletins. Any subsequent revision to this standard may or may not reflect the contents of these Technical Information Bulletins.

Current INCITS practice is to make Technical Information Bulletins available through:

Global EngineeringTelephone: 303-792-2181 or

15 Inverness Way East 800-854-7179

Englewood, CO 80112-5704

Facsimile: 303-792-2192

Requests for interpretation, suggestions for improvement and addenda, or defect reports are welcome. They should be sent to the INCITS Secretariat, National Committee for Information Technology Standards, Information Technology Institute, 1250 Eye Street, NW, Suite 200, Washington, DC 20005-3922.

This standard was processed and approved for submittal to ANSI by the InterNational Committee for Information Technology Standards (INCITS). Committee approval of the standard does not necessarily imply that all committee members voted for approval. At the time of it approved this standard, INCITS had the following members:

<<Insert INCITS member list>>

Technical Committee T10 on Lower Level Interfaces, which developed and reviewed this standard, had the following members:

Introduction

The SCSI / ATA Translation (SAT) standard is divided into the following clauses:

Clause 1 defines the scope of this standard.
Clause 2 enumerates the normative references that apply to this standard.
Clause 3 describes the definitions, symbols, abbreviations, and notation conventions used in this standard.
Clause 4 describes the general framework for defining elements of translation between SCSI and ATA protocol.
Clause 5 describes elements of SCSI/ATA translation that relate to the SCSI architecture model.
Clause 6 describes the mapping of task management functions in the SATL layer.
Clause 7 provide a summary of SCSI commands mapped to ATA in this standard.
Clause 8 describes the mapping between SCSI Primary Commands and ATA protocol.
Clause 9 describes the mapping between SCSI Block Commands and ATA protocol.
Clause 10 describes the mapping of mode page and log page information to selected ATA protocol elements.
Clause 11 describes the mapping of SMART capabilities from ATA to SCSI.
Clause 12 describes error reporting and sense data conventions for SCSI/ATA translation.
Clause 13 describes SCSI commands, mode pages and log pages to support SCSI / ATA Translation.
Clause 14 describes SCSI / ATA Translation elements specific to ATAPI devices.
Appendix A provides informative text to assist in the implementation of SCSI/ATA translation.

American National Standard INCITS.*:200x**

American National Standard for Information Systems - Information Technology - SCSI / ATA Translation

1 Scope

The set of SCSI standards specifies the interfaces, functions, and operations necessary to ensure interoperability between conforming SCSI implementations. This standard is a functional description. Conforming implementations may employ any design technique that does not violate interoperability.

This standard defines the protocol requirements of the SCSI / ATA Translation Layer (SATL) to allow conforming SCSI / ATA translating elements to interoperate with ~~various~~ ATA devices and ~~various~~ SCSI application layers. The SATL covers the range of implementations that use ATA ~~class~~ devices to emulate the behavior of SCSI devices as viewed by the SCSI application layer. The primary focus of this standard is to define SCSI / ATA translation for an ATA device (see 3.1.4).

Where possible, this standard defines SCSI / ATA translation in a manner that is consistent with SAM-3, SPC-3, and SBC-2 standards. In some instances, the defined function of an attached ATA device is ~~fundamentally~~ different from corresponding functions defined for SCSI target devices (e.g., ATA/ATAPI-7 provides no explicit method to disable an ATA device's read cache). The translation defined in this standard, in such cases, may not be ~~entirely~~ consistent with other SCSI standards. However, in such cases, this standard specifies the expected behavior, and in what manner it is inconsistent with the behavior specified in other SCSI standards.

The objectives of the SATL are:

a) to provide host computers with device independence with respect to the ATA/ATAPI devices that have storage capacity, and with respect to various implementations of the translation layer used to emulate the behavior of SCSI devices;
b) to define common elements representing a subset of the capabilities ~~normally~~ available in SCSI devices that apply to SCSI / ATA Translation implementations;
c) to define common methods to manage aspects of ATA/ATAPI devices that do not map ~~directly~~ to previously defined elements of SCSI, with provision made for the addition of special features and functions; and
d) to provide consistent means for discovery and control of optional SCSI features that may or may not be emulated in SCSI/ATA translator implementations by specifying handling of specific transport elements as required to represent a mixed-domain topology in a manner consistent with management of devices in a SCSI domain.

Figure 1 shows the general structure of SCSI standards. Figure 1 is not intended to imply a relationship such as a hierarchy, protocol stack, or system architecture.

"constituent" or just delete?
1
(global)

"attached ATA device" is not a good phrase, since in SAS attached means directly attached. The SAT in a SAS HBA, however, can be many expanders away from the ATA device.

Change "attached" globally to something like "mapped" or "translated"

Resolution: Replace "attached" with "constituent" (since the ATA device is one element used in the emulation of a SCSI target device), or just delete the word "attached" everywhere.

RESOLUTION: Delete the word "attached" from "attached ATA device", per Feb 28 WG.

American National Standard INCITS.*:200x**

American National Standard for Information Systems - Information Technology - SCSI / ATA Translation

1 Scope

The set of SCSI standards specifies the interfaces, functions, and operations necessary to ensure interoperability between conforming SCSI implementations. This standard is a functional description. Conforming implementations may employ any design technique that does not violate interoperability.

This standard defines the protocol requirements of the SCSI / ATA Translation Layer (SATL) to allow conforming SCSI / ATA translating elements to interoperate with ~~various~~ ATA devices and ~~various~~ SCSI application layers. The SATL covers the range of implementations that use ATA ~~class~~ devices to emulate the behavior of SCSI devices as viewed by the SCSI application layer. The primary focus of this standard is to define SCSI / ATA translation for an ATA device (see 3.1.4).

Where possible, this standard defines SCSI / ATA translation in a manner that is consistent with SAM-3, SPC-3, and SBC-2 standards. In some instances, the defined function of an attached ATA device is ~~fundamentally~~ different from corresponding functions defined for SCSI target devices (e.g., [8] ATA/ATAPI-7 provides no explicit method [9] to disable an ATA device's read cache). The translation defined in this standard, in such cases, may not be [10] ~~direly~~ consistent with other SCSI standards. However, in such cases, this standard specifies the expected behavior, and in what manner it is inconsistent with the behavior specified in other SCSI standards.

The objectives of the SATL are:

a) to provide host computers with device independence with respect to the [11] ATA/ATAPI devices that have storage capacity, and with respect to various implementations of the translation layer [12] used to emulate the behavior of SCSI devices;
b) to define common elements representing a subset of the capabilities [13] ~~formally~~ available in SCSI devices that apply to SCSI / ATA Translation implementations;
c) to define common methods to manage aspects of ATA/ATAPI devices that do not map ~~directly~~ to previously defined elements of SCSI, with provision made for the addition of special features and functions; and
d) to provide consistent means for discovery and control of optional SCSI features that may or may not be emulated in SCSI/ATA translator implementations by specifying handling of specific transport elements as required to represent a mixed-domain topology in a manner consistent with management of devices in a SCSI domain.

Figure 1 shows the general structure of SCSI standards. Figure 1 is not intended to imply a relationship such as a hierarchy, protocol stack, or system architecture.

American National Standard for Information Systems - Information Technology - SCSI / ATA Translation

1 Scope

The set of SCSI standards specifies the interfaces, functions, and operations necessary to ensure interoperability between conforming SCSI implementations. This standard is a functional description. Conforming implementations may employ any design technique that does not violate interoperability.

This standard defines the protocol requirements of the SCSI / ATA Translation Layer (SATL) to allow conforming SCSI / ATA translating elements to interoperate with ~~various~~ ATA devices and ~~various~~ SCSI application layers. The SATL covers the range of implementations that use ATA ~~class~~ devices to emulate the behavior of SCSI devices as viewed by the SCSI application layer. The primary focus of this standard is to define SCSI / ATA translation for an ATA device (see 3.1.4).

Where possible, this standard defines SCSI / ATA translation in a manner that is consistent with SAM-3, SPC-3, and SBC-2 standards. In some instances, the defined function of an attached ATA device is ~~fundamentally~~ different from corresponding functions defined for SCSI target devices (e.g., ATA/ATAPI-7 provides no explicit method to disable an ATA device's read cache). The translation defined in this standard, in such cases, may not be ~~entirely~~ consistent with other SCSI standards. However, in such cases, this standard specifies the expected behavior, and in what manner it is inconsistent with the behavior specified in other SCSI standards.

The objectives of the SATL are:

a) to provide host computers with device independence with respect to the ATA/ATAPI devices that have storage capacity, and with respect to various implementations of the translation layer used to emulate the behavior of SCSI devices;
b) to define common elements representing a subset of the capabilities ~~normally~~ available in SCSI devices that apply to SCSI / ATA Translation implementations;
c) to define common methods to manage aspects of [15] ATA/ATAPI devices that do not map [14] ~~ectly~~ to previously defined elements of SCSI, with provision made for the addition of special features and functions; and
d) [16] provide consistent means for discovery and control of optional SCSI features that may or may not be emulated in SCSI/ATA translator implementations by specifying handling of specific transport elements as required to represent a mixed-domain topology in a manner consistent with management of devices in a SCSI domain.

Figure 1 shows the general structure of SCSI standards. Figure 1 is not intended to imply a relationship such as a hierarchy, protocol stack, or system architecture.

2 Normative References

~~Editor's Note 1: This list shall be updated as required.~~

2.1 Normative references

The following standards contain provisions that, by reference in the text, constitute provisions of this standard. At the time of publication, the editions indicated were valid. All standards are subject to revision, and parties to agreements based on this standard are encouraged to investigate the possibility of applying the most recent editions of the standards listed below.

Copies of the following documents may be obtained from ANSI: approved ANSI standards, approved and draft international and regional standards (ISO, IEC, CEN/CENELEC, ITUT), and approved and draft foreign standards (including BSI, JIS, and DIN). For further information, contact ANSI Customer Service Department at 212-642-4900 (phone), 212-302-1286 (fax) or via the World Wide Web at http://www.ansi.org.

Additional availability contact information is provided below as needed.

2.2 Approved references

~~ISO/IEC 14776-971, *AT Attachment - 7 with Packet Interface (ATA/ATAPI-7)* [ANSI INCITS 397-2005]~~

3 Definitions, symbols, abbreviations, and conventions

3.1 Definitions

3.1.1 additional sense code: A combination of the ADDITIONAL SENSE CODE and ADDITIONAL SENSE CODE QUALIFIER fields in the sense data. A detailed definition of sense data may be found in SPC-3.

3.1.2 application client: An object that is the source of SCSI commands. Further definition of an application client is found in SAM-3.

~~**3.1.3 AT Attachment (ATA):** A standard for the attachment of storage devices to hosts. See ATA/ATAPI-7 V1.~~

3.1.4 ATA device: A device implementing the general feature set, and does not implement the ~~packet~~ feature set, as described in ATA/ATAPI-7 (see 2.2).

~~**3.1.5 ATA/ATAPI device:** ATA/ATAPI-7 device (see 3.1.6).~~

~~**3.1.6 ATA/ATAPI-7 device:** A device that complies with ATA/ATAPI-7.~~

3.1.7 ATA domain: An I/O system consisting of ~~an ATA host~~s and ATA/ATAPI devices that communicate with one another by means of a service delivery subsystem.

3.1.8 ATA flush command: A FLUSH CACHE or FLUSH CACHE EXT command defined in ATA/ATAPI-7.

3.1.9 ATA hard reset: For a SATA device, an action in response to a reset event (COMRESET ~~or power on reset~~) in which the SATA Phy state machine transitions to the initial state (see ATA8-AST). For a PATA device, assertion of the RESET- signal (Hardware reset) by an ATA host to reset the attached ATA device (See ATA8-APT).

3.1.10 ATA host: A host device that originates requests to be processed by an ATA/ATAPI device.

3.1.11 ATA LBA: ~~.~~If the attached ATA device is a PATA device, this is the set of registers comprised of the LBA High, LBA Mid, and LBA Low registers (i.e., inclusive of both previous and current instances of those registers when 48-bit addressing is used) in the ATA Command Block registers. If the attached ATA device is a SATA device, this is the set of fields in the SATA Command FIS comprised if the LBA Low, LBA Mid, LBA High, LBA Low (ext), LBA Mid (ext), and LBA High (ext) fields (see ATA/ATAPI-7).

3.1.12 AT Attachment Packet Interface (ATAPI): An element of the ATA specification that defines a Packet Command feature set that provides the capability to pass-through SCSI-type commands encapsulated through an ATA transport.

3.1.13 ATAPI device: A device implementing the ~~packet feature~~ set as described in ATA/ATAPI-7.

3.1.14 ATA queued commands: Queued read and write commands issued to an ATA device (see 3.1.4) that supports the Overlapped feature set of ATA/ATAPI-7 or the native command queuing (see 3.1.45) feature of SATA 2.5 (see 3.1.59).

3.1.15 ATA read command: One of the following ATA commands: READ DMA, READ DMA EXT, READ DMA QUEUED, READ DMA QUEUED EXT, READ MULTIPLE, READ MULTIPLE EXT, READ SECTOR(S), or READ SECTOR(S) EXT defined in ATA/ATAPI-7; or READ FPDMA QUEUED defined in SATA 2.5.

3.1.16 ATA Sector Count: If the attached ATA device is a PATA device this is the Sector Count register (i.e., inclusive of both previous and current instances of the register when 48-bit addressing is used). If the attached device is a SATA device this is the Sector Count and Sector Count (ext) fields in a SATA Command FIS.

3.1 Definitions

3.1.1 additional sense code: A combination of the ADDITIONAL SENSE CODE and ADDITIONAL SENSE CODE QUALIFIER fields in the sense data. A detailed definition of sense data may be found in SPC-3.

3.1.2 application client: An object that is the source of SCSI commands. Further definition of an application client is found in SAM-3.

~~**3.1.3 AT Attachment (ATA):** A standard for the attachment of storage devices to hosts. See ATA/ATAPI-7~~.

3.1.4 ATA device: A device implementing the general feature set, and does not implement the ~~packet~~ feature set, as described in ATA/ATAPI-7 (see 2.2).

~~**3.1.5 ATA/ATAPI device:** ATA/ATAPI-7 device (see 3.1.6).~~

~~**3.1.6 ATA/ATAPI-7 device:** A device that complies with ATA/ATAPI-7.~~

3.1.7 ATA domain: An I/O system consisting of ~~an ATA hosts~~ and ATA/ATAPI devices that communicate with one another by means of a service delivery subsystem.

3.1.8 ATA flush command: A FLUSH CACHE or FLUSH CACHE EXT command defined in ATA/ATAPI-7.

3.1.9 ATA hard reset: For a SATA device, an action in response to a reset event (COMRESET ~~or power on reset~~) in which the SATA Phy state machine transitions to the initial state (see ATA8-AST). For a PATA device, assertion of the RESET- signal (Hardware reset) by an ATA host to reset the attached ATA device (See ATA8-APT).

3.1.10 ATA host: A host device that originates requests to be processed by an ATA/ATAPI device.

3.1.11 ATA LBA: ~~.~~If the attached ATA device is a PATA device, this is the set of registers comprised of the LBA High, LBA Mid, and LBA Low registers (i.e., inclusive of both previous and current instances of those registers when 48-bit addressing is used) in the ATA Command Block registers. If the attached ATA device is a SATA device, this is the set of fields in the SATA Command FIS comprised if the LBA Low, LBA Mid, LBA High, LBA Low (ext), LBA Mid (ext), and LBA High (ext) fields (see ATA/ATAPI-7).

3.1.12 AT Attachment Packet Interface (ATAPI): An element of the ATA specification that defines a Packet Command feature set that provides the capability to pass-through SCSI-type commands encapsulated through an ATA transport.

3.1.13 ATAPI device: A device implementing the ~~packet feature~~ set as described in ATA/ATAPI-7.

3.1.14 ATA queued commands: Queued read and write commands issued to an ATA device (see 3.1.4) that supports the Overlapped feature set of ATA/ATAPI-7 or the native command queuing (see 3.1.45) feature of SATA 2.5 (see 3.1.59).

3.1.15 ATA read command: One of the following ATA commands: READ DMA, READ DMA EXT, READ DMA QUEUED, READ DMA QUEUED EXT, READ MULTIPLE, READ MULTIPLE EXT, READ SECTOR(S), or READ SECTOR(S) EXT defined in ATA/ATAPI-7; or READ FPDMA QUEUED defined in SATA 2.5.

3.1.16 ATA Sector Count: If the attached ATA device is a PATA device this is the Sector Count register (i.e., inclusive of both previous and current instances of the register when 48-bit addressing is used). If the attached device is a SATA device this is the Sector Count and Sector Count (ext) fields in a SATA Command FIS.

3.1.12 AT Attachment Packet Interface (ATAPI): An element of the ATA specification that defines a Packet Command feature set that provides the capability to pass-through SCSI-type commands encapsulated through an ATA transport.

3.1.13 ATAPI device: A device implementing the ~~packet feature~~ set as described in ATA/ATAPI-7.

3.1.14 ATA queued commands: Queued read and write commands issued to an ATA device (see 3.1.4) that supports the Overlapped feature set of ATA/ATAPI-7 or the native command queuing (see 3.1.45) feature of SATA 2.5 (see 3.1.59).

3.1.15 ATA read command: One of the following ATA commands: READ DMA, READ DMA EXT, READ DMA QUEUED, READ DMA QUEUED EXT, READ MULTIPLE, READ MULTIPLE EXT, READ SECTOR(S), or READ SECTOR(S) EXT defined in ATA/ATAPI-7; or READ FPDMA QUEUED defined in SATA 2.5.

3.1.16 ATA Sector Count: If the attached ATA device is a PATA device this is the Sector Count register (i.e., inclusive of both previous and current instances of the register when 48-bit addressing is used). If the attached device is a SATA device this is the Sector Count and Sector Count (ext) fields in a SATA Command FIS.

to
"...consisting of an ATA host and ATA/ATAPI..."

Don't follow argument of a SATA A/A Mux having only one domain.
REASON: Duplicate of MXO comment, and the SATA A/A mux isn't (yet) defined by any standard or public specification.

3 Definitions, symbols, abbreviations, and conventions

3.1 Definitions

3.1.1 additional sense code: A combination of the ADDITIONAL SENSE CODE and ADDITIONAL SENSE CODE QUALIFIER fields in the sense data. A detailed definition of sense data may be found in SPC-3.

3.1.2 application client: An object that is the source of SCSI commands. Further definition of an application client is found in SAM-3.

~~**3.1.3 AT Attachment (ATA):** A standard for the attachment of storage devices to hosts. See ATA/ATAPI-7 V1.~~

3.1.4 ATA device: A device implementing the general feature set, and does not implement the ~~packet~~ feature set, as described in ATA/ATAPI-7 (see 2.2).

~~**3.1.5 ATA/ATAPI device:** ATA/ATAPI-7 device (see 3.1.6).~~

~~**3.1.6 ATA/ATAPI-7 device:** A device that complies with ATA/ATAPI-7.~~

3.1.7 ATA domain: An I/O system consisting of ~~an ATA hosts~~ and ATA/ATAPI devices that communicate with one another by means of a service delivery subsystem.

3.1.8 ATA flush command: A FLUSH CACHE or FLUSH CACHE EXT command defined in ATA/ATAPI-7.

3.1.9 ATA hard reset: For a SATA device, an action in response to a reset event (COMRESET ~~or power on reset~~) in which the SATA Phy state machine transitions to the initial state (see ATA8-AST). For a PATA device, assertion of the -RESET- signal (Hardware reset) by an ATA host to reset the attached ATA device (See ATA8-APT).

3.1.10 ATA host: A host device that originates requests to be processed by an ATA/ATAPI device.

3.1.11 ATA LBA: If the attached ATA device is a PATA device, this is the set of registers comprised of the LBA High, LBA Mid, and LBA Low registers (i.e., inclusive of both previous and current instances of those registers when 48-bit addressing is used) in the ATA Command Block registers. If the attached ATA device is a SATA device, this is the set of fields in the SATA Command FIS comprised if the LBA Low, LBA Mid, LBA High, LBA Low (ext), LBA Mid (ext), and LBA High (ext) fields (see ATA/ATAPI-7).

3.1.12 AT Attachment Packet Interface (ATAPI): An element of the ATA specification that defines a Packet Command feature set that provides the capability to pass-through SCSI-type commands encapsulated through an ATA transport.

3.1.13 ATAPI device: A device implementing the ~~packet feature~~ set as described in ATA/ATAPI-7.

3.1.14 ATA queued commands: Queued read and write commands issued to an ATA device (see 3.1.4) that supports the Overlapped feature set of ATA/ATAPI-7 or the native command queuing (see 3.1.45) feature of SATA 2.5 (see 3.1.59).

3.1.15 ATA read command: One of the following ATA commands: READ DMA, READ DMA EXT, READ DMA QUEUED, READ DMA QUEUED EXT, READ MULTIPLE, READ MULTIPLE EXT, READ SECTOR(S), or READ SECTOR(S) EXT defined in ATA/ATAPI-7; or READ FPDMA QUEUED defined in SATA 2.5.

3.1.16 ATA Sector Count: If the attached ATA device is a PATA device this is the Sector Count register (i.e., inclusive of both previous and current instances of the register when 48-bit addressing is used). If the attached device is a SATA device this is the Sector Count and Sector Count (ext) fields in a SATA Command FIS.

3.1.16 ATA Sector Count: change the definition to, "For a PATA device, the ATA Sector Count is contained in the set of registers comprised of the Sector Count register inclusive of both previous and current instances of that register when 48-bit addressing is

Comments from page 25 continued on next page

3 Definitions, symbols, abbreviations, and conventions

3.1 Definitions

3.1.1 additional sense code: A combination of the ADDITIONAL SENSE CODE and ADDITIONAL SENSE CODE QUALIFIER fields in the sense data. A detailed definition of sense data may be found in SPC-3.

3.1.2 application client: An object that is the source of SCSI commands. Further definition of an application client is found in SAM-3.

~~**3.1.3 AT Attachment (ATA):** A standard for the attachment of storage devices to hosts. See ATA/ATAPI-7 V1.~~

3.1.4 ATA device: A device implementing the general feature set, and does not implement the ~~packet~~ feature set, as described in ATA/ATAPI-7 (see 2.2).

~~**3.1.5 ATA/ATAPI device:** ATA/ATAPI-7 device (see 3.1.6).~~

~~**3.1.6 ATA/ATAPI-7 device:** A device that complies with ATA/ATAPI-7.~~

3.1.7 ATA domain: An I/O system consisting of ~~an ATA hosts~~ and ATA/ATAPI devices that communicate with one another by means of a service delivery subsystem.

3.1.8 ATA flush command: A FLUSH CACHE or FLUSH CACHE EXT command defined in ATA/ATAPI-7.

3.1.9 ATA hard reset: For a SATA device, an action in response to a reset event (COMRESET ~~or power on reset~~) in which the SATA Phy state machine transitions to the initial state (see ATA8-AST). For a PATA device, assertion of the RESET- signal (Hardware reset) by an ATA host to reset the attached ATA device (See ATA8-APT).

3.1.10 ATA host: A host device that originates requests to be processed by an ATA/ATAPI device.

3.1.11 ATA LBA: ~~.~~If the attached ATA device is a PATA device, this is the set of registers comprised of the LBA High, LBA Mid, and LBA Low registers (i.e., inclusive of both previous and current instances of those registers when 48-bit addressing is used) in the ATA Command Block registers. If the attached ATA device is a SATA device, this is the set of fields in the SATA Command FIS comprised if the LBA Low, LBA Mid, LBA High, LBA Low (ext), LBA Mid (ext), and LBA High (ext) fields (see ATA/ATAPI-7).

3.1.12 AT Attachment Packet Interface (ATAPI): An element of the ATA specification that defines a Packet Command feature set that provides the capability to pass-through SCSI-type commands encapsulated through an ATA transport.

3.1.13 ATAPI device: A device implementing the ~~packet feature~~ set as described in ATA/ATAPI-7.

3.1.14 ATA queued commands: Queued read and write commands issued to an ATA device (see 3.1.4) that supports the Overlapped feature set of ATA/ATAPI-7 or the native command queuing (see 3.1.45) feature of SATA 2.5 (see 3.1.59).

3.1.15 ATA read command: One of the following ATA commands: READ DMA, READ DMA EXT, READ DMA QUEUED, READ DMA QUEUED EXT, READ MULTIPLE, READ MULTIPLE EXT, READ SECTOR(S), or READ SECTOR(S) EXT defined in ATA/ATAPI-7; or READ FPDMA QUEUED defined in SATA 2.5.

3.1.16 ATA Sector Count: If the attached ATA device is a PATA device this is the Sector Count register (i.e., inclusive of both previous and current instances of the register when 48-bit addressing is used). If the attached device is a SATA device this is the Sector Count and Sector Count (ext) fields in a SATA Command FIS.

used. For a SATA device, the ATA Sector Count is contained in the Sector Count and Sector Count (ext) fields in a SATA Command FIS (see ATA/ATAPI-7)."
Proposed resolution:
"For a PATA device, the ATA Sector Count is contained in the set of registers comprised of the Sector Count register inclusive of both previous and current instances of that register when 48-bit addressing is used. For a SATA device, the ATA Sector Count is contained in the Sector Count field and Sector Count (ext) field in a SATA Command FIS (see ATA8-ACS)."
RESOLUTION: To conform with the global LB comment to reference ATA8, change definition to,
"A count of ATA logical sectors to transfer or process, represented by the Count field in an ATA command (see ATA8-ACS)".

3.1.17 ATA verify command: A READ VERIFY SECTOR(S) or READ VERIFY SECTOR(S) EXT command defined in ATA/ATAPI-7.

3.1.18 ATA write command: One of the following ATA commands: WRITE DMA, WRITE DMA EXT, WRITE DMA FUA EXT, WRITE DMA QUEUED, WRITE DMA QUEUED EXT, WRITE DMA QUEUED FUA EXT, WRITE MULTIPLE, WRITE MULTIPLE EXT, WRITE MULTIPLE FUA EXT, WRITE SECTOR(S), or WRITE SECTOR(S) EXT defined in ATA/ATAPI-7; or WRITE FPDMA QUEUED defined in SATA 2.5.

3.1.19 ATA write FUA command sequence: A sequence of commands that writes logical blocks to an attached ATA device in a way that forces media access and consists of one of the following:

a) a write followed by read verify command sequence as follows:
   1) a WRITE DMA, WRITE DMA EXT, WRITE DMA QUEUED, WRITE DMA QUEUED EXT, WRITE MULTIPLE, WRITE MULTIPLE EXT, WRITE SECTOR(S), or WRITE SECTOR(S) EXT command (see ATA/ATAPI-7) followed by
   2) a READ VERIFY SECTOR(S) or READ VERIFY SECTOR(S) EXT command (see ATA/ATAPI-7) accessing the same range of logical blocks written in the previous step;
c) a WRITE DMA FUA EXT, WRITE DMA QUEUED FUA EXT, or WRITE MULTIPLE FUA EXT command (ATA/ATAPI-7), or
d) a WRITE FPDMA QUEUED command (see SATA 2.5) with the FUA bit in the Device/Head field set to one.

See 5.3 for a description of multiple command sequence error handling.

3.1.20 auto-contingent allegiance (ACA): The task set condition established following the return of a CHECK CONDITION status when the NACA bit is set to one in the CONTROL byte. A detailed definition of ACA may be found in SAM-3.

3.1.21 autosense: Sense data that is returned in the same I_T_L_Q nexus transaction as the CHECK CONDITION status (see SAM-3). The alternative to autosense (i.e., use of a REQUEST SENSE command) is defined in SAM-2.

3.1.22 big-endian: A format for storage or transmission of binary data in which the most significant byte appears first. In a multi-byte value, the byte containing the most significant bit is stored in the lowest memory address and transmitted first and the byte containing the least significant bit is stored in the highest memory address and transmitted last (e.g., for the value 0080h, the byte containing 00h is stored in the lowest memory address and the byte containing 80h is stored in the highest memory address).

3.1.23 byte: A sequence of eight contiguous bits considered as a unit.

3.1.24 command descriptor block (CDB): A structure used to communicate a command from a SCSI application client to a SCSI device server.

3.1.25 device server: An object within the logical unit that processes SCSI tasks according to the rules for task management as described in SAM-3.

3.1.26 domain: A SCSI domain (see SAM-3) or an ATA domain (see ATA8-AAM).

3.1.27 DRQ data block: A unit of data words associated with available status when using either the PIO data-in command protocol or the PIO data-out command protocol (see ATA8-ACS)

3.1.28 field: A group of one or more contiguous bits.

3.1.29 first-party direct memory access (FPDMA): A method by which a device accesses host memory (see SATA 2.5).

~~**3.1.30 frame information structure (FIS):** The SATA frame format. The payload of a frame, does not include the SOF, CRC, and EOF delimiters (see ATA/ATAPI-7).~~

Date: 2/28/2006 4:07:22 PM
3.1.21 autosense: this term is not found in SAM-3, so this is a new definition unique to this standard, though the definition here is similar to the definition for "sense data" in SAM (except that the last phrase here is incorrect). However, the definition here does not reflect how the term is used in this standard. Change the definition to, "The ability for a SCSI target device to return sense data in the same I_T_L_Q nexus transaction as the CHECK CONDITION status (see SAM-3)."
REASON: Autosense is defined in SAM-2, and SAM-3 specifies what SAM-2 defines as autosense as returning SENSE data since the other method is not recognized. So this is the proper way to reference it. There should be an informative note to clarify what's going on.

RESOLUTION: add an informative note:
NOTE x - Autosense is defined in SAM-2. SAM-3 specifies what SAM-2 defines as autosense as the only valid way of returning SENSE data, but does not refer to it as autosense.

3.1.31 I_T nexus: A nexus ~~that exists~~ between a SCSI initiator port and a SCSI target port (see SAM-3).

3.1.32 I_T_L nexus: A nexus that exists between a SCSI initiator port, a SCSI target port, and a logical unit. This relationship extends the prior I_T nexus (see SAM-3).

3.1.33 I_T_L_Q nexus: A nexus between a SCSI initiator port, a SCSI target port, a logical unit, and a queue tag following the successful receipt of a queue tag. This relationship replaces the prior I_T nexus or I_T_L nexus (see SAM-3).

3.1.34 least significant bit (LSB): In a binary code, the bit or bit position with the smallest numerical weighting in a group of bits that, when taken as a whole, represent a numerical value (e.g., in the number 0001b, the bit that is set to one).

3.1.35 link reset: Performing the link reset sequence.

3.1.36 link reset sequence: For SATA, a phy reset sequence. For PATA, a software reset as defined in ATA/ATAPI-7.

3.1.37 little-endian: A format for storage or transmission of binary data in which the least significant byte appears first. In a multi-byte value, the byte containing the least significant bit is stored in the lowest memory address and transmitted first and the byte containing the most significant bit is stored in the highest memory address and transmitted last (e.g., for the value 0080h, the byte containing 80h is stored in the lowest memory address and the byte containing 00h is stored in the highest memory address).

3.1.38 logical block address (LBA): The value used to reference a logical block.

3.1.39 logical unit number: An identifier for a ~~SCSI~~ logical unit.

3.1.40 logical unit reset event: An event that triggers a logical unit reset from a logical unit as described in SAM-3.

3.1.41 logical unit reset: A logical unit action in response to a logical unit reset event in which the logical unit performs the operations described in SAM-3.

3.1.42 logical unit: An externally addressable entity within a SCSI target device. See SAM-3 for a detailed definition of a logical unit.

3.1.43 medium: The material on which data is stored (e.g., a magnetic disk).

3.1.44 most significant bit (MSB): In a binary code, the bit or bit position with the largest numerical weighting in a group of bits that, when taken as a whole, represent a numerical value (e.g., in the number 1000b, the bit that is set to one).

3.1.45 native command queuing (NCQ): A method by which a device may maintain up to 32 outstanding commands concurrently and may order processing of those outstanding commands (see SATA 2.5). An ATA device indicates support for NCQ in IDENTIFY DEVICE information word 76, bit 8 (see ATA/ATAPI-7). ~~There is no enable or disable function.~~

3.1.46 nexus: A relationship between a SCSI initiator port and a SCSI target port that may extend to a logical unit and a task ~~tag~~ (see SAM-3).

3.1.47 object: An architectural abstraction or container that encapsulates data types, services, or other objects that are related in some way.

3.1.48 PATA bus: An interface that contains no more than two ATA/ATAPI devices connected by a single signal path using parallel signalling (see ATA/ATAPI-7).

3.1.36
change
"3.1.36 link reset sequence: For SATA, a phy reset sequence. For PATA, a software reset as defined in ATA/ATAPI-7."
to
"3.1.36 link reset sequence: A phy reset sequence (see ATA/ATAPI-7)."

link reset or link reset sequence is never used with reference to PATA in spec.
RESOLUTION:
"3.1.36 link reset sequence: A phy reset sequence (see SATA 2.5)."

3.1.36 link reset sequence: change the definition to, "For SATA, a phy reset sequence (see SATA 2.5), or, for PATA, a software reset (see ATA/ATAPI-7)."
REASON: Accepted DELL comment which accounts for the fact that a link reset sequence isn't defined for PATA.

Status
rlsheffi Rejected 3/2/2006 8:37:00 PM

Comments from page 27 continued on next page

3.1.31 I_T nexus: A nexus ~~that exists~~ between a SCSI initiator port and a SCSI target port (see SAM-3).

3.1.32 I_T_L nexus: A nexus that exists between a SCSI initiator port, a SCSI target port, and a logical unit. This relationship extends the prior I_T nexus (see SAM-3).

3.1.33 I_T_L_Q nexus: A nexus between a SCSI initiator port, a SCSI target port, a logical unit, and a queue tag following the successful receipt of a queue tag. This relationship replaces the prior I_T nexus or I_T_L nexus (see SAM-3).

3.1.34 least significant bit (LSB): In a binary code, the bit or bit position with the smallest numerical weighting in a group of bits that, when taken as a whole, represent a numerical value (e.g., in the number 0001b, the bit that is set to one).

3.1.35 link reset: Performing the link reset sequence.

3.1.36 link reset sequence: For SATA, a phy reset sequence. For PATA, a software reset as defined in ATA/ATAPI-7.

3.1.37 little-endian: A format for storage or transmission of binary data in which the least significant byte appears first. In a multi-byte value, the byte containing the least significant bit is stored in the lowest memory address and transmitted first and the byte containing the most significant bit is stored in the highest memory address and transmitted last (e.g., for the value 0080h, the byte containing 80h is stored in the lowest memory address and the byte containing 00h is stored in the highest memory address).

6

3.1.38 logical block address (LBA): The value used to reference a logical block.

3.1.39 8ogical unit number: An identifier for a 7~~SCSI~~ logical unit.

3.1.40 logical unit reset event: 10 event that triggers a logical 9nit reset from a logical unit as described in SAM-3.

11**.41 logical unit reset:** A logical unit action in response to a logical unit reset event in which the logical unit performs the operations described in SAM-3.

3.1.42 logical unit: An externally addressable entity within a SCSI target device. See SAM-3 for a detailed definition of a logical unit.

3.1.43 medium: The material on which data is stored (e.g., a magnetic disk).

3.1.44 most significant bit (MSB): In a binary code, the bit or bit position with the largest numerical weighting in a group of bits that, when taken as a whole, represent a numerical value (e.g., in the number 1000b, the bit that is set to one).

3.1.45 native command queuing (NCQ): 12method by which a device may maintain up to 32 outstanding commands concurrently and may order processing of those outstanding commands (see SATA 2.5). An ATA device indicates support for NCQ in IDENTIFY DEVICE information word 76, bit 8 (see ATA/ATAPI-7). ~~There is no enable or disable function.~~

3.1.46 nexus: A relationship between a SCSI initiator port and a SCSI target port that may extend to a logical unit and a task ~~tag~~ (see SAM-3).

3.1.47 object: An architectural abstraction or container that encapsulates data types, services, or other objects that are related in some way.

3.1.48 PATA bus: An interface that contains no more than two ATA/ATAPI devices connected by a single signal path using parallel signalling (see ATA/ATAPI-7).

3.1.31 I_T nexus: A nexus ~~that exists~~ between a SCSI initiator port and a SCSI target port (see SAM-3).

3.1.32 I_T_L nexus: A nexus that exists between a SCSI initiator port, a SCSI target port, and a logical unit. This relationship extends the prior I_T nexus (see SAM-3).

3.1.33 I_T_L_Q nexus: A nexus between a SCSI initiator port, a SCSI target port, a logical unit, and a queue tag following the successful receipt of a queue tag. This relationship replaces the prior I_T nexus or I_T_L nexus (see SAM-3).

3.1.34 least significant bit (LSB): In a binary code, the bit or bit position with the smallest numerical weighting in a group of bits that, when taken as a whole, represent a numerical value (e.g., in the number 0001b, the bit that is set to one).

3.1.35 link reset: Performing the link reset sequence.

3.1.36 link reset sequence: For SATA, a phy reset sequence. For PATA, a software reset as defined in ATA/ATAPI-7.

3.1.37 little-endian: A format for storage or transmission of binary data in which the least significant byte appears first. In a multi-byte value, the byte containing the least significant bit is stored in the lowest memory address and transmitted first and the byte containing the most significant bit is stored in the highest memory address and transmitted last (e.g., for the value 0080h, the byte containing 80h is stored in the lowest memory address and the byte containing 00h is stored in the highest memory address).

3.1.38 logical block address (LBA): The value used to reference a logical block.

3.1.39 logical unit number: An identifier for a ~~SCSI~~ logical unit.

3.1.40 logical unit reset event: An event that triggers a logical unit reset from a logical unit as described in SAM-3.

3.1.41 logical unit reset: A logical unit action in response to a logical unit reset event in which the logical unit performs the operations described in SAM-3.

3.1.42 logical unit: An externally addressable entity within a SCSI target device. See SAM-3 for a detailed definition of a logical unit.

3.1.43 medium: The material on which data is stored (e.g., a magnetic disk).

3.1.44 most significant bit (MSB): In a binary code, the bit or bit position with the largest numerical weighting in a group of bits that, when taken as a whole, represent a numerical value (e.g., in the number 1000b, the bit that is set to one).

3.1.45 native command queuing (NCQ): A method by which a device may maintain up to 32 outstanding commands concurrently and may order processing of those outstanding commands (see SATA 2.5). An ATA device indicates support for NCQ in IDENTIFY DEVICE information word 76, bit 8 (see ATA/ATAPI-7). ~~There is no enable or disable function.~~

3.1.46 nexus: A relationship between a SCSI initiator port and a SCSI target port that may extend to a logical unit and a task ~~tag~~ (see SAM-3).

3.1.47 object: An architectural abstraction or container that encapsulates data types, services, or other objects that are related in some way.

3.1.48 PATA bus: An interface that contains no more than two ATA/ATAPI devices connected by a single signal path using parallel signalling (see ATA/ATAPI-7).

Subject: Highlight

3.1.49 PATA device: storage device that uses the PATA transport (see ATA/ATAPI-7).

3.1.50 PATA host: host that uses the PATA transport (see ATA/ATAPI-7).

3.1.51 power on: Power being applied.

3.1.52 queue: The arrangement of tasks within a task set usually according to the temporal order that they were created.

3.1.53 reset event: An event that triggers a hard reset from a SCSI initiator device (see SAM-3) or an ATA/ATAPI host (see ATA/ATAPI-7).

3.1.54 SAS address: A worldwide unique name assigned to a SAS initiator port, SAS target port, expander device, SAS initiator device, or SAS target device (see SAS-1.1).

3.1.55 SAS initiator device: A device containing SSP, STP, and/or SMP initiator ports in a SAS domain (see SAS-1.1).

3.1.56 SAS initiator port: An SSP initiator port, STP initiator port, and/or SMP initiator port in a SAS domain (see SAS-1.1).

3.1.57 SATA device: A device that implements a Serial ATA transport (see ATA/ATAPI-7).

3.1.58 SATA host: A host that implements a Serial ATA transport (see ATA/ATAPI-7).

~~**3.1.59 SATA 2.5:** A specification for the internal attachment of storage devices to hosts. See Serial ATA Revision 2.5.~~

3.1.60 SCSI / ATA translation layer (SATL): The functional layer that emulates a SCSI logical unit, device server, task manager, and task set (see SAM-3), using an ATA device.

3.1.61 SCSI device: A device that contains one or more SCSI ports that are connected to a service delivery subsystem and supports a SCSI application protocol.

3.1.62 SCSI hard reset: A condition resulting from a power on condition or a reset event in which the SCSI device performs the hard reset operations described in SAM-3, SPC-3, and the appropriate command standards.

3.1.63 SCSI initiator port: A SCSI initiator device object acts as the connection between application clients and the service delivery subsystem through which requests and responses are routed. See SAM-3 for a detailed definition of a SCSI initiator port.

3.1.64 SCSI read command: A ~~SCSI~~ READ (6), READ (10), READ (12), or READ (16) command defined in SBC-2.

3.1.65 SCSI synchronize cache command: ~~.~~A ~~SCSI~~ SYNCHRONIZE CACHE(10), or SYNCHRONIZE CACHE (16) command defined in SBC-2

3.1.66 SCSI target port: A SCSI target device object that contains a task router and acts as the connection between device servers and task managers and the service delivery subsystem through which requests and responses are routed. See SAM-3 for a detailed definition of a SCSI target port.

3.1.67 SCSI verify command: ~~.~~A ~~SCSI~~ VERIFY (10), VERIFY (12), or VERIFY (16) command defined in SBC-2.

3.1.68 SCSI write command: ~~.~~A SCSI WRITE (6), WRITE (10), WRITE (12), or WRITE (16) command defined in SBC-2.

3.1.50 PATA host: A host that uses the PATA transport (see ATA/ATAPI-7).

3.1.51 power on: Power being applied.

3.1.52 queue: The arrangement of tasks within a task set usually according to the temporal order that they were created.

3.1.53 reset event: An event that triggers a hard reset from a SCSI initiator device (see SAM-3) or an ATA/ATAPI host (see ATA/ATAPI-7).

3.1.54 SAS address: A worldwide unique name assigned to a SAS initiator port, SAS target port, expander device, SAS initiator device, or SAS target device (see SAS-1.1).

3.1.55 SAS initiator device: A device containing SSP, STP, and/or SMP initiator ports in a SAS domain (see SAS-1.1).

3.1.56 SAS initiator port: An SSP initiator port, STP initiator port, and/or SMP initiator port in a SAS domain (see SAS-1.1).

3.1.57 SATA device: A device that implements a Serial ATA transport (see ATA/ATAPI-7).

3.1.58 SATA host: [12] host that implements a Serial ATA transport (see ATA/ATAPI-7).

[13] **~~3.1.59 SATA 2.5:~~** ~~A specification for the internal attachment of storage devices to hosts. See Serial ATA Revision 2.5.~~ [14]

3.1.60 SCSI / ATA translation layer (SATL): [15] e functional layer that emulates a SCSI logical unit, device server, task manager, and task set (see SAM-3), using an ATA device.

3.1.61 SCSI device: A device that contains one or more SCSI ports that are connected to a service delivery subsystem and supports a SCSI application protocol.

3.1.62 SCSI hard reset: [16] condition resulting from a power on condition or a reset event in which the SCSI device performs the hard reset operations described in SAM-3, SPC-3, and the appropriate command standards.

3.1.63 SCSI initiator port: [17] SCSI initiator device object acts as the connection between application clients and the service delivery subsystem through which requests and responses are routed. See SAM-3 for a detailed definition of a SCSI initiator port.

[18] **~~3~~.1.64 SCSI read command:** A ~~SCSI~~ READ (6), READ (10), READ (12), or READ (16) command defined in SBC-2.

3.1.65 SCSI synchronize cache command: ~~.~~A ~~SCSI~~ SYNCHRONIZE CACHE(10), or SYNCHRONIZE CACHE (16) command defined in SBC-2

3.1.66 SCSI target port: A SCSI target device object that contains a task router and acts as the connection between device servers and task managers and the service delivery subsystem through which requests and responses are routed. See SAM-3 for a detailed definition of a SCSI target port.

3.1.67 SCSI verify command: ~~.~~A ~~SCSI~~ VERIFY (10), VERIFY (12), or VERIFY (16) command defined in SBC-2.

3.1.68 SCSI write command: ~~.~~A SCSI WRITE (6), WRITE (10), WRITE (12), or WRITE (16) command defined in SBC-2.

3.1.69 SCSI write and verify command: A SCSI WRITE AND VERIFY (10), WRITE AND VERIFY(12), or WRITE AND VERIFY (16) command defined in SBC-2.

3.1.70 Serial ATA (SATA): A protocol defined by ATA/ATAPI-7.

3.1.71 Serial ATA Tunneled Protocol (STP): The protocol defined in this standard used by STP initiator ports to communicate with STP target ports in a SAS domain.

3.1.72 Serial Attached SCSI (SAS): A set of protocols and the interconnect defined by SAS-1.1.

3.1.73 service delivery subsystem: The part of a SCSI I/O system that transmits information between a SCSI initiator port and a SCSI target port, or the part of an ATA I/O system that transmits information between an ATA host and an ATA/ATAPI device, or the part of a SAS I/O system that transmits information between a SAS initiator port and a SAS target port (see SAM-3 and SAS-1.1).

3.1.74 STP initiator port: A SAS initiator device object in a SAS domain that interfaces to the service delivery subsystem with STP (see SAS-1.1).

3.1.75 STP target port: A SAS target device object in a SAS domain that interfaces to the service delivery subsystem with STP (see SAS-1.1).

3.1.76 STP/SATA bridge: An expander device object containing an STP target port, a SATA host port, and the functions required to forward information between the STP target port and SATA host port to enable STP initiator ports in a SAS domain to communicate with SATA devices in an ATA domain (see SAS-1.1).

3.1.77 task management function: A task manager service capable of being requested by an application client to affect the processing of one or more tasks.

3.1.78 task set: A group of tasks within a device server whose interaction is dependent on the task management and auto-contingent allegiance rules. See SAM-3 for a detailed definition of a task set.

3.1.79 task: An object within the logical unit representing the work associated with a command or group of linked commands. ~~A task consists of one initial connection and zero or more physical or logical reconnections, all pertaining to the task.~~

3.1.80 tagged command queuing (TCQ): A method that makes use of the ATA/ATAPI-7 Queued feature set by which an ATA device may maintain up to 32 outstanding commands concurrently, may order processing of those outstanding commands, and identifies the context of each outstanding command with a unique Tag (see ATA/ATAPI-7). An ATA device indicates support for the Queued feature set in IDENTIFY DEVICE data word 83, bit 1 (see ATA/ATAPI-7). An ATA device indicates the number of commands that may be queued at one time in IDENTIFY DEVICE data word 75, bits 4:0 (see ATA/ATAPI-7).

3.1.81 vendor-specific: Something (e.g., a bit, field, code value) that is not defined by this standard and may be used differently in various implementations.

3.1.82 word: A sequence of two contiguous bytes considered as a unit.

3.2 Symbols and abbreviations

≠ or NE	not equal
≤ or LE	less than or equal to
±	plus or minus
≈	approximately
x	multiply
+	add
-	subtract
< or LT	less than

Comments from page 29 continued on next page

3.1.69 SCSI write and verify command: .A SCSI WRITE AND VERIFY (10), WRITE AND VERIFY(12), or WRITE AND VERIFY (16) command defined in SBC-2.

3.1.70 Serial ATA (SATA): [7] protocol defined by ATA/ATAPI-7.

[8]**1.71 Serial ATA Tunneled Protocol (STP):** [10]e protocol defined[9]n this standard used by STP initiator ports to communicate with STP target ports in a SAS domain.

3.1.72 Serial Attached SCSI (SAS): A set of protocols and the interconnect defined by SAS-1.1.

3.1.73 service delivery subsystem: [11]e part of a SCSI I/O system that transmits information between a SCSI initiator port and a SCSI target port, or the part of an ATA I/O system that transmits information between an ATA host and an ATA/ATAPI device, or the part of a SAS I/O system that transmits information between a SAS initiator port and a SAS target port (see SAM-3 and SAS-1.1).

3.1.74 STP initiator port: A SAS initiator device object in a SAS domain that interfaces to the service delivery subsystem with STP (see SAS-1.1).

3.1.75 STP target port: A SAS target device object in a SAS domain that interfaces to the service delivery subsystem with STP (see SAS-1.1).

3.1.76 STP/SATA bridge: An expander device object containing an STP target port, a SATA host port, and the functions required to forward information between the STP target port and SATA host port to enable STP initiator ports in a SAS domain to communicate with SATA devices in an ATA domain (see SAS-1.1).

3.1.77 task management function: A task manager service capable of being requested by an application client to affect the processing of [12]e or more tasks.

3.1.78 task set: A group of tasks within a device server whose interaction is dependent on the task management and auto-contingent [13]egiance rules. See SAM-3 for a detailed definition of a task set.

3.1.79 task: An object within the logical unit representing the work associated with a command or group of linked commands. ~~A task consists of one initial connection and zero or more physical or logical reconnections, all pertaining to the task.~~

3.1.80 tagged command queuing (TCQ): A method that makes use of the ATA/ATAPI-7 Queued feature set by which an ATA device may maintain up to 32 outstanding commands concurrently, may order processing of those outstanding commands, and identifies the context of each outstanding command with a unique Tag (see ATA/ATAPI-7). An ATA device indicates support for the Queued feature set in IDENTIFY DEVICE data word 83, bit 1 (see ATA/ATAPI-7). An ATA device indicates the number of commands that may be queued at one time in IDENTIFY DEVICE data word 75, bits 4:0 (see ATA/ATAPI-7).

3.1.81 vendor-specific: Something (e.g., a bit, field, code value) that is not defined by this standard and may be used differently in various implementations.

3.1.82 word: A sequence of two contiguous bytes considered as a unit.

---

reserved code values in defined fields shall be reported as an error.

3.3.9 shall: A keyword indicating a mandatory requirement (equivalent to “is required”). Designers are required to implement all such requirements to ensure interoperability with other products that conform to this standard.

3.3.10 should: A keyword indicating flexibility of choice with a preferred alternative (equivalent to “it is strongly recommended”).

3.4 Command description specific terminology

3.4.1 emulated: A term that specifies a requirement for the SATL to implement a specified function by emulating the behavior in a way that involves more than the simple use of a corresponding ATA function implemented in the attached ATA device.

3.4.2 implemented: A term that specifies a requirement for the SATL to implement a specified function by using a corresponding ATA function implemented in the attached ATA device. Implemented fields shall not be emulated (e.g., the ~~SCSI~~ READ (10) command has a 32 bit address, and a 16 bit transfer length. This enables the translator, under the right conditions, to issue a single ATA READ DMA EXT command without providing additional information or capability).

3.4.3 unspecified: A term indicating that this version of this standard does not specify a translation for a SCSI protocol element, but does not preclude a future version of this standard defining a translation. Implementations for fields marked unspecified shall not conflict with SPC-3 or SBC-2.

3.5 Conventions

3.5.1 Overview

Certain words and terms used in this standard have a specific meaning beyond the normal English meaning. These words and terms are defined either in clause 3.1 or in the text where they first appear. Names of commands, statuses, sense keys, and additional sense codes are in all uppercase (e.g., REQUEST SENSE). Lowercase is used for words having the normal English meaning.

If there is more than one CDB length for a particular command (e.g., MODE SENSE (6) and MODE SENSE (10)) and the name of the command is used in a sentence without any CDB length descriptor (e.g., MODE SENSE), then the condition specified in the sentence applies to all CDB lengths for that command.

The names of fields are in small uppercase (e.g., ALLOCATION LENGTH). When a field name is a concatenation of acronyms, uppercase letter may be used for readability (e.g., NORMACA). Normal case is used when the contents of a field are being discussed. Fields containing only one bit are usually referred to as the NAME bit instead of the NAME field.

A binary number is represented in this standard by any sequence of digits comprised of only the Western-Arabic numerals 0 and 1 immediately followed by a lower-case b (e.g., 0101b). Underscores or spaces may be included in binary number representations to increase readability or delineate field boundaries (e.g., 0 0101 1010b or 0_0101_1010b).

A hexadecimal number is represented in this standard by any sequence of digits comprised of only the Western-Arabic numerals 0 through 9 and/or the upper-case English letters A through F immediately followed by a lower-case h (e.g., FA23h). Underscores or spaces may be included in hexadecimal number representations to increase readability or delineate field boundaries (e.g., B FD8C FA23h or B_FD8C_FA23h).

A decimal number is represented in this standard by any sequence of digits comprised of only the Western-Arabic numerals 0 through 9 not immediately followed by a lower-case b or lower-case h (e.g., 25).

When the value of the bit or field is not relevant, x or xx appears in place of a specific value.

3.5.1 [Conventions] Overview: make a new "head2" clause, "Numeric conventions", after the third paragraph.

Status
rlsheffi Completed 5/29/2006 4:22:02 PM

This standard uses the ISO convention for representing decimal numbers (e.g., the thousands and higher multiples are separated by a space and a comma is used as the decimal point). Table 1 shows some examples of decimal numbers represented using the ISO and American conventions.

Table 1 — ISO and American numbering conventions examples

ISO	American
0,6	0.6
3,141 592 65	3.14159265
1 000	1,000
1 323 462,95	1,323,462.95

Lists sequenced by letters (e.g., a-red, b-blue, c-green) show no ordering relationship between the listed items. Numbered lists (e.g., 1-red, 2-blue, 3-green) show a ordering relationship between the listed items.

If a conflict arises between text, tables, or figures, the order of precedence to resolve the conflicts is text; then tables; and finally figures. Not all tables or figures are fully described in the text. Tables show data format and values. Notes do not constitute any requirements for implementors.

5.2 Bit and byte ordering

This subclause describes the representation of fields in a table that defines the format of a SCSI structure (e.g., the format of a CDB).

If a field consists of more than one bit and contains a single value (e.g., a number), the least significant bit (LSB) is shown on the right and the most significant bit (MSB) is shown on the left (e.g., in a byte, bit 7 is the MSB and is shown on the left; and bit 0 is the LSB and is shown on the right). The MSB and LSB are not labeled if the field consists of 8 or fewer bits.

If a field consists of more than one byte and contains a single value, the byte containing the MSB is stored at the lowest address and the byte containing the LSB is stored at the highest address (i.e., big-endian byte ordering). The MSB and LSB are labeled.

If a field consists of more than one byte and contains multiple fields each with their own values (e.g., a descriptor), there is no MSB and LSB of the field itself and thus there are no MSB and LSB labels. Each individual field has an MSB and LSB that are labeled as appropriate in the table (if any) that describes the format of the sub-structure having multiple fields.

If a field contains a text string (e.g., ASCII or UTF-8), the MSB label is the MSB of the first character and the LSB label is the LSB of the last character.

When required for clarity, multiple byte fields may be represented with only two rows in a table. This condition is represented by values in the byte number column not increasing by one in each subsequent table row, thus indicating the presence of additional bytes.

5.3 Notation for byte encoded character strings

When this standard requires one or more bytes to contain specific encoded character, the specific characters are enclosed in single quotation marks. The single quotation marks identify the start and end of the characters that are required to be encoded but are not themselves to encoded. The characters that are to be encoded are shown in exactly the case that is to be encoded.

The encoded characters and the single quotation marks that enclose them are preceded by text that specifies the character encoding methodology and the number of characters required to be encoded.

Using the notation described in this subclause, stating that eleven ASCII characters ‘SCSI device’ are to be encoded would be the same writing out the following sequence of byte values: 53h 43h 53h 49h 20h 64h 65h 76h 69h 63h 65h.

Comments from page 32 continued on next page

This standard uses the ISO convention for representing decimal numbers (e.g., the thousands and higher multiples are separated by a space and a comma is used as the decimal point). Table 1 shows some examples of decimal numbers represented using the ISO and American conventions.

Table 1 — ISO and American numbering conventions examples

ISO	American
0,6	0.6
3,141 592 65	3.14159265
1 000	1,000
1 323 462,95	1,323,462.95

Lists sequenced by letters (e.g., a-red, b-blue, c-green) show no ordering relationship between the listed items. Numbered lists (e.g., 1-red, 2-blue, 3-green) show a ordering relationship between the listed items.

If a conflict arises between text, tables, or figures, the order of precedence to resolve the conflicts is text; then tables; and finally figures. Not all tables or figures are fully described in the text. Tables show data format and values. Notes do not constitute any requirements for implementors.

3.5.2 Bit and byte ordering

This subclause describes the representation of fields in a table that defines the format of a SCSI structure (e.g., the format of a CDB).

If a field consists of more than one bit and contains a single value (e.g., a number), the least significant bit (LSB) is shown on the right and the most significant bit (MSB) is shown on the left (e.g., in a byte, bit 7 is the MSB and is shown on the left; and bit 0 is the LSB and is shown on the right). The MSB and LSB are not labeled if the field consists of 8 or fewer bits.

If a field consists of more than one byte and contains a single value, the byte containing the MSB is stored at the lowest address and the byte containing the LSB is stored at the highest address (i.e., big-endian byte ordering). The MSB and LSB are labeled.

If a field consists of more than one byte and contains multiple fields each with their own values (e.g., a descriptor), there is no MSB and LSB of the field itself and thus there are no MSB and LSB labels. Each individual field has an MSB and LSB that are labeled as appropriate in the table (if any) that describes the format of the sub-structure having multiple fields.

If a field contains a text string (e.g., ASCII or UTF-8), the MSB label is the MSB of the first character and the LSB label is the LSB of the last character.

When required for clarity, multiple byte fields may be represented with only two rows in a table. This condition is represented by values in the byte number column not increasing by one in each subsequent table row, thus indicating the presence of additional bytes.

3.5.3 Notation for byte encoded character strings

When this standard requires one or more bytes to contain specific encoded character, the specific characters are enclosed in single quotation marks. The single quotation marks identify the start and end of the characters that are required to be encoded but are not themselves to encoded. The characters that are to be encoded are shown in exactly the case that is to be encoded.

The encoded characters and the single quotation marks that enclose them are preceded by text that specifies the character encoding methodology and the number of characters required to be encoded.

Using the notation described in this subclause, stating that eleven ASCII characters ‘SCSI device’ are to be encoded would be the same writing out the following sequence of byte values: 53h 43h 53h 49h 20h 64h 65h 76h 69h 63h 65h.

Subject: Highlight
Date: 2/7/2006 2:27:07 PM
3.5.3 Notation for byte encoded character strings: make this clause be consistent with the SCSI style guide.

Status
rlsheffi Completed 5/29/2006 5:32:24 PM

An ASCII space character (value 20h) may be represented in a string by the character '¬' (e.g., 'SCSI¬device'). This is useful when a string contains adjacent space characters.

3.5.4 Notation for command descriptions

3.5.4.1 Description

The description of each command begins with a subclause describing the general method applied in translating the SCSI command to the corresponding ATA commands, as well as any constraints and special considerations that may apply to the translation applied.

The subclause describing the general translation method for each command contains a table formatted like Table 2 with two columns as follows:

a) the first column lists each of the fields in the SCSI CDB (the format and byte-position of each field is defined in the SCSI command standard that defines the CDB for that command); and
b) the second column is either a brief description of the corresponding ATA protocol element(s) used to implement the identified SCSI field, or a reference to a subsequent subclause containing a more lengthy description of the method of emulation or implementation.

Table 2 — Format for translated command field descriptions

Field	Description or reference
IMPLEMENTED OR EMULATED FIELD	A brief identification of the corresponding ATA protocol element, or a paragraph reference if there are special considerations that need to be applied in the use of the corresponding ATA protocol element that require a separate paragraph of description.
SUMMARY EMULATED FIELD	Summary field with more detailed structure.
UNSPECIFIED FIELD	Unspecified ~~(see 3.4.3)~~

Tables listing fields in mode pages have an additional column that indicates whether the field is changeable or not.

~~3.5.4.2 Recursive descent~~

3.5.4.2.1 Overview

Many times a field may itself either be a summary of a more complex structure of fields or may refer to other structures such as mode pages or log pages. In this case the subclause describing the summary field may contain a table with a structure like that shown in Table 2 to describe the emulation or implementation of each of the specific fields represented in the summary field identified at the next level up, with references to following subclauses, as required. This method of documentation may be applied recursively until all the applicable fields involved in the translation of a SCSI command to ATA protocol elements have been described in sufficient detail.

Table 3 — Format for summary field expanded descriptions

Field	SATType	Description or reference
FIELD NAME	U	Brief description of field or reference to paragraph (see 3.5.4.2.2)

~~3.5.4.2 Recursive descent~~

3.5.4.2.1 Overview

Many times a field may itself either be a summary of a more complex structure of fields or may refer to other structures such as mode pages or log pages. In this case the subclause describing the summary field may contain a table with a structure like that shown in Table 2 to describe the emulation or implementation of each of the specific fields represented in the summary field identified at the next level up, with references to following subclauses, as required. This method of documentation may be applied recursively until all the applicable fields involved in the translation of a SCSI command to ATA protocol elements have been described in sufficient detail.

Table 3 — Format for summary field expanded descriptions

Field	SATType	Description or reference
FIELD NAME	U	Brief description of field or reference to paragraph (see 3.5.4.2.2)
Additional fields as required		
[a] Table footnotes		

Table 2 and global: delete "(see 3.4.3)". This unnecessary cross reference points to the definition for "unspecified" and occurs many, many times in this standard. It is interesting to note that the other two words defined in clause 3.4 ("emulated" and "implemented") are never cross referenced anywhere in this standard.
REASON: The "unspecified" instances all have cross references, and the "emulated" instances do not simply because the instances of "unspecified" all occur as isolated terms in table cells, whereas all instances of "emulated" occur in normal text. So if "emulated" appeared alone in a table cell, it would have a cross reference. It just happens that there are no such instances.

3.5.4.2.1 [Recursive decent] Overview, first paragraph: The whole paragraph is not clear, beginning with the first sentence. This sentence reads, “Many times a field may itself either be a summary of a more complex structure of fields or may refer to other structures such as mode pages or log pages.” However, a field is defined in other SCSI standards as, “A group of one or more contiguous bits, a part of a larger structure such as a CDB or sense data.” Ignoring the “many times”, is this intended to mean “The content of a cell in the Field column may refer to other structures”? Including this and other changes, make the paragraph be, “The content of a cell in the Field column may refer to other structures (i.e., mode pages or log pages). A subclause describing one of the other structures may contain a table to describe the emulation or implementation of that structure with references to following subclauses, as required. Table 2 shows an example of a table in a subclause describing one of the other structures. This method of documentation may be applied recursively until all the applicable fields involved in the translation of a SCSI command to ATA protocol elements have been described in sufficient detail.”

An ASCII space character (value 20h) may be represented in a string by the character '¬' (e.g., 'SCSI¬device'). This is useful when a string contains adjacent space characters.

3.5.4 Notation for command descriptions

3.5.4.1 Description

The description of each command begins with a subclause describing the general method applied in translating the SCSI command to the corresponding ATA commands, as well as any constraints and special considerations that may apply to the translation applied.

The subclause describing the general translation method for each command contains a table formatted like Table 2 with two columns as follows:

a) the first column lists each of the fields in the SCSI CDB (the format and byte-position of each field is defined in the SCSI command standard that defines the CDB for that command); and
b) the second column is either a brief description of the corresponding ATA protocol element(s) used to implement the identified SCSI field, or a reference to a subsequent subclause containing a more lengthy description of the method of emulation or implementation.

Table 2 — Format for translated command field descriptions

Field	Description or reference
IMPLEMENTED OR EMULATED FIELD	A brief identification of the corresponding ATA protocol element, or a paragraph reference if there are special considerations that need to be applied in the use of the corresponding ATA protocol element that require a separate paragraph of description.
SUMMARY EMULATED FIELD	Summary field with more detailed structure.
UNSPECIFIED FIELD	Unspecified ~~(see 3.4.3)~~

Tables listing fields in mode pages have an additional column that indicates whether the field is changeable or not.

~~3.5.4.2.2 Detailed field description~~

~~A paragraph at this level is used to describe the implementation of a sub-field of a summary field at a higher level, or a field in a mode page, log page, sense data, or other referenced information structure.~~

3.5.5 Use of field names defined in ATA standards and specifications

This standard discusses fields and values defined in other standards and specifications, in particular the ~~ATA/ATAPI-7~~, ~~ATA8-AST,~~ ATA8-APT, ATA8-ACS, ATA8-AAM, and SCT standards developed by T13, and the SATA-2.5 specification. Such fields and values discussed in this standard are shown using the same notation conventions used in the standards where those fields and values are defined.

When this standard uses terms defined in T13 ATA standards or the SATA-2.5 specification, the following conventions apply:

a) The names of abbreviations, commands, and acronyms used as signal names are in all uppercase (e.g., IDENTIFY DEVICE). Fields containing only one bit are usually referred to as the “name” bit instead of the “name” field.
b) Names of device registers, fields in data structures, and other defined terms begin with a upper-case letter (e.g., LBA Mid register) and may be represented in mixed-case (e.g. PhyRdy).
c) The expression “word n” or “bit n” shall be interpreted as indicating the content of word n or bit n.
d) Signal names are shown in all uppercase letters. All signals are either high active or low active signals. A dash character (-) at the end of a signal name indicates the signal is a low active signal. No dash at the end of a signal name indicates the signal is a high active signal.
e) Asserted means that the signal is driven by an active circuit to the true state. Negated means that the signal is driven by an active circuit to the false state. Released means that the signal is not actively driven to any state.
f) SIGNAL(n:m) denotes a set of signals, for example, DD(15:0).
g) Bit names are shown in all uppercase letters except where a lowercase n precedes a bit name. If there is no preceding n, then when BIT is set to one the meaning of the bit is true, and when BIT is cleared to zero the meaning of the bit is false. If there is a preceding n, then when nBIT is cleared to zero the meaning of the bit is true and when nBIT is set to one the meaning of the bit is false.
h) Bit (n:m) denotes a set of bits, for example, bits (7:0).
i) Primitive names are followed by a ‘P’ subscript (e.g., R_OK$_P$).

1 General

This standard defines a translation layer that may be inserted between host driver software and Serial ATA or Parallel ATA devices. The translation layer thus defined maps SCSI commands and SAM-3 behaviors to ATA devices. The mapping provides a consistent SAM-3, SPC-3, and SBC-2 view of the translated ATA devices to the host driver software.

The following items are defined.

a) translation of selected SCSI commands implemented using ATA devices;
b) specification of sense data reporting;
c) mode and log pages applicable to SCSI devices emulated using ATA devices;
d) usage of task management functions for SCSI emulation using ATA devices;
e) mapping of SMART functions;
f) elements to facilitate use of SATA port selectors and SATA port multipliers;
g) elements to provide consistent mapping of ATA/ATAPI devices as SCSI devices; and
h) other capabilities that may fit within the scope of this standard.

Implementations of SCSI/ATA Translation may provide varying levels of SCSI function. Two examples are:

a) The SATL may provide a level of SCSI emulation that is indistinguishable from native SCSI devices in terms of reported capabilities. Such SATL implementations need little guidance from this standard to effect interoperability since other SCSI protocol standards define all that is required to establish interoperability; and
b) A SCSI / ATA Translation implementation may:
   A) implement a subset of SCSI;
   B) have limited or no capability to maintain persistent information about the characteristics or state of the emulated SCSI device;
   C) have limited capability to manage device state information that carries forward from one command to the next; and
   D) maintain little or no capability to coordinate between multiple commands outstanding at a time.

   The characteristics and behavior of the underlying ATA devices in these minimal implementations of the SATL are expected to be more visible to the SCSI application clients.

This standard provides a set of definitions, conventions, and guidelines for:

a) the consistent reporting of capabilities of emulated SCSI devices implemented by the SATL;
b) the consistent identification of the attached devices; and
c) identification of limits for specific levels of SATL capability.

This allows SATL aware and SATL non-aware application clients to establish standard behaviors for all implementations.

The objective of this standard is to allow a complete set of SCSI functions while minimizing the complexity of the SATL and preserving compatibility with existing SCSI application clients.

By outlining expected behavior in terms of the SCSI commands issued, corresponding activity in the ATA domain, and expected SCSI responses based on the results of activity in the ATA domain; this standard eliminates:

a) incompatibility between legacy SCSI/ATA Translation implementations; and
b) SCSI application client /device interdependence.

This standard refers to behaviors for SCSI devices defined in SBC-2 and SPC-3. Unless otherwise specified, any behaviors that are optional in SBC-2 or SPC-3 are optional for devices implementing SCSI / ATA Translation. Any optional behaviors referred to in this standard and implemented by the SATL shall be implemented as described in this standard.

If the SATL receives a SCSI request specifying any value in any field of the CDB that the SATL does not support, the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB (see SPC-3).

If the SATL receives a SCSI request specifying any value in any field of the parameter data that the SATL does not support, the SATL shall terminate the command with CHECK CONDITION status with the sense key

4 General

This standard defines a translation layer that may be inserted between host driver software and Serial ATA or Parallel ATA devices. The translation layer thus defined maps SCSI commands and SAM-3 behaviors to ATA devices. The mapping provides a consistent SAM-3, SPC-3, and SBC-2 view of the translated ATA devices to the host driver software.

The following items are defined.

a) translation of selected SCSI commands implemented using ATA devices;
b) specification of sense data reporting;
c) mode and log pages applicable to SCSI devices emulated using ATA devices;
d) usage of task management functions for SCSI emulation using ATA devices;
e) mapping of SMART functions;
f) elements to facilitate use of SATA port selectors and SATA port multipliers;
g) elements to provide consistent mapping of ATA/ATAPI devices as SCSI devices; and
h) other capabilities that may fit within the scope of this standard.

Implementations of SCSI/ATA Translation may provide varying levels of SCSI function. Two examples are:

a) The SATL may provide a level of SCSI emulation that is indistinguishable from native SCSI devices in terms of reported capabilities. Such SATL implementations need little guidance from this standard to effect interoperability since other SCSI protocol standards define all that is required to establish interoperability; and
b) A SCSI / ATA Translation implementation may:
   A) implement a subset of SCSI;
   B) have limited or no capability to maintain persistent information about the characteristics or state of the emulated SCSI device;
   C) have limited capability to manage device state information that carries forward from one command to the next; and
   D) maintain little or no capability to coordinate between multiple commands outstanding at a time.

   The characteristics and behavior of the underlying ATA devices in these minimal implementations of the SATL are expected to be more visible to the SCSI application clients.

This standard provides a set of definitions, conventions, and guidelines for:

a) the consistent reporting of capabilities of emulated SCSI devices implemented by the SATL;
b) the consistent identification of the attached devices; and
c) identification of limits for specific levels of SATL capability.

This allows SATL aware and SATL non-aware application clients to establish standard behaviors for all implementations.

The objective of this standard is to allow a complete set of SCSI functions while minimizing the complexity of the SATL and preserving compatibility with existing SCSI application clients.

By outlining expected behavior in terms of the SCSI commands issued, corresponding activity in the ATA domain, and expected SCSI responses based on the results of activity in the ATA domain; this standard eliminates:

a) incompatibility between legacy SCSI/ATA Translation implementations; and
b) SCSI application client /device interdependence.

This standard refers to behaviors for SCSI devices defined in SBC-2 and SPC-3. Unless otherwise specified, any behaviors that are optional in SBC-2 or SPC-3 are optional for devices implementing SCSI / ATA Translation. Any optional behaviors referred to in this standard and implemented by the SATL shall be implemented as described in this standard.

If the SATL receives a SCSI request specifying any value in any field of the CDB that the SATL does not support, the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB (see SPC-3).

If the SATL receives a SCSI request specifying any value in any field of the parameter data that the SATL does not support, the SATL shall terminate the command with CHECK CONDITION status with the sense key

4 General

This standard defines a translation layer that may be inserted between host driver software and Serial ATA or Parallel ATA devices. The translation layer thus defined maps SCSI commands and SAM-3 behaviors to ATA devices. The mapping provides a consistent SAM-3, SPC-3, and SBC-2 view of the translated ATA devices to the host driver software.

The following items are defined.

a) translation of selected SCSI commands implemented using ATA devices;
b) specification of sense data reporting;
c) mode and log pages applicable to SCSI devices emulated using ATA devices;
d) usage of task management functions for SCSI emulation using ATA devices;
e) mapping of SMART functions;
f) elements to facilitate use of SATA port selectors and SATA port multipliers;
g) elements to provide consistent mapping of ATA/ATAPI devices as SCSI devices; and
h) other capabilities that may fit within the scope of this standard.

Implementations of SCSI/ATA Translation may provide varying levels of SCSI function. Two examples are:

a) The SATL may provide a level of SCSI emulation that is indistinguishable from native SCSI devices in terms of reported capabilities. Such SATL implementations need little guidance from this standard to effect interoperability since other SCSI protocol standards define all that is required to establish interoperability; and
b) A SCSI / ATA Translation implementation may:
   A) implement a subset of SCSI;
   B) have limited or no capability to maintain persistent information about the characteristics or state of the emulated SCSI device;
   C) have limited capability to manage device state information that carries forward from one command to the next; and
   D) maintain little or no capability to coordinate between multiple commands outstanding at a time.
   The characteristics and behavior of the underlying ATA devices in these minimal implementations of the SATL are expected to be more visible to the SCSI application clients.

This standard provides a set of definitions, conventions, and guidelines for:

a) the consistent reporting of capabilities of emulated SCSI devices implemented by the SATL;
b) the consistent identification of the attached devices; and
c) identification of limits for specific levels of SATL capability.

This allows SATL aware and SATL non-aware application clients to establish standard behaviors for all implementations.

The objective of this standard is to allow a complete set of SCSI functions while minimizing the complexity of the SATL and preserving compatibility with existing SCSI application clients.

By outlining expected behavior in terms of the SCSI commands issued, corresponding activity in the ATA domain, and expected SCSI responses based on the results of activity in the ATA domain; this standard eliminates:

a) incompatibility between legacy SCSI/ATA 10 anslation implementations; and
b) SCSI application client /device interdependence.

This standard refers to behaviors for SCSI devices defined in SBC-2 and SPC-3. Unless otherwise specified, any behaviors that are optional in SBC-2 or SPC-3 are optional for devices implementing SCSI / ATA Translation. Any optional behaviors referred to in this standard and implemented by the SATL shall be implemented as described in this standard.

If the SATL receives a SCSI request specifying any value in any field of the CDB that the SATL does not support, the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB (see SPC-3).

If the SATL receives a SCSI request specifying any value in any field of the parameter data that the SATL does not support, the SATL shall terminate the command with CHECK CONDITION status with the sense key

5 SCSI Architectural Elements

5.1 Overview

Clause 5 defines SCSI/ATA translation elements that impact the representation of the storage domain in terms of elements defined in SAM-3.

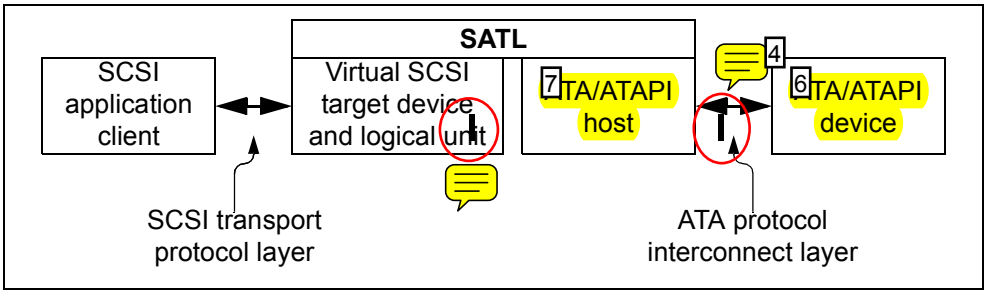

Figure 4 — SAT functional protocol reference model

Figure 4 shows a SATL connecting a SCSI application client to an ATA/ATAPI device. The SATL accomplishes this by:

a) emulating a SCSI logical unit;
b) integrating an ATA/ATAPI host; and
c) providing the translation elements to link them together.
d) This standard defines SCSI/ATA translation using SCSI and ATA command sets. This standard does not define the mapping of transport capabilities as defined at the SCSI Transport Protocol Layer and the ATA Protocol Interconnect Layer.

An implementation utilizing a SATL may ~~or may not~~ include a SCSI transport. Examples of a SATL implemented in accordance to this standard include:

a) A SATL contained within a SCSI target comprised of ATA/ATAPI devices using a defined SCSI transport (e.g., Fibre Channel, SCSI parallel interface, or SBP-3);
b) An ATA/ATAPI Host Bus Adapter (HBA) directly connected to ATA/ATAPI devices, and provides SCSI transport protocol layer services to a SCSI application client in accordance with SAM-3; and
c) A SAS STP initiator port (see SAS-1.1) to connect ATA/ATAPI devices. The STP initiator port includes a SATL to provide the SCSI transport protocol layer services to the application client.

This standard defines SCSI/ATA Translation rules for:

a) generating responses to SCSI task management requests;
b) returning standard INQUIRY data and VPD pages;
c) mapping of ATA IDENTIFY DEVICE data to common and protocol-specific VPD pages;
d) mapping SCSI tasks to ATA commands (e.g., SATA NCQ);
e) mapping SCSI mode page fields to the capabilities provided by underlying ATA devices;
f) implementing mode pages, and the effects of mode page settings on ATA-domain operations;
g) returning log pages;
h) implementing read and write commands;
i) implementing the ATA PASS-THROUGH command;
j) returning SCSI sense data with respect to conditions that may occur in the ATA domain; and
k) mapping ATA responses to SCSI responses.

5.2 Unit attention condition

The SATL shall report asynchronous events to SCSI application clients by emulating unit attention conditions (see SAM-3).

5 SCSI Architectural Elements

5.1 Overview

Clause 5 defines SCSI/ATA translation elements that impact the representation of the storage domain in terms of elements defined in SAM-3.

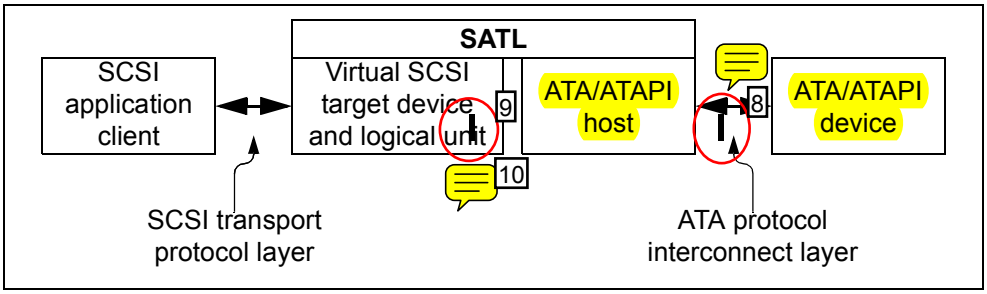

Figure 4 — SAT functional protocol reference model

Figure 4 shows a SATL connecting a SCSI application client to an ATA/ATAPI device. The SATL accomplishes this by:

a) emulating a SCSI logical unit;
b) integrating an ATA/ATAPI host; and
c) providing the translation elements to link them together.
d) This standard defines SCSI/ATA translation using SCSI and ATA command sets. This standard does not define the mapping of transport capabilities as defined at the SCSI Transport Protocol Layer and the ATA Protocol Interconnect Layer.

An implementation utilizing a SATL may ~~or may not~~ include a SCSI transport. Examples of a SATL implemented in accordance to this standard include:

a) A SATL contained within a SCSI target comprised of ATA/ATAPI devices using a defined SCSI transport (e.g., Fibre Channel, SCSI parallel interface, or SBP-3);
b) An ATA/ATAPI Host Bus Adapter (HBA) directly connected to ATA/ATAPI devices, and provides SCSI transport protocol layer services to a SCSI application client in accordance with SAM-3; and
c) A SAS STP initiator port (see SAS-1.1) to connect ATA/ATAPI devices. The STP initiator port includes a SATL to provide the SCSI transport protocol layer services to the application client.

This standard defines SCSI/ATA Translation rules for:

a) generating responses to SCSI task management requests;
b) returning standard INQUIRY data and VPD pages;
c) mapping of ATA IDENTIFY DEVICE data to common and protocol-specific VPD pages;
d) mapping SCSI tasks to ATA commands (e.g., SATA NCQ);
e) mapping SCSI mode page fields to the capabilities provided by underlying ATA devices;
f) implementing mode pages, and the effects of mode page settings on ATA-domain operations;
g) returning log pages;
h) implementing read and write commands;
i) implementing the ATA PASS-THROUGH command;
j) returning SCSI sense data with respect to conditions that may occur in the ATA domain; and
k) mapping ATA responses to SCSI responses.

5.2 Unit attention condition

The SATL shall report asynchronous events to SCSI application clients by emulating unit attention conditions (see SAM-3).

5 SCSI Architectural Elements

5.1 Overview

Clause 5 defines SCSI/ATA translation elements that impact the representation of the storage domain in terms of elements defined in SAM-3.

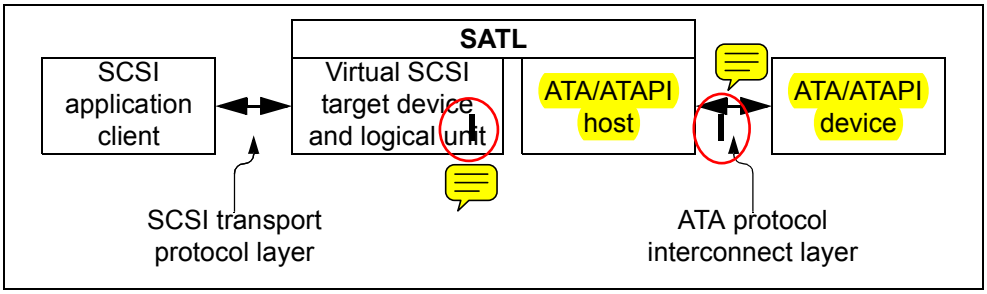

Figure 4 — SAT functional protocol reference model

Figure 4 shows a SATL connecting a SCSI application client to an ATA/ATAPI device. The SATL accomplishes this by:

a) emulating a SCSI logical unit;
b) integrating an ATA/ATAPI host; and
c) providing the translation elements to link them together.
d) This standard defines SCSI/ATA translation using SCSI and ATA command sets. This standard does not define the mapping of transport capabilities as defined at the SCSI Transport Protocol Layer and the ATA Protocol Interconnect Layer.

An implementation utilizing a SATL may ~~or may not~~ include a SCSI transport. Examples of a SATL implemented in accordance to this standard include:

a) A SATL contained within a SCSI target comprised of ATA/ATAPI devices using a defined SCSI transport (e.g., Fibre Channel, SCSI parallel interface, or SBP-3);
b) An ATA/ATAPI Host Bus Adapter (HBA) directly connected to ATA/ATAPI devices, and provides SCSI transport protocol layer services to a SCSI application client in accordance with SAM-3; and
c) A SAS STP initiator port (see SAS-1.1) to connect ATA/ATAPI devices. The STP initiator port includes a SATL to provide the SCSI transport protocol layer services to the application client.

This standard defines SCSI/ATA Translation rules for:

a) generating responses to SCSI task management requests;
b) returning standard INQUIRY data and VPD pages;
c) mapping of ATA IDENTIFY DEVICE data to common and protocol-specific VPD pages;
d) mapping SCSI tasks to ATA commands (e.g., SATA NCQ);
e) mapping SCSI mode page fields to the capabilities provided by underlying ATA devices;
f) implementing mode pages, and the effects of mode page settings on ATA-domain operations;
g) returning log pages;
h) implementing read and write commands;
i) implementing the ATA PASS-THROUGH command;
j) returning SCSI sense data with respect to conditions that may occur in the ATA domain; and
k) mapping ATA responses to SCSI responses.

5.2 Unit attention condition

The SATL shall report asynchronous events to SCSI application clients by emulating unit attention conditions 34 (see SAM-3).

Mark the two-line paragraph that introduces this subclause "keep with next" so that it joins the main body of the subclause on the next page. This will not affect overall pagination because there is almost half a page of white space on the next page.

Status
rlsheffi Completed 5/30/2006 8:38:14 PM

A SATL that detects a link reset for a Serial ATA device or initiates any reset of an ATA/ATAPI device shall establish a unit attention condition on behalf of the logical unit corresponding to the ATA/ATAPI device with an additional sense code of POWER ON, RESET, OR BUS DEVICE RESET OCCURRED for the SCSI initiator port associated with each I_T nexus. The method a SATL uses to detect a link reset on the Serial ATA link is vendor specific.

A SATL shall establish a unit attention condition on behalf of the logical unit in response to a reset condition initiated by the ATA host on any logical unit corresponding to an ATA/ATAPI device on the PATA bus or on a SATA link for the SCSI initiator port associated with each I_T nexus.

The SATL shall report unit attention conditions, in accordance with SAM-3, even when the SCSI command being processed results in no action on the ATA interface (e.g., a READ (10) command with a transfer length of zero).

5.3 Handling errors in ATA commands

When a SCSI command is translated into one or more ATA commands and one of the ATA commands completes with an error, the SATL shall terminate processing of the SCSI command and report the error as described in Clause 11.

When interpreting data from an ATA command, the SATL shall use the data only if no error was reported for the command. In addition:

a) when interpreting IDENTIFY DEVICE data and IDENTIFY PACKET DEVICE data, the SATL shall use the data only if the integrity word (word 255) contains the signature defined in ATA/ATAPI-7 and the checksum is correct;
b) when interpreting SMART READ DATA data for the Summary SMART error log (i.e., log address 01h), the Comprehensive SMART error log (i.e., log address 02h), the SMART self-test log (i.e., log address 06h), or the Selective self-test log (i.e., log address 09h) (see ATA/ATAPI-7), the SATL shall use the data only if the data structure checksum ~~byte~~ (byte 511) is correct; and
c) when interpreting READ LOG EXT data for Extended Comprehensive SMART error log (i.e., log address 03h) or Extended SMART self-test log (i.e., log address 07h) (see ATA/ATAPI-7), the SATL shall use the data only if the data structure checksum ~~byte~~ (byte 511) is correct.

OK: Perhaps it should say "...establish a unit attention condition (see SPC-3) on behalf of the..."

5.2 Unit attention condition
2nd Paragraph, 1st Sentence

change
"...device with an additional sense code of POWER ON, RESET, OR BUS DEVICE RESET OCCURRED for the SCSI initiator..."
to
"...device with the sense key set to UNIT ATTENTION and the additional sense code set to POWER ON, RESET, OR BUS DEVICE RESET OCCURRED for the SCSI initiator..."

REASON: SPC-3 specifies in several places to establish a unit attention condition, but does not, in that context, specify to set the sense key to UNIT ATTENTION. It would be redundant since it's already defined in the text that describes establishing a unit attention condition.

Comments from page 38 continued on next page

A SATL that detects a link reset for a Serial ATA device or initiates any reset of an ATA/ATAPI device shall establish a unit attention condition on behalf of the logical unit corresponding to the ATA/ATAPI device with an additional sense code of POWER ON, RESET, OR BUS DEVICE RESET OCCURRED for the SCSI initiator port associated with each I_T nexus. The method a SATL uses to detect a link reset on the Serial ATA link is vendor specific.

A SATL shall establish a unit attention condition on behalf of the logical unit in response to a reset condition initiated by the ATA host on any logical unit corresponding to an ATA/ATAPI device on the PATA bus or on a SATA link for the SCSI initiator port associated with each I_T nexus.

The SATL shall report unit attention conditions, in accordance with SAM-3, even when the SCSI command being processed results in no action on the ATA interface (e.g., a READ (10) command with a transfer length of zero).

5.3 Handling errors in ATA commands

When a SCSI command is translated into one or more ATA commands and one of the ATA commands completes with an error, the SATL shall terminate processing of the SCSI command and report the error as described in clause 11.

When interpreting data from an ATA command, the SATL shall use the data only if no error was reported for the command. In addition:

a) when interpreting IDENTIFY DEVICE data and IDENTIFY PACKET DEVICE data, the SATL shall use the data only if the integrity word (word 255) contains the signature defined in ATA/ATAPI-7 and the checksum is correct;
b) when interpreting SMART READ DATA data for the Summary SMART error log (i.e., log address 01h), the Comprehensive SMART error log (i.e., log address 02h), the SMART self-test log (i.e., log address 06h), or the Selective self-test log (i.e., log address 09h) (see ATA/ATAPI-7), the SATL shall use the data only if the data structure checksum ~~byte~~ (byte 511) is correct; and
c) when interpreting READ LOG EXT data for Extended Comprehensive SMART error log (i.e., log address 03h) or Extended SMART self-test log (i.e., log address 07h) (see ATA/ATAPI-7), the SATL shall use the data only if the data structure checksum ~~byte~~ (byte 511) is correct.

Author: DELL[KMarks]
Subject: Note
Date: 3/5/2006 1:27:47 PM

5.2 Unit attention condition

This seems to say the same as above. What reset condition initiated by the ATA host is not covered in the previous paragraph..

What reset condition can be initiated from the ATA host without the SATL's instructions to do so.

RESOLUTION: delete the paragraph: "A SATL shall establish a unit attention condition on behalf of the logical unit in response to a reset condition initiated by the ATA host on any logical unit corresponding to an ATA/ATAPI device on the PATA bus or on a SATA link for the SCSI initiator port associated with each I_T nexus."

---

a) report support for the basic task management model in SCSI standard INQUIRY data (i.e., the BQUE bit is set to one and CMDQUE bit is set to zero), and follow the rules for the basic task management model (see SAM-3); or

b) report support for the full task management model in SCSI standard INQUIRY data (i.e., the BQUE bit is set to zero and CMDQUE bit is set to one), and report 01b in the Queue error management (QERR) field of the SCSI Control mode page.

A SATL that supports SATA NCQ or ATA TCQ may report support for the full task management model with a QERR field set to a value other than 01b only if the SATL reissues all queued commands aborted by the ATA device due to an error condition reported by the ATA device on any one of the queued commands.

Error conditions with outstanding commands to an attached ATA device ~~generally~~ affect all outstanding commands being processed by the ATA device. See ATA/ATAPI-7 or SATA-2 for a description of how to determine the status of each command.

For each SCSI tagged task the SATL translates to an ATA device using SATA NCQ or ATA TCQ, the SATL shall allocate an inactive tag value (e.g. for NCQ, corresponding to an available bit in the reserved field of the SActive register). The SATL shall maintain a mapping between allocated NCQ or TCQ tags and the corresponding SCSI task tags.

The SATL shall detect the maximum queue depth supported by the ATA device (i.e., check word 75 in IDENTIFY DEVICE data), and may either:

a) report a status of TASK SET FULL in response to a SCSI command issued to the corresponding emulated SCSI device when the ATA device represented has the maximum number of queued commands outstanding; or

b) queue the command internally and return TASK SET FULL status when the SATL exhausts ~~it's~~ internal queueing resources.

6.2.3 Commands the SATL queues internally

When queued commands are outstanding to the ATA device and new commands are received by the SATL that cannot be queued by the ATA device, the SATL shall queue the commands internally, or return a TASK SET FULL or BUSY status until at least one queued command has ~~been~~ completed. The SATL shall defer processing of the newly received non queued commands until the queued commands complete processing. The SATL shall perform task management in accordance with the reported task management model supported in accordance with the requirements in SAM-3.

If the SATL supports queued commands and the translation requires a mix of queued and non queued commands the SATL shall defer processing of subsequent commands, complete processing of all outstanding queued commands, process the non queued command, and then continue processing the previously deferred commands.

6.2.4 Multi-initiator and multi-port command queuing

If the SATL is accessed through a SCSI target port the SATL may be accessible by more than one SCSI initiator port and through more than one SCSI target port. As specified in SAM-3, the task tags maintained in the SATL mapping of task tags to NCQ tags or TCQ tags shall be qualified by the I_T_nexus from which the command was received. When translating from an NCQ tag or TCQ tag to the corresponding SCSI task tag, the SATL shall determine the correct SCSI I_T_nexus using the qualification information associated with the SCSI task tag. The SATL may return TASK SET FULL even if the SATA device has available NCQ tags or TCQ tags in order to maintain tags available for other initiators.

6.3 Task management functions

6.3.1 Task management functions overview

This subclause describes the translation of SCSI task management functions to ATA or SATA equivalents.

NOTE 2 - Due to architectural differences, some task management functions may not be successfully translated to ATA commands or control operations.

Comments from page 40 continued on next page

a) report support for the basic task management model in ~~SCSI~~ standard INQUIRY data (i.e., the BQUE bit is set to one and CMDQUE bit is set to zero), and follow the rules for the basic task management model (see SAM-3); or

b) report support for the full task management model in ~~SCSI~~ standard INQUIRY data (i.e., the BQUE bit is set to zero and CMDQUE bit is set to one), and report 01b in the Queue error management (QERR) field of the SCSI Control mode page.

A SATL that supports SATA NCQ or ATA TCQ may report support for the full task management model with a QERR field set to a value other than 01b only if the SATL reissues all queued commands aborted by the ATA device due to an error condition reported by the ATA device on any one of the queued commands.

Error conditions with outstanding commands to an attached ATA device ~~generally~~ affect all outstanding commands being processed by the ATA device. See ATA/ATAPI-7 or 13 ATA-2 for a description of how to determine the status of each command.

For each SCSI tagged task the SATL translates to an ATA device using SATA NCQ or ATA TCQ, the SATL shall allocate an 14 active tag 15 ue (e.g. for NCQ, corresponding to an available bit in the reserved field of the SActive register). The SATL shall maintain a mapping between allocated NCQ or TCQ tags and the corresponding SCSI task tags. 16

The SATL shall detect the maximum queue depth supported by the ATA device (i.e., check word 75 in IDENTIFY DEVICE data), and may either:

a) report a status of TASK SET FULL in response to a SCSI command issued to the corresponding emulated SCSI device when the ATA device represented has the maximum number of queued commands outstanding; or

b) queue the command internally and return TASK SET FULL status when the SATL exhausts ~~it's~~ internal queueing resources.

6.2.3 Commands the SATL queues internally

When queued commands are outstanding to the ATA device and new commands are received by the SATL that cannot be queued by the ATA device, the SATL shall queue the commands internally, or return a TASK SET FULL or BUSY status until at least one queued command has ~~been~~ completed. The SATL shall defer processing of the newly received non queued commands until the queued commands complete processing. The SATL shall perform task management in accordance with the reported task management model supported in accordance with the requirements in SAM-3.

If the SATL supports queued commands and the translation requires a mix of queued and non queued commands the SATL shall defer processing of subsequent commands, complete processing of all outstanding queued commands, process the non queued command, and then continue processing the previously deferred commands.

6.2.4 Multi-initiator and multi-port command queuing

If the SATL is accessed through a SCSI target port the SATL may be accessible by more than one SCSI initiator port and through more than one SCSI target port. As specified in SAM-3, the task tags maintained in the SATL mapping of task tags to NCQ tags or TCQ tags shall be qualified by the I_T_nexus from which the command was received. When translating from an NCQ tag or TCQ tag to the corresponding SCSI task tag, the SATL shall determine the correct SCSI I_T_nexus using the qualification information associated with the SCSI task tag. The SATL may return TASK SET FULL even if the SATA device has available NCQ tags or TCQ tags in order to maintain tags available for other initiators.

6.3 Task management functions

Comments from page 40 continued on next page

a) report support for the basic task management model in ~~SCSI~~ standard INQUIRY data (i.e., the BQUE bit is set to one and CMDQUE bit is set to zero), and follow the rules for the basic task management model (see SAM-3); or

b) report support for the full task management model in ~~SCSI~~ standard INQUIRY data (i.e., the BQUE bit is set to zero and CMDQUE bit is set to one), and report 01b in the Queue error management (QERR) field of the SCSI Control mode page.

A SATL that supports SATA NCQ or ATA TCQ may report support for the full task management model with a QERR field set to a value other than 01b only if the SATL reissues all queued commands aborted by the ATA device due to an error condition reported by the ATA device on any one of the queued commands.

Error conditions with outstanding commands to an attached ATA device ~~generally~~ affect all outstanding commands being processed by the ATA device. See ATA/ATAPI-7 or SATA-2 for a description of how to determine the status of each command.

For each SCSI tagged task the SATL translates to an ATA device using SATA NCQ or ATA TCQ, the SATL shall allocate an inactive tag value (e.g. for NCQ, corresponding to an available bit in the reserved field of the SActive register). The SATL shall maintain a mapping between allocated NCQ or TCQ tags and the corresponding SCSI task tags.

The SATL shall detect the maximum queue depth supported by the ATA device (i.e., check word 75 in IDENTIFY DEVICE data), and may either:

a) report a status of TASK SET FULL in response to a SCSI command issued to the corresponding emulated SCSI device when the ATA device represented has the maximum number of queued commands outstanding; or

b) queue the command internally and return TASK SET FULL status when the SATL exhausts its internal queueing resources.

6.2.3 Commands the SATL queues internally

When queued commands are outstanding to the ATA device and new commands are received by the SATL that cannot be queued by the ATA device, the SATL shall queue the commands internally, or return a TASK SET FULL or BUSY status until at least one queued command has ~~been~~ completed. The SATL shall defer processing of the newly received non queued commands until the queued commands complete processing. The SATL shall perform task management in accordance with the reported task management model supported in accordance with the requirements in SAM-3.

If the SATL supports queued commands and the translation requires a mix of queued and non queued commands the SATL shall defer processing of subsequent commands, complete processing of all outstanding queued commands, process the non queued command, and then continue processing the previously deferred commands.

6.2.4 Multi-initiator and multi-port command queuing

If the SATL is accessed through a SCSI target port the SATL may be accessible by more than one SCSI initiator port and through more than one SCSI target port. As specified in SAM-3, the task tags maintained in the SATL mapping of task tags to NCQ tags or TCQ tags shall be qualified by the I_T_nexus from which the command was received. When translating from an NCQ tag or TCQ tag to the corresponding SCSI task tag, the SATL shall determine the correct SCSI I_T_nexus using the qualification information associated with the SCSI task tag. The SATL may return TASK SET FULL even if the SATA device has available NCQ tags or TCQ tags in order to maintain tags available for other initiators.

6.3 Task management functions

6.3.1 Task management functions overview

RESOLUTION:
Replace subclause 6.2.3 as follows:

6.2.3 Commands the SATL queues internally

If the translation of a SCSI command requires the SATL to send a non-queued command to the ATA device, then the SATL shall not send the non-queued command to the ATA device until any commands outstanding in the ATA device have returned command complete (i.e., with or without error) and the bus is idle.

If the ATA device corresponding to a logical unit has not returned command complete for all ATA commands the SATL has previously sent to the ATA device, and the SATL receives a SCSI command that requires the SATL to send a non-queued command to the ATA device, the SATL shall:
a) suspend processing of the SCSI command, maintain the SCSI command in an internal queue, and resume processing when the ATA device returns command complete for all ATA commands the SATL has previously sent to the ATA device;
b) return TASK SET FULL status for the SCSI command; or
c) return BUSY status for the SCSI command.

The SATL shall perform task management in accordance with the task management model (see SAM-3) indicated in INQUIRY data and parameter data for the Control mode page (see SPC-3).

NOTE: Editor added new comments to define the terms "queued command" and "non-queued command".

Comments from page 40 continued on next page

a) report support for the basic task management model in ~~SCSI~~ standard INQUIRY data (i.e., the BQUE bit is set to one and CMDQUE bit is set to zero), and follow the rules for the basic task management model (see SAM-3); or

b) report support for the full task management model in ~~SCSI~~ standard INQUIRY data (i.e., the BQUE bit is set to zero and CMDQUE bit is set to one), and report 01b in the Queue error management (QERR) field of the SCSI Control mode page.

A SATL that supports SATA NCQ or ATA TCQ may report support for the full task management model with a QERR field set to a value other than 01b only if the SATL reissues all queued commands aborted by the ATA device due to an error condition reported by the ATA device on any one of the queued commands.

Error conditions with outstanding commands to an attached ATA device ~~generally~~ affect all outstanding commands being processed by the ATA device. See ATA/ATAPI-7 or SATA-2 for a description of how to determine the status of each command.

For each SCSI tagged task the SATL translates to an ATA device using SATA NCQ or ATA TCQ, the SATL shall allocate an inactive tag value (e.g. for NCQ, corresponding to an available bit in the reserved field of the SActive register). The SATL shall maintain a mapping between allocated NCQ or TCQ tags and the corresponding SCSI task tags.

The SATL shall detect the maximum queue depth supported by the ATA device (i.e., check word 75 in IDENTIFY DEVICE data), and may either:

a) report a status of TASK SET FULL in response to a SCSI command issued to the corresponding emulated SCSI device when the ATA device represented has the maximum number of queued commands outstanding; or

b) queue the command internally and return TASK SET FULL status when the SATL exhausts ~~it's~~ internal queueing resources.

6.2.3 Commands the SATL queues internally

When queued commands are outstanding to the ATA device and new commands are received by the SATL that cannot be queued by the ATA device, the SATL shall queue the commands internally, or return a TASK SET FULL or BUSY status until at least one queued command has been completed. The SATL shall defer processing of the newly received non queued commands until the queued commands complete processing. The SATL shall perform task management in accordance with the reported task management model supported in accordance with the requirements in SAM-3.

If the SATL supports queued commands and the translation requires a mix of queued and non queued commands the SATL shall defer processing of subsequent commands, complete processing of all outstanding queued commands, process the non queued command, and then continue processing the previously deferred commands.

6.2.4 Multi-initiator and multi-port command queuing

If the SATL is accessed through a SCSI target port the SATL may be accessible by more than one SCSI initiator port and through more than one SCSI target port. As specified in SAM-3, the task tags maintained in the SATL mapping of task tags to NCQ tags or TCQ tags shall be qualified by the I_T_nexus from which the command was received. When translating from an NCQ tag or TCQ tag to the corresponding SCSI task tag, the SATL shall determine the correct SCSI I_T_nexus using the qualification information associated with the SCSI task tag. The SATL may return TASK SET FULL even if the SATA device has available NCQ tags or TCQ tags in order to maintain tags available for other initiators.

6.3 Task management functions

6.3.1 Task management functions overview

This subclause describes the translation of SCSI task management functions to ATA or SATA equivalents.

NOTE 2 - Due to architectural differences, some task management functions may not be successfully translated to ATA commands or control operations.

Date: 2/16/2006 1:43:02 PM
6.2.3 Commands the SATL queues internally

6.2.3 Commands the SATL queues internally
1st Paragraph, 2nd Sentence
change
"The SATL shall defer processing of the newly received non queued commands until the queued commands complete processing."
to
"If the SATL receives a SCSI command that requires a non ATA queued commands to be issues to the ATA device, the SATL shall defer processing of the SCSI command until all outstanding ATA queued commands complete."

or similar wording with this intent.

Comments from page 40 continued on next page

a) report support for the basic task management model in ~~SCSI~~ standard INQUIRY data (i.e., the BQUE bit is set to one and CMDQUE bit is set to zero), and follow the rules for the basic task management model (see SAM-3); or

b) report support for the full task management model in ~~SCSI~~ standard INQUIRY data (i.e., the BQUE bit is set to zero and CMDQUE bit is set to one), and report 01b in the Queue error management (QERR) field of the SCSI Control mode page.

A SATL that supports SATA NCQ or ATA TCQ may report support for the full task management model with a QERR field set to a value other than 01b only if the SATL reissues all queued commands aborted by the ATA device due to an error condition reported by the ATA device on any one of the queued commands.

Error conditions with outstanding commands to an attached ATA device ~~generally~~ affect all outstanding commands being processed by the ATA device. See ATA/ATAPI-7 or SATA-2 for a description of how to determine the status of each command.

For each SCSI tagged task the SATL translates to an ATA device using SATA NCQ or ATA TCQ, the SATL shall allocate an inactive tag value (e.g. for NCQ, corresponding to an available bit in the reserved field of the SActive register). The SATL shall maintain a mapping between allocated NCQ or TCQ tags and the corresponding SCSI task tags.

The SATL shall detect the maximum queue depth supported by the ATA device (i.e., check word 75 in IDENTIFY DEVICE data), and may either:

a) report a status of TASK SET FULL in response to a SCSI command issued to the corresponding emulated SCSI device when the ATA device represented has the maximum number of queued commands outstanding; or

b) queue the command internally and return TASK SET FULL status when the SATL exhausts ~~it's~~ internal queueing resources.

6.2.3 Commands the SATL queues internally

When queued commands are outstanding to the ATA device and new commands are received by the SATL that cannot be queued by the ATA device, the SATL shall queue the commands internally, or return a TASK SET FULL or BUSY status until at least one queued command has ~~been~~ completed. The SATL shall defer processing of the newly received non queued commands until the queued commands complete processing. The SATL shall perform task management in accordance with the reported task management model supported in accordance with the requirements in SAM-3.

If the SATL supports queued commands and the translation requires a mix of queued and non queued commands the SATL shall defer processing of subsequent commands, complete processing of all outstanding queued commands, process the non queued command, and then continue processing the previously deferred commands.

6.2.4 Multi-initiator and multi-port command queuing

If the SATL is accessed through a SCSI target port the SATL may be accessible by more than one SCSI initiator port and through more than one SCSI target port. As specified in SAM-3, the task tags maintained in the SATL mapping of task tags to NCQ tags or TCQ tags shall be qualified by the I_T_nexus from which the command was received. When translating from an NCQ tag or TCQ tag to the corresponding SCSI task tag, the SATL shall determine the correct SCSI I_T_nexus using the qualification information associated with the SCSI task tag. The SATL may return TASK SET FULL even if the SATA device has available NCQ tags or TCQ tags in order to maintain tags available for other initiators.

6.3 Task management functions

6.3.1 Task management functions overview

This subclause describes the translation of SCSI task management functions to ATA or SATA equivalents.

NOTE 2 - Due to architectural differences, some task management functions may not be successfully translated to ATA commands or control operations.

RESOLUTION: See EDITOR's comment.

6.2.4 Multi-initiator and multi-port command queuing, first sentence (“If the SATL is accessed through a SCSI target port the SATL may be accessible by more than one SCSI initiator port and through more than one SCSI target port.”): a SATL is always accessed by a SCSI initiator device through a SCSI target port, though the SCSI target port through which the SATL is accessed may be an abstract object in a system with a SATL (i.e., a virtual SCSI target port), and the SATL may contain more than one of the virtual SCSI target ports for more than one virtual SCSI target device. Change this sentence to, “A SATL may present SCSI target ports for more than one SCSI target device and may be accessed by more than one SCSI initiator port.”

Discussion: Is a SCSI target port ever associated with more than one SCSI target device? Suggestion: "A SATL may emulate more than one SCSI target device and may present more than one target port per emulated SCSI target device." Still, the point is that a SATL in an HBA that doesn't have a SCSI target port attached to an actual SCSI transport only has to worry about a single SCSI initiator port (a virtual one), and so doesn't need to apportion SATL resources among multiple initiators or qualify task tags with an initiator ID. But a SATL that attaches to an actual SCSI transport via an actual SCSI target port does have to worry about multi-initiator sorts of things. Has this point been lost in the suggested rewrite?

"A SATL that receives SCSI requests through a target port attached to a defined SCSI transport shall qualify task tags with the I_T_L nexus"

Another recommendation - after the figures are added to subclause 5.1 showing the applicable usage models, refer back to the figures to distinguish which requires a SATL to deal with multiple initiators and which doesn't.

RESOLUTION: see 06-262.

Status

Comments from page 40 continued on next page

a) report support for the basic task management model in ~~SCSI~~ standard INQUIRY data (i.e., the BQUE bit is set to one and CMDQUE bit is set to zero), and follow the rules for the basic task management model (see SAM-3); or

b) report support for the full task management model in ~~SCSI~~ standard INQUIRY data (i.e., the BQUE bit is set to zero and CMDQUE bit is set to one), and report 01b in the Queue error management (QERR) field of the SCSI Control mode page.

A SATL that supports SATA NCQ or ATA TCQ may report support for the full task management model with a QERR field set to a value other than 01b only if the SATL reissues all queued commands aborted by the ATA device due to an error condition reported by the ATA device on any one of the queued commands.

Error conditions with outstanding commands to an attached ATA device ~~generally~~ affect all outstanding commands being processed by the ATA device. See ATA/ATAPI-7 or SATA-2 for a description of how to determine the status of each command.

For each SCSI tagged task the SATL translates to an ATA device using SATA NCQ or ATA TCQ, the SATL shall allocate an inactive tag value (e.g. for NCQ, corresponding to an available bit in the reserved field of the SActive register). The SATL shall maintain a mapping between allocated NCQ or TCQ tags and the corresponding SCSI task tags.

The SATL shall detect the maximum queue depth supported by the ATA device (i.e., check word 75 in IDENTIFY DEVICE data), and may either:

a) report a status of TASK SET FULL in response to a SCSI command issued to the corresponding emulated SCSI device when the ATA device represented has the maximum number of queued commands outstanding; or

b) queue the command internally and return TASK SET FULL status when the SATL exhausts ~~it's~~ internal queueing resources.

6.2.3 Commands the SATL queues internally

When queued commands are outstanding to the ATA device and new commands are received by the SATL that cannot be queued by the ATA device, the SATL shall queue the commands internally, or return a TASK SET FULL or BUSY status until at least one queued command has ~~been~~ completed. The SATL shall defer processing of the newly received non queued commands until the queued commands complete processing. The SATL shall perform task management in accordance with the reported task management model supported in accordance with the requirements in SAM-3.

If the SATL supports queued commands and the translation requires a mix of queued and non queued commands the SATL shall defer processing of subsequent commands, complete processing of all outstanding queued commands, process the non queued command, and then continue processing the previously deferred commands.

6.2.4 Multi-initiator and multi-port command queuing

If the SATL is accessed through a SCSI target port the SATL may be accessible by more than one SCSI initiator port and through more than one SCSI target port. As specified in SAM-3, the task tags maintained in the SATL mapping of task tags to NCQ tags or TCQ tags shall be qualified by the I_T_nexus from which the command was received. When translating from an NCQ tag or TCQ tag to the corresponding SCSI task tag, the SATL shall determine the correct SCSI I_T_nexus using the qualification information associated with the SCSI task tag. The SATL may return TASK SET FULL even if the SATA device has available NCQ tags or TCQ tags in order to maintain tags available for other initiators.

3.3.2 ABORT TASK

The SATL may process the ABORT TASK service request an any of the following ways:

a) If no commands have yet been issued to the ATA device for the processing of the specified SCSI task tag the SATL shall delete the specified task from the SATL internal context and respond to the ABORT TASK request with FUNCTION COMPLETE.

b) If the only command(s) being processed in the ATA device are related to the SCSI task specified by the ABORT TASK request, then the SATL may abort the ATA command(s) and respond with FUNCTION COMPLETE.

c) If the ATA device is processing commands for SCSI tasks in addition to the task specified by the ABORT TASK request the SATL shall:

A) abort outstanding ATA commands and respond to the ABORT TASK request with FUNCTION COMPLETE (see SAM3); and

B) for each initiator port associated with an I_T_Nexus that had a task aborted, the SATL shall complete at least one command for that I_T_Nexus with CHECK CONDITION status with the sense key set to UNIT ATTENTION and additional sense code set to COMMANDS CLEARED BY ANOTHER INITIATOR.

NOTE 3 - It may be that the first place the SATL can abort the command without preventing the processing of other commands is when the attached ATA device returns completion status for the ATA command. In this case the SATL would not provide a SCSI response for the aborted command, even though processing completed in the ATA domain, but instead return FUNCTION COMPLETE for the ABORT TASK request.

6.3.3 ABORT TASK SET

The SATL may handle the ABORT TASK SET service request differently depending on whether the SATL provides multiple initiators access to the emulated SCSI device or not.

If the SATL does not provide multiple I_T nexuses access to the emulated SCSI device, the SATL shall process the service request as follows:

1) If commands have not been issued to the ATA device for the processing of the specified SCSI task tag the SATL shall delete all tasks in the task set from the SATL internal context and respond to the ABORT TASK SET request with FUNCTION COMPLETE.

2) If the only command(s) being processed in the ATA device are associated to the SCSI tasks in the task set, then the SATL shall abort the ATA command(s) and respond with FUNCTION COMPLETE.

3) The SATL shall abort outstanding ATA command(s) and respond to the ABORT TASK SET request with a FUNCTION COMPLETE.

If the SATL provides multiple initiators access to the emulated SCSI device, the SATL shall process the service request as follows:

a) If commands have not been issued to the ATA device for the processing of the specified SCSI task tag the SATL shall delete the specified task from the SATL internal context and respond to the ABORT TASK SET request with FUNCTION COMPLETE.

b) For each initiator port associated with an I_T_Nexus that had a task aborted, the SATL shall complete at least one command for that I_T_Nexus with CHECK CONDITION status with the sense key set to UNIT ATTENTION and additional sense code set to COMMANDS CLEARED BY ANOTHER INITIATOR.

6.3.4 CLEAR ACA

The SATL shall not support auto-contingent allegiance. The SATL shall indicate ACA is not supported by returning zero in the NORMACA bit in standard INQUIRY data. The SATL shall respond to a CLEAR ACA service request with FUNCTION REJECTED.

6.3.5 CLEAR TASK SET

The SATL may handle the CLEAR TASK SET service request differently depending on whether the SATL provides multiple initiators access to the emulated SCSI device or not.

If no ATA commands have yet been issued to the ATA device for the processing of the SCSI task tag specified in the ABORT TASK task management function, then the SATL shall delete the specified task from the SATL internal context and respond to the ABORT TASK task management function with service response of FUNCTION COMPLETE (see SAM-3).

If the only ATA command(s) being processed in the ATA device are related to the SCSI task specified by the ABORT TASK task management function, then the SATL shall abort the ATA command(s) and respond to the ABORT TASK task management function with a service response of FUNCTION COMPLETE.

If the ATA device is processing ATA commands for SCSI tasks in addition to the task specified by the ABORT TASK task management function, then the SATL shall abort all outstanding ATA commands, and:

a) respond to the ABORT TASK task management function with a service response of FUNCTION COMPLETE;
b) if outstanding commands for other tasks in the task set for the same I_T nexus as the one that originated the ABORT TASK task management function are aborted, then the SATL shall complete at least one command for the I_T nexus that originated the ABORT TASK task management function with CHECK CONDITION status with the sense key set to UNIT ATTENTION and the additional sense code set to COMMANDS CLEARED BY ANOTHER INITIATOR; and
c) for each other I_T nexus that had a task aborted, the SATL shall complete at least one command for that I_T nexus with CHECK CONDITION status with the sense key set to UNIT ATTENTION and additional sense code set to COMMANDS CLEARED BY ANOTHER INITIATOR.

NOTE 3 - It may be that the first time the SATL is able to abort the command without preventing the processing of other commands is when the attached ATA device returns completion status for the ATA command. In this case, the SATL does not provide a SCSI response for the aborted command, even though processing completed in the ATA domain, but instead returns a service response of FUNCTION COMPLETE for the ABORT TASK task management function.

6.3.2 ABORT TASK

The SATL may process the ABORT TASK service request in any of the following ways:

a) If no commands have yet been issued to the ATA device for the processing of the specified SCSI task tag the SATL shall delete the specified task from the SATL internal context and respond to the ABORT TASK request with FUNCTION COMPLETE.

b) If the only command(s) being processed in the ATA device are related to the SCSI task specified by the ABORT TASK request, then the SATL may abort the ATA command(s) and respond with FUNCTION COMPLETE.

c) If the ATA device is processing commands for SCSI tasks in addition to the task specified by the ABORT TASK request the SATL shall:

A) abort outstanding ATA commands and respond to the ABORT TASK request with FUNCTION COMPLETE (see SAM3); and

B) for each initiator port associated with an I_T_Nexus that had a task aborted, the SATL shall complete at least one command for that I_T_Nexus with CHECK CONDITION status with the sense key set to UNIT ATTENTION and additional sense code set to COMMANDS CLEARED BY ANOTHER INITIATOR.

NOTE 3 - It may be that the first place the SATL can abort the command without preventing the processing of other commands is when the attached ATA device returns completion status for the ATA command. In this case the SATL would not provide a SCSI response for the aborted command, even though processing completed in the ATA domain, but instead return FUNCTION COMPLETE for the ABORT TASK request.

6.3.3 ABORT TASK SET

The SATL may handle the ABORT TASK SET service request differently depending on whether the SATL provides multiple initiators access to the emulated SCSI device or not.

If the SATL does not provide multiple I_T nexuses access to the emulated SCSI device, the SATL shall process the service request as follows:

1) If commands have not been issued to the ATA device for the processing of the specified SCSI task tag the SATL shall delete all tasks in the task set from the SATL internal context and respond to the ABORT TASK SET request with FUNCTION COMPLETE.

2) If the only command(s) being processed in the ATA device are associated to the SCSI tasks in the task set, then the SATL shall abort the ATA command(s) and respond with FUNCTION COMPLETE.

3) The SATL shall abort outstanding ATA command(s) and respond to the ABORT TASK SET request with a FUNCTION COMPLETE.

If the SATL provides multiple initiators access to the emulated SCSI device, the SATL shall process the service request as follows:

a) If commands have not been issued to the ATA device for the processing of the specified SCSI task tag the SATL shall delete the specified task from the SATL internal context and respond to the ABORT TASK SET request with FUNCTION COMPLETE.

b) For each initiator port associated with an I_T_Nexus that had a task aborted, the SATL shall complete at least one command for that I_T_Nexus with CHECK CONDITION status with the sense key set to UNIT ATTENTION and additional sense code set to COMMANDS CLEARED BY ANOTHER INITIATOR.

6.3.4 CLEAR ACA

The SATL shall not support auto-contingent allegiance. The SATL shall indicate ACA is not supported by returning zero in the NORMACA bit in standard INQUIRY data. The SATL shall respond to a CLEAR ACA service request with FUNCTION REJECTED.

6.3.5 CLEAR TASK SET

The SATL may handle the CLEAR TASK SET service request differently depending on whether the SATL provides multiple initiators access to the emulated SCSI device or not.

b) if outstanding commands for other tasks in the task set were aborted, then the SATL shall complete at least one command for the I_T nexus that originated the ABORT TASK service request with CHECK CONDITION status with the sense key set to UNIT ATTENTION and additional sense code set to COMMANDS CLEARED BY ANOTHER INITIATOR; and
c) for each other I_T nexus that had a task aborted, the SATL shall complete at least one command for that I_T nexus with CHECK CONDITION status with the sense key set to UNIT ATTENTION and additional sense code set to COMMANDS CLEARED BY ANOTHER INITIATOR.

NOTE 3 - It may be that the first time the SATL is able to abort the command without preventing the processing of other commands is when the attached ATA device returns completion status for the ATA command. In this case the SATL does not provide a SCSI response for the aborted command, even though processing completed in the ATA domain, but instead return FUNCTION COMPLETE for the ABORT TASK request.

Confirm (with Mark Evans): Item b) still isn't quite correct. It seems to apply to "other tasks in the task set", whether the "other tasks" are in the same I_T nexus as the ABORT TASK request or not. So, if it happens that all the "other tasks" are for a different I_T nexus, b) specifies, incorrectly, to generate a UNIT ATTENTION condition for the I_T nexus that originated the ABORT TASK service request. This could be fixed by rewriting b) as follows:
b) if outstanding commands for other tasks in the task set for the same I_T nexus as the one that originated the ABORT TASK service request are aborted, then the SATL shall complete at least one command for the I_T nexus that originated the ABORT TASK service request with CHECK CONDITION status with the sense key set to UNIT ATTENTION and the additional sense code set to COMMANDS CLEARED BY ANOTHER INITIATOR; and

T6.3.2 ABORT TASK
1st Paragraph, 2nd Sentent
change
"...the ABORT TASK service request an any of the following ways:"
to
"...the ABORT TASK task management function request as follows:"

Comments from page 41 continued on next page

6.3.2 ABORT TASK

The SATL may process the ABORT TASK service request an any of the following ways:

a) If no commands have yet been issued to the ATA device for the processing of the specified SCSI task tag the SATL shall delete the specified task from the SATL internal context and respond to the ABORT TASK request with FUNCTION COMPLETE.

b) If the only command(s) being processed in the ATA device are related to the SCSI task specified by the ABORT TASK request, then the SATL may abort the ATA command(s) and respond with FUNCTION COMPLETE.

c) If the ATA device is processing commands for SCSI tasks in addition to the task specified by the ABORT TASK request the SATL shall:

A) abort outstanding ATA commands and respond to the ABORT TASK request with FUNCTION COMPLETE (see SAM3); and

B) for each initiator port associated with an I_T_Nexus that had a task aborted, the SATL shall complete at least one command for that I_T_Nexus with CHECK CONDITION status with the sense key set to UNIT ATTENTION and additional sense code set to COMMANDS CLEARED BY ANOTHER INITIATOR.

NOTE 3 - It may be that the first place the SATL can abort the command without preventing the processing of other commands is when the attached ATA device returns completion status for the ATA command. In this case the SATL would not provide a SCSI response for the aborted command, even though processing completed in the ATA domain, but instead return FUNCTION COMPLETE for the ABORT TASK request.

6.3.3 ABORT TASK SET

The SATL may handle the ABORT TASK SET service request differently depending on whether the SATL provides multiple initiators access to the emulated SCSI device or not.

If the SATL does not provide multiple I_T nexuses access to the emulated SCSI device, the SATL shall process the service request as follows:

1) If commands have not been issued to the ATA device for the processing of the specified SCSI task tag the SATL shall delete all tasks in the task set from the SATL internal context and respond to the ABORT TASK SET request with FUNCTION COMPLETE.
2) If the only command(s) being processed in the ATA device are associated to the SCSI tasks in the task set, then the SATL shall abort the ATA command(s) and respond with FUNCTION COMPLETE.
3) The SATL shall abort outstanding ATA command(s) and respond to the ABORT TASK SET request with a FUNCTION COMPLETE.

If the SATL provides multiple initiators access to the emulated SCSI device, the SATL shall process the service request as follows:

a) If commands have not been issued to the ATA device for the processing of the specified SCSI task tag the SATL shall delete the specified task from the SATL internal context and respond to the ABORT TASK SET request with FUNCTION COMPLETE.
b) For each initiator port associated with an I_T_Nexus that had a task aborted, the SATL shall complete at least one command for that I_T_Nexus with CHECK CONDITION status with the sense key set to UNIT ATTENTION and additional sense code set to COMMANDS CLEARED BY ANOTHER INITIATOR.

6.3.4 CLEAR ACA

The SATL shall not support auto-contingent allegiance. The SATL shall indicate ACA is not supported by returning zero in the NORMACA bit in standard INQUIRY data. The SATL shall respond to a CLEAR ACA service request with FUNCTION REJECTED.

6.3.5 CLEAR TASK SET

The SATL may handle the CLEAR TASK SET service request differently depending on whether the SATL provides multiple initiators access to the emulated SCSI device or not.

service requests are generally for commands not TMFs.

Comments from page 41 continued on next page

6.3.2 ABORT TASK

The SATL may process the ABORT TASK service request an any of the following ways:

a) If no commands have yet been issued to the ATA device for the processing of the specified SCSI task tag the SATL shall delete the specified task from the SATL internal context and respond to the ABORT TASK request with FUNCTION COMPLETE.

13 If the only command(s) being processed in the ATA device are related to the SCSI task specified by 14 the ABORT TASK request, then the SATL may abort the ATA command(s) and respond with FUNCTION 15 COMPLETE.

16 If the ATA device is processing commands for SCSI tasks in addition to the task specified by the ABORT TASK request the SATL shall:

A) abort outstanding ATA commands and respond to the ABORT TASK request with FUNCTION COMPLETE (see SAM3); and

B) for each initiator port associated with an I_T_Nexus that had a task aborted, the SATL shall complete at least one command for that I_T_Nexus with CHECK CONDITION status with the sense key set to UNIT ATTENTION and additional sense code set to COMMANDS CLEARED BY ANOTHER INITIATOR.

NOTE 3 - It may be that the first place the SATL can abort the command without preventing the processing of other commands is when the attached ATA device returns completion status for the ATA command. In this case the SATL would not provide a SCSI response for the aborted command, even though processing completed in the ATA domain, but instead return FUNCTION COMPLETE for the ABORT TASK request.

6.3.3 ABORT TASK SET

The SATL may handle the ABORT TASK SET service request differently depending on whether the SATL provides multiple initiators access to the emulated SCSI device or not.

If the SATL does not provide multiple I_T nexuses access to the emulated SCSI device, the SATL shall process the service request as follows:

1) If commands have not been issued to the ATA device for the processing of the specified SCSI task tag the SATL shall delete all tasks in the task set from the SATL internal context and respond to the ABORT TASK SET request with FUNCTION COMPLETE.
2) If the only command(s) being processed in the ATA device are associated to the SCSI tasks in the task set, then the SATL shall abort the ATA command(s) and respond with FUNCTION COMPLETE.
3) The SATL shall abort outstanding ATA command(s) and respond to the ABORT TASK SET request with a FUNCTION COMPLETE.

If the SATL provides multiple initiators access to the emulated SCSI device, the SATL shall process the service request as follows:

a) If commands have not been issued to the ATA device for the processing of the specified SCSI task tag the SATL shall delete the specified task from the SATL internal context and respond to the ABORT TASK SET request with FUNCTION COMPLETE.
b) For each initiator port associated with an I_T_Nexus that had a task aborted, the SATL shall complete at least one command for that I_T_Nexus with CHECK CONDITION status with the sense key set to UNIT ATTENTION and additional sense code set to COMMANDS CLEARED BY ANOTHER INITIATOR.

6.3.4 CLEAR ACA

The SATL shall not support auto-contingent allegiance. The SATL shall indicate ACA is not supported by returning zero in the NORMACA bit in standard INQUIRY data. The SATL shall respond to a CLEAR ACA service request with FUNCTION REJECTED.

6.3.5 CLEAR TASK SET

The SATL may handle the CLEAR TASK SET service request differently depending on whether the SATL provides multiple initiators access to the emulated SCSI device or not.

3) The SATL shall abort outstanding ATA command(s) and respond to the ABORT TASK SET request with a FUNCTION COMPLETE."

Comments from page 41 continued on next page

6.3.2 ABORT TASK

The SATL may process the ABORT TASK service request an any of the following ways:

a) If no commands have yet been issued to the ATA device for the processing of the specified SCSI task tag the SATL shall delete the specified task from the SATL internal context and respond to the ABORT TASK request with FUNCTION COMPLETE.

b) If the only command(s) being processed in the ATA device are related to the SCSI task specified by the ABORT TASK request, then the SATL may abort the ATA command(s) and respond with FUNCTION COMPLETE.

c) If the ATA device is processing commands for SCSI tasks in addition to the task specified by the ABORT TASK request the SATL shall:

A) abort outstanding ATA commands and respond to the ABORT TASK request with FUNCTION COMPLETE (see SAM3); and

B) for each initiator port associated with an I_T_Nexus that had a task aborted, the SATL shall complete at least one command for that I_T_Nexus with CHECK CONDITION status with the sense key set to UNIT ATTENTION and additional sense code set to COMMANDS CLEARED BY ANOTHER INITIATOR.

NOTE 3 - It may be that the first place the SATL can abort the command without preventing the processing of other commands is when the attached ATA device returns completion status for the ATA command. In this case the SATL would not provide a SCSI response for the aborted command, even though processing completed in the ATA domain, but instead return FUNCTION COMPLETE for the ABORT TASK request.

6.3.3 ABORT TASK SET

The SATL may handle the ABORT TASK SET service request differently depending on whether the SATL provides multiple initiators access to the emulated SCSI device or not.

If the SATL does not provide multiple I_T nexuses access to the emulated SCSI device, the SATL shall process the service request as follows:

1) If commands have not been issued to the ATA device for the processing of the specified SCSI task tag the SATL shall delete all tasks in the task set from the SATL internal context and respond to the ABORT TASK SET request with FUNCTION COMPLETE.

2) If the only command(s) being processed in the ATA device are associated to the SCSI tasks in the task set, then the SATL shall abort the ATA command(s) and respond with FUNCTION COMPLETE.

3) The SATL shall abort outstanding ATA command(s) and respond to the ABORT TASK SET request with a FUNCTION COMPLETE.

If the SATL provides multiple initiators access to the emulated SCSI device, the SATL shall process the service request as follows:

a) If commands have not been issued to the ATA device for the processing of the specified SCSI task tag the SATL shall delete the specified task from the SATL internal context and respond to the ABORT TASK SET request with FUNCTION COMPLETE.

b) For each initiator port associated with an I_T_Nexus that had a task aborted, the SATL shall complete at least one command for that I_T_Nexus with CHECK CONDITION status with the sense key set to UNIT ATTENTION and additional sense code set to COMMANDS CLEARED BY ANOTHER INITIATOR.

6.3.4 CLEAR ACA

The SATL shall not support auto-contingent allegiance. The SATL shall indicate ACA is not supported by returning zero in the NORMACA bit in standard INQUIRY data. The SATL shall respond to a CLEAR ACA service request with FUNCTION REJECTED.

6.3.5 CLEAR TASK SET

The SATL may handle the CLEAR TASK SET service request differently depending on whether the SATL provides multiple initiators access to the emulated SCSI device or not.

to
"If the SATL does not provide multiple initiators access to the emulated SCSI logical unit, the SATL shall process the ABORT TASK SET task management function request by aborting any outstanding ATA command(s), deleting all tasks in the task set from the SATL internal context and respond to the ABORT TASK SET task management function request with a task management response of FUNCTION COMPLETE."

If the SATL only supports 1 initiator, then there is only one task set, so abort all the ATA commands and SATL internal context and response FUNCTION COMPLETE. Don't see what the SCSI task tag has to do with ABORT TASK SET?

6.3.2 ABORT TASK

The SATL may process the ABORT TASK service request an any of the following ways:

a) If no commands have yet been issued to the ATA device for the processing of the specified SCSI task tag the SATL shall delete the specified task from the SATL internal context and respond to the ABORT TASK request with FUNCTION COMPLETE.

b) If the only command(s) being processed in the ATA device are related to the SCSI task specified by the ABORT TASK request, then the SATL may abort the ATA command(s) and respond with FUNCTION COMPLETE.

c) If the ATA device is processing commands for SCSI tasks in addition to the task specified by the ABORT TASK request the SATL shall:

A) abort outstanding ATA commands and respond to the ABORT TASK request with FUNCTION COMPLETE (see SAM3); and

B) for each initiator port associated with an I_T_Nexus that had a task aborted, the SATL shall complete at least one command for that I_T_Nexus with CHECK CONDITION status with the sense key set to UNIT ATTENTION and additional sense code set to COMMANDS CLEARED BY ANOTHER INITIATOR.

NOTE 3 - It may be that the first place the SATL can abort the command without preventing the processing of other commands is when the attached ATA device returns completion status for the ATA command. In this case the SATL would not provide a SCSI response for the aborted command, even though processing completed in the ATA domain, but instead return FUNCTION COMPLETE for the ABORT TASK request.

6.3.3 ABORT TASK SET

The SATL may handle the ABORT TASK SET service request differently depending on whether the SATL provides multiple initiators access to the emulated SCSI device or not.

If the SATL does not provide multiple I_T nexuses access to the emulated SCSI device, the SATL shall process the service request as follows:

1) If commands have not been issued to the ATA device for the processing of the specified SCSI task tag the SATL shall delete all tasks in the task set from the SATL internal context and respond to the ABORT TASK SET request with FUNCTION COMPLETE.

2) If the only command(s) being processed in the ATA device are associated to the SCSI tasks in the task set, then the SATL shall abort the ATA command(s) and respond with FUNCTION COMPLETE.

3) The SATL shall abort outstanding ATA command(s) and respond to the ABORT TASK SET request with a FUNCTION COMPLETE.

If the SATL provides multiple initiators access to the emulated SCSI device, the SATL shall process the service request as follows:

a) If commands have not been issued to the ATA device for the processing of the specified SCSI task tag the SATL shall delete the specified task from the SATL internal context and respond to the ABORT TASK SET request with FUNCTION COMPLETE.

b) For each initiator port associated with an I_T_Nexus that had a task aborted, the SATL shall complete at least one command for that I_T_Nexus with CHECK CONDITION status with the sense key set to UNIT ATTENTION and additional sense code set to COMMANDS CLEARED BY ANOTHER INITIATOR.

6.3.4 CLEAR ACA

The SATL shall not support auto-contingent allegiance. The SATL shall indicate ACA is not supported by returning zero in the NORMACA bit in standard INQUIRY data. The SATL shall respond to a CLEAR ACA service request with FUNCTION REJECTED.

6.3.5 CLEAR TASK SET

The SATL may handle the CLEAR TASK SET service request differently depending on whether the SATL provides multiple initiators access to the emulated SCSI device or not.

Date: 3/31/2006 5:01:30 PM
6.3.3 ABORT TASK SET
3nd Paragraph
change

"If the SATL provides multiple initiators access to the emulated SCSI device, the SATL shall process the service request as follows:
a) If commands have not been issued to the ATA device for the processing of the specified SCSI task tag the SATL shall delete the specified task from the SATL internal context and respond to the ABORT TASK SET request with FUNCTION COMPLETE.
b) For each initiator port associated with an I_T_Nexus that had a task aborted, the SATL shall complete at least one command for that I_T_Nexus with CHECK CONDITION status with the sense key set to UNIT ATTENTION and additional sense code set to COMMANDS CLEARED BY ANOTHER INITIATOR."

Current text directly violates SAM-3, in that the ABORT TASK SET shall not affect tasks from other I_T nexuses.

to

"If the SATL does provide multiple initiators access to the emulated SCSI logical unit, the SATL shall process the ABORT TASK SET task management function request as follows:
1) allow any outstanding ATA command(s) to complete related to the processing of tasks associated with the I_T nexus which the ABORT TASK SET task management function was received;
2) delete all tasks in the task set from the SATL internal context for tasks associated with the I_T nexus which the ABORT TASK SET task management function was received; and
3) respond to the ABORT TASK SET task management function request with a task management function response of FUNCTION COMPLETE."

6.3.2 ABORT TASK

The SATL may process the ABORT TASK service request an any of the following ways:

a) If no commands have yet been issued to the ATA device for the processing of the specified SCSI task tag the SATL shall delete the specified task from the SATL internal context and respond to the ABORT TASK request with FUNCTION COMPLETE.

b) If the only command(s) being processed in the ATA device are related to the SCSI task specified by the ABORT TASK request, then the SATL may abort the ATA command(s) and respond with FUNCTION COMPLETE.

c) If the ATA device is processing commands for SCSI tasks in addition to the task specified by the ABORT TASK request the SATL shall:

A) abort outstanding ATA commands and respond to the ABORT TASK request with FUNCTION COMPLETE (see SAM3); and

B) for each initiator port associated with an I_T_Nexus that had a task aborted, the SATL shall complete at least one command for that I_T_Nexus with CHECK CONDITION status with the sense key set to UNIT ATTENTION and additional sense code set to COMMANDS CLEARED BY ANOTHER INITIATOR.

NOTE 3 - It may be that the first place the SATL can abort the command without preventing the processing of other commands is when the attached ATA device returns completion status for the ATA command. In this case the SATL would not provide a SCSI response for the aborted command, even though processing completed in the ATA domain, but instead return FUNCTION COMPLETE for the ABORT TASK request.

6.3.3 ABORT TASK SET

The SATL may handle the ABORT TASK SET service request differently depending on whether the SATL provides multiple initiators access to the emulated SCSI device or not.

If the SATL does not provide multiple I_T nexuses access to the emulated SCSI device, the SATL shall process the service request as follows:

1) If commands have not been issued to the ATA device for the processing of the specified SCSI task tag the SATL shall delete all tasks in the task set from the SATL internal context and respond to the ABORT TASK SET request with FUNCTION COMPLETE.

2) If the only command(s) being processed in the ATA device are associated to the SCSI tasks in the task set, then the SATL shall abort the ATA command(s) and respond with FUNCTION COMPLETE.

3) The SATL shall abort outstanding ATA command(s) and respond to the ABORT TASK SET request with a FUNCTION COMPLETE.

If the SATL provides multiple initiators access to the emulated SCSI device, the SATL shall process the service request as follows:

a) If commands have not been issued to the ATA device for the processing of the specified SCSI task tag the SATL shall delete the specified task from the SATL internal context and respond to the ABORT TASK SET request with FUNCTION COMPLETE.

b) For each initiator port associated with an I_T_Nexus that had a task aborted, the SATL shall complete at least one command for that I_T_Nexus with CHECK CONDITION status with the sense key set to UNIT ATTENTION and additional sense code set to COMMANDS CLEARED BY ANOTHER INITIATOR.

6.3.4 CLEAR ACA

The SATL shall not support auto-contingent allegiance. The SATL shall indicate ACA is not supported by returning zero in the NORMACA bit in standard INQUIRY data. The SATL shall respond to a CLEAR ACA service request with FUNCTION REJECTED.

6.3.5 CLEAR TASK SET

The SATL may handle the CLEAR TASK SET service request differently depending on whether the SATL provides multiple initiators access to the emulated SCSI device or not.

6.3.5 CLEAR TASK SET: change the clause to be as specified in the next comment.

Comments from page 41 continued on next page

6.3.2 ABORT TASK

The SATL may process the ABORT TASK service request an any of the following ways:

a) If no commands have yet been issued to the ATA device for the processing of the specified SCSI task tag the SATL shall delete the specified task from the SATL internal context and respond to the ABORT TASK request with FUNCTION COMPLETE.

b) If the only command(s) being processed in the ATA device are related to the SCSI task specified by the ABORT TASK request, then the SATL may abort the ATA command(s) and respond with FUNCTION COMPLETE.

c) If the ATA device is processing commands for SCSI tasks in addition to the task specified by the ABORT TASK request the SATL shall:

A) abort outstanding ATA commands and respond to the ABORT TASK request with FUNCTION COMPLETE (see SAM3); and

B) for each initiator port associated with an I_T_Nexus that had a task aborted, the SATL shall complete at least one command for that I_T_Nexus with CHECK CONDITION status with the sense key set to UNIT ATTENTION and additional sense code set to COMMANDS CLEARED BY ANOTHER INITIATOR.

NOTE 3 - It may be that the first place the SATL can abort the command without preventing the processing of other commands is when the attached ATA device returns completion status for the ATA command. In this case the SATL would not provide a SCSI response for the aborted command, even though processing completed in the ATA domain, but instead return FUNCTION COMPLETE for the ABORT TASK request.

6.3.3 ABORT TASK SET

The SATL may handle the ABORT TASK SET service request differently depending on whether the SATL provides multiple initiators access to the emulated SCSI device or not.

If the SATL does not provide multiple I_T nexuses access to the emulated SCSI device, the SATL shall process the service request as follows:

1) If commands have not been issued to the ATA device for the processing of the specified SCSI task tag the SATL shall delete all tasks in the task set from the SATL internal context and respond to the ABORT TASK SET request with FUNCTION COMPLETE.

2) If the only command(s) being processed in the ATA device are associated to the SCSI tasks in the task set, then the SATL shall abort the ATA command(s) and respond with FUNCTION COMPLETE.

3) The SATL shall abort outstanding ATA command(s) and respond to the ABORT TASK SET request with a FUNCTION COMPLETE.

If the SATL provides multiple initiators access to the emulated SCSI device, the SATL shall process the service request as follows:

a) If commands have not been issued to the ATA device for the processing of the specified SCSI task tag the SATL shall delete the specified task from the SATL internal context and respond to the ABORT TASK SET request with FUNCTION COMPLETE.

b) For each initiator port associated with an I_T_Nexus that had a task aborted, the SATL shall complete at least one command for that I_T_Nexus with CHECK CONDITION status with the sense key set to UNIT ATTENTION and additional sense code set to COMMANDS CLEARED BY ANOTHER INITIATOR.

6.3.4 CLEAR ACA

The SATL shall not support auto-contingent allegiance. The SATL shall indicate ACA is not supported by returning zero in the NORMACA bit in standard INQUIRY data. The SATL shall respond to a CLEAR ACA service request with FUNCTION REJECTED.

6.3.5 CLEAR TASK SET

46 The SATL may handle the CLEAR TASK SET service request differently depending on whether the SATL provides multiple initiators access to the emulated SCSI device or not.

RESOLUTION: see 06-179rX: SAT - Fix Task Management Functions

T6.3.5 CLEAR TASK SET
1st Paragraph, 1st Sentence
change

"The SATL may handle the CLEAR TASK SET service request differently depending on whether the SATL provides multiple initiators access to the emulated SCSI device or not."

to

"The SATL may handle the CLEAR TASK SET task management function request differently depending on whether the SATL provides multiple initiators access to the emulated SCSI logical unit."

Probably need to add a statement about it being optional for LU's supporting only the basic task management model.

RESOLUTION: see 06-179rX: SAT - Fix Task Management Functions (Need consistency regarding support for the BASIC task management model)

Status
rlsheffi Completed 6/24/2006 2:31:08 PM

If the SATL does not provide multiple initiators access to the emulated SCSI device, the SATL shall process the service request as follows:

1) If commands have not been issued to the ATA device for the processing of the specified SCSI task tag the SATL shall delete all tasks in the task set from the SATL internal context and respond to the CLEAR TASK SET request with FUNCTION COMPLETE.
2) If the only command(s) being processed in the ATA device are associated to the SCSI tasks in the task set, then the SATL shall abort the SATA command(s) and respond with FUNCTION COMPLETE.
3) The SATL shall abort outstanding ATA command(s) and respond to the CLEAR TASK SET request with FUNCTION COMPLETE.

If the SATL provides multiple initiators access to the emulated SCSI device, the SATL shall process the service request as follows:

1) If commands have not been issued to the ATA device for the processing of the specified SCSI task tag the SATL shall delete the specified task from the SATL internal context and respond to the CLEAR TASK SET request with FUNCTION COMPLETE.
2) For each initiator port associated with an I_T_Nexus that had a task aborted, the SATL shall complete at least one command for that I_T_Nexus with CHECK CONDITION status with the sense key set to UNIT ATTENTION and additional sense code set to COMMANDS CLEARED BY ANOTHER INITIATOR.

6.3.6 LOGICAL UNIT RESET

LOGICAL UNIT RESET shall cause the SATL to issue a software reset (i.e., set the SRST bit to one in the Device Control register, then set the bit to zero) to the ATA device representing the specified logical unit. Any persistent behaviors shall be reestablished by the SATL afterwards, including any behaviors related to saveable mode parameters.

NOTE 4 - BUS RESET is commonly used by SCSI application layers to hard reset each device mapped to a target ID on a given SCSI bus. The SATL may translate the BUS RESET by issuing a protocol specific HARD RESET to each target device (e.g. SATA COMRESET or SAS PHY HARD RESET).

NOTE 5 - If more than one device is present on a PATA bus, issuing a soft reset causes both devices to be reset.

6.3.7 QUERY TASK

QUERY TASK shall cause the SATL to search for the specified task and, if found, respond with FUNCTION SUCCEEDED. If the specified task is not found the SATL shall respond with FUNCTION COMPLETE.

6.4 SCSI Control Byte

6.4.1 CONTROL byte overview

Table 5 describes SATL handling of the CDB CONTROL byte. See SAM-3 for CONTROL byte details.

Table 5 — Control byte fields

Field	Description or reference
Vendor specific	The SATL may use this field for vendor-specific purposes.
NACA	If set to one, the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.

6.3.5 CLEAR TASK SET
3rd Paragraph, 1st Sentence
change

"If the SATL provides multiple initiators access to the emulated SCSI device, the SATL shall process the service request as follows:

1) If commands have not been issued to the ATA device for the processing of the specified SCSI task tag the SATL shall delete the specified task from the SATL internal context and respond to the CLEAR TASK SET request with FUNCTION COMPLETE.

2) For each initiator port associated with an I_T_Nexus that had a task aborted, the SATL shall complete at least one command for that I_T_Nexus with CHECK CONDITION status with the sense key set to UNIT ATTENTION and additional sense code set to COMMANDS CLEARED BY ANOTHER INITIATOR."

to

"If the SATL does provide multiple initiators access to the emulated SCSI logical unit, the SATL shall process the CLEAR TASK SET task management function request as follows:

1) Abort any outstanding ATA command(s), delete all tasks in the task set from the SATL internal context and respond to the CLEAR TASK SET task management function request with a task management response of FUNCTION COMPLETE; and

2) For each initiator port associated with an I_T nexus that had a task aborted, complete at least one command for that I_T nexus with CHECK CONDITION status with the sense key set to UNIT ATTENTION and additional sense code set to COMMANDS CLEARED BY ANOTHER INITIATOR."

This assumes TST=0 for SAT devices

Comments from page 42 continued on next page

If the SATL does not provide multiple initiators access to the emulated SCSI device, the SATL shall process the service request as follows:

1) If commands have not been issued to the ATA device for the processing of the specified SCSI task tag the SATL shall delete all tasks in the task set from the SATL internal context and respond to the CLEAR TASK SET request with FUNCTION COMPLETE.
2) If the only command(s) being processed in the ATA device are associated to the SCSI tasks in the task set, then the SATL shall abort the SATA command(s) and respond with FUNCTION COMPLETE.
3) The SATL shall abort outstanding ATA command(s) and respond to the CLEAR TASK SET request with FUNCTION COMPLETE.

If the SATL provides multiple initiators access to the emulated SCSI device, the SATL shall process the service request as follows:

1) If commands have not been issued to the ATA device for the processing of the specified SCSI task tag the SATL shall delete the specified task from the SATL internal context and respond to the CLEAR TASK SET request with FUNCTION COMPLETE.
2) For each initiator port associated with an I_T_Nexus that had a task aborted, the SATL shall complete at least one command for that I_T_Nexus with CHECK CONDITION status with the sense key set to UNIT ATTENTION and additional sense code set to COMMANDS CLEARED BY ANOTHER INITIATOR.

6.3.6 LOGICAL UNIT RESET

LOGICAL UNIT RESET shall cause the SATL to issue a software reset (i.e., set the SRST bit to one in the Device Control register, then set the bit to zero) to the ATA device representing the specified logical unit. Any persistent behaviors shall be reestablished by the SATL afterwards, including any behaviors related to saveable mode parameters.

NOTE 4 - BUS RESET is commonly used by SCSI application layers to hard reset each device mapped to a target ID on a given SCSI bus. The SATL may translate the BUS RESET by issuing a protocol specific HARD RESET to each target device (e.g. SATA COMRESET or SAS PHY HARD RESET).

NOTE 5 - If more than one device is present on a PATA bus, issuing a soft reset causes both devices to be reset.

6.3.7 QUERY TASK

QUERY TASK shall cause the SATL to search for the specified task and, if found, respond with FUNCTION SUCCEEDED. If the specified task is not found the SATL shall respond with FUNCTION COMPLETE.

6.4 SCSI Control Byte

6.4.1 CONTROL byte overview

Table 5 describes SATL handling of the CDB CONTROL byte. See SAM-3 for CONTROL byte details.

Table 5 — Control byte fields

Field	Description or reference
Vendor specific	The SATL may use this field for vendor-specific purposes.
NACA	If set to one, the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.
LINK	If set to one, the SATL shall return a CHECK CONDITION with the sense key set to ILLEGAL REQUEST and additional sense code set to INVALID FIELD IN CDB.

RESOLUTION: see 06-179rX: SAT - Fix Task Management Functions (The Control mode page requires TST=000h for SAT devices - i.e., only one task set shared by I_T_L nexuses).

6.3.6 LOGICAL UNIT RESET
1st Paragraph, 1st Sentence
change
"LOGICAL UNIT RESET shall cause the SATL to issue a software reset (i.e., set the SRST bit to one in the Device Control register, then set the bit to zero) to the ATA device representing the specified logical unit. Any persistent behaviors shall be reestablished by the SATL afterwards, including any behaviors related to saveable mode parameters."
to
"A LOGICAL UNIT RESET task management function request shall cause the SATL to issue a software reset (i.e., set the SRST bit to one in the Device Control register, then set the bit to zero) to the ATA device representing the specified logical unit and delete all tasks in the task set from the SATL internal context and respond to the LOGICAL UNIT RESET task management function request with a task management response of FUNCTION COMPLETE. Any persistent behaviors shall be reestablished by the SATL afterwards, including any behaviors related to saveable mode parameters. "

Another instance of saveable mode page support?

RESOLUTION: see 06-179rX: SAT - Fix Task Management Functions (LOGICAL UNIT RESET clears "current" mode page values, so if SAT disallows savable mode parameters, behaviors should be restored to default values. I believe we've decided to allow support for savable mode pages, so the text is OK in that regard). Note: 06-179r1 incorrectly says to restore "current" values. The final version should say to restore to "saved or default values (see SPC-3)".

6.5 I_T nexus loss

1st paragraph, 1st Sentence

change

"The SATL may detect an I_T nexus loss (see SAM-3). If the SATL detects an I_T nexus loss (e.g., in a SAS domain the expander device with an STP/SATA bridge transmits a BROADCAST (CHANGE) and the subsequent REPORT PHY SATA response from the affected phy contains an STP I_T NEXUS LOSS OCCURRED bit set to one), the SATL:

1) shall issue an ATA hard reset (see 3.1.9) to the affected ATA device;
2) shall terminate processing of any commands to the affected ATA device; and
3) should establish a unit attention with the additional sense code set to I_T NEXUS LOSS OCCURRED."

to

"The SATL may detect an I_T nexus loss event (see SAM-3). If the SATL detects an I_T nexus loss the SATL may handle the I_T nexus loss differently depending on whether the SATL provides multiple initiators access to the emulated SCSI logical unit.

If the SATL does not provide multiple initiators access to the emulated SCSI logical unit, the SATL shall handle the I_T nexus loss as follows:

1) abort any outstanding ATA command(s);
2) delete all tasks in the task set from the SATL internal context; and
3) establish a unit attention with the additional sense code set to I_T NEXUS LOSS OCCURRED.

If the SATL does provide multiple initiators access to the emulated SCSI logical unit, the SATL shall handle the I_T nexus loss as follows:

1) allow any outstanding ATA command(s) to complete for the I_T nexus for which the I_T nexus loss event occured;
2) delete all tasks in the task set from the SATL internal context for tasks associated with the I_T nexus that the I_T nexus loss event occured; and
3) establish a unit attention with the additional sense code set to I_T NEXUS LOSS OCCURRED for the SCSI initiator port associated with the I_T nexus."

The e.g. given in the original text is not an I_T nexus loss in terms of what this section is trying to define. The e.g. I_T nexus loss is between the SATL and the ATA device, and not between the SATL and SCSI initiator port.

Also why is the UA a should and not shall? SAM-3 says a shall.

RESOLUTION (see 06-270): Delete the e.g., (accept Kevin's rewording).
Add a subclause on ATA nexus loss handling.
Hard reset and power loss should also be covered.
When the SATL sees an ATA nexus loss (see ATA8-ACM), it needs to CHECK CONDITION all the commands with a sense key indicating a HW error with an additional sense code of LOGICAL UNIT COMMUNICATION FAILURE for each command aborted. Indicate the device is no longer present with 001b in the PERIPHERAL QUALIFIER field in standard INQUIRY data.
NOTE: SAM-3 and SPC-3 define how the SATL processes subsequent commands when the logical unit is no longer

Comments from page 43 continued on next page

6.5 ~~SAM-3~~ I_T nexus loss

The SATL may detect an I_T nexus loss (see SAM-3). If the SATL detects an I_T nexus loss (e.g., in a SAS domain the expander device with an STP/SATA bridge transmits a BROADCAST (CHANGE) and the subsequent REPORT PHY SATA response from the affected phy contains an STP I_T NEXUS LOSS OCCURRED bit set to one), the SATL:

1) shall issue an ATA hard reset (see 3.1.9) to the affected ATA device;
2) shall terminate processing of any commands to the affected ATA device; and
3) should establish a unit attention with the additional sense code set to I_T NEXUS LOSS OCCURRED.

available (i.e., incorrect logical unit selection).

Add a subclause in clause-5 to define ATA hardware reset, ATA software reset, and returning from ATA nexus loss. Before using the ATA device to process SCSI commands following an ATA hardware reset, an ATA software reset, or reestablishing an ATA nexus following an ATA nexus loss, the SATL shall ensure the ATA software settings (e.g., ATA SET FEATURES command) are the same as they were before the ATA hardware reset, ATA software reset, or ATA nexus loss.

7 Summary of SCSI / ATA command mappings

7.1 Translated and emulated commands

In the event of a discrepancy between the contents of this section and the description of individual commands, description of individual commands shall apply.

Clause 7, clause 8, and clause 9 describe the SCSI to ATA command mapping. Translation for ATAPI devices is described in clause 13.

~~Unless otherwise noted, the IMMED bit (immediate return) shall be ignored. For the FORMAT UNIT command, this bit shall be supported.~~

All ATA commands with the exception of ATA queued commands (see 3.1.14) shall be single threaded per device. The SATL shall queue received SCSI commands as necessary to enforce this.

Table 6 lists the SCSI / ATA command mappings defined in this standard. A SATL may implement commands defined in SPC-3 and SBC-2, but not listed in table 6. Translation of commands not listed in table 6 is vendor-specific.

Table 6 — Summary of SCSI / ATA Command Mapping (part 1 of 2)

SCSI command	ATA commands	Reference
ATA PASS-THROUGH (12)	Any	12.2.2
ATA PASS-THROUGH (16)		12.2.3
FORMAT UNIT	READ VERIFY SECTORS, READ VERIFY SECTORS EXT, WRITE SECTORS, WRITE SECTORS EXT	9.2

8 SCSI Primary Commands (SPC) mapping

8.1 INQUIRY command

8.1.1 INQUIRY command overview

The ~~SCSI~~ INQUIRY command requests general information about a target or component LUN. The INQUIRY command and selected vital product data pages shall be emulated using information from the ATA IDENTIFY DEVICE command, and other information as described in subsequent subclauses. Table 7 describes the emulation of fields in the ~~SCSI~~ INQUIRY CDB.

Table 7 — INQUIRY command CDB fields

Field	Description or reference
OPERATION CODE	The SATL shall issue an IDENTIFY DEVICE command ~~(ECh)~~ to the attached ATA device.
EVPD	The SATL shall implement this field as defined in SPC-3. (see 10.3)
PAGE CODE[a]	The SATL: a) shall support the Supported VPD pages (00h); b) may support the Unit Serial Number VPD page (80h); c) shall support the Device Identification VPD page (83h); and d) shall support the ATA Information VPD page (89h).
ALLOCATION LENGTH	The SATL shall implement this field as defined in SPC-3.
CONTROL	6.4
[a] VPD page translations are defined in subclause 10.3	

The logical unit number identified with the I_T_L nexus should be set to zero. If the logical unit number of the request is not zero, the SATL may terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to LOGICAL UNIT NOT SUPPORTED.

8.1.2 Standard INQUIRY data

Table 8 describes the standard INQUIRY data fields supported by the SATL.

8 SCSI Primary Commands (SPC) Mapping

8.1 INQUIRY command

8.1.1 INQUIRY command overview

The ~~SCSI~~ INQUIRY command requests general information about a target or component LUN. The INQUIRY command and selected vital product data pages shall be emulated using information from the ATA IDENTIFY DEVICE command, and other information as described in subsequent subclauses. Table 7 describes the emulation of fields in the ~~SCSI~~ INQUIRY CDB.

Table 7 — INQUIRY command CDB fields

Field	Description or reference
OPERATION CODE	The SATL shall issue an IDENTIFY DEVICE command ~~(ECh)~~ to the attached ATA device.
EVPD	The SATL shall implement this field as defined in SPC-3 (see 10.3)
PAGE CODE[a]	The SATL: a) shall support the Supported VPD pages (00h); b) may support the Unit Serial Number VPD page (80h); c) shall support the Device Identification VPD page (83h); and d) shall support the ATA Information VPD page (89h).
ALLOCATION LENGTH	The SATL shall implement this field as defined in SPC-3.
CONTROL	

[a] VPD page translations are defined in subclause 10.3

The logical unit number identified with the I_T_L nexus should be set to zero. If the logical unit number of the request is not zero, the SATL may terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to LOGICAL UNIT NOT SUPPORTED.

8 SCSI Primary Commands (SPC) Mapping

8.1 INQUIRY command

8.1.1 INQUIRY command overview

The ~~SCSI~~ INQUIRY command requests general information about a target or component LUN. The INQUIRY command and selected vital product data pages shall be emulated using information from the ATA IDENTIFY DEVICE command, and other information as described in subsequent subclauses. Table 7 describes the emulation of fields in the ~~SCSI~~ INQUIRY CDB.

Table 7 — INQUIRY command CDB fields

Field	Description or reference
OPERATION CODE	The SATL shall issue an IDENTIFY DEVICE command ~~(ECh)~~ to the attached ATA device.
EVPD	The SATL shall implement this field as defined in SPC-3. (see 10.3)
PAGE CODE[a]	The SATL: a) shall support the Supported VPD pages (00h); b) may support the Unit Serial Number VPD page (80h); c) shall support the Device Identification VPD page (83h); and d) shall support the ATA Information VPD page (89h).
ALLOCATION LENGTH	The SATL shall implement this field as defined in SPC-3.
CONTROL	6.4
[a] VPD page translations are defined in subclause 10.3	

The logical unit number identified with the I_T_L nexus should be set to zero. If the logical unit number of the request is not zero, the SATL may terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to LOGICAL UNIT NOT SUPPORTED.

8.1.2 Standard INQUIRY data

Table 8 describes the standard INQUIRY data fields supported by the SATL.

Sequence number: 13
Author: DELL[KMarks]
Subject: Note
Date: 4/4/2006 11:33:13 AM

8.1.1 INQUIRY command overview
1st Paragraph after Table 7.

This paragraph does not seem correct. The SATL should return the INQUIRY data, with the PF=011b and PDT=1fh. I agree this is the response to other command types to an incorrect LU, expect request sense and report luns.

Additionally it contradicts what is in footnote a of Table 8.

RESOLUTION: Delete the paragraph (see HPQ comment).

Status
rlsheffi Completed 6/5/2006 9:32:58 AM

Table 8 — Standard INQUIRY data fields (part 1 of 3)

Field	Description or reference
PERIPHERAL QUALIFIER	This field shall be set to 000b to indicate that the peripheral device is currently connected to this logical unit.[a]
PERIPHERAL DEVICE TYPE	This field shall be set to 00h to indicate that the peripheral device is a direct access block device.[a]
RMB	The SATL shall set this bit to the value of bit 7 of the GENERAL CONFIGURATION field of the IDENTIFY DEVICE data retrieved from the attached ATA device.
VERSION	The VERSION field indicates the version of SPC to which the SATL complies (see SPC-3) (e.g., 05h for SPC-3).
NORMACA	The SATL shall set this bit to zero to indicate the SATL does not support the NACA bit in the CONTROL byte (see 6.4).
HISUP	Unspecified (see 3.4.3)
RESPONSE DATA FORMAT	The SATL shall set this field to 2h.
ADDITIONAL LENGTH	The SATL shall set this field to the length of the INQUIRY data that follows.
SCCS	Unspecified (see 3.4.3)
ACC	Unspecified (see 3.4.3)
TPGS	Unspecified (see 3.4.3)
3PC	Unspecified (see 3.4.3)
PROTECT	The SATL shall set this bit to zero to indicate that the peripheral device does not support protection information.
BQUE	Unspecified (see 3.4.3)
ENCSERV	Unspecified (see 3.4.3)
MULTIP	Unspecified (see 3.4.3)
MCHNGR	The SATL shall set this bit to zero to indicate the peripheral device is not attached to a medium transport element.
ADDR16	Unspecified (see 3.4.3)
WBUS16	Unspecified (see 3.4.3)
SYNC	Unspecified (see 3.4.3)

[a] If the INQUIRY command is issued to an unsupported logical unit the SATL shall set the PERIPHERAL QUALIFIER field to 011b and shall set the PERIPHERAL DEVICE TYPE field to 1Fh.

[b] The full ATA IDENTIFY DEVICE data MODEL NUMBER field contents and the REVISION NUMBER field contents are retrieved with the ATA Information VPD page (see 10.3.5).

[c] There can only be 6 total version descriptors. Normally e) and f) are not together so they fit. A FC to SAS bridge might have both, though.

[d] The encoding used by T10 for INQUIRY version descriptors (see SPC-3) and T13 for IDENTIFY DEVICE major and minor version numbers (see ATA/ATAPI-7) differ, and the two standards organizations may not define values for the same revisions.

Page 27, Table 8 footnote c
What does "Normally e) and f) are not together so they fit." mean?

RESOLUTION: Delete table footnote c and change the Field name to "VERSION DESCRIPTOR 1 through VERSION DESCRIPTOR 8".
REASON: The original intent may have been to try to show that the information the SATL "shall" include can fit into 6 descriptors (leaving two more available, since there are 8 in total). But SPC-3 adequately describes the options for including or not including descriptors, and the way e and f are worded makes it clear they are not both required, so table footnote c is not needed.

Table 8 — Standard INQUIRY data fields (part 1 of 3)

Field	Description or reference
PERIPHERAL QUALIFIER	This field shall be set to 000b to indicate that the peripheral device is currently connected to this logical unit.[a]
PERIPHERAL DEVICE TYPE	This field shall be set to 00h to indicate that the peripheral device is a direct access block device.[a]
RMB	The SATL shall set this bit to the value of bit 7 of the GENERAL CONFIGURATION field of the IDENTIFY DEVICE data retrieved from the attached ATA device.
VERSION	The VERSION field indicates the version of SPC to which the SATL complies (see SPC-3) (e.g., 05h for SPC-3).
NORMACA	The SATL shall set this bit to zero to indicate the SATL does not support the NACA bit in the CONTROL byte (see 6.4).
HISUP	Unspecified (see 3.4.3)
RESPONSE DATA FORMAT	The SATL shall set this field to 2h.
ADDITIONAL LENGTH	The SATL shall set this field to the length of the INQUIRY data that follows.
SCCS	Unspecified (see 3.4.3)
ACC	Unspecified (see 3.4.3)
TPGS	Unspecified (see 3.4.3)
3PC	Unspecified (see 3.4.3)
PROTECT	The SATL shall set this bit to zero to indicate that the peripheral device does not support protection information.
BQUE	Unspecified (see 3.4.3)
ENCSERV	Unspecified (see 3.4.3)
MULTIP	Unspecified (see 3.4.3)
MCHNGR	The SATL shall set this bit to zero to indicate the peripheral device is not attached to a medium transport element.
ADDR16	Unspecified (see 3.4.3)
WBUS16	Unspecified (see 3.4.3)
SYNC	Unspecified (see 3.4.3)

[a] If the INQUIRY command is issued to an unsupported logical unit the SATL shall set the PERIPHERAL QUALIFIER field to 011b and shall set the PERIPHERAL DEVICE TYPE field to 1Fh.

[b] The full ATA IDENTIFY DEVICE data MODEL NUMBER field contents and the REVISION NUMBER field contents are retrieved with the ATA Information VPD page (see 10.3.5).

[c] There can only be 6 total version descriptors. Normally e) and f) are not together so they fit. A FC to SAS bridge might have both, though.

[d] The encoding used by T10 for INQUIRY version descriptors (see SPC-3) and T13 for IDENTIFY DEVICE major and minor version numbers (see ATA/ATAPI-7) differ, and the two standards organizations may not define values for the same revisions.

Table 8 — Standard INQUIRY data fields (part 2 of 3)

Field	Description or reference
LINKED	The SATL shall set this field to 0 to indicate that this peripheral device does not support linked commands.
CMDQUE	Unspecified (see 3.4.3)
VENDOR IDENTIFICATION	The SATL shall set the VENDOR IDENTIFICATION field to 'ATA¬¬¬¬¬¬'.
PRODUCT IDENTIFICATION	The SATL shall set the PRODUCT IDENTIFICATION field to a representation of the first 16 bytes of the ATA device IDENTIFY DEVICE data MODEL NUMBER field, where each pair of bytes are swapped to create a valid ASCII string format [b]: 1) byte 0 contains IDENTIFY DEVICE word 27 bits 15:8 (i.e., byte 1); 2) byte 1 contains IDENTIFY DEVICE word 27 bits 7:0 (i.e., byte 0); 3) byte 2 contains IDENTIFY DEVICE word 28 bits 15:8 (i.e., byte 3); 4) byte 3 contains IDENTIFY DEVICE word 28 bits 7:0 (i.e., byte 2); ... 15) byte 14 contains IDENTIFY DEVICE word 34 bits 15:8 (i.e., byte 15); and 16) byte 15 contains IDENTIFY DEVICE word 34 bits 7:0 (i.e., byte 14).
PRODUCT REVISION LEVEL	The SATL shall set the PRODUCT REVISION LEVEL field to a four byte ASCII character representation of the ATA device IDENTIFY DEVICE data Firmware Revision field. Each pair of bytes are swapped to create a valid ASCII string format. Since the ATA device IDENTIFY DEVICE data Firmware Revision field contains eight ASCII characters and the Standard INQUIRY data PRODUCT REVISION LEVEL field is four ASCII characters, the SATL shall select four of the eight ASCII characters from the IDENTIFY DEVICE data Firmware Revision field to return in the PRODUCT REVISION LEVEL field as follows: a) If the IDENTIFY DEVICE data received in words 25 and 26 from the ATA device are ASCII spaces (20h), then the four ASCII characters selected shall be: 1) byte 0 contains IDENTIFY DEVICE data word 23 bits 15:8 (i.e., byte 1); 2) byte 1 contains IDENTIFY DEVICE data word 23 bits 7:0 (i.e., byte 0); 3) byte 2 contains IDENTIFY DEVICE data word 24 bits 15:8 (i.e., byte 3); and 4) byte 3 contains IDENTIFY DEVICE data word 24 bits 7:0 (i.e., byte 2); or b) If the IDENTIFY DEVICE data received in words 25 and 26 from the ATA device are not ASCII spaces (20h), then the four ASCII characters selected shall be: 1) byte 0 contains IDENTIFY DEVICE data word 25 bits 15:8 (i.e., byte 5); 2) byte 1 contains IDENTIFY DEVICE data word 25 bits 7:0 (i.e., byte 4); 3) byte 2 contains IDENTIFY DEVICE data word 26 bits 15:8 (i.e., byte 7); and 4) byte 3 contains IDENTIFY DEVICE data word 26 bits 7:0 (i.e., byte 6).
CLOCKING	Unspecified (see 3.4.3)
QAS	Unspecified (see 3.4.3)
IUS	Unspecified (see 3.4.3)

[a] If the INQUIRY command is issued to an unsupported logical unit the SATL shall set the PERIPHERAL QUALIFIER field to 011b and shall set the PERIPHERAL DEVICE TYPE field to 1Fh.

[b] The full ATA IDENTIFY DEVICE data MODEL NUMBER field contents and the REVISION NUMBER field contents are retrieved with the ATA Information VPD page (see 10.3.5).

[c] There can only be 6 total version descriptors. Normally e) and f) are not together so they fit. A FC to SAS bridge might have both, though.

[d] The encoding used by T10 for INQUIRY version descriptors (see SPC-3) and T13 for IDENTIFY DEVICE major and minor version numbers (see ATA/ATAPI-7) differ, and the two standards organizations may not define values for the same revisions.

What is this??
Note: This is described in '3.5.3 Notation for byte encoded character strings', and is consistent with notation described in the T10 style guide. The '¬' represents an ASCII space. Putting actual ASCII spaces here would make it impossible for the reader to determine the correct number of them to include.
RESOLUTION: Added a table footnote.

Table 8 — Standard INQUIRY data fields (part 2 of 3)

Field	Description or reference
LINKED	The SATL shall set this field to 0 to indicate that this peripheral device does not support linked commands.
CMDQUE	Unspecified (see 3.4.3)
VENDOR IDENTIFICATION	The SATL shall set the VENDOR IDENTIFICATION field to 'ATA¬¬¬¬¬'.
PRODUCT IDENTIFICATION	The SATL shall set the PRODUCT IDENTIFICATION field to a representation of the first 16 bytes of the ATA device IDENTIFY DEVICE data MODEL NUMBER field, where each pair of bytes are swapped to create a valid ASCII string format [b]: 1) byte 0 contains IDENTIFY DEVICE word 27 bits 15:8 (i.e., byte 1); 2) byte 1 contains IDENTIFY DEVICE word 27 bits 7:0 (i.e., byte 0); 3) byte 2 contains IDENTIFY DEVICE word 28 bits 15:8 (i.e., byte 3); 4) byte 3 contains IDENTIFY DEVICE word 28 bits 7:0 (i.e., byte 2); ... 15) byte 14 contains IDENTIFY DEVICE word 34 bits 15:8 (i.e., byte 15); and 16) byte 15 contains IDENTIFY DEVICE word 34 bits 7:0 (i.e., byte 14).
PRODUCT REVISION LEVEL	The SATL shall set the PRODUCT REVISION LEVEL field to a four byte ASCII character representation of the ATA device IDENTIFY DEVICE data Firmware Revision field. Each pair of bytes are swapped to create a valid ASCII string format. Since the ATA device IDENTIFY DEVICE data Firmware Revision field contains eight ASCII characters and the Standard INQUIRY data PRODUCT REVISION LEVEL field is four ASCII characters, the SATL shall select four of the eight ASCII characters from the IDENTIFY DEVICE data Firmware Revision field to return in the PRODUCT REVISION LEVEL field as follows: a) If the IDENTIFY DEVICE data received in words 25 and 26 from the ATA device are ASCII spaces (20h), then the four ASCII characters selected shall be: 1) byte 0 contains IDENTIFY DEVICE data word 23 bits 15:8 (i.e., byte 1); 2) byte 1 contains IDENTIFY DEVICE data word 23 bits 7:0 (i.e., byte 0); 3) byte 2 contains IDENTIFY DEVICE data word 24 bits 15:8 (i.e., byte 3); and 4) byte 3 contains IDENTIFY DEVICE data word 24 bits 7:0 (i.e., byte 2); or b) If the IDENTIFY DEVICE data received in words 25 and 26 from the ATA device are not ASCII spaces (20h), then the four ASCII characters selected shall be: 1) byte 0 contains IDENTIFY DEVICE data word 25 bits 15:8 (i.e., byte 5); 2) byte 1 contains IDENTIFY DEVICE data word 25 bits 7:0 (i.e., byte 4); 3) byte 2 contains IDENTIFY DEVICE data word 26 bits 15:8 (i.e., byte 7); and 4) byte 3 contains IDENTIFY DEVICE data word 26 bits 7:0 (i.e., byte 6).
CLOCKING	Unspecified (see 3.4.3)
QAS	Unspecified (see 3.4.3)
IUS	Unspecified (see 3.4.3)

[a] If the INQUIRY command is issued to an unsupported logical unit the SATL shall set the PERIPHERAL QUALIFIER field to 011b and shall set the PERIPHERAL DEVICE TYPE field to 1Fh.

[b] The full ATA IDENTIFY DEVICE data MODEL NUMBER field contents and the REVISION NUMBER field contents are retrieved with the ATA Information VPD page (see 10.3.5).

[c] There can only be 6 total version descriptors. Normally e) and f) are not together so they fit. A FC to SAS bridge might have both, though.

[d] The encoding used by T10 for INQUIRY version descriptors (see SPC-3) and T13 for IDENTIFY DEVICE major and minor version numbers (see ATA/ATAPI-7) differ, and the two standards organizations may not define values for the same revisions.

Page 29, Version Descriptor field definitions, Item g

Comment:
Item 'g' seems to expose into the SCSI layer some ATA specific information that probably isn't very meaningful to SCSI. If the host were SATL aware, wouldn't it be better to get this information directly from the ATA Information VPD Page. Why duplicate it here.

Preferred resolution:
Agnostic. Doesn't make the translation harder or easier. Just seems misplaced so I wanted to ask the question.

REASON: SPC-3 table D.14 defines codes for all SCSI device types, including values for ATA/ATAPI. Some level of exposure of the ATA/ATAPI conformance version is already anticipated in SPC-3 for one reason or another, so it doesn't seem unreasonable to allow it here.

Date: 4/11/2006 4:39:58 PM
Table 9 and global: change “8.2.2” to “See 8.2.2". This style was first noted in table 7 and thought to be an anomaly. It now appears to be a “style” -- an incorrect one. Change each “x.y” in subsequent tables to “See x.y”.

REASON: All the stand-alone references under the column heading "Description or reference" were changed to the "8.2.2" format rather than the "See 8.2.2" format according to recommendations from T10 editors at earlier SAT editor's sessions. The SAT editor could still change them all back to the "See 8.2.2" format, but only if there's consensus among the current T10 editors.

8.2.3 PAGE CODE field
Table 11 - PAGE CODE field values

The text in Table 11, for codes 2Fh and 10h is not necessary because of the detailed description already given in table 76 in determining supported pages.

REASON: The detailed description in table 76 is there to define the conditions for whether the Self-Test Results log page is listed in the Supported Log Pages log page. This row in Table 11 describes the behavior when the Self-Test Results log page itself is requested. In both cases it is necessary to determine if the ATA device supports the corresponding function. There could be a common subclause to describe the heuristic for making that determination and then refer to it both from table 11 and table 76, but that would force the reader to bounce around. The editor's opinion is that the text is brief enough that duplicating it is not a problem.

8.3 MODE SELECT (6) command

8.3.1 MODE SELECT (6) command overview

The MODE SELECT (6) command provides a mechanism for application clients to change the operating parameters of the target or a logical unit. Parameters specified by the MODE SELECT (6) command may be retrieved with the MODE SENSE (6) command. The application client should send a MODE SENSE (6) command before issuing a MODE SELECT (6) command for the same mode page, to determine the format, length changeable field etc.

The Mode Page Policy VPD page (see 10.3) should be implemented. The MODE PAGE POLICY shall be set to 'Shared', and only one copy of 'current' mode page values shall maintained for all logical units of a target. After a logical unit reset, the SATL shall set all mode page values to default values. See clause 10 for supported mode pages.

8.3.2 MODE SELECT (6) CDB fields

The SATL shall support MODE SELECT (6) CDB fields as shown in Table 12.

Table 12 — MODE SELECT (6) command CDB fields

Field	Description or reference
OPERATION CODE	Some operational parameters in individual pages are provided via ATA. See clause 10 for specific requirements.
SP	Unspecified (see 3.4.3)
PF	The SATL shall not support 0b (indicating modes pages are vendor specific). The SATL shall support 1b (indicating all page formats correspond to SPC-3 and SBC-2 MODE PAGE formats). If this bit is set to 0b, the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.
PARAMETER LIST LENGTH[A]	This field should be set to the length of the mode parameter list to be transferred from the application client.
CONTROL	6.4
[a] The SATL shall recognize the differing PARAMETER LIST LENGTH field size in the MODE SELECT (10) command and the MODE SELECT (6) command.	

8.3.3 Mode parameter header

Table 13 shows the fields in the mode parameter header for MODE SELECT (6).

Table 13 — Mode parameter header (6) fields

Field	Description or reference
MODE DATA LENGTH	See SPC-3
MEDIUM TYPE	Unspecified (see 3.4.3)
DEVICE SPECIFIC PARAMETER	Unspecified (see 3.4.3)
BLOCK DESCRIPTOR LENGTH	See SPC-3. This value shall be obtained by multiplying the number of block descriptors by 8. The SATL shall support at most one mode parameter block descriptor, so this value should be set to 8 if a mode parameter block descriptor is provided.

8.3 MODE SELECT (6) command

8.3.1 MODE SELECT (6) command overview

The MODE SELECT (6) command provides a mechanism for application clients to change the operating parameters of the target or a logical unit. Parameters specified by the MODE SELECT (6) command may be retrieved with the MODE SENSE (6) command. The application client should send a MODE SENSE (6) command before issuing a MODE SELECT (6) command for the same mode page, to determine the format, length changeable field etc.

7 he 6 lode Page Policy VPD page (see 10.3) should be implemented. 8 he MODE PAGE POLICY shall be set to 'Shared', and only one copy of 9 urrent' mode page values shall maintained for all logical units of a target. After a logical unit reset, the SATL shall set all mode page values to default values. See clause 10 for supported mode pages.

8.3.2 MODE SELECT (6) CDB fields

The SATL shall support MODE SELECT (6) CDB fields as shown in Table 12.

Table 12 — MODE SELECT (6) command CDB fields

Field	Description or reference
OPERATION CODE	Some operational parameters in individual pages are provided via ATA. See clause 10 for specific requirements.
SP	Unspecified (see 3.4.3)
PF	The SATL shall not support 0b (indicating modes pages are vendor specific). The SATL shall support 1b (indicating all page formats correspond to SPC-3 and SBC-2 MODE PAGE formats). If this bit is set to 0b, the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.
PARAMETER LIST LENGTH[A]	This field should be set to the length of the mode parameter list to be transferred from the application client.
CONTROL	6.4
[a] The SATL shall recognize the differing PARAMETER LIST LENGTH field size in the MODE SELECT (10) command and the MODE SELECT (6) command.	

8.3.3 Mode parameter header

Table 13 shows the fields in the mode parameter header for MODE SELECT (6).

Table 13 — Mode parameter header (6) fields

Field	Description or reference
MODE DATA LENGTH	See SPC-3
MEDIUM TYPE	Unspecified (see 3.4.3)
DEVICE SPECIFIC PARAMETER	Unspecified (see 3.4.3)
BLOCK DESCRIPTOR LENGTH	See SPC-3. This value shall be obtained by multiplying the number of block descriptors by 8. The SATL shall support at most one mode parameter block descriptor, so this value should be set to 8 if a mode parameter block descriptor is provided.

8.3 MODE SELECT (6) command

8.3.1 MODE SELECT (6) command overview

The MODE SELECT (6) command provides a mechanism for application clients to change the operating parameters of the target or a logical unit. Parameters specified by the MODE SELECT (6) command may be retrieved with the MODE SENSE (6) command. The application client should send a MODE SENSE (6) command before issuing a MODE SELECT (6) command for the same mode page, to determine the format, length changeable field etc.

The Mode Page Policy VPD page (see 10.3) should be implemented. The MODE PAGE POLICY shall be set to 'Shared', and only one copy of 'current' mode page values shall maintained for all logical units of a target. After a logical unit reset, the SATL shall set all mode page values to default values. See clause 10 for supported mode pages.

8.3.2 MODE SELECT (6) CDB fields

The SATL shall support MODE SELECT (6) CDB fields as shown in Table 12.

Table 12 — MODE SELECT (6) command CDB fields

Field	Description or reference
OPERATION CODE	Some operational parameters in individual pages are provided via ATA. See clause 10 for specific requirements.
SP	Unspecified (see 3.4.3)
PF	16 The SATL shall not support 0b (indicating modes pages are vendor specific). The SATL shall support 1b (indicating all page formats correspond to SPC-3 and SBC-2 MODE PAGE formats). If this bit is set to 0b, the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.
PARAMETER LIST LENGTH 19 17	This field should be set to the length of the mode parameter list to be transferred from the application client.
CONTROL	6.4
a The SATL shall recognize the differing PARAMETER LIST LENGTH field size in the MODE SELECT (10) command and the MODE SELECT (6) command.

to
"Describes the length of the block descriptors:
a) If set to zero, the mode parameter block descriptor is eight bytes long; or
b) If set to one, the mode parameter block descriptor is 16 bytes long."

Comments from page 52 continued on next page

8.3.3.1 Mode parameter block descriptor fields

The SATL may support the direct-access mode parameter block descriptor. The SATL may support the long LBA mode parameter block descriptor. The SATL shall not support the general mode parameter block descriptor. The DENSITY CODE (see SPC-3) is reserved for SATL devices. Table 14 shows the fields in the mode parameter block descriptors supported by the SATL.

Table 14 — Mode parameter block descriptor fields

Field	Description or reference
NUMBER OF BLOCKS	The SATL shall not support changing its capacity by changing the NUMBER OF BLOCKS field using the MODE SELECT command, and the value in this field is ignored. [a]
BLOCK LENGTH	The SATL shall return the same block length for the entire LUN. For direct access devices, the SATL shall set this field to 200h.

[a] This is because the ATA device provides no method to modify the capacity

8.4 MODE SELECT (10) command

8.4.1 MODE SELECT (10) command overview

The SATL shall implement the MODE SELECT (10) command as described in 8.3, except that the SATL shall recognize the longer PARAMETER LIST LENGTH field in the CDB, and shall recognize the LONGLBA bit in the mode parameter header (10).

8.4.2 Mode parameter header (10)

Table 13 shows the fields in the mode parameter header (10).

Table 15 — Mode parameter header (10) fields

Field	Description or reference
MODE DATA LENGTH	8.3.3
MEDIUM TYPE	For direct access devices, this field should be set to 00h
DEVICE SPECIFIC PARAMETER	8.3.3
LONGLBA	Describes the length of the block descriptors. a) If set to 0b, the mode parameter block descriptor is 8 bytes long. b) If set to 1b, the mode parameter block descriptor is 16 bytes long.
BLOCK DESCRIPTOR LENGTH	This field indicates the length of the mode parameter block descriptor. This value shall be obtained by multiplying the number of block descriptors by 8 if LONGLBA bit is set to 0, or by 16 if LONGLBA bit is set to 1. No more than one mode parameter block descriptor shall be supported, so this value should be set to 8 or 16. (see 8.3.3)

8.5 MODE SENSE (6) command

8.5.1 MODE SENSE (6) command overview

The MODE SENSE (6) command is used to query the SATL about operational parameters of the target device or logical unit(s). The SATL emulates the SCSI behavior for ATA devices. The MODE SENSE (6) command is the complementary command of the MODE SELSECT (6) command. See 10.1 for supported mode pages.

8.5.2 MODE SENSE (6) CDB fields

The SATL shall support MODE SENSE (6) CDB fields as shown in Table 16.

Table 16 — MODE SENSE (6) CDB fields

Field	Description or reference
OPERATION CODE	Mostly emulated. Some operational parameters in individual pages are gathered by issuing ATA commands. See 10.1. for more details.
DBD	A value 0b indicates that one or more block descriptors may be returned in mode sense data. The SATL shall support only the mode parameter block descriptor format for direct-attach devices.
PC	8.5.3
PAGE CODE	This field identifies the particular page requested. See section on Mode pages for further details.
SUB PAGE CODE	This field identifies the sub page code within the page code specified by PAGE CODE field that is required by the client. See section on Mode pages for further details.
ALLOCATION LENGTH	The SATL shall return no more bytes of data than the number specified in this field, but any length fields in the returned data shall be consistent with the number of bytes that would have been returned if this field had specified at least as many bytes as required to transmit the information requested.
CONTROL	6.4

table 17
_T_ Does 'No' in the supported column mean 'unspecified' or does it mean the SATL is required to reject commands that specific the listed page code values? Clarify.

Comments from page 53 continued on next page

8.5 MODE SENSE (6) command

8.5.1 MODE SENSE (6) command overview

The MODE SENSE (6) command is used to query the SATL about operational parameters of the target device or logical unit(s). The SATL emulates the SCSI behavior for ATA devices. The MODE SENSE (6) command is the complementary command of the MODE SELSECT (6) command. See 10.1 for supported mode pages.

8.5.2 MODE SENSE (6) CDB fields

The SATL shall support MODE SENSE (6) CDB fields as shown in Table 16.

Table 16 — MODE SENSE (6) CDB fields

Field	Description or reference
OPERATION CODE	Mostly emulated. Some operational parameters in individual pages are gathered by issuing ATA commands. See 10.1. for more details.
DBD	A value 0b indicates that one or more block descriptors may be returned in mode sense data. The SATL shall support only the mode parameter block descriptor format for direct-attach devices.
PC	8.5.3
PAGE CODE	This field identifies the particular page requested. See section on Mode pages for further details.
SUB PAGE CODE	This field identifies the sub page code within the page code specified by PAGE CODE field that is required by the client. See section on Mode pages for further details.
ALLOCATION LENGTH	The SATL shall return no more bytes of data than the number specified in this field, but any length fields in the returned data shall be consistent with the number of bytes that would have been returned if this field had specified at least as many bytes as required to transmit the information requested.
CONTROL	6.4

8.5.3 PC ~~(Page Control)~~

Table 17 shows the values of the PC field.

Table 17 — PC values and their descriptions

Value	Type of Parameter	Supported
00b	Current Values	Yes
01b	Changeable Values	30
10b	Default Values	No
11b	Saved Values	No

8.5.4 Mode parameter header (6)

Table 18 shows the fields in the mode parameter header (6)

RESOLUTION: Delete subclause 8.5.3 (see EDITOR's comment). The description of the PC field in table 16 (see EDITOR's comment) is revised to clarify that the translations for changeable values, default values, and saved values are unspecified.

In 8.5.3 PC (Page Control)

Not sure the value of this section/table 17. Seems a lot easier to say SATL shall support the field set to 00b in table 16 and if not 00b, then check condition/illegal request/invalid field in CDB?

However, since the SP bit in the MODE SELECT is unspecified, it would seem to me that Saved Values would be supported also if the device allowed for saving values.

The more I think about it, they should be set to unspecified for all the No values.
RESOLUTION: Delete subclause 8.5.3 (see EDITOR's comment). The description of the PC field in table-16 is revised to clarify that changeable values, default values, and saved values are unspecified.

Table 18 — Mode parameter header (6) fields

Field	Description or reference
MODE DATA LENGTH	Indicates the number of bytes following this field that was transferred.
MEDIUM TYPE	For direct access devices, this field should be set to 00h.
DEVICE SPECIFIC PARAMETER	See SBC-2. If the DPOFUA bit is set to 0b it indicates that SATL does not support DPO and FUA bits. If the DPOFUA bit is set to 1b it indicates that the SATL supports DPO and FUA bits. If the WP bit is set to 0b, it indicates that the device is write enabled. This is the only supported value for this bit. If the WP bit is set to 1b, it indicates that the device is write protected. A WP bit set to 1b shall not be supported.
BLOCK DESCRIPTOR LENGTH	This field indicates the length of the mode parameter block descriptor. This value is obtained by multiplying the number of block descriptors by 8, for MODE SELECT (6) commands and MODE SELECT (10) commands, if LONGLBA bit is set to zero, or by 16 for MODE SELECT (10) commands and LONGLBA bit is set to one. Only one mode parameter block descriptor is supported, so this value should be set to 8 or 16.

8.5.5 General mode parameter block descriptor fields

Table 19 describes the translation of the general mode parameter block descriptor fields.

Table 19 — General mode parameter block descriptor fields

Field	Description or reference
NUMBER OF BLOCKS	Unspecified (see 3.4.3)
~~DENSITY CODE~~	~~For direct access devices, this field should be set to 00h.~~
BLOCK LENGTH	Describes the block length for the section of the LUN described by this mode parameter block descriptor. Since there is only one mode parameter block descriptor, this describes the block length of the entire LUN. For direct access devices, the block length is set to 200h or 512 bytes per block.

~~SATL shall support only the mode parameter block descriptor formats for direct access devices.~~

~~8.5.6 Mode Sense Block Descriptor (8 byte format)~~

~~The general format used to return data for a MODE SENSE command contains a Mode Parameter header, followed by one or more BLOCK DESCRIPTORS, followed by a variable length mode page(s).~~ ~~Please refer SPC-3~~

8.5.5 General mode parameter block descriptor fields

In Section 8.3.3.1, it states that the SATL shall not support the General mode parameter block descriptor. Yet it is shown here.

This comes back to the point of, is this standard(v1.0) only for block devices? If so, this should be changed to the Mode parameter descriptor section, defining the fields for the short and long LBA mpbd.

And Delete 8.5.6
RESOLUTION: Modify 8.5.5 to define the translation for the "Mode parameter block descriptor" per DELL comment on the subheading.
Also, move this subclause to clause 10.

Row: BLOCK LENGTH
change
"Describes the block length for the section of the LUN described by this mode parameter block descriptor. Since there is only one mode parameter block descriptor, this describes the block length of the entire LUN. For direct access devices, the block length is set to 200h or 512 bytes per block."
to
"For direct access block devices, the SATL shall set this field to 200h (i.e., 512 bytes)."

RESOLUTION: Specified in 06-216.

Status
rlsheffi Accepted 5/11/2006 12:53:38 PM

Sequence number: 19
Author: ELX[KHirata]
Subject: Highlight
Date: 5/11/2006 12:54:25 PM
Location: Page 34, Table 19, Block Length Description.

Comment:
Shouldn't the Block Length be reported as per the sector size field in the IDENTIFY DEVICE data? (Defaulting to 512-bytes if the IDENTIFY DEVICE field isn't valid.) Why is this hard coded to 512 bytes?

Preferred resolution:
Clarification. If there is a good reason for this then I don't care.

RESOLUTION: Specified in 06-216.

Table 18 — Mode parameter header (6) fields

Field	Description or reference
MODE DATA LENGTH	Indicates the number of bytes following this field that was transferred.
MEDIUM TYPE	For direct access devices, this field should be set to 00h.
DEVICE SPECIFIC PARAMETER	See SBC-2. If the DPOFUA bit is set to 0b it indicates that SATL does not support DPO and FUA bits. If the DPOFUA bit is set to 1b it indicates that the SATL supports DPO and FUA bits. If the WP bit is set to 0b, it indicates that the device is write enabled. This is the only supported value for this bit. If the WP bit is set to 1b, it indicates that the device is write protected. A WP bit set to 1b shall not be supported.
BLOCK DESCRIPTOR LENGTH	This field indicates the length of the mode parameter block descriptor. This value is obtained by multiplying the number of block descriptors by 8, for MODE SELECT (6) commands and MODE SELECT (10) commands, if LONGLBA bit is set to zero, or by 16 for MODE SELECT (10) commands and LONGLBA bit is set to one. Only one mode parameter block descriptor is supported, so this value should be set to 8 or 16.

8.5.5 General mode parameter block descriptor fields

Table 19 describes the translation of the general mode parameter block descriptor fields.

Table 19 — General mode parameter block descriptor fields

Field	Description or reference
NUMBER OF BLOCKS	Unspecified (see 3.4.3)
~~DENSITY CODE~~	~~For direct access devices, this field should be set to 00h.~~
BLOCK LENGTH	Describes the block length for the section of the LUN described by this mode parameter block descriptor. Since there is only one mode parameter block descriptor, this describes the block length of the entire LUN. For direct access devices, the block length is set to 200h or 512 bytes per block.

~~SATL shall support only the mode parameter block descriptor formats for direct access devices.~~

~~8.5.6 Mode Sense Block Descriptor (8 byte format)~~

~~23 The general format used to return data for a MODE SENSE command contains a Mode Parameter header, followed by one or more BLOCK DESCRIPTORS, followed by a variable length mode page(s).~~ 26 ~~Please refer SPC-3~~

8.7 READ BUFFER command

8.7.1 READ BUFFER command overview

The READ BUFFER command is used with the write buffer command to determine the integrity of the target device's buffer memory and the physical interconnect that connects the target device and the initiator.

Table 22 — READ BUFFER command CDB fields

Field	Description or reference
OPERATION CODE	The SATL shall issue the ATA READ BUFFER command ~~(E4h)~~ to the attached ATA device.
MODE	8.7.2
BUFFER ID	Unspecified (see 3.4.3)
BUFFER OFFSET	Refers to the offset in the buffer to start reading data from. The BUFFER OFFSET should be less than the size of the buffer size, otherwise a CHECK CONDITION shall be sent back with sense key set to ILLEGAL REQUEST and additional sense code set to INVALID FIELD IN CDB.
ALLOCATION LENGTH	Refer to individual sections for the meaning of this term.
CONTROL	6.4

The logical sector buffer in a ATA device shall be used to emulate the READ BUFFER command, so the size of the buffer is limited to 512 bytes for data buffer and echo buffers.

8.7.2 MODE field

Table 23 describes modes supported. ~~Only data and data buffer descriptor shall be supported.~~

Table 23 — MODE field

Code	Translated ATA Opcode
02h (i.e., Data)	Translated to the ATA READ BUFFER command (see 8.7.3).
03h (i.e., Descriptor)	See 8.7.4.
All others	Unspecified (see 3.4.3)

8.7.3 Data Only mode (02h)

In this mode, data is read from the device's logical sector buffer and returned to the requestor. Note that logical sector buffer in the ATA device is being used to emulate the SCSI READ BUFFER command, so the maximum length of data that can be written is 512 bytes. Valid fields in the CDB, apart from the MODE field, are BUFFER ID, BUFFER OFFSET and ALLOCATION LENGTH. The BUFFER OFFSET shall be less than or equal to 512. The ALLOCATION LENGTH shall be less than or equal to 512. A write buffer command may sent to the same BUFFER ID before it is read.

8.7.4 Descriptor mode (03h)

Four bytes of information shall be returned to the requestor describing the requested buffer. These four bytes include the OFFSET BOUNDARY and the BUFFER CAPACITY. The BUFFER ID should be set to 0. For all other BUFFER ID's, all zeros shall be returned. ALLOCATION LENGTH should be set to 4.

READ Buffer and WRITE Buffer can also be used to read and write to the SATL buffers. SPC allows for the vendor to map the BUFFER ID to a specific buffer in the device. This could be a buffer in the SATL in addition to a buffer on the device. Loosen up this definition to allow a buffer to reside in the SATL.
RESOLUTION: in **8.7.2 MODE field delete, "Only data and data buffer descriptor shall be supported." (see DELL comment)**

8.7 READ BUFFER command

8.7.1 READ BUFFER command overview

The READ BUFFER command is used with the write buffer command to determine the integrity of the target device's buffer memory and the physical interconnect that connects the target device and the initiator.

Table 22 — READ BUFFER command CDB fields

Field	Description or reference
OPERATION CODE	The SATL shall issue the ATA READ BUFFER command (~~E4h~~) to the attached ATA device.
MODE	8.7.2
BUFFER ID	Unspecified (see 3.4.3)
BUFFER OFFSET	Refers to the offset in the buffer to start reading data from. The BUFFER OFFSET should be less than the size of the buffer size, otherwise a CHECK CONDITION shall be sent back with sense key set to ILLEGAL REQUEST and additional sense code set to INVALID FIELD IN CDB.
ALLOCATION LENGTH	Refer to individual sections for the meaning of this term.
CONTROL	6.4

The logical sector buffer in a ATA device shall be used to emulate the READ BUFFER command, so the size of the buffer is limited to 512 bytes for data buffer and echo buffers.

8.7.2 MODE field

Table 23 describes modes supported. ~~Only data and data buffer descriptor shall be supported.~~

Table 23 — MODE field

Code	Translated ATA Opcode
02h (i.e., Data)	Translated to the ATA READ BUFFER command (see 8.7.3).
03h (i.e., Descriptor)	See 8.7.4.
All others	Unspecified (see 3.4.3)

8.7.3 Data Only mode (02h)

In this mode, data is read from the device's logical sector buffer and returned to the requestor. Note that logical sector buffer in the ATA device is being used to emulate the SCSI READ BUFFER command, so the maximum length of data that can be written is 512 bytes. Valid fields in the CDB, apart from the MODE field, are BUFFER ID, BUFFER OFFSET and ALLOCATION LENGTH. The BUFFER OFFSET shall be less than or equal to 512. The ALLOCATION LENGTH shall be less than or equal to 512. A write buffer command may sent to the same BUFFER ID before it is read.

8.7.4 Descriptor mode (03h)

Four bytes of information shall be returned to the requestor describing the requested buffer. These four bytes include the OFFSET BOUNDARY and the BUFFER CAPACITY. The BUFFER ID should be set to 0. For all other BUFFER ID's, all zeros shall be returned. ALLOCATION LENGTH should be set to 4.

8.7.3 Data Only mode (02h)

In this mode, data is read from the device's logical sector buffer and returned to the requestor. Note that logical sector buffer in the ATA device is being used to emulate the SCSI READ BUFFER command, so the maximum length of data that can be written is 512 bytes. Valid fields in the CDB, apart from the MODE field, are BUFFER ID, BUFFER OFFSET and ALLOCATION LENGTH. The BUFFER OFFSET shall be less than or equal to 512. The ALLOCATION LENGTH shall be less than or equal to 512. A write buffer command may sent to the same BUFFER ID before it is read.

8.7.4 Descriptor mode (03h)

Four bytes of information shall be returned to the requestor describing the requested buffer. These four bytes include the OFFSET BOUNDARY and the BUFFER CAPACITY. The BUFFER ID should be set to 0. For all other BUFFER ID's, all zeros shall be returned. ALLOCATION LENGTH should be set to 4.

Subject: Comment on Text
Date: 4/18/2006 9:38:15 PM

Since an ATA device only has one buffer and a full 512 bytes shall be written, if the buffer offset is non-zero, doesn't an illegal request result.

REASON: Seems most are leaning towards a less restrictive definition which allows things like reading and writing a buffer implemented in the SATL itself. In this case, a SATL could implement anything a SCSI device could implement. The 512 byte limit will be captured in the description of the "data mode" in subclause 8.7.3.

change
"Four bytes of information shall be returned to the requestor describing the requested buffer. These four bytes include the OFFSET BOUNDARY and the BUFFER CAPACITY. The BUFFER ID should be set to 0. For all other BUFFER ID's, all zeros shall be returned. ALLOCATION LENGTH should be set to 4."
to
"Four bytes of data shall be returned to the application client describing the requested buffer. These four bytes include the OFFSET BOUNDARY and BUFFER CAPACITY fields. The BUFFER ID field should be set to zero. For all other BUFFER ID's, all zeros shall be returned. The BUFFER OFFSET field is Reserved in the this mode. The ALLOCATION LENGTH should be set to 4h."

DISCUSS FLAG: proposed resolution - s/b
"The SATL shall return the lesser of four bytes or the number of bytes specified in the ALLOCATION LENGTH field. The four bytes describe the requested buffer, including the OFFSET BOUNDARY field and the BUFFER CAPACITY field.

If the BUFFER ID field is set to zero then the SATL shall return values in the OFFSET BOUNDARY field and the BUFFER CAPACITY field describing the buffer in the ATA device that is accessible using the ATA READ BUFFER command and the ATA WRITE BUFFER command by returning a value of FFh in the OFFSET BOUNDARY field (i.e., zero is the only supported value in the BUFFER OFFSET field) and a value of 200h (i.e., 512 bytes) in the BUFFER CAPACITY field.

The SATL may support a value other than zero in the BUFFER ID field. If the SATL supports a value other than zero in the BUFFER ID field the implementation shall be as defined in SPC-3."

Comments from page 56 continued on next page

8.7 READ BUFFER command

8.7.1 READ BUFFER command overview

The READ BUFFER command is used with the write buffer command to determine the integrity of the target device's buffer memory and the physical interconnect that connects the target device and the initiator.

Table 22 — READ BUFFER command CDB fields

Field	Description or reference
OPERATION CODE	The SATL shall issue the ATA READ BUFFER command ~~(E4h)~~ to the attached ATA device.
MODE	8.7.2
BUFFER ID	Unspecified (see 3.4.3)
BUFFER OFFSET	Refers to the offset in the buffer to start reading data from. The BUFFER OFFSET should be less than the size of the buffer size, otherwise a CHECK CONDITION shall be sent back with sense key set to ILLEGAL REQUEST and additional sense code set to INVALID FIELD IN CDB.
ALLOCATION LENGTH	Refer to individual sections for the meaning of this term.
CONTROL	6.4

The logical sector buffer in a ATA device shall be used to emulate the READ BUFFER command, so the size of the buffer is limited to 512 bytes for data buffer and echo buffers.

8.7.2 MODE field

Table 23 describes modes supported. ~~Only data and data buffer descriptor shall be supported.~~

Table 23 — MODE field

Code	Translated ATA Opcode
02h (i.e., Data)	Translated to the ATA READ BUFFER command (see 8.7.3).
03h (i.e., Descriptor)	See 8.7.4.
All others	Unspecified (see 3.4.3)

8.7.3 Data Only mode (02h)

In this mode, data is read from the device's logical sector buffer and returned to the requestor. Note that logical sector buffer in the ATA device is being used to emulate the SCSI READ BUFFER command, so the maximum length of data that can be written is 512 bytes. Valid fields in the CDB, apart from the MODE field, are BUFFER ID, BUFFER OFFSET and ALLOCATION LENGTH. The BUFFER OFFSET shall be less than or equal to 512. The ALLOCATION LENGTH shall be less than or equal to 512. A write buffer command may sent to the same BUFFER ID before it is read.

8.7.4 Descriptor mode (03h)

Four bytes of information shall be returned to the requestor describing the requested buffer. These four bytes include the OFFSET BOUNDARY and the BUFFER CAPACITY. The BUFFER ID should be set to 0. For all other BUFFER ID's, all zeros shall be returned. ALLOCATION LENGTH should be set to 4.

37

The << 0 >> should be << zero >> and the << 4 >> should be << four >>.

8.8 READ MEDIA SERIAL NUMBER command

8.8.1 READ MEDIA SERIAL NUMBER command overview

READ MEDIA SERIAL NUMBER returns the serial number of the currently mounted media, as returned by the device. This command is emulated in the ATA environment as ATA provides no direct corresponding command to the device.

Table 24 — READ MEDIA SERIAL NUMBER command CDB fields

Field	Description or reference
OPERATION CODE	See 8.8.2
SERVICE ACTION	As defined in SPC-3
ALLOCATION LENGTH	As defined in SPC-3
CONTROL	6.4

8.8.2 READ MEDIAL SERIAL NUMBER emulation

A SATL emulating the READ MEDIA SERIAL NUMBER command shall issue an IDENTIFY DEVICE (ECh) ATA opcode to the attached ATA device. If the IDENTIFY DEVICE command completes with success, the SATL shall return a media serial number to the application client as defined in SPC-3. The media serial number shall be generated as follows:

1) If IDENTIFY DEVICE data, word 87, bit 2 is set, the SATL shall return the media serial number located in words 176-205. The data from the medial serial number shall be treated as an ASCII string, defined in ATA/ATAPI-7.
2) If IDENTIFY DEVICE data, word 87, bit 2 is not set, the SATL shall issue a READ VERIFY SECTOR(S) or READ VERIFY SECTOR(S) EX to LBA 0. Alternatively, if the ATA device indicates support for the Removable Media Status Notification feature set, the SATL may issue a GET MEDIA STATUS command to verify presence of the medial. If the READ VERIFY SECTOR(S) or READ VEIRFY SECTOR(S) EX commands complete successfully, or the GET MEDIA STATUS command completes successfully without the NM bit set, the SATL shall return a media serial number of zero as defined in SPC-3. Otherwise, the SATL shall terminate the command with CHECK CONDITION status, with the sense key set to NOT READY, and the additional sense code set to MEDIUM NOT PRESENT.

8.9 REQUEST SENSE command

8.9.1 REQUEST SENSE command overview

The REQUEST SENSE command requests any available sense data to be returned to the application client. A SATL may implement sense data processing as defined SAM-2 and not support autosense (see 3.1.21). If the SCSI transport protocol for the SATL supports autosense (see 3.1.21) the SATL shall support autosense (see SAM-3). The SATL shall implement the REQUEST SENSE command as specified in SPC-3.

The SATL shall determine if any of the conditions listed in table 25 exist. If none of these conditions exist and the SATL has no status other than GOOD to return, the SATL shall complete this command with GOOD status

8.8.2 READ MEDIAL SERIAL NUMBER emulation
1st Paragraph , 2) in 1,2 list.

Comments from page 57 continued on next page

8.8 READ MEDIA SERIAL NUMBER command

8.8.1 READ MEDIA SERIAL NUMBER command overview

READ MEDIA SERIAL NUMBER returns the serial number of the currently mounted media, as returned by the device. This command is emulated in the ATA environment as ATA provides no direct corresponding command to the device.

Table 24 — READ MEDIA SERIAL NUMBER command CDB fields

Field	Description or reference
OPERATION CODE	See 8.8.2
SERVICE ACTION	As defined in SPC-3
ALLOCATION LENGTH	As defined in SPC-3
CONTROL	6.4

8.8.2 READ MEDIAL SERIAL NUMBER emulation

A SATL emulating the READ MEDIA SERIAL NUMBER command shall issue an IDENTIFY DEVICE (ECh) ATA opcode to the attached ATA device. If the IDENTIFY DEVICE command completes with success, the SATL shall return a media serial number to the application client as defined in SPC-3. The media serial number shall be generated as follows:

1) If IDENTIFY DEVICE data, word 87, bit 2 is set, the SATL shall return the media serial number located in words 176-205. The data from the medial serial number shall be treated as an ASCII string, defined in ATA/ATAPI-7.
2) If IDENTIFY DEVICE data, word 87, bit 2 is not set, the SATL shall issue a READ VERIFY SECTOR(S) or READ VERIFY SECTOR(S) EX to LBA 0. Alternatively, if the ATA device indicates support for the Removable Media Status Notification feature set, the SATL may issue a GET MEDIA STATUS command to verify presence of the medial. If the READ VERIFY SECTOR(S) or READ VEIRFY SECTOR(S) EX commands complete successfully, or the GET MEDIA STATUS command completes successfully without the NM bit set, the SATL shall return a media serial number of zero as defined in SPC-3. Otherwise, the SATL shall terminate the command with CHECK CONDITION status, with the sense key set to NOT READY, and the additional sense code set to MEDIUM NOT PRESENT.

8.9 REQUEST SENSE command

8.9.1 REQUEST SENSE command overview

The REQUEST SENSE command requests any available sense data to be returned to the application client. A SATL may implement sense data processing as defined SAM-2 and not support autosense (see 3.1.21). If the SCSI transport protocol for the SATL supports autosense (see 3.1.21) the SATL shall support autosense (see SAM-3). The SATL shall implement the REQUEST SENSE command as specified in SPC-3.

The SATL shall determine if any of the conditions listed in table 25 exist. If none of these conditions exist and the SATL has no status other than GOOD to return, the SATL shall complete this command with GOOD status

"2) If IDENTIFY DEVICE data, word 87, bit 2 is not set, the SATL shall issue a READ VERIFY SECTOR(S) or READ VERIFY SECTOR(S) EX to LBA 0. Alternatively, if the ATA device indicates support for the Removable Media Status Notification feature set, the SATL may issue a GET MEDIA STATUS command to verify presence of the medial. If the READ VERIFY SECTOR(S) or READ
VEIRFY SECTOR(S) EX commands complete successfully, or the GET MEDIA STATUS command completes successfully without the NM bit set, the SATL shall return a media serial number of zero as defined in SPC-3. Otherwise, the SATL shall terminate the command with CHECK CONDITION status, with the sense key set to NOT READY, and the additional sense code set to MEDIUM NOT PRESENT."
to
"b) If ATA IDENTIFY DEVICE data, word 87, bit 2 is set to zero, the SATL shall issue an ATA READ VERIFY SECTOR(S) or READ VERIFY SECTOR(S) EX command to LBA 0. Alternatively, if the ATA device indicates support for the Removable Media Status Notification feature set (i.e., ATA IDENTIFY DEVICE data, word 127, bits (1:0) is set to 01b), the SATL may issue an ATA GET MEDIA STATUS command to verify presence of media. If the ATA READ VERIFY SECTOR(S) or READ VERIFY SECTOR(S) EXT command complete without error, or the ATA GET MEDIA STATUS command completes with the NM bit set to zero in the Error register, the SATL shall return a media serial number of zero as defined in SPC-3. Otherwise, the SATL shall terminate the command with CHECK CONDITION status, with the sense key set to NOT READY, and the additional sense code set to MEDIUM NOT PRESENT."

Suggested: s/b
"b) If ATA IDENTIFY DEVICE data, word 87, bit 2 is set to zero, the SATL shall issue an ATA READ VERIFY SECTOR(S) or READ VERIFY SECTOR(S) EXT command to LBA 0. Alternatively, if the ATA device indicates support for the Removable Media Status Notification feature set (i.e., ATA IDENTIFY DEVICE data, word 127, bits (1:0) is set to 01b), the SATL may issue an ATA GET MEDIA STATUS command to verify presence of media. If the ATA READ VERIFY SECTOR(S) or READ VERIFY SECTOR(S) EXT command complete without error, or the ATA GET MEDIA STATUS command completes with the NM bit set to zero in the Error register, the SATL shall return a media serial number of zero as defined in SPC-3. Otherwise, the SATL shall terminate the command with CHECK CONDITION status, with the sense key set to NOT READY, and the additional sense code set to MEDIUM NOT PRESENT."

SERVICE ACTION	As defined in SPC-3
ALLOCATION LENGTH	As defined in SPC-3
CONTROL	6.4

8.8.2 READ MEDIAL SERIAL NUMBER emulation

A SATL emulating the READ MEDIA SERIAL NUMBER command shall issue an IDENTIFY DEVICE (ECh) ATA opcode to the attached ATA device. If the IDENTIFY DEVICE command completes with success, the SATL shall return a media serial number to the application client as defined in SPC-3. The media serial number shall be generated as follows:

1) If IDENTIFY DEVICE data, word 87, bit 2 is set, the SATL shall return the media serial number located in words 176-205. The data from the medial serial number shall be treated as an ASCII string, defined in ATA/ATAPI-7.
2) If IDENTIFY DEVICE data, word 87, bit 2 is not set, the SATL shall issue a READ VERIFY SECTOR(S) or READ VERIFY SECTOR(S) EX to LBA 0. Alternatively, if the ATA device indicates support for the Removable Media Status Notification feature set, the SATL may issue a GET MEDIA STATUS command to verify presence of the medial. If the READ VERIFY SECTOR(S) or READ VERIFY SECTOR(S) EX commands complete successfully, or the GET MEDIA STATUS command completes successfully without the NM bit set, the SATL shall return a media serial number of zero as defined in SPC-3. Otherwise, the SATL shall terminate the command with CHECK CONDITION status, with the sense key set to NOT READY, and the additional sense code set to MEDIUM NOT PRESENT.

8.9 REQUEST SENSE command

8.9.1 REQUEST SENSE command overview

The REQUEST SENSE command requests any available sense data to be returned to the application client. A SATL may implement sense data processing as defined SAM-2 and not support autosense (see 3.1.21). If the SCSI transport protocol for the SATL supports autosense (see 3.1.21) the SATL shall support autosense (see SAM-3). The SATL shall implement the REQUEST SENSE command as specified in SPC-3.

The SATL shall determine if any of the conditions listed in table 25 exist. If none of these conditions exist and the SATL has no status other than GOOD to return, the SATL shall complete this command with GOOD status

8.9.1 REQUEST SENSE command overview
1st Paragraph, 2nd Sentence
change
"A SATL may implement sense data processing as defined SAM-2 and not support autosense (see 3.1.21). If the SCSI transport protocol for the SATL supports autosense (see 3.1.21) the SATL shall support autosense (see SAM-3). The SATL shall implement the REQUEST SENSE command as specified in SPC-3."
to
"A SATL may implement sense data processing as defined in SAM-2 and not support autosense (see 3.1.21). If a SCSI transport protocol of the target port for the SATL supports autosense the SATL shall support autosense (see SAM-3). The SATL shall implement the REQUEST SENSE command as defined in SPC-3."

REASON: The transport, by definition, applies to both the target port and the initiator port, so it is the transport protocol that determines whether or not autosense is supported. It is implicit that a SATL attached to a defined SCSI transport via a SCSI target port. See HP comment for the resolution.

change
"If the ATA device has the SMART feature set enabled, the MRIE field in the Informational Exceptions Control mode page is set to 6h (see 10.1.7.2), and the most recent SMART RETURN STATUS command to the device indicates that the error threshold has been reached, then the SATL shall return GOOD status with the sense key set to NO SENSE with the additional sense code set to HARDWARE IMPENDING FAILURE GENERAL HARD DRIVE FAILURE."
to
"If the ATA device has the SMART feature set enabled (i.e., IDENTIFY DEVICE data word 85 bit 0 is set to one), the MRIE field in the Informational Exceptions Control mode page of the SATL is set to 6h (see 10.1.7.2), and the most recent ATA

Comments from page 58 continued on next page

~~with the sense key set to NO SENSE and the additional sense code set to NO ADDITIONAL SENSE DATA. Otherwise, the SATL shall take the actions~~ specified in the subclause for that condition specified in table 25.

Table 25 — Special Request Sense behavior reference

ATA Device Condition	Reference
Status other than GOOD to return	SPC-3
FORMAT UNIT in progress	8.9.2
SMART Threshold Exceeded Condition	8.9.3
ATA Device in Low Power State	8.9.4

Table 26 shows the fields in the REQUEST SENSE CDB.

Table 26 — REQUEST SENSE command CDB fields

Field	Description or reference
OPERATION CODE	If autosense is supported and no condition from table 25 exists the SATL shall return GOOD status with the sense key set to NO SENSE with the additional sense code set to NO ADDITIONAL SENSE DATA.
DESC	A SATL may support returning fixed format sense data, descriptor format sense data, or both. This bit shall be implemented as described in SPC-3.
ALLOCATION LENGTH	This field specifies the number bytes allocated for the returned sense data. This field shall be implemented as described in SPC-3.
CONTROL	6.4

8.9.2 FORMAT UNIT In Progress

If a FORMAT UNIT command is in progress, and the SATL receives a REQUEST SENSE command, the SATL shall return GOOD status with the sense key set to NOT READY with the additional sense code set to LOGICAL UNIT NOT READY, FORMAT IN PROGRESS. The sense key specific bytes shall be set to progress indication as defined in SBC-2 and SPC-3.

8.9.3 SMART Threshold Exceeded Condition

If the ATA device has the SMART feature set enabled, the MRIE field in the Informational Exceptions Control mode page is set to 6h (see 10.1.7.2), and the most recent SMART RETURN STATUS command to the device indicates that the error threshold has been reached, then the SATL shall return GOOD status with the sense key set to NO SENSE with the additional sense code set to HARDWARE IMPENDING FAILURE GENERAL HARD DRIVE FAILURE.

8.9.4 ATA Device in Low Power State

If the ATA device is in a low power state (i.e., ATA state of STANDBY) the SATL shall return GOOD status with the sense key set to NO SENSE with the additional sense code set to LOW POWER CONDITION ON.

SMART RETURN STATUS command to the ATA device indicates that the error threshold has been exceeded, then the SATL shall return GOOD status with the sense key set to NO SENSE with the additional sense code set to HARDWARE IMPENDING FAILURE GENERAL HARD DRIVE FAILURE."

Does the DEXCPT bit need to be added here, i,e. and DEXCPT bit =0

RESOLUTION:
"If:
a) the ATA device has the SMART feature set enabled (i.e., IDENTIFY DEVICE data word 85 bit 0 is set to one);
b) the MRIE field in the Informational Exceptions Control mode page of the SATL is set to 6h (see 10.1.7.2);
c) the DEXCPT bit in the Informational Exceptions Control mode page is set to zero; and
d) the most recent ATA SMART RETURN STATUS command to the ATA device indicates that the error threshold has been exceeded;
then the SATL shall:
a) return parameter data containing sense data with the sense key set to NO SENSE with the additional sense code set to HARDWARE IMPENDING FAILURE GENERAL HARD DRIVE FAILURE; and
b) return GOOD status for the command."

Table 25 — Special Request Sense behavior reference

ATA Device Condition	Reference
Status other than GOOD to return	SPC-3
FORMAT UNIT in progress	8.9.2
SMART Threshold Exceeded Condition	8.9.3
ATA Device in Low Power State	8.9.4

Table 26 shows the fields in the REQUEST SENSE CDB.

Table 26 — REQUEST SENSE command CDB fields

Field	Description or reference
OPERATION CODE	If autosense is supported and no condition from table 25 exists the SATL shall return GOOD status with the sense key set to NO SENSE with the additional sense code set to NO ADDITIONAL SENSE DATA.
DESC	A SATL may support returning fixed format sense data, descriptor format sense data, or both. This bit shall be implemented as described in SPC-3.
ALLOCATION LENGTH	This field specifies the number bytes allocated for the returned sense data. This field shall be implemented as described in SPC-3.
CONTROL	6.4

8.9.2 FORMAT UNIT In Progress

If a FORMAT UNIT command is in progress, and the SATL receives a REQUEST SENSE command, the SATL shall return GOOD status with the sense key set to NOT READY with the additional sense code set to LOGICAL UNIT NOT READY, FORMAT IN PROGRESS. The sense key specific bytes shall be set to progress indication as defined in SBC-2 and SPC-3.

8.9.3 SMART Threshold Exceeded Condition

If the ATA device has the SMART feature set enabled, the MRIE field in the Informational Exceptions Control mode page is set to 6h (see 10.1.7.2), and the most recent SMART RETURN STATUS command to the device indicates that the error threshold has been reached, then the SATL shall return GOOD status with the sense key set to NO SENSE with the additional sense code set to HARDWARE IMPENDING FAILURE GENERAL HARD DRIVE FAILURE.

8.9.4 ATA Device in Low Power State

If the ATA device is in a low power state (i.e., ATA state of STANDBY) the SATL shall return GOOD status with the sense key set to NO SENSE with the additional sense code set to [18]W POWER CONDITION ON.

LOGICAL UNIT NOT READY, INITIALIZING COMMAND REQUIRED. If the ATA device is in the Standby power management state for any other reason, the SATL shall return GOOD status with the sense key set to NO SENSE with the additional sense code set to NO ADDITIONAL SENSE DATA."

Note - SPC-3 and SBC-2 do not specify what to return when the device is in the stopped power condition, but the following resolution represents what REQUEST SENSE normally returns when the device server uses auto-sense to return sense data for a CHECK CONDITION, or when the device server does normally return sense data for a prior CHECK CONDITION in REQUEST SENSE parameter data (i.e., no autosense), but there is no sense data for a prior CHECK CONDITION to return.

RESOLUTION:
"If the emulated logical unit is in the stopped power condition (i.e., the ATA device is in the Standby power management state) and there is no sense data to return for a previously returned CHECK CONDITION status, then the SATL shall return:
a) parameter data containing sense data with the sense key set to NO SENSE with the additional sense code set to NO ADDITIONAL SENSE DATA; and
b) GOOD status for the command.

Sense data returned for a previously returned CHECK CONDITION status resulting from a media access command or a TEST UNIT READY command received when the logical unit is in the stopped power condition is described in 8.10 (i.e., the TEST UNIT READY command) and 9.11 (i.e., the START STOP UNIT command)."

8.10 SEND DIAGNOSTIC command

8.10.1 SEND DIAGNOSTIC command overview

The SEND DIAGNOSTIC command provides a mechanism for an application client to request diagnostic operations to be performed on the ~~SCSI~~ target device, ~~SCSI~~ logical unit, or both. The SATL shall implement the default self-test feature (see SPC-3).

Table 27 — SEND DIAGNOSTIC command CDB fields

Field	Description or reference
OPERATION CODE	Set to 1Dh. This field value is specific to the SEND DIAGNOSTIC command.
SELF-TEST CODE	8.10.2 and 8.10.3.
PF	If the PF bit is set to zero, then the SATL shall process the command as specified in SPC-3. If the PF bit is set to one, then the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.
SELFTEST	8.10.3
DEVOFFL	If the DEVOFFL bit is set to zero, then the SATL shall process the command as specified in SPC-3. If the DEVOFFL bit is set to one, then the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.
UNITOFFL	If the UNITOFFL bit is set to zero, then the SATL shall process the command as specified in SPC-3. If the UNITOFFL bit is set to one, then the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.
PARAMETER LIST LENGTH	If the PARAMETER LIST LENGTH field is set to zero, then the SATL shall process the command as specified in SPC-3. If the PARAMETER LIST LENGTH field is not set to zero, then the SATL shall terminate the command with a CHECK CONDITION status with sense key set to ILLEGAL REQUEST and additional sense code set to INVALID FIELD IN CDB.
CONTROL	6.4

8.10.2 SELF-TEST CODE field

The SATL shall determine if the contents of this field are valid depending on the value of the SELFTEST bit and what is reported by the attached ATA device with respect to the SMART EXECUTE OFF-LINE IMMEDIATE command (see 8.10.3).

If the contents of the SELF-TEST CODE field are valid, then the SATL shall process the command as described in table 28.

8.10 SEND DIAGNOSTIC command

8.10.1 SEND DIAGNOSTIC command overview

The SEND DIAGNOSTIC command provides a mechanism for an application client to request diagnostic operations to be performed on the ~~SCSI~~ target device, ~~SCSI~~ logical unit, or both. The SATL shall implement the default self-test feature (see SPC-3).

Table 27 — SEND DIAGNOSTIC command CDB fields

Field	Description or reference
OPERATION CODE	Set to 1Dh. This field value is specific to the SEND DIAGNOSTIC command.
SELF-TEST CODE	8.10.2 and 8.10.3.
PF	If the PF bit is set to zero, then the SATL shall process the command as specified in SPC-3. If the PF bit is set to one, then the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.
SELFTEST	8.10.3
DEVOFFL	If the DEVOFFL bit is set to zero, then the SATL shall process the command as specified in SPC-3. If the DEVOFFL bit is set to one, then the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.
UNITOFFL	If the UNITOFFL bit is set to zero, then the SATL shall process the command as specified in SPC-3. If the UNITOFFL bit is set to one, then the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.
PARAMETER LIST LENGTH	If the PARAMETER LIST LENGTH field is set to zero, then the SATL shall process the command as specified in SPC-3. If the PARAMETER LIST LENGTH field is not set to zero, then the SATL shall terminate the command with a CHECK CONDITION status with sense key set to ILLEGAL REQUEST and additional sense code set to INVALID FIELD IN CDB.
CONTROL	6.4

8.10.2 SELF-TEST CODE field

The SATL shall determine if the contents of this field are valid depending on the value of the SELFTEST bit and what is reported by the attached ATA device with respect to the SMART EXECUTE OFF-LINE IMMEDIATE command (see 8.10.3).

If the contents of the SELF-TEST CODE field are valid, then the SATL shall process the command as described in table 28.

change
"The SATL shall determine if the contents of this field are valid depending on the value of the SELFTEST bit and what is reported by the attached ATA device with respect to the SMART EXECUTE OFF-LINE IMMEDIATE command (see 8.10.3).

If the contents of the SELF-TEST CODE field are valid, then the SATL shall process the command as described in table 28."
to
"The SATL shall determine if the value in this field is valid depending on the value of the SELFTEST bit and what is reported by the ATA device with respect to the ATA SMART EXECUTE OFF-LINE IMMEDIATE command (see 8.10.3).

If the value of the SELF-TEST CODE field is valid, then the SATL shall process the command as described in table 28."

RESOLUTION: s/b
"The SATL shall determine if the value in the SELF-TEST CODE field is valid depending on the value of the SELFTEST bit and what is reported by the ATA device with respect to the ATA SMART EXECUTE OFF-LINE IMMEDIATE command (see 8.10.3).

If the value of the SELF-TEST CODE field is valid, then the SATL shall process the command as described in table 28."

Status
rlsheffi Completed 6/15/2006 11:50:09 AM

Table 28 — SELF-TEST CODE field ~~code~~

Code	Name of test	Description of test
000b	Default self-test	Used when the SELFTEST bit is set to one.
001b	Background short self-test	The SATL shall perform the following: 1) return status for the command as soon as the CDB has been validated and initialize the Self-Test Results log page (see 10.2.4 and SPC-3); and 2) issue an ATA SMART EXECUTE OFF-LINE IMMEDIATE command with the LBA Low register set to 1 (i.e., Execute SMART Short self-test routine immediately in off-line mode) to the ATA device.
010b	Background extended self-test	The SATL shall perform the following: 1) return status for the command as soon as the CDB has been validated and initialize the Self-Test Results log page (see 10.2.4 and SPC-3); and 2) issue an ATA SMART EXECUTE OFF-LINE IMMEDIATE command with the LBA Low register set to 2 (i.e., Execute SMART Extended self-test routine immediately in off-line mode) to the ATA device.
011b	Reserved	~~Unspecified (see 3.4.3)~~
100b	Abort background self-test	If a previous SEND DIAGNOSTIC command specified a background self-test function and that self-test has not completed (see SPC-3), then the SATL shall issue an ATA SMART EXECUTE OFF-LINE IMMEDIATE command with the LBA Low register set to 7Fh (i.e., Abort off-line mode self-test routine) to the ATA device. If the command completes successfully, the SATL shall return GOOD status. If the command fails the SATL shall respond as defined in SPC-3.
101b	Foreground short self-test	The SATL shall issue an ATA SMART EXECUTE OFF-LINE IMMEDIATE command with the LBA Low register set to 81h (i.e., Execute SMART Short self-test routine immediately in captive mode) to the ATA device. If the command completes successfully, the SATL shall update the Self-Test Results log page prior to returning GOOD status. If the command fails the SATL shall first update the Self-Test Results log page (if capable, see SPC-3) then return a CHECK CONDITION status with sense key set to HARDWARE ERROR and additional sense code set to LOGICAL UNIT FAILED SELF-TEST.
110b	Foreground extended self-test	The SATL shall issue an ATA SMART EXECUTE OFF-LINE IMMEDIATE command with the LBA Low register set to 82h (i.e., Execute SMART Extended self-test routine immediately in captive mode) to the ATA device. If the command completes successfully, the SATL shall update the Self-Test Results log page prior to returning GOOD status. If the command fails the SATL shall first update the Self-Test Results log page (if capable, see SPC-3) then return a CHECK CONDITION status with sense key set to HARDWARE ERROR and additional sense code set to LOGICAL UNIT FAILED SELF-TEST.
111b	Reserved	~~Unspecified (see 3.4.3)~~

Table 28 — SELF-TEST CODE field ~~decode~~

Code	Name of test	Description of test
000b	Default self-test	Used when the SELFTEST bit is set to one.
001b	Background short self-test	The SATL shall perform the following: 1) return status for the command as soon as the CDB has been validated and initialize the Self-Test Results log page (see 10.2.4 and SPC-3); and 2) issue an ATA SMART EXECUTE OFF-LINE IMMEDIATE command with the LBA Low register set to 1 (i.e., Execute SMART Short self-test routine immediately in off-line mode) to the ATA device.
010b	Background extended self-test	The SATL shall perform the following: 1) return status for the command as soon as the CDB has been validated and initialize the Self-Test Results log page (see 10.2.4 and SPC-3); and 2) issue an ATA SMART EXECUTE OFF-LINE IMMEDIATE command with the LBA Low register set to 2 (i.e., Execute SMART Extended self-test routine immediately in off-line mode) to the ATA device.
011b	Reserved	[8] ~~Unspecified (see 3.4.3)~~
100b	Abort background self-test	[9] If a previous SEND DIAGNOSTIC command specified a background self-test function and that self-test has not completed (see SPC-3), then the SATL shall issue an ATA SMART EXECUTE OFF-LINE IMMEDIATE command with the LBA Low register set to 7Fh (i.e., Abort off-line mode self-test routine) to the ATA device. If the command completes [10] successfully, the SATL shall return GOOD status. If the command fails the SATL shall respond as defined in SPC-3.
101b	Foreground short self-test	[11] The SATL shall issue an ATA SMART EXECUTE OFF-LINE IMMEDIATE command with the LBA Low register set to 81h (i.e., Execute SMART Short self-test routine immediately in captive mode) to the ATA device. If the command completes successfully, the SATL shall update the Self-Test Results log page prior to returning GOOD status. If the command fails the SATL shall first update the Self-Test Results log page (if capable, see SPC-3) then return a CHECK CONDITION status with sense set to HARDWARE ERROR and additional sense code set to LOGICAL UNIT FAILED SELF-TEST.
110b	Foreground extended self-test	The SATL shall issue an ATA SMART EXECUTE OFF-LINE IMMEDIATE command with the LBA Low register set to 82h (i.e., Execute SMART Extended self-test routine immediately in captive mode) to the ATA device. If the command completes successfully, the SATL shall update the Self-Test Results log page prior to returning GOOD status. If the command fails the SATL shall first update the Self-Test Results log page (if capable, see SPC-3) then return a CHECK CONDITION status with sense key set to HARDWARE ERROR and additional sense code set to LOGICAL UNIT FAILED SELF-TEST.
111b	Reserved	~~Unspecified (see 3.4.3)~~

Earlier information indicates that another cdb field's validity depends on this bit value and device configuration. I suggest that because of the stressing of another field's dependent "validity" that the editor add the following statement prior the existing statement here to help alleviate confusion for developers and also readers:
add: "SELF-TEST CODE field is valid."
RESOLUTION: change
"The SATL shall process the command according to the value specified in the SELF-TEST CODE field as defined in 8.10.2."

a) an ATA verify command with the Sector Count set to one and the LBA set to zero;
b) an ATA verify command with the Sector Count set to one and the LBA set to the maximum LBA; and
c) an ATA verify command with the Sector Count set to one and the LBA set to a random number between zero and the maximum LBA.
If any of the three ATA verify commands fails, then the SATL shall terminate the command with CHECK CONDITION status with the sense key set to HARDWARE ERROR and the additional sense code set to LOGICAL UNIT FAILED SELF-TEST.

If all three commands complete successfully, then the SATL shall return GOOD status."

to

"The SATL shall send three ATA verify commands (see 3.1.17) to the ATA device with the Sector Count set to one and the LBA set to:
a) zero;
b) the maximum LBA; and
c) a random number between zero and the maximum LBA.

If any of the three ATA verify commands end with an error, then the SATL shall terminate the SEND DIAGNOSTIC command with a CHECK CONDITION status with the sense key set to HARDWARE ERROR and the additional sense code set to LOGICAL UNIT FAILED SELF-TEST.

If all three ATA verify commands complete with no error, then the SATL shall return GOOD status."

RESOLUTION (added "user-addressable"):
"The SATL shall send three ATA verify commands (see 3.1.17) to the ATA device with the Sector Count set to one and the LBA set to:
a) zero;
b) the maximum user-addressable LBA; and
c) an arbitrary number between zero and the maximum user-addressable LBA.

If any of the three ATA verify commands end with an error, then the SATL shall terminate the SEND DIAGNOSTIC command with a CHECK CONDITION status with the sense key set to HARDWARE ERROR and the additional sense code set to LOGICAL UNIT FAILED SELF-TEST.

Comments from page 61 continued on next page

8.10.3 SELFTEST bit

The SATL shall ~~decode~~ the SELFTEST bit according to whether or not the ~~attached~~ ATA device supports and has enabled the SMART EXECUTE OFF-LINE IMMEDIATE command as shown in Table 29.

Table 29 — SELFTEST bit

Code	SMART EXECUTE OFF-LINE IMMEDIATE command [a]		SATL emulation
	supported	enabled	
0	no	n/a	The SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.
0	yes	no	The SATL shall terminate the command with CHECK CONDITION status with the sense key set to ABORTED COMMAND and the additional sense code set to ATA DEVICE FEATURE NOT ENABLED.
0	yes	yes	The SATL shall process the command according to the value specified in the SELF-TEST CODE field as defined in 8.10.2.
1	15	n/a	The SATL shall disregard the contents of the SELF-TEST CODE FIELD. The SATL shall send three ATA verify commands (see 3.1.17) to the attached ATA device with with the LBA set as follows: a) an ATA verify command with the Sector Count set to one and the LBA set to zero; b) an ATA verify command with the Sector Count set to one and the LBA set to the maximum LBA; and c) an ATA verify command with the Sector Count set to one and the LBA set to a random number between zero and the maximum LBA. If any of the three ATA verify commands fails, then the SATL shall terminate the command with CHECK CONDITION status with the sense key set to HARDWARE ERROR and the additional sense code set to LOGICAL UNIT FAILED SELF-TEST. If all three commands complete successfully, then the SATL shall return GOOD status.
16			
1	yes	no	
1	yes	yes	The SATL shall issue a SMART EXECUTE OFF-LINE IMMEDIATE command with the LBA Low register set to 81h (i.e., Execute SMART Short self-test routine immediately in captive mode) to the ATA device. If the command completes successfully, the SATL shall return GOOD status. If the command fails the SATL shall terminate the command with CHECK CONDITION status with the sense key set to HARDWARE ERROR and the additional sense code set to LOGICAL UNIT FAILED SELF-TEST.

[a] The SATL shall determine if the SMART EXECUTE OFF-LINE IMMEDIATE command is supported and enabled from the ATA device IDENTIFY DEVICE data word 84, bit 1, and word 85, bit 0 (see ATA/ATAPI-7).

If all three ATA verify commands complete without error, then the SATL shall return GOOD status."

DISCUSS (is this too draconian?) Suggestion - to ATA verify to two arbitrary sectors and only return HARDWARE ERROR if both arbitrary sectors fail - or DF bit set on any command.
TODO: Put this out on the T10 and T13 reflectors.

Section 8.10.3 SELFTEST bit
Table 29 - SELFTEST bit
Self-Test bit set to 1, SMART EXECUTE OFF-LINE IMMEDIATE not supported.

The mechanism of issuing ATA Verify commands to the first, last and a middle random LBA seems fickle. A Verify command can fail but it's possible that a block can be reallocated. We could be potentially failing a self test for a condition that is remediable. I read in the Minutes from a previous meeting and there was a statement that Execute Device Diagnostics command may potentially have dire consequences. So my suggestions for this case is to *remove the SHALL and make it more of a suggestion*, include the option for *simply returning GOOD status in this case without performing any activities*, or possibly leaving it *unspecified* such that a vendor may implement as they wish but put in place some informative text.

RESOLUTION: Add a table footonte as follows:
"The SATL may retry any of the three Verify commands if a Verify command fails on the first attempt, and the retry may specify an alternate LBA. If the retry completes without error, the SATL may consider the Verify command as completed without error."

Location: Page 41, 8.10.3, Table 29, Row 4 & 5.

Comment:
If the attached ATA device doesn't implement a basic diagnostic routine then why is the SATL trying to emulate this with VERIFY commands? Perhaps it's a value-add, but it seems like work that is beyond the scope of a translation layer.

Preferred resolution:
We can make the existing approach work, but it seems like work that the SATL perhaps shouldn't be doing. Why not just fail the command as per some of the surrounding table entries.

Note: Those at the May 11, 2006 SAT WG felt the need to do some form of verification was sufficiently crucial to products that a "shall" is warranted, and allowing it to be optional would cause non-interoperability problems.

RESOLUTION: Add a footnote as follows -
"The SATL may retry any of the three Verify commands if a Verify command fails on the first attempt, and the retry may specify an alternate LBA. If the retry completes without error, the SATL may consider the Verify command as completed without error."

8.11 TEST UNIT READY command

8.11.1 TEST UNIT READY command overview

The TEST UNIT READY command is used to determine whether the device is ready (see table 30).

Table 30 — TEST UNIT READY command CDB fields

Field	Description or reference
OPERATION CODE	8.11.2.
CONTROL	6.4

8.11.2 TEST UNIT READY OPERATION CODE

The SATL shall:

1) If the device was previously stopped through a START STOP UNIT command (see 9.11), then the SATL shall terminate the TEST UNIT READY command with CHECK CONDITION status with the sense key set to NOT READY and the additional sense code of LOGICAL UNIT NOT READY, INITIALIZING COMMAND REQUIRED;
2) If the device is being formatted (see 9.2), then the SATL shall terminate the TEST UNIT READY command with CHECK CONDITION status with the sense key set to NOT READY and the additional sense code set to LOGICAL UNIT NOT READY, FORMAT IN PROGRESS;
3) If the ATA device supports the removable media feature set, then the SATL shall issue a GET MEDIA STATUS command to the attached ATA device. If the device reports an error with the NM bit set to one, then the SATL shall terminate the TEST UNIT READY command with CHECK CONDITION status with the sense key set to NOT READY and the additional sense code of MEDIUM NOT PRESENT;
4) If an ATA command was previously issued to the ATA device and that command completed with an error with the DF bit in the status register set to one, then the SATL shall terminate the TEST UNIT READY command with CHECK CONDITION status with the sense key set to HARDWARE ERROR and the additional sense code of LOGICAL UNIT FAILURE;
5) If none of the previous conditions exist, then the SATL shall issue an ATA CHECK POWER MODE command;
6) If the ATA CHECK POWER MODE command completes with an error the SATL shall terminate the TEST UNIT READY command with CHECK CONDITOIN status with the sense key set to NOT READY, and the additional sense code set to LOGICAL UNIT DOES NOT RESPOND TO SELECTION; and
7) If the ATA CHECK POWER MODE command completes without error, then the SATL shall complete the TEST UNIT READY command with GOOD status.

If any other condition exists that prevents the SATL from issuing commands to the ATA device, the SATL should terminate the command with CHECK CONDITION status with the sense key set to NOT READY with the additional sense code of LOGICAL UNIT NOT READY, CAUSE NOT REPORTABLE.

8.11 TEST UNIT READY command

8.11.1 TEST UNIT READY command overview

The TEST UNIT READY command is used to determine whether the device is ready (see table 30).

Table 30 — TEST UNIT READY command CDB fields

Field	Description or reference
OPERATION CODE	8.11.2.
CONTROL	6.4

8.11.2 TEST UNIT READY OPERATION CODE

The SATL shall:

1) If the device was previously stopped through a START STOP UNIT command (see 9.11), then the SATL shall terminate the TEST UNIT READY command with CHECK CONDITION status with the sense key set to NOT READY and the additional sense code of LOGICAL UNIT NOT READY, INITIALIZING COMMAND REQUIRED;
2) If the device is being formatted (see 9.2), then the SATL shall terminate the TEST UNIT READY command with CHECK CONDITION status with the sense key set to NOT READY and the additional sense code set to LOGICAL UNIT NOT READY, FORMAT IN PROGRESS;
3) If the ATA device supports the removable media feature set, then the SATL shall issue a GET MEDIA STATUS command to the attached ATA device. If the device reports an error with the NM bit set to one, then the SATL shall terminate the TEST UNIT READY command with CHECK CONDITION status with the sense key set to NOT READY and the additional sense code of MEDIUM NOT PRESENT;
4) If an ATA command was previously issued to the ATA device and that command completed with an error with the DF bit in the status register set to one, then the SATL shall terminate the TEST UNIT READY command with CHECK CONDITION status with the sense key set to HARDWARE ERROR and the additional sense code of LOGICAL UNIT FAILURE;
5) If none of the previous conditions exist, then the SATL shall issue an ATA CHECK POWER MODE command;
6) If the ATA CHECK POWER MODE command completes with an error the SATL shall terminate the TEST UNIT READY command with CHECK CONDITOIN status with the sense key set to NOT READY, and the additional sense code set to LOGICAL UNIT DOES NOT RESPOND TO SELECTION; and
7) If the ATA CHECK POWER MODE command completes without error, then the SATL shall complete the TEST UNIT READY command with GOOD status.

If any other condition exists that prevents the SATL from issuing commands to the ATA device, the SATL should terminate the command with CHECK CONDITION status with the sense key set to NOT READY with the additional sense code of LOGICAL UNIT NOT READY, CAUSE NOT REPORTABLE.

8.12 WRITE BUFFER command

8.12.1 WRITE BUFFER command overview

The WRITE BUFFER command is used with the read buffer command to determine the integrity of the target device's buffer memory and the physical interconnect that connects the target device and the initiator.

Table 31 — WRITE BUFFER command CDB fields

Field	Description or reference
OPERATION CODE	The SATL shall issue either an ATA WRITE BUFFER command or an ATA DOWNLOAD MICROCODE command to the attached ATA device, depending on the setting of MODE.
MODE	8.12.2
BUFFER ID [a]	Unspecified (see 3.4.3)
BUFFER OFFSET	Refers to the offset in the buffer to start reading data from. The BUFFER OFFSET should be less than the size of the buffer, otherwise a CHECK CONDITION shall be sent back with sense key set to ILLEGAL REQUEST and additional sense code set to INVALID FIELD IN CDB. This applies to modes 06h and 07h.
PARAMETER LIST LENGTH	Refer to individual sections for the meaning of this term.
CONTROL	6.4

[a] The logical sector buffer in a ATA device shall be used to emulate the WRITE BUFFER command, therefore the size of the buffer is limited to 512 bytes for data buffer and echo buffers.

8.12.2 MODE field

The MODE field specifies the function to be performed by the SATL. If the MODE is 02h, the SATL shall issue an ATA WRITE BUFFER command to the attached ATA device. If the MODE is 05h, 6h, or 07h, the SATL shall issue a DOWNLOAD MICROCODE command to the attached ATA device as specified in table 32.

Table 32 — MODE field

Code	Translated ATA Opcode
02h (i.e., Write data)	Translated to ATA WRITE BUFFER command (see 8.12.3).
05h (i.e., Download microcode and save)	Translated to the ATA DOWNLOAD MICROCODE command. The features register shall be set to 07h indicating downloaded microcode is saved for immediate and future use (see 8.12.4).
All others [a]	Unspecified (see 3.4.3)

[a] ~~This standard does not define other download microcode modes because ATA devices generally support only modes that save the downloaded code image, and because the SATL has no means to determine the size of the microcode image to support offset modes. Application clients may use the ATA PASS-THROUGH command (see 12.2) to access ATA MICROCODE DOWNLOAD commands not referenced in this standard.~~

8.12.3 Data Only mode (02h)

In this mode, data is written to the device's logical sector buffer. Note that the logical sector buffer in the ATA device is being used to emulate the SCSI WRITE BUFFER command, so the maximum length of data that can be written is 512 bytes.

When the MODE field is set to 02h, the BUFFER ID field, the BUFFER OFFSET field, and the PARAMETER LIST LENGTH field are valid. If the values of these fields do not meet any of the conditions shown in table 33, then the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST with the additional sense code set to INVALID FIELD IN CDB.

Table 33 — Constraints for fields in the WRITE BUFFER command CDB

Field	Constraint
BUFFER ID	Should be set to zero
BUFFER OFFSET	Should be less than or equal to 512
PARAMETER LIST LENGTH	Should be less than or equal to 512

8.12.4 Download microcode mode (5h)

In this mode, data is transferred from the application client is transmitted to the device using the ATA DOWNLOAD MICROCODE command.

The SATL shall issue an ATA DOWNLOAD MICROCODE command when it receives a WRITE BUFFER command specifying mode 05h. The SATL shall transfer the microcode image or control information from the application client to the attached ATA device, and then complete the WRITE BUFFER command with GOOD status. The SATL shall check the attached ATA device for any returned errors, or confirmation that the ATA DOWNLOAD MICROCODE command has completed. If the ATA DLOWNLOAD MICROCODE command terminates with an error returned, the SATL shall generate a unit attention condition and return a deferred error (see SPC-3).

After the attached ATA device reinitializes successfully, running the new microcode image, the SATL shall generate a unit attention condition (see SAM-3) for the initiator port associated with all I_T nexuses except the I_T nexus on which the set of WRITE BUFFER commands was received, with the additional sense code set to MICROCODE HAS BEEN CHANGED

9 SCSI Block Commands (SBC) Mapping

9.1 Translating LBA and transfer length and ATA command use constraints

A SATL emulates SCSI logical blocks. The ~~SCSI~~ BLOCK LENGTH IN BYTES field in the READ CAPACITY data (see 9.8.2 and 9.9.2) may not be equal to the Logical Sector Size of the ATA device (see ATA/ATAPI-7).

NOTE 6 - The Logical Sector Size indicated by an ATA device is the number of words in a logical sector. The number of bytes in an ATA device logical sector is twice the value indicated in the Logical Sector Size.

The ATA commands the SATL may use to implement the functions specified by SCSI block commands depend upon:

a) the value of the LOGICAL BLOCK ADDRESS and TRANSFER LENGTH fields specified in the SCSI CDB; and
b) the capabilities of the ~~attached~~ ATA device and the ATA host within the SATL.

9.1

Is the point of this "may not" statement that units of bytes are different from units of words? In that case, "are not" would be correct.

If the point is that the SATL might expose 4096 byte SCSI logical blocks based on 512 byte ATA logical sectors, then I think more discussion is warranted.

Note: I (the editor) believe the intent is that the SATL might expose 4096-byte SCSI logical blocks based on 512-byte ATA logical sectors, or the SATL might expose 512-byte SCSI logical blocks based on 4096-byte ATA logical sectors, or various other mappings (e.g., with protection information taking part of a 512-byte increment in ATA logical sector size, etc.). The spectrum of options seemed too broad to attempt to define them all, so the "may not" is intended to allow flexibility to accommodate a variety of options and avoid leaving the impression that SCSI logical block size must match ATA logical sector size.
RESOLUTION: To be documented in 06-216

Table 34 relates selection conditions to allowable ATA commands used to implement SCSI block storage data transfer commands.

Table 34 — Read and write type command translation selection

Selection Prerequisites [a]					Allowed ATA commands
SCSI CDB	ATA feature sets supported and enabled [d]				
(transfer length + LBA) ≤ 2^{28}	48-bit Address [b]	DMA [c]	Overlap	SATA 2.5 NCQ	
~~n/a~~	~~n/a~~	~~n/a~~	~~n/a~~	~~n/a~~	~~FLUSH CACHE~~ [f] ~~FLUSH CACHE EXT~~ [g]
yes [b, e]	n/a	n/a	n/a	n/a	READ MULTIPLE READ SECTOR(S) READ VERIFY SECTOR(S) WRITE MULTIPLE WRITE SECTOR(S)
yes [b, e]	n/a	yes	n/a	n/a	READ DMA WRITE DMA
yes [b, e]	n/a	yes	yes	n/a	READ DMA QUEUED WRITE DMA QUEUED
n/a	yes	yes	n/a	n/a	READ DMA EXT WRITE DMA EXT WRITE DMA FUA EXT
n/a	yes	yes	yes	n/a	READ DMA QUEUED EXT WRITE DMA QUEUED EXT WRITE DMA QUEUED FUA EXT
n/a	yes	n/a	n/a	n/a	READ MULTIPLE EXT READ SECTOR(S) EXT READ VERIFY SECTOR(S) EXT WRITE MULTIPLE EXT WRITE MULTIPLE FUA EXT WRITE SECTOR(S) EXT
n/a	n/a	n/a	n/a	yes	READ FPDMA QUEUED WRITE FPDMA QUEUED

[a] An ATA command may be used to implement a SCSI block command only if all the prerequisites in the prerequisite columns for that command marked as yes are satisfied.

[b] If the attached ATA device does not support the 48-bit Address feature set (see ATA/ATAPI-7) or NCQ (see SATA 2.5) and the SATL receives a request to access an LBA beyond (2^{28}-1), the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the sense code set to LOGICAL BLOCK ADDRESS OUT OF RANGE.

[c] The DMA prerequisite requires both the ATA host in the SATL and the attached ATA device to have the same DMA transfer mode enabled (i.e., bit 8 of word 49 in the IDENTIFY DEVICE data is set to one and at least one DMA mode is enabled in word 63 or word 88 of the IDENTIFY DEVICE data).

[d] See ATA/ATAPI-7.

[e] The SATL may transfer the number of logical blocks requested in the TRANSFER LENGTH field by sending multiple ATA commands, each time incrementing the ATA LBA by the ATA Sector Count transferred.

[f] ~~The FLUSH CACHE command may be used if ATA IDENTIFY DEVICE data indicates the command is supported in word 83 bit 12, and the command is enabled in word 86 bit 12 (see ATA/ATAPI-7).~~

[g] ~~The FLUSH CACHE EXT command may be used if ATA IDENTIFY DEVICE data indicates the command is supported in word 83 bit 13, and the command is enabled in word 86 bit 13 (see ATA/ATAPI-7).~~

Most of my readers do not see N/A as Yes or No, They see it as Not Applicable; meaning that the commands in the allowed ATA column do not apply if the 48-bit address feature set is supported. I do not think this is the intention of the table, but I believe that the statement is ambiguous.

DISCUSS: would the word "irrelevant" be better than "n/a"? Or "Don't care"

[a] An ATA command may be used to implement a SCSI block command only if all the prerequisites in the prerequisite columns for that command marked as yes are satisfied.

[b] If the attached ATA device does not support the 48-bit Address feature set (see ATA/ATAPI-7) or NCQ (see SATA 2.5) and the SATL receives a request to access an LBA beyond (2^{28}-1), the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the sense code set to LOGICAL BLOCK ADDRESS OUT OF RANGE.

[c] The DMA prerequisite requires both the ATA host in the SATL and the attached ATA device to have the same DMA transfer mode enabled (i.e., bit 8 of word 49 in the IDENTIFY DEVICE data is set to one and at least one DMA mode is enabled in word 63 or word 88 of the IDENTIFY DEVICE data).

[d] See ATA/ATAPI-7.

[e] The SATL may transfer the number of logical blocks requested in the TRANSFER LENGTH field by sending multiple ATA commands, each time incrementing the ATA LBA by the ATA Sector Count transferred.

[f] ~~The FLUSH CACHE command may be used if ATA IDENTIFY DEVICE data indicates the command is supported in word 83 bit 12, and the command is enabled in word 86 bit 12 (see ATA/ATAPI-7).~~

[g] ~~The FLUSH CACHE EXT command may be used if ATA IDENTIFY DEVICE data indicates the command is supported in word 83 bit 13, and the command is enabled in word 86 bit 13 (see ATA/ATAPI-7).~~

RESOLUTION: Change occurernces of "n/a" in table 34 to " no" (see 06-216)

Table 34 — Read and write type command translation selection
Remove footnotes f & g, per prior comment removing flush commands.

"f The FLUSH CACHE command may be used if ATA IDENTIFY DEVICE data indicates the command is supported in word 83 bit 12, and the command is enabled in word 86 bit 12 (see ATA/ATAPI-7).
g The FLUSH CACHE EXT command may be used if ATA IDENTIFY DEVICE data indicates the command is supported in word 83 bit 13, and the command is enabled in word 86 bit 13 (see ATA/ATAPI-7)."

Additionally f is not needed, ATA FLUSH CACHE is mandatory.
RESOLUTION: Keep (but fix per resolution of earlier comment) FLUSH CACHE and FLUSH CACHE EXT, and replace table footnotes f and g with the following text:
"f The FLUSH CACHE command may be used if ATA IDENTIFY DEVICE data word 83 bit 12 indicates the command is supported, and ATA IDENTIFY DEVICE data word 86 bit 12 indicates the command is enabled (see ATA8-ACS).
g The FLUSH CACHE EXT command may be used if ATA IDENTIFY DEVICE data word 83 bit 13 indicates the command is supported, and ATA IDENTIFY DEVICE data word 86 bit 13 indicates the command is enabled (see ATA8-ACS)."
See 06-216

Status
rlsheffi Accepted 4/27/2006 4:51:18 PM

The SATL may use the ATA commands listed in table 34 in the translation of SCSI read commands (see 3.1.64), SCSI write commands (see 3.1.68), SCSI write and verify commands (see 3.1.69), SCSI verify commands (see 3.1.67), and SCSI synchronize cache commands (see 3.1.65) if the prerequisites defined for the command as shown in table 34 are satisfied. The translations for specific SCSI block commands in clause 9 further constrain the use of the available ATA commands in implementing the translation.

The SATL emulation of a six-byte SCSI read command, SCSI verify command, SCSI write command, or SCSI write and verify command in which the TRANSFER LENGTH field or ~~VERIFICATION LENGTH field~~ is set to zero, shall translate the transfer length or verification length to 256, and issue ATA commands that operate on the ATA logical sectors corresponding to the specified 256 SCSI logical blocks.

In all other cases, the SATL shall transfer or operate on the ATA logical sectors corresponding to the number of logical blocks specified by the SCSI command.

9.2 FORMAT UNIT command

9.2.1 FORMAT UNIT command overview

The FORMAT UNIT command verifies that all logical block addresses accessible to SCSI application clients are formatted and ready for data transfers.

Table 35 — FORMAT UNIT command CDB fields

Field	Description or reference
OPERATION CODE	If no defect list header is provided or a defect list header is provided with the DCRT bit set to one, then the SATL shall return GOOD status without issuing any commands to the ATA device. If the SATL supports certification of media and a defect list header is provided with the DCRT bit set to zero, then the SATL shall certify the media as described in 9.2.5
DEFECT LIST FORMAT	If the DEFECT LIST FORMAT field is the mandatory format (000b) or the vendor specific format (110b) the defect list length shall be zero (see SBC-2). If the DEFECT LIST FORMAT field is any other value the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.
CMPLIST	If a cmplist is specified, the FMTDATA bit is set to one, and the CMPLIST bit is set to one, then the SATL shall terminate the command with a CHECK CONDITION status with sense key set to ILLEGAL REQUEST and additional sense code set to INVALID FIELD IN CDB.
FMTDATA	If set to zero no data shall be transferred from the data-out buffer. If set to one the FORMAT UNIT parameter list shall be transferred from the client's data out buffer. The SATL may accept a FORMAT UNIT parameter list specifying the IMMED bit and an initialization pattern. The SATL shall ignore any defect list descriptors and any other fields provided in the FORMAT UNIT parameter list (see 9.2.2).
LONGLIST	Unspecified (see 3.4.3)
FMTPINFO	Unspecified (see 3.4.3)
CONTROL	6.4

The SATL shall process commands received during the processing of the FORMAT UNIT command as specified in SBC-2.

9.2.2 FORMAT UNIT parameter list

If the FORMAT command CDB specifies a FMTDATA bit of one, the SATL shall accept a FORMAT UNIT parameter list consisting of a short or long defect list header and may accept an initialization pattern

Should it say IMMED bit set to one?

Thoughts: SAT allows both settings of the IMMED bit, so the description of the FMTDATA bit shouldn't qualify the IMMED bit one way or the other. Perhaps the description of the FMTDATA bit should say nothing about the IMMED bit since there is a reference to the FORMAT UNIT parameter list and the IMMED bit is described there.

RESOLUTION: see 06-216

rlsheffi Accepted 5/1/2006 1:45:03 PM

Comments from page 67 continued on next page

The SATL may use the ATA commands listed in table 34 in the translation of SCSI read commands (see 3.1.64), SCSI write commands (see 3.1.68), SCSI write and verify commands (see 3.1.69), SCSI verify commands (see 3.1.67), and SCSI synchronize cache commands (see 3.1.65) if the prerequisites defined for the command as shown in table 34 are satisfied. The translations for specific SCSI block commands in clause 9 further constrain the use of the available ATA commands in implementing the translation.

The SATL emulation of a six-byte SCSI read command, SCSI verify command, SCSI write command, or SCSI write and verify command in which the TRANSFER LENGTH field ~~or VERIFICATION LENGTH field~~ is set to zero, shall translate the transfer length or verification length to 256, and issue ATA commands that operate on the ATA logical sectors corresponding to the specified 256 SCSI logical blocks.

In all other cases, the SATL shall transfer or operate on the ATA logical sectors corresponding to the number of logical blocks specified by the SCSI command.

9.2 FORMAT UNIT command

9.2.1 FORMAT UNIT command overview

The FORMAT UNIT command verifies that all logical block addresses accessible to SCSI application clients are formatted and ready for data transfers.

Table 35 — FORMAT UNIT command CDB fields

Field	Description or reference
OPERATION CODE	If no defect list header is provided or a defect list header is provided with the DCRT bit set to one, then the SATL shall return GOOD status without issuing any commands to the ATA device. If the SATL supports certification of media and a defect list header is provided with the DCRT bit set to zero, then the SATL shall certify the media as described in 9.2.5
DEFECT LIST FORMAT	If the DEFECT LIST FORMAT field is the mandatory format (000b) or the vendor specific format (110b) the defect list length shall be zero (see SBC-2). If the DEFECT LIST FORMAT field is any other value the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.
CMPLIST	If a cmplist is specified, the FMTDATA bit is set to one, and the CMPLIST bit is set to one, then the SATL shall terminate the command with a CHECK CONDITION status with sense key set to ILLEGAL REQUEST and additional sense code set to INVALID FIELD IN CDB.
FMTDATA	If set to zero no data shall be transferred from the data-out buffer. If set to one the FORMAT UNIT parameter list shall be transferred from the client's data out buffer. The SATL may accept a FORMAT UNIT parameter list specifying the IMMED bit and an initialization pattern. The SATL shall ignore any defect list descriptors and any other fields provided in the FORMAT UNIT parameter list (see 9.2.2).
LONGLIST	Unspecified (see 3.4.3)
FMTPINFO	Unspecified (see 3.4.3)
CONTROL	6.4

The SATL shall process commands received during the processing of the FORMAT UNIT command as specified in SBC-2.

9.2.2 FORMAT UNIT parameter list

If the FORMAT command CDB specifies a FMTDATA bit of one, the SATL shall accept a FORMAT UNIT parameter list consisting of a short or long defect list header and may accept an initialization pattern

Table 35 — FORMAT UNIT command CDB fields
Row: FMTPINFO

This field can not be set to Unspecified, because the PROTECT bit in the INQUIRY data is a shall be set to zero. Change the PROTECT bit to Unspecified or change this field to if not zero, then CHECK CONDITION/IR/IFIC.

RESOLUTION: Changing the PROTECT bit in INQUIRY data to "Unspecified" (per comment from SIERLGC in subclause 8.1.2).

Status
rlsheffi Completed 6/20/2006 5:46:35 PM

descriptor. The SATL shall ignore any defect descriptors provided. Table 36 defines the SATL handling of fields in the FORMAT UNIT defect list header.

Table 36 — SATL defect list header

Field	Description or reference
FOV	9.2.3 and 9.2.4
DPRY	The SATL shall ignore this field.
DCRT	9.2.3 and 9.2.5
STPF	Unspecified (see 3.4.3)
IP	9.2.3 and 9.2.6
IMMED	9.2.3
DEFECT LIST LENGTH	The SATL shall ignore any defect descriptors provided.

9.2.3 SATL defect list header field combinations

Table 37 describes the actions the SATL takes depending on the values set in the IMMED bit, the FOV bit, the DCRT bit, and the IP bit.

Table 37 — SATL defect list header field combinations

IMMED	FOV	DCRT	IP	Description of SATL processing
one	n/a	n/a	n/a	The SATL may complete the FORMAT UNIT command immediately with GOOD status.
n/a	zero	n/a	n/a	
n/a	one	one	zero	
zero	one	zero	zero	If the SATL does not support media certification, then the SATL may terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST with the additional sense code set to INVALID FIELD PARAMETER LIST. Otherwise, the SATL shall issue the required read and write commands to certify and initialize the media as specified by DCRT bit and IP bit, and shall then return GOOD status if no unrecoverable write errors occur.
		zero	one	
		one	one	

9.2.4 FOV bit

The FOV bit may be set to one to include an initialization pattern descriptor and no defect descriptors, otherwise the SATL may terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST with the additional sense code set to INVALID FIELD PARAMETER LIST.

9.2.5 DCRT bit

If the DCRT bit is set to zero and media certification is supported by the SATL, then the SATL shall issue ATA verify commands (see 3.1.17) to access all the logical sectors on the ATA device's medium that comprise every SCSI logical block emulated by the SATL. For every unrecoverable read error that is encountered, the SATL shall issue an ATA write command (see 3.1.18) to the defective logical sector to attempt to cause logical sector reallocation. The data written shall be the data pattern specified by the initialization pattern descriptor, if any, or vendor-specific. After writing the affected logical sector, the SATL shall again issue an ATA verify command to the same logical sector to verify the alternate logical sector is not defective. The process (verify, write, verify, write,...) shall repeat until the logical sector is verified successfully or the disk returns a fatal error other than an unrecoverable read error (e.g., device fault). See 5.3 for a description of error handling for multiple ATA command sequences.

9.2.6 IP bit

If the SATL supports an IP bit value of one and the IP bit is set to one, the SATL shall process the command as follows:

a) If the attached ATA device supports the SCT LBA Segment Access (see SCT) command and the value of the INITIALIZATION PATTERN LENGTH field in the initialization pattern descriptor is four, and the value of the IP MODIFIER field in the initialization pattern descriptor is zero, then the SATL should issue an SCT LBA Segment Access command to the attached ATA device with the Function Code field set to 0001b (i.,e., Repeat Write Pattern), with the Start field and the Count field set to initialize the area of the media accessible by the application client, and with the Pattern field set to the value of the INITIALIZATION PATTERN field from the FORMAT command initialization pattern descriptor; and
b) if the SCT LBA Segment Access command is not used to write the initialization pattern, then the SATL shall write the specified pattern by issuing ATA write commands (see 3.1.18 and 9.1) to the attached ATA device.

If the IP bit is set to zero, then the SATL shall return GOOD status.

1 OTE 7 The SATL should reverse the order of the bytes between the Pattern field in the SCT LBA Segment Access command and the value stored in the INITIALIZATION PATTERN field in the FORMAT command initialization pattern descriptor to adjust for the translation from little-endian to big-endian byte ordering.

9.3 READ commands overview

9.3.1 READ commands operation code translation

This subclause applies to the translation of 2 ~~SCSI~~ READ(6), READ(10), READ(12), and READ(16) commands.

The SATL shall issue ATA read commands (see 3.1.15) in accordance with the constraints specified in 9.1 to cause the ATA device to transfer the logical blocks specified in the SCSI read command (see 3.1.64).

3 the SATL returns an error other than an ILLEGAL REQUEST while processing the command the SATL may transfer a vendor-specific amount of data before terminating the command.

4 **3.2 READ commands with FUA**

If the SATL does not support FUA and the FUA bit is set to one, the SATL shall terminate the READ (10), READ (12) or READ (16) command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.

6 he SATL shall process a SCSI read command with the FUA bit set to one as follows depending on whether or not the attached ATA device supports NCQ:

a) If the attached device supports NCQ (i.e., bit-8 in word 77 of ATA IDENTIFY DEVICE data is set to one) the SATL shall issue a READ FPDMA QUEUED command (see SATA 2.5) with the FUA bit in the Device field set to one;
b) otherwise, the SATL shall,
   1) if the ATA device's write cache is enabled (see ATA/ATAPI-7), issue an ATA verify command (see 3.1.17); and,
   2) issue an ATA read command as specified in 9.3.1.

9.2.6 IP bit

If the SATL supports an IP bit value of one and the IP bit is set to one, the SATL shall process the command as follows:

a) If the attached ATA device supports the SCT LBA Segment Access (see SCT) command and the value of the INITIALIZATION PATTERN LENGTH field in the initialization pattern descriptor is four, and the value of the IP MODIFIER field in the initialization pattern descriptor is zero, then the SATL should issue an SCT LBA Segment Access command to the attached ATA device with the Function Code field set to 0001b (i.,e., Repeat Write Pattern), with the Start field and the Count field set to initialize the area of the media accessible by the application client, and with the Pattern field set to the value of the INITIALIZATION PATTERN field from the FORMAT command initialization pattern descriptor; and
b) if the SCT LBA Segment Access command is not used to write the initialization pattern, then the SATL shall write the specified pattern by issuing ATA write commands (see 3.1.18 and 9.1) to the attached ATA device.

If the IP bit is set to zero, then the SATL shall return GOOD status.

NOTE 7 The SATL should reverse the order of the bytes between the Pattern field in the SCT LBA Segment Access command and the value stored in the INITIALIZATION PATTERN field in the FORMAT command initialization pattern descriptor to adjust for the translation from little-endian to big-endian byte ordering.

9.3 READ commands overview

9.3.1 READ commands operation code translation

This subclause applies to the translation of ~~SCSI~~ READ(6), READ(10), READ(12), and READ(16) commands.

The SATL shall issue ATA read commands (see 3.1.15) in accordance with the constraints specified in 9.1 to cause the ATA device to transfer the logical blocks specified in the SCSI read command (see 3.1.64).

If the SATL returns an error other than an ILLEGAL REQUEST while processing the command the SATL may transfer a vendor-specific amount of data before terminating the command.

9.3.2 READ commands with FUA

If the SATL does not support FUA and the FUA bit is set to one, the SATL shall terminate the READ (10), READ (12) or READ (16) command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.

The SATL shall process a SCSI read command with the FUA bit set to one as follows depending on whether or not the attached ATA device supports NCQ:

7) If the attached device supports NCQ (i.e., bit-8 in word 77 of ATA IDENTIFY DEVICE data is set to one) the SATL shall issue a READ FPDMA QUEUED command (see SATA 2.5) with the FUA bit in the Device field set to one;
8) otherwise, the SATL shall,
   1) if the ATA device's write cache is enabled (see ATA/ATAPI-7), issue an ATA verify command (see 3.1.17); and,
   2) issue an ATA read command as specified in 9.3.1.

Date: 5/25/2006 12:25:48 PM
9.3.2 READ commands with FUA: change the second paragraph to:

The SATL shall process a SCSI read command with the FUA bit set to one as follows:

a) If the attached ATA device supports NCQ (i.e., bit 8 in word 77 of ATA IDENTIFY DEVICE data is set to one) the SATL shall issue a READ FPDMA QUEUED command (see SATA 2.5) with the FUA bit in the Device field set to one;
b) If the attached ATA device supports the Overlapped feature set and there are outstanding ATA queued commands, then the SATL shall:
1) wait until all ATA queued commands have completed;
2) if the ATA device's write cache is enabled (see ATA/ATAPI-7), issue an ATA verify command (see 3.1.17); and,
3) issue an ATA read command as specified in 9.3.1;
or
c) If the attached ATA device does not support the Overlapped feature set or there are no outstanding ATA queued commands, then the SATL shall:
1) if the ATA device's write cache is enabled (see ATA/ATAPI-7), issue an ATA verify command (see 3.1.17); and,
2) issue an ATA read command as specified in 9.3.1.

RESOLUTION: - s/b
"The SATL shall process a SCSI read command with the FUA bit set to one as follows:

a) If the ATA device supports NCQ (i.e., ATA IDENTIFY DEVICE data word 76 bit 8 is set to one) the SATL shall issue a READ FPDMA QUEUED command (see SATA 2.5) with the FUA bit in the Device register set to one;
b) If the ATA device supports the Tagged Command Queuing feature set (see ATA8-ACS) and there are outstanding ATA queued commands, then the SATL shall:
1) wait until all ATA queued commands have completed;
2) if the write cache is enabled (ATA8-ACS) on the ATA device, issue an ATA verify command (see 3.1.17); and,
3) issue an ATA read command as specified in 9.3.1;
or
c) If the ATA device does not support the Tagged Command Queuing feature set or there are no outstanding ATA queued commands, then the SATL shall:

9.2.6 IP bit

If the SATL supports an IP bit value of one and the IP bit is set to one, the SATL shall process the command as follows:

a) If the attached ATA device supports the SCT LBA Segment Access (see SCT) command and the value of the INITIALIZATION PATTERN LENGTH field in the initialization pattern descriptor is four, and the value of the IP MODIFIER field in the initialization pattern descriptor is zero, then the SATL should issue an SCT LBA Segment Access command to the attached ATA device with the Function Code field set to 0001b (i.,e., Repeat Write Pattern), with the Start field and the Count field set to initialize the area of the media accessible by the application client, and with the Pattern field set to the value of the INITIALIZATION PATTERN field from the FORMAT command initialization pattern descriptor; and
b) if the SCT LBA Segment Access command is not used to write the initialization pattern, then the SATL shall write the specified pattern by issuing ATA write commands (see 3.1.18 and 9.1) to the attached ATA device.

If the IP bit is set to zero, then the SATL shall return GOOD status.

NOTE 7 The SATL should reverse the order of the bytes between the Pattern field in the SCT LBA Segment Access command and the value stored in the INITIALIZATION PATTERN field in the FORMAT command initialization pattern descriptor to adjust for the translation from little-endian to big-endian byte ordering.

9.3 READ commands overview

9.3.1 READ commands operation code translation

This subclause applies to the translation of ~~SCSI~~ READ(6), READ(10), READ(12), and READ(16) commands.

The SATL shall issue ATA read commands (see 3.1.15) in accordance with the constraints specified in 9.1 to cause the ATA device to transfer the logical blocks specified in the SCSI read command (see 3.1.64).

If the SATL returns an error other than an ILLEGAL REQUEST while processing the command the SATL may transfer a vendor-specific amount of data before terminating the command.

9.3.2 READ commands with FUA

If the SATL does not support FUA and the FUA bit is set to one, the SATL shall terminate the READ (10), READ (12) or READ (16) command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.

The SATL shall process a SCSI read command with the FUA bit set to one as follows depending on whether or not the attached ATA device supports NCQ:

a) If the attached device supports NCQ (i.e., bit-8 in word 77 of ATA IDENTIFY DEVICE data is set to one) the SATL shall issue a READ FPDMA QUEUED command (see SATA 2.5) with the FUA bit in the Device field set to one;
10 otherwise, the SATL shall,
   1) if the ATA device's write cache is enabled (see ATA/ATAPI-7), issue an ATA verify command (see 3.1.17); and,
   2) issue an ATA read command as specified in 9.3.1.

Date: 4/28/2006 2:13:00 PM

9.3.2 READ commands with FUA
2nd Paragraph b) in a,b list
change
"b) otherwise, the SATL shall,
1) if the ATA device's write cache is enabled (see ATA/ATAPI-7), issue an ATA verify command (see 3.1.17); and
2) issue an ATA read command as specified in 9.3.1."

"b) otherwise, the SATL shall:
1) if the write cache is enabled (see ATA/ATAPI-7) on the ATA device, issue an ATA verify command (see 3.1.17); and
2) issue an ATA read command as specified in 9.3.1."

9.4 READ (6) command

The READ (6) command is used to request the device to transfer logical blocks of user data to the requester. Data may be read from ATA device's medium or, data may be read from the ATA device's cache if the most recent copy is in the ATA device's cache (see SBC-2)

Table 38 — READ (6) command CDB fields

Field	Description or reference
OPERATION CODE	9.3.1
LOGICAL BLOCK ADDRESS	The logical block address shall be used to set the ATA LBA (see 3.1.11).
TRANSFER LENGTH	The transfer length shall be used to set the ATA sector count (see 3.1.16) [a]
CONTROL	6.4

[a] A transfer length of zero specifies to transfer 256 data blocks from the attached ATA device to the application client (see SBC-2).

9.5 READ (10) command

The SATL shall process the READ (10) command the same as the READ (6) command (see 9.3.1). with the additional fields in the CDB implemented as described in the table 39 and 9.3.2.

Table 39 — READ (10) command CDB fields

Field	Description or reference
OPERATION CODE	9.3.1 and 9.3.2
RDPROTECT	Unspecified (see 3.4.3)
DPO	Unspecified (see 3.4.3)
FUA	The SATL may support the FUA bit as defined in SBC-2 (see 9.3.2).
FUA_NV	If the FUA_NV bit is set to one the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.
LOGICAL BLOCK ADDRESS	The logical block address shall be used to set the ATA LBA (see 3.1.11).
GROUP NUMBER	Unspecified (see 3.4.3)
TRANSFER LENGTH	The transfer length is used to set the ATA sector count (see 3.1.16).[a] The SATL shall issue as many ATA read commands (see 3.1.15) as needed to satisfy the transfer length specified by the READ (10) command.
CONTROL	6.4

[a] A transfer length of zero indicates that a data transfer shall not take place.

9.4 READ (6) command

1st Paragraph

**"The READ (6) command is used to request the device to transfer logical blocks of user data to the requester
Data may be read from ATA device's medium or, data may be read from the ATA device's cache if the most recent copy is in the ATA device's cache (see SBC-2)"**

to

"The READ (6) command is used to request the device to transfer logical blocks of user data to the application client. The requested data may be read from the medium or cache of the ATA device, if the most recent copy is in the cache (see SBC-2)

Table 38 shows the translation for fields specified in the READ (6) CDB."

**This kind of prohibits the SATL from having cache?
RESOLUTION: s/b
"The READ (6) command is used to request the device to transfer logical blocks of user data to the application client (see SBC-2).**

Table 38 shows the translation for fields specified in the READ (6) CDB."

**More thoughts:
The SATL may not have any control over whether the data is retrieved from the media or cache of the ATA device. If the translation is specifying command for command translations, perhaps it shouldn't say anything about the ATA device cache.**

Do we want this standard to discuss a SATL that has its own cache? At some point it becomes a full-blown storage controller with SBC-2 and the other SCSI command sets governing the behavior. (SAT WG 6/19/06: "No").

See resolution in 06-216.

9.4 READ (6) command

The READ (6) command is used to request the device to transfer logical blocks of user data to the requester. Data may be read from ATA device's medium or, data may be read from the ATA device's cache if the most recent copy is in the ATA device's cache (see SBC-2)

Table 38 — READ (6) command CDB fields

Field	Description or reference
OPERATION CODE	9.3.1
LOGICAL BLOCK ADDRESS	The logical block address shall be used to set the ATA LBA (see 3.1.11).
TRANSFER LENGTH	The transfer length shall be used to set the ATA sector count (see 3.1.16) [a]
CONTROL	6.4

[a] A transfer length of zero specifies to transfer 256 data blocks from the attached ATA device to the application client (see SBC-2).

9.5 READ (10) command

The SATL shall process the READ (10) command the same as the READ (6) command (see 9.3.1). with the additional fields in the CDB implemented as described in the table 39 and 9.3.2.

Table 39 — READ (10) command CDB fields

Field	Description or reference
OPERATION CODE	9.3.1 and 9.3.2
RDPROTECT	Unspecified (see 3.4.3)
DPO	Unspecified (see 3.4.3)
FUA	The SATL may support the FUA bit as defined in SBC-2 (see 9.3.2).
FUA_NV	If the FUA_NV bit is set to one the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.
LOGICAL BLOCK ADDRESS	The logical block address shall be used to set the ATA LBA (see 3.1.11).
GROUP NUMBER	Unspecified (see 3.4.3)
TRANSFER LENGTH	The transfer length is used to set the ATA sector count (see 3.1.16).[a] The SATL shall issue as many ATA read commands (see 3.1.15) as needed to satisfy the transfer length specified by the READ (10) command.

RESOLUTION: s/b
"The READ CAPACITY (10) command (see SBC-2) requests that the device server transfer 8 bytes of parameter data describing the capacity and medium format of the direct-access block device to the application client.

Table 42 shows the translation for fields specified in the READ CAPACITY(10) CDB."
RESOLUTION: see 06-216

Comments from page 72 continued on next page

9.8 READ CAPACITY (10) command

9.8.1 READ CAPACITY command overview

The READ CAPACITY (10) command shall request information about the capacity of the block device being addressed.

Table 42 — READ CAPACITY(10) command CDB fields

Field	Description or reference
OPERATION CODE	The SATL shall use ATA IDENTIFY DEVICE information to compute the ATA device's maximum user addressable medium capacity.
LOGICAL BLOCK ADDRESS	If the LOGICAL BLOCK ADDRESS field is not set to zero the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.
PMI	If the PMI bit is not zero the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.
CONTROL	6.4

9.8.2 READ CAPACITY data

The SATL shall return READ CAPACITY data as defined by SBC-2. Table 45 describes the translation of fields in the READ CAPACITY data.

Table 43 — READ CAPACITY (10) data

Field	Description or reference
RETURNED LOGICAL BLOCK ADDRESS	Unspecified (see 3.4.3)
BLOCK LENGTH IN BYTES	Unspecified (see 3.4.3)

9.9 READ CAPACITY (16) command

9.9.1 READ CAPACITY (16) command overview

The READ CAPACITY (16) command shall request information about the capacity of the block device being addressed.

Table 44 — READ CAPACITY(16) command CDB fields

Field	Description or reference
OPERATION CODE	The SATL shall use ATA IDENTIFY DEVICE information to compute the ATA device's maximum user addressable medium capacity.
LOGICAL BLOCK ADDRESS	If the LOGICAL BLOCK ADDRESS field is not set to 0000000h the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.
PMI	If the PMI bit is not zero the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.

9.9.2 READ CAPACITY data

The SATL shall return READ CAPACITY data as defined by SBC-2. Table 45 describes the translation of fields in the READ CAPACITY data.

Table 45 — READ CAPACITY (16) data

Field	Description or reference
RETURNED LOGICAL BLOCK ADDRESS	Unspecified (see 3.4.3)
BLOCK LENGTH IN BYTES	Unspecified (see 3.4.3)
RTO_EN	Unspecified (see 3.4.3)
PROT_EN	Unspecified (see 3.4.3)

9.10 REASSIGN BLOCKS command

9.10.1 REASSIGN BLOCKS command overview

The REASSIGN BLOCKS command requests that the SATL reassign defective logical blocks (see SBC-2). ATA devices do not support or have a direct translation for the REASSIGN BLOCKS command. The SATL shall emulate the ~~SCSI~~ REASSIGN BLOCKS command as defined in table 46.

Table 46 — REASSIGN BLOCKS command CDB fields

Field	Description or reference
OPERATION CODE	9.10.2
LONGLBA	See SBC-2
LONGLIST	See SBC-2
CONTROL	6.4

The REASSIGN BLOCKS command parameter list provided in the data-out buffer contains the LBAs to be reassigned. The LBAs provided in the parameter list shall be utilized for the LBAs in any ATA verify commands (see 3.1.17) or ATA write commands (see 3.1.18) issued by the SATL.

The SATL shall support the LONGLBA field and the LONGLIST field (see SBC-2).

9.10.2 REASSIGN BLOCKS operation code

The SATL shall accept a parameter list specifying LBAs to be reassigned (see SBC-2). For each LBA in the parameter list, the SATL shall:

1) issue an ATA verify command (see 3.1.17) to the specified LBA;
2) if the ATA verify command completes successfully, then the SATL shall return GOOD status for the REASSIGN BLOCKS command;
3) if the ATA verify command does not complete successfully, then the SATL shall Issue an ATA write command (see 3.1.18) with vendor-specific data to the LBA that failed the ATA verify command;
4) if the ATA write command fails, then the SATL shall terminate the REASSIGN BLOCKS command with CHECK CONDITION status with the sense key set to HARDWARE ERROR and the additional sense code set to WRITE ERROR – AUTO REALLOCATION FAILED;
5) if the write command completes successfully, then the SATL shall issue a second ATA verify command to the same LBA;
6) if the second ATA verify command completes successfully, then the SATL shall return GOOD status for the REASSIGN BLOCKS command; and
7) if the second ATA verify command does not complete successfully, then the SATL shall terminate the REASSIGN BLOCKS command with CHECK CONDITION status with the sense key set to MEDIUM

9.10.2 REASSIGN BLOCKS operation code
RESOLUTION: see 06-216 - Replace the subclause as follows:
"9.10.2 REASSIGN BLOCKS operation code

The SATL shall accept a parameter list specifying LBAs to be reassigned (see SBC-2).
The SATL shall process each LBA specified in the parameter list according to the process shown in figure xx."
(insert flow-chart)

The flow chart has the following algorithm depicted:
1) Issue an ATA verify command (see 3.1.17) to the current LBA;
2) If the ATA verify command completes without error, the SATL shall either:
a) if there are one or more LBAs specified in the parameter list remaining to process, continue with step-1 to process the next LBA in the parameter list; or
b) return GOOD status for the REASSIGN BLOCKS command if there are no more LBAs remaining to process;
3) Issue an ATA write command (see 3.1.18) with vendor-specific data to the current LBA;
4) If the ATA write command completes with an error, the SATL shall terminate the REASSIGN BLOCKS command with CHECK CONDITION status with the sense key set to HARDWARE ERROR and the additional sense code set to WRITE ERROR – AUTO REALLOCATION FAILED;
5) Issue a second ATA verify command to the current LBA;
6) If the second ATA verify command completes without error, the SATL shall:
a) if there are one or more LBAs specified in the parameter list remaining to process, continue with step-1 to process the next LBA in the parameter list; and
b) If there are no more LBAs remaining to process, then return GOOD status for the REASSIGN BLOCKS command;
and
7) Terminate the REASSIGN BLOCKS command with CHECK CONDITION status with the sense key set to MEDIUM ERROR and the additional sense code set to UNRECOVERED READ ERROR - AUTO REALLOCATE FAILED.

This is not correct and does not comply with proposal 05-136r2. The command may have more than one LBA to reassign in its parameter list. Thus, this statement as it stands is incorrect. It should probably have something like "if the ATA verify command for each LBA in the parameter list completes successfully, then...."

This is incorrect. (Similar type of mistake here as for 2) above). This is not following 05-136r2. There could be more than one LBA to be reassigned and this verbiage is incorrect for such a situation. The SATL has to perform this complete routine on the next LBA in the parameter list, i. e., "return GOOD status for the REASSIGN BLOCKS command" is not correct.
TO DO: Get with Wayne and craft a rewrite in a new comment.

ERROR and the additional sense code set to UNRECOVERED READ ERROR – AUTO REALLOCATE FAILED.

9.11 START STOP UNIT command

9.11.1 START STOP UNIT command overview

The START STOP UNIT command provides a method for controlling the power state of a logical unit.

Table 47 — START/STOP UNIT command CDB fields

Field	Description or reference
OPERATION CODE	Commands issued to the attached device depend upon the other values in the CDB as described in 9.11.3.
IMMED	The SATL shall implement this field as defined in 9.11.3.
POWER CONDITIONS	The SATL shall ignore this field.
LOEJ	The SATL shall implement this field as defined in 9.11.3.
START	The SATL shall implement this field as defined in 9.11.3.
CONTROL	6.4

If a SATL receives a command other than a START STOP UNIT command for a device that is in the Stopped state (see SBC-2), then the SATL shall return CHECK CONDITION status, with the sense key set to NOT READY and the additional sense code set to LOGICAL UNIT NOT READY, INITIALIZING COMMAND REQUIRED.

9.11.2 IMMED bit processing for the START STOP UNIT command

9.11.2.1 Before processing the START STOP UNIT command

The SATL shall:

1) return GOOD status if the IMMED bit is set to one, and
2) continue processing the START STOP UNIT command.

9.11.2.2 After START STOP UNIT completes with no error

If no error occurs during the processing of the START STOP UNIT command and the IMMED bit is set to zero, then the SATL shall return GOOD status.

9.11.2.3 After START STOP UNIT completes with an error

If an error occurs during the processing of the START STOP UNIT command and the IMMED bit is set to zero, the SATL shall terminate the command with CHECK CONDITION status with a sense key of ABORTED COMMAND, and the additional sense code for specified for the error being reported.

If an error occurs during the processing of the START STOP UNIT command and the IMMED bit is set to one, the SATL shall terminate the command and return CHECK CONDITION status as a deferred error (see SPC-3) with a sense key of ABORTED COMMAND, and the additional sense code set to the value specified for the error being reported.

9.11 START STOP UNIT command

9.11.1 START STOP UNIT command overview

The START STOP UNIT command provides a method for controlling the power state of a logical unit.

Table 47 — START/STOP UNIT command CDB fields

Field	Description or reference
OPERATION CODE	Commands issued to the attached device depend upon the other values in the CDB as described in 9.11.3.
IMMED	The SATL shall implement this field as defined in 9.11.3.
POWER CONDITIONS	The SATL shall ignore this field.
LOEJ	The SATL shall implement this field as defined in 9.11.3.
START	The SATL shall implement this field as defined in 9.11.3.
CONTROL	6.4

If a SATL receives a command other than a START STOP UNIT command for a device that is in the Stopped state (see SBC-2), then the SATL shall return CHECK CONDITION status, with the sense key set to NOT READY and the additional sense code set to LOGICAL UNIT NOT READY, INITIALIZING COMMAND REQUIRED.

9.11.2 IMMED bit processing for the START STOP UNIT command

9.11.2.1 Before processing the START STOP UNIT command

The SATL shall:

1) return GOOD status if the IMMED bit is set to one, and
2) continue processing the START STOP UNIT command.

9.11.2.2 After START STOP UNIT completes with no error

If no error occurs during the processing of the START STOP UNIT command and the IMMED bit is set to zero, then the SATL shall return GOOD status.

9.11.2.3 After START STOP UNIT completes with an error

If an error occurs during the processing of the START STOP UNIT command and the IMMED bit is set to zero, the SATL shall terminate the command with CHECK CONDITION status with a sense key of ABORTED COMMAND, and the additional sense code for specified for the error being reported.

If an error occurs during the processing of the START STOP UNIT command and the IMMED bit is set to one, the SATL shall terminate the command and return CHECK CONDITION status as a deferred error (see SPC-3) with a sense key of ABORTED COMMAND, and the additional sense code set to the value specified for the error being reported.

Table 47 — START/STOP UNIT command CDB fields
Row: POWER CONDITIONS
change
"The SATL shall ignore this field."
to
"The field shall be set to 000b."

The way SBC-2 reads to me is that if the POWER CONDITIONS field is not set to zero, the the LEOF and START bits are ignored.
REASON: "shall be set to 000b" is a requirement on the application client, which isn't the norm for SCSI standards, and would place special requirements on application clients that work with SATLs. A better approach is to define the SATL's behavior when the application client sets a value the SATL doesn't support. See HPQ comment.

9.11.1 START STOP UNIT command overview

1st Paragraph after Table 47 — START/STOP UNIT command CDB fields

Comments from page 74 continued on next page

ERROR and the additional sense code set to UNRECOVERED READ ERROR – AUTO REALLOCATE FAILED.

9.11 START STOP UNIT command

9.11.1 START STOP UNIT command overview

The START STOP UNIT command provides a method for controlling the power state of a logical unit.

Table 47 — START/STOP UNIT command CDB fields

Field	Description or reference
OPERATION CODE	Commands issued to the attached device depend upon the other values in the CDB as described in 9.11.3.
IMMED	The SATL shall implement this field as defined in 9.11.3.
POWER CONDITIONS	The SATL shall ignore this field.
LOEJ	The SATL shall implement this field as defined in 9.11.3.
START	The SATL shall implement this field as defined in 9.11.3.
CONTROL	6.4

11 If a SATL receives a command other than a START STOP UNIT command for a device that is in the Stopped state (see SBC-2), then the SATL shall return CHECK CONDITION status, with the sense key set to NOT READY and the additional sense code set to LOGICAL UNIT NOT READY, INITIALIZING COMMAND REQUIRED.

12 **9.11.2 IMMED bit processing for the START STOP UNIT command**

9.11.2.1 Before processing the START STOP UNIT command 13

The SATL shall:

1) return GOOD status if the IMMED bit is set to one, and
2) continue processing the START STOP UNIT command.

9.11.2.2 After START STOP UNIT completes with no error

If no error occurs during the processing of the START STOP UNIT command and the IMMED bit is set to zero, then the SATL shall return GOOD status.

9.11.2.3 After START STOP UNIT completes with an error

If an error occurs during the processing of the START STOP UNIT command and the IMMED bit is set to zero, the SATL shall terminate the command with CHECK CONDITION status with a sense key of ABORTED COMMAND, and the additional sense code for specified for the error being reported.

If an error occurs during the processing of the START STOP UNIT command and the IMMED bit is set to one, the SATL shall terminate the command and return CHECK CONDITION status as a deferred error (see SPC-3) with a sense key of ABORTED COMMAND, and the additional sense code set to the value specified for the error being reported.

change
"If a SATL receives a command other than a START STOP UNIT command for a device that is in the Stopped state (see SBC-2), then the SATL shall return CHECK CONDITION status, with the sense key set to NOT READY and the additional sense code set to LOGICAL UNIT NOT READY, INITIALIZING COMMAND REQUIRED."
to
"If a SATL receives a command that requires medium access while the device is in the Stopped state (see SBC-2), the SATL shall return CHECK CONDITION status, with the sense key set to NOT READY and the additional sense code set to LOGICAL UNIT NOT READY, INITIALIZING COMMAND REQUIRED."

Shouldn't this be "receives a medium access command", not any command. To my knowledge, in standby mode, an ATA device will still response to commands that do not require media access.

RESOLUTION: reword as suggested, though not because an ATA device in standby mode responds to non-media access commands, but because a SCSI device in the stopped state responds to non-media access commands, per SBC-2.

9.11.2 IMMED bit processing for the START STOP UNIT command: much has been changed in this and the following table from the accepted proposal (05-226r3). It appears this has been done to make the table smaller. This is a laudable goal. Make the following changes to do this better. First, replace 9.11.2 and its subclauses with the following:

9.11.2 Processing ending status if an error occurs

If an error occurs during the processing of the START STOP UNIT command and the IMMED bit is set to zero, then the SATL shall terminate the command with CHECK CONDITION status with a sense key of ABORTED COMMAND, and the additional sense code specified for the error being reported (see table 48).

If an error occurs during the processing of the START STOP UNIT command and the IMMED bit is set to one, then the SATL shall terminate the command and return CHECK CONDITION status as a deferred error (see SPC-3) with a sense key of ABORTED COMMAND, and the additional sense code set to the value specified for the error being reported (see table 48).

RESOLUTION: see 06-216 - s/b
"9.11.2 Processing ending status if an error occurs

If an error occurs during the processing of the START STOP UNIT command and the IMMED bit is set to zero, then the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ABORTED COMMAND, and the additional sense code specified for the error being reported (see table 48).

If an error occurs during the processing of the START STOP UNIT command and the IMMED bit is set to one, then the SATL shall terminate the START STOP UNIT command with CHECK CONDITION status as a deferred error (see SPC-3) with the sense key set to ABORTED COMMAND, and the additional sense code set to the value specified for the error being reported (see table 48)."

9.11.3 START STOP UNIT START bit LOEJ bit combinations

The SATL shall perform the actions shown in table 48 in response to a START STOP UNIT command.

Table 48 — Definition of ~~IMMED,~~ LOEJ, and START bits in the START STOP UNIT CDB

START	LOEJ	Definition
0	0	The SATL shall: 1) Process the IMMED bit (see 9.11.2.1); 2) Issue a FLUSH CACHE or FLUSH CACHE EXT command to the attached ATA device; 3) If the FLUSH CACHE or FLUSH CACHE EXTENDED command completes with any error, then process ending status according to the IMMED bit (see 9.11.2.3) with the additional sense code set to COMMAND SEQUENCE ERROR; 4) If the FLUSH CACHE or FLUSH CACHE EXT command completes with no error, then issue a STANDBY command to the attached ATA device with zero in Sector Count; 5) If the STANDBY command completes with any error, then process ending status according to the IMMED bit (see 9.11.2.3) with the additional sense code set to COMMAND SEQUENCE ERROR; and 6) If the STANDBY command completes with no error [a], then process GOOD status according to the IMMED bit (see 9.11.2.2) [b].
1	0	The SATL shall: 1) Process the IMMED bit (see 9.11.2.1); 2) Issue an ATA verify command (see 3.1.17) to the attached ATA device with one in Sector Count and a value in LBA from zero to the maximum LBA supported by the ATA device in its current configuration [d]; and 3) When command completion is received for the ATA verify command (see 3.1.17) process GOOD status according to the IMMED bit (see 9.11.2.2) [c].
0	1	If the attached ATA device supports the Removable Media feature set, then the SATL shall: 1) Process the IMMED bit (see 9.11.2.1); 2) Issue a MEDIA EJECT command to the attached ATA device; 3) If the MEDIA EJECT command completes with any error, then process ending status according to the IMMED bit (see 9.11.2.3) with the additional sense code set to MEDIA LOAD OR EJECT FAILED; and 4) If the MEDIA EJECT command completes with no error, then process GOOD status according to the IMMED bit (see 9.11.2.2). If the attached ATA device does not support the Removable Media feature set, then the SATL shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.
1	1	The SATL shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST, with the additional sense code set to INVALID FIELD IN CDB.

[a] An ATA device may return completion status for a STANDBY command before removal of the ATA device may be accomplished without damaging the ATA device.

[b] After returning GOOD status for a START STOP UNIT command with the START bit set to zero, the SATL shall consider the ATA device to be in the Stopped power state (see SBC-2).

[c] After returning GOOD status for a START STOP UNIT command with the START bit set to one, the SATL shall consider the ATA device to be in the Active power state (see SBC-2).

[d] An ATA device medium access occurs when an LBA is specified whose data is not contained in ATA device's cache memory. If a value in LBA is specified for an ATA verify command where the data is contained in ATA device's cache memory, then an ATA device may not be in the Active power mode (see ATA/ATAPI-7) after completion of the ATA verify command.

9.11.3 START STOP UNIT START bit LOEJ bit combinations

The SATL shall perform the actions shown in table 48 in response to a START STOP UNIT command.

Table 48 — Definition of ~~IMMED,~~ LOEJ, and START bits in the START STOP UNIT CDB

START	LOEJ	Definition
0	0	The SATL shall: 1) Process the IMMED bit (see 9.11.2.1); 2) Issue a FLUSH CACHE or FLUSH CACHE EXT command to the attached ATA device; 3) If the FLUSH CACHE or FLUSH CACHE EXTENDED command completes with any error, then process ending status according to the IMMED bit (see 9.11.2.3) with the additional sense code set to COMMAND SEQUENCE ERROR; 4) If the FLUSH CACHE or FLUSH CACHE EXT command completes with no error, then issue a STANDBY command to the attached ATA device with zero in Sector Count; 5) If the STANDBY command completes with any error, then process ending status according to the IMMED bit (see 9.11.2.3) with the additional sense code set to COMMAND SEQUENCE ERROR; and 6) If the STANDBY command completes with no error [a], then process GOOD status according to the IMMED bit (see 9.11.2.2) [b].
1	0	The SATL shall: 1) Process the IMMED bit (see 9.11.2.1); 2) Issue an ATA verify command (see 3.1.17) to the attached ATA device with one in Sector Count and a value in LBA from zero to the maximum LBA supported by the ATA device in its current configuration [d]; and 3) When command completion is received for the ATA verify command (see 3.1.17) process GOOD status according to the IMMED bit (see 9.11.2.2) [c].
0	1	If the attached ATA device supports the Removable Media feature set, then the SATL shall: 1) Process the IMMED bit (see 9.11.2.1); 2) Issue a MEDIA EJECT command to the attached ATA device; 3) If the MEDIA EJECT command completes with any error, then process ending status according to the IMMED bit (see 9.11.2.3) with the additional sense code set to MEDIA LOAD OR EJECT FAILED; and 4) If the MEDIA EJECT command completes with no error, then process GOOD status according to the IMMED bit (see 9.11.2.2). If the attached ATA device does not support the Removable Media feature set, then the SATL shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.
1	1	The SATL shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST, with the additional sense code set to INVALID FIELD IN CDB.

[a] An ATA device may return completion status for a STANDBY command before removal of the ATA device may be accomplished without damaging the ATA device.

[b] After returning GOOD status for a START STOP UNIT command with the START bit set to zero, the SATL shall consider the ATA device to be in the Stopped power state (see SBC-2).

[c] After returning GOOD status for a START STOP UNIT command with the START bit set to one, the SATL shall consider the ATA device to be in the Active power state (see SBC-2).

[d] An ATA device medium access occurs when an LBA is specified whose data is not contained in ATA device's cache memory. If a value in LBA is specified for an ATA verify command where the data is contained in ATA device's cache memory, then an ATA device may not be in the Active power mode (see ATA/ATAPI-7) after completion of the ATA verify command.

9.11.3 START STOP UNIT START bit LOEJ bit combinations

The SATL shall perform the actions shown in table 48 in response to a START STOP UNIT command.

Table 48 — Definition of ~~IMMED,~~ LOEJ, and START bits in the START STOP UNIT CDB

START	LOEJ	Definition
0	0	The SATL shall: 1) Process the IMMED bit (see 9.11.2.1); 2) Issue a FLUSH CACHE or FLUSH CACHE EXT command to the attached ATA device; 3) If the FLUSH CACHE or FLUSH CACHE EXTENDED command completes with any error, then process ending status according to the IMMED bit (see 9.11.2.3) with the additional sense code set to COMMAND SEQUENCE ERROR; 4) If the FLUSH CACHE or FLUSH CACHE EXT command completes with no error, then issue a STANDBY command to the attached ATA device with zero in Sector Count; 5) If the STANDBY command completes with any error, then process ending status according to the IMMED bit (see 9.11.2.3) with the additional sense code set to COMMAND SEQUENCE ERROR; and 6) If the STANDBY command completes with no error, then process GOOD status according to the IMMED bit (see 9.11.2.2) [b].
1	0	The SATL shall: 1) Process the IMMED bit (see 9.11.2.1); 2) Issue an ATA verify command (see 3.1.17) to the attached ATA device with one in Sector Count and a value in LBA from zero to the maximum LBA supported by the ATA device in its current configuration [d]; and 3) When command completion is received for the ATA verify command (see 3.1.17) process GOOD status according to the IMMED bit (see 9.11.2.2) [c].
0	1	If the attached ATA device supports the Removable Media feature set, then the SATL shall: 1) Process the IMMED bit (see 9.11.2.1); 2) Issue a MEDIA EJECT command to the attached ATA device; 3) If the MEDIA EJECT command completes with any error, then process ending status according to the IMMED bit (see 9.11.2.3) with the additional sense code set to MEDIA LOAD OR EJECT FAILED; and 4) If the MEDIA EJECT command completes with no error, then process GOOD status according to the IMMED bit (see 9.11.2.2). If the attached ATA device does not support the Removable Media feature set, then the SATL shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.
1	1	The SATL shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST, with the additional sense code set to INVALID FIELD IN CDB.

[a] An ATA device may return completion status for a STANDBY command before removal of the ATA device may be accomplished without damaging the ATA device.

[b] After returning GOOD status for a START STOP UNIT command with the START bit set to zero, the SATL shall consider the ATA device to be in the Stopped power state (see SBC-2).

[c] After returning GOOD status for a START STOP UNIT command with the START bit set to one, the SATL shall consider the ATA device to be in the Active power state (see SBC-2).

[d] An ATA device medium access occurs when an LBA is specified whose data is not contained in ATA device's cache memory. If a value in LBA is specified for an ATA verify command where the data is contained in ATA device's cache memory, then an ATA device may not be in the Active power mode (see ATA/ATAPI-7) after completion of the ATA verify command.

Table 48 — Definition of IMMED, LOEJ, and START bits in the START STOP UNIT CDB
Row: 0 0 In Definition column 6) in 1,2..6 list
change

"6) If the STANDBY command completes with no error a, then process GOOD status according to the IMMED bit (see 9.11.2.2) b."

to

"6) If the ATA STANDBY command completes with no error a, and the IMMED bit is set to zero, return GOOD status (see 9.11.2.2) b."

6) is kind of strange, in that if the IMMED bit was one, then GOOD status is already returned, and 9.11.2.2 only deals with IMMED set to zero. This applied to Rows: 0 0, 1 0 and 0 1.

RESOLUTION: see 06-216 - Don't need to deal with the IMMED bit set to zero because there's nothing left to do - processing is complete. Also, left off the reference to 9.11.2.2 because that subclause (dealing with non-error IMMED bit processing) is being removed and covered in-line in the table.

9.12 SYNCHRONIZE CACHE (10) command

9.12.1 SYNCHRONIZE CACHE (10) command overview

The SYNCHRONIZE CACHE (10) command is used to flush the most recent data values in the ATA device's cache to physical medium. Unlike in SCSI, ATA does not provide a way to specify a particular LBA to start flushing the ATA device's cache.

Table 49 — SYNCHRONIZE CACHE (10) command CDB fields

Field	Description or reference
OPERATION CODE	The SATL shall issue an ATA flush command (see 3.1.8) in accordance with the constraints described in 9.1
SYNC_NV	Unspecified (see 3.4.3)
IMMED	If the IMMED bit is set to one the SATL shall return GOOD status and then issue an ATA flush command. If the IMMED bit is set to zero the SATL shall issue an ATA flush command and return status upon completion.
LOGICAL BLOCK ADDRESS	The SATL shall ignore this field and shall process this command as though this field contained zero.
GROUP NUMBER	Unspecified (see 3.4.3)
NUMBER OF BLOCKS	The SATL shall ignore this field and shall process this command as though this field contained zero (i.e., synchronize all logical blocks starting with the one specified in the LOGICAL BLOCK ADDRESS field to the last logical block on the ATA device's medium).

9.12 SYNCHRONIZE CACHE (10) command

9.12.1 SYNCHRONIZE CACHE (10) command overview

The SYNCHRONIZE CACHE (10) command is used to flush the most recent data values in the ATA device's cache to physical medium. Unlike in SCSI, ATA does not provide a way to specify a particular LBA to start flushing the ATA device's cache.

Table 49 — SYNCHRONIZE CACHE (10) command CDB fields

Field	Description or reference
OPERATION CODE	The SATL shall issue an ATA flush command (see 3.1.8) in accordance with the constraints described in 9.1
SYNC_NV	Unspecified (see 3.4.3)
IMMED	If the IMMED bit is set to one the SATL shall return GOOD status and then issue an ATA flush command. If the IMMED bit is set to zero the SATL shall issue an ATA flush command and return status upon completion.
LOGICAL BLOCK ADDRESS	The SATL shall ignore this field and shall process this command as though this field contained zero.
GROUP NUMBER	Unspecified (see 3.4.3)
NUMBER OF BLOCKS	The SATL shall ignore this field and shall process this command as though this field contained zero (i.e., synchronize all logical blocks starting with the one specified in the LOGICAL BLOCK ADDRESS field to the last logical block on the ATA device's medium).

table 49

"(i.e., synchronize all logical blocks starting with the one specified in the LOGICAL BLOCK ADDRESS field to the last logical block on the ATA device's medium)."

Although that's the correct meaning in SCSI, 2 rows above this entry stated that the logical block address of 0 is always used as the first. So, the meaning in SAT is that the entire medium is synchronized.

RESOLUTION: see 06-216

1 ~~ata blocks specified in the LOGICAL BLOCK ADDRESS field shall be transferred to the specified ATA device, and the ATA device may transfer the data to its cache or medium.~~

9.17.2 WRITE commands with FUA

This subclause applies to the translation of SCSI WRITE (10), WRITE (12), and WRITE (16) commands.

2 If the FUA bit is zero the SATL shall process this command as described in 9.17.1.

If the FUA bit is one the SATL shall issue an ATA write FUA command sequence (see 3.1.19) to the attached ATA device in accordance with the constraints described in 9.1.

3 9.18 WRITE (6) command

The WRITE (6) command is used to request the ATA device to transfer user data to the ATA device's medium or to the ATA device's cache. Data may be written to the ATA device's medium or to the ATA device's cache.

Table 54 — WRITE (6) command CDB fields

Field	Description or reference
OPERATION CODE	9.17.1
TRANSFER LENGTH	The transfer length shall be used to set the ATA Sector Count (see 3.1.16). [a]
LOGICAL BLOCK ADDRESS	The logical block address shall be used to set the ATA LBA (see 3.1.11).
CONTROL	6.4
[a] A transfer length of zero specifies to transfer 256 data blocks from the application client to the attached ATA device (see SBC-2).	

9.19 WRITE (10) command

The WRITE (10) command is used to request the ATA device to transfer user data to the ATA device's medium or to the ATA device's cache. Data may be written to the ATA device's medium or to the ATA device's cache.

Table 55 — WRITE (10) command CDB fields

Field	Description or reference
OPERATION CODE	9.17.1 and 9.17.2
WRPROTECT	Unspecified (see 3.4.3)
DPO	Unspecified (see 3.4.3)
FUA	The SATL may support the FUA bit as defined in SBC-2 (see 9.17.2).
FUA_NV	If the FUA_NV bit is set to one the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.
LOGICAL BLOCK ADDRESS	The logical block address shall be used to set the ATA LBA (see 3.1.11).
GROUP NUMBER	Unspecified (see 3.4.3)
TRANSFER LENGTH	The transfer length shall be used to set the ATA Sector Count (see 3.1.16).[a] The SATL shall issue as many ATA write commands (see 3.1.18) as needed to satisfy the transfer length specified by the WRITE (10) command.
CONTROL	6.4
[a] A transfer length of zero indicates that a data transfer shall not take place.

9.17.2 WRITE commands with FUA
2nd & 3rd paragraphs
change

"If the FUA bit is zero the SATL shall process this command as described in 9.17.1.

If the FUA bit is one the SATL shall issue an ATA write FUA command sequence (see 3.1.19) to the attached ATA device in accordance with the constraints described in 9.1."

to

"If the FUA bit is set to zero in the SCSI write command CDB, the SATL shall process this command as described in 9.17.1.

If the FUA bit is set to one in the SCSI write command CDB, the SATL shall issue an ATA write FUA command sequence (see 3.1.19) to the ATA device in accordance with the constraints described in 9.1."

RESOLUTION: see 06-216 - s/b
If the FUA bit is set to zero in the SCSI write command CDB, then the SATL shall process this command as described in 9.17.1.

If the FUA bit is set to one in the SCSI write command CDB, then the SATL shall issue, in accordance with the constraints described in 9.1:
a) two ATA commands as follows:
1) an ATA write command (see 3.1.xx) excluding WRITE DMA FUA EXT, WRITE DMA QUEUED FUA EXT, WRITE MULTIPLE FUA EXT, and WRITE FPDMA QUEUE; and
2) an ATA verify command (see 3.1.xx);
b) one of the following ATA commands (see ATA8-ACS):
A) WRITE DMA FUA EXT;
B) WRITE DMA QUEUED FUA EXT; or
C) WRITE MULTIPLE FUA EXT;
or
c) an ATA WRITE FPDMA QUEUED command (see SATA 2.5) with the FUA bit in the Device register set to one.
See 5.3 for a description of multiple command sequence error handling.

Table 57 — WRITE (16) command CDB fields

Field	Description or reference
OPERATION CODE	9.17.1 and 9.17.2
WRPROTECT	Unspecified (see 3.4.3)
DPO	Unspecified (see 3.4.3)
FUA	The SATL may support the FUA bit as defined in SBC-2 (see 9.17.2).
FUA_NV	If the FUA_NV bit is set to one the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.
LOGICAL BLOCK ADDRESS	The logical block address shall be used to set the ATA LBA (see 3.1.11).
GROUP NUMBER	Unspecified (see 3.4.3)
TRANSFER LENGTH	The transfer length shall be used to set the ATA Sector Count (see 3.1.16).[a] SATL shall issue as many ATA write commands (see 3.1.18) as needed to satisfy the transfer length specified by the WRITE (16) command.
CONTROL	6.4

[a] A transfer length of zero indicates that a data transfer shall not take place.

9.22 WRITE AND VERIFY commands overview

This subclause applies to the translation of ~~SCSI~~ WRITE AND VERIFY (10), WRITE AND VERIFY (12), and WRITE AND VERIFY (16) commands.

The SATL shall issue:

1) an ATA write command (see 3.1.18) in accordance with the constraints defined in 9.1; and
2) an ATA verify command (see 3.1.17).

9.23 WRITE AND VERIFY (10) command

The WRITE AND VERIFY (10) command is used to transfer application data to the ATA device's medium and then to verify that data was written correctly.

Table 58 — WRITE AND VERIFY (10) command CDB fields

Field	Description or reference
OPERATION CODE	9.22
WRPROTECT	Unspecified (see 3.4.3)
DPO	Unspecified (see 3.4.3)
BYTCHK	If the application client specifies a value other than zero in this field, the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.
LOGICAL BLOCK ADDRESS	The logical block address shall be used to set the ATA LBA (see 3.1.11).
GROUP NUMBER	Unspecified (see 3.4.3)
TRANSFER LENGTH	The transfer length shall be used to set the ATA Sector Count (see 3.1.16).[a] The SATL shall issue as many ATA write commands (see 3.1.18) as needed to satisfy the transfer length specified by the WRITE AND VERIFY (10) command.
CONTROL	6.4

[a] A transfer length of zero indicates that a data transfer shall not take place.

9.24 WRITE AND VERIFY (12) command

The WRITE AND VERIFY (12) command is used to transfer application data to the ATA device's medium and then to verify that data was written correctly.

Table 59 — WRITE AND VERIFY (12) command CDB fields

9.26 WRITE SAME (10) command

9.26.1 WRITE SAME (10) command overview

The WRITE SAME (10) command (see table 61) requests that the SATL transfer a single logical block from the data-out buffer and write the contents of that single logical block, with modifications based on the LBDATA bit and the PBDATA bit, to the specified range of logical block addresses.

Table 61 — WRITE SAME (10) command CDB fields

Field	Description or reference
OPERATION CODE	If the ATA device supports SCT LBA Segment Access (see SCT), the SATL should issue SCT LBA Segment Access to repeatedly write the data in the buffer to the device. If the device does not implement SCT then the SATL shall issue ATA write commands as defined in 9.17.1.
WRPROTECT	Unspecified (see 3.4.3)
LBDATA	9.26.2
PBDATA	9.26.2
LOGICAL BLOCK ADDRESS	The logical block address shall be used to set the ATA LBA (see 3.1.11).
GROUP NUMBER	Unspecified (see 3.4.3)
NUMBER OF BLOCKS	A number of blocks of zero indicates that the data-out buffer shall be repeatedly written from the specified logical block address through the last user addressable logical sector on the media. If the number of blocks is not zero, the SATL shall repeatedly write the data-out buffer for the number of logical sectors specified to the device. The SATL shall send as many ATA commands as required to satisfy the number of logical blocks specified by the WRITE SAME (10) command.
CONTROL	6.4

9.26.2 LBDATA bit and PBDATA bit

The SATL shall write data to the specified logical block addresses according to the values in the LBDATA and PBDATA bits as shown in table 62.

Table 62 — LBDATA and PBDATA fields

LBDATA	PBDATA	Description
0	0	The SATL shall transfer the single block of data from the data output buffer to the range of blocks specified in LOGICAL BLOCK ADDRESS and NUMBER OF BLOCKS repeatedly on the media. If the ATA device supports the SCT LBA Segment Access capability, then this should be used for the data transfer. Otherwise, write commands shall be used as documented in 9.12.2. See SBC-2
0	1	The SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.
1	0	The SATL shall replace the first four bytes of the logical block received from the data-out buffer with the least significant four bytes of the LBA of the logical block being written to the media, ending with the least significant byte (e.g., if the LBA is 77665544_33221100h, 33221100h is written with 33h written first and 00h written last).
1	1	The SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.

9.27 WRITE SAME (16) command

The WRITE SAME (16) command (see table 63) requests that the SATL transfer a single logical block from the data-out buffer and write the contents of that single logical block, with modifications based on the LBDATA bit and the PBDATA bit, to the specified range of logical block addresses.

Table 63 — WRITE SAME (16) command CDB fields

Field	Description or reference
OPERATION CODE	If the ATA device supports SCT LBA Segment Access (see SCT), the SATL should issue SCT LBA Segment Access to repeatedly write the data in the buffer to the ATA device. If the ATA device does not implement SCT then the SATL shall issue ATA write commands as defined in 9.17.1.
WRPROTECT	Unspecified (see 3.4.3)
LBDATA	9.26.2
PBDATA	9.26.2
LOGICAL BLOCK ADDRESS	The logical block address shall be used to set the ATA LBA (see 3.1.11).
GROUP NUMBER	Unspecified (see 3.4.3)
NUMBER OF BLOCKS	A number of blocks of zero indicates that the data-out buffer shall be repeatedly written from logical block address through the last user addressable logical sector on the media. If the number of blocks is not zero, the SATL shall repeatedly write the data-out buffer for the number of sectors specified to the device. The SATL shall send as many ATA commands as required to satisfy the number of logical blocks specified by the WRITE SAME (16) command.

10 Parameters for SAT implementations

10.1 Mode parameters

10.1.1 General information

SCSI mode parameters provide a mechanism to ~~be used to~~ set operating parameters for SCSI devices. MODE SENSE command is used to obtain operating parameters while MODE SELECT command is used to set operating parameters. In the context SCSI to SATA command translation most operating parameters defined by the contents of MODE PAGES are not supported due to lack of equivalent operations or features in ATA devices. The translator emulates a SCSI device server for all MODE SENSE and MODE SELECT commands and emulates the MODE PAGES listed in 10.1.3.

In SCSI, four types of mode page values are defined: current values, saved values, default values, and changeable values. The save parameters operation shall not be supported. Default values are manufacturing time initial values and are not changeable. All pages are shared between all logical units in the target. Mode Page Policy VPD is not implemented, therefore sharing of Mode pages across logical units is implied.

10.1.2 Changeable parameters

~~Except as specified in the descriptions of specific fields in supported mode pages, the SATL shall not implement changeable parameters mode pages.~~ If the SATL receives a MODE SENSE command with 01b in the PC field, the SATL shall terminate the command with CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST, and the additional sense code set to INVALID FIELD IN CDB.

An attempt to change a non-changeable mode parameter using the MODE SELECT command shall result in an error condition, and the command shall be terminated with CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST, and the additional sense code shall be set to INVALID FIELD IN CDB.

10.1.3 Commonly used SCSI mode pages overview

Mode parameters for which this standard defines translations are listed in table 64.

Table 64 — Summary of SCSI / ATA mode page mapping

Default values are manufacturing time initial values and are not changeable. All pages are shared between all logical units in the target device. If the Mode Page Policy VPD page is not implemented, sharing of mode pages across logical units is implied."

1. I see no reason that saveable pages can not be implemented by the SATL, and can think of reason why they might be useful. Additionally, the SP bit in the MODE SELECT command on each mode page is Unspecified, which to me conflicts with the statement that saving shall not be supported.
2. Saying "Mode Page Policy VPD is not implemented" goes against the MODE SENSE section that says should be implemented.

10 Parameters for SAT implementations

10.1 Mode parameters

10.1.1 General information

SCSI mode parameters provide a mechanism to ~~be used to~~ set operating parameters for SCSI devices. MODE SENSE command is used to obtain operating parameters while MODE SELECT command is used to set operating parameters. In the context SCSI to SATA command translation most operating parameters defined by the contents of MODE PAGES are not supported due to lack of equivalent operations or features in ATA devices. The translator emulates a SCSI device server for all MODE SENSE and MODE SELECT commands and emulates the MODE PAGES listed in 10.1.3.

In SCSI, four types of mode page values are defined: current values, saved values, default values, and changeable values. The save parameters operation shall not be supported. Default values are manufacturing time initial values and are not changeable. All pages are shared between all logical units in the target. Mode Page Policy VPD is not implemented, therefore sharing of Mode pages across logical units is implied.

10.1.2 Changeable parameters

~~Except as specified in the descriptions of specific fields in supported mode pages, the SATL shall not implement changeable parameters mode pages.~~ If the SATL receives a MODE SENSE command with 01b in the PC field, the SATL shall terminate the command with CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST, and the additional sense code set to INVALID FIELD IN CDB.

An attempt to change a non-changeable mode parameter using the MODE SELECT command shall result in an error condition, and the command shall be terminated with CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST, and the additional sense code shall be set to INVALID FIELD IN CDB.

10.1.3 Commonly used SCSI mode pages overview

Mode parameters for which this standard defines translations are listed in table 64.

Table 64 — Summary of SCSI / ATA mode page mapping

SCSI mode page	Reference
Control	10.1.4

Table 65 describes the translation of the control mode page for an ~~attached~~ ATA device.

Table 65 — Control mode page fields

Field	Changeable	Description or reference
PS	n/a	Unspecified (see 3.4.3)
PAGE CODE	no	Set to 01h. This field value is specific to the Read-Write Error Recovery mode page.
PAGE LENGTH	no	See SBC-2.
TST	no	Shall be set to 000b to indicate that a SCSI representation of an ATA device has one task set for all initiators
TMF_ONLY	no	Shall be set to 0b [a]
D_SENSE	no [b]	A SATL shall support 0b for this field indicating that the emulated SCSI device uses the fixed sense data format. A SATL may support 1b for this field to support the descriptor format sense data. SATL implementations that support 1b shall also support this field as being changeable.
GLTSD	no	Shall be set to 1b. Log page translations are implemented as emulated pages based on ATA data that may not be saved by the attached ATA device.
RLEC	no	Shall be set to 0b
QUEUE ALGORITHM MODIFIER	no	Shall be set to 1b if the ATA device supports any form of command queuing, otherwise shall be set to 0b
QERR	no	If the SATL resubmits queued commands that did not fail to the drive on behalf of any I_T Nexus, this field shall be set to 00b. Otherwise, the SATL shall set this field to 01b and comply with the unit attention requirements for a task completed with CHECK CONDITION status (see SPC-3)
TAS	no	Shall be set to 0b
RAC	Unspecified	Unspecified (see 3.4.3)
UA_INTLCK_CTRL	no	Shall be set to 00b
SWP	no	Shall be set to 0b
ATO	Unspecified	Unspecified (see 3.4.3)
AUTOLOAD MODE	no	Shall be set to 000b
BUSY TIMEOUT PERIOD	no [b]	The default value shall be set to FFFFh. A SATL may support variable timeout periods and allow the application client to set a new value through a MODE SELECT operation for this mode page (see SPC-3)
EXTENDED SELF-TEST COMPLETION TIME	no	10.1.4.2

[a] SATL implementations shall not support ACA, therefore this field shall be 0b.
[b] If the SATL supports the optional behavior for this field, the SATL may support this field as changeable.

10.1.4.2 Extended self-test completion time

A SATL implementation shall set this field to 0000h unless the attached ATA device supports SMART self-tests and the SATL supports a non-000b value for the SELF-TEST CODE field for a SEND DIAGNOSTIC command. The SATL determines if the attached ATA device supports SMART self-test by examining the

Table 65 — Control mode page fields
Row: GLTSD

Although the ATA device does not save the actual log parameters, Not sure that Set to 1b would be correct. Seems to me that the 2 defined log pages are both persistent across POR, etc, so it seems they do do an implicitly save, when looking at it from a point of view of the SATL plus ATA drive being the SCSI target device.

Discussed: Supported Log Pages is clearly saved implicitly, but the Self-Test Results log page and the Informational Exceptions log page may contain information that does not persist across a power-on reset. Subsequent versions of SAT may define more log pages that have information which doesn't persist across POR, and nothing prevents a SATL from implementing defined log pages that have information that may not persist across power cycles. The definition of the GLTSD bit here applied to all log pages implemented by a SATL, whether SAT provides a specific translation for those log pages or not.

Also, this is a mode page, so the statement "shall be set to" needs to be qualified as to whether it applies to a device server or an application client. SAT shouldn't prohibit an application client from setting the bit one way or the other, but should define the SATL response if the application client sets the bit to a value that is not supported.

Now - if SAT is opening the door to allow mode pages to be saveable, should SAT not also permit implicit saving of log pages? If so, this field should be "Unspecified (see 3.4.3)".

RESOLUTION: Replace the text in the table cell with "Unspecified (see 3.4.3)", and make it "Unspecified" whether the bit is changeable.

Table 65 describes the translation of a control mode page for an ~~attached~~ ATA device.

Table 65 — Control mode page fields

Field	Changeable	Description or reference
PS	n/a	Unspecified (see 3.4.3)
PAGE CODE	no	Set to 01h. This field value is specific to the Read-Write Error Recovery mode page.
PAGE LENGTH	no	See SBC-2.
TST	no	Shall be set to 000b to indicate that a SCSI representation of an ATA device has one task set for all initiators
TMF_ONLY	no	Shall be set to 0b [a]
D_SENSE	no [b]	A SATL shall support 0b for this field indicating that the emulated SCSI device uses the fixed sense data format. A SATL may support 1b for this field to support the descriptor format sense data. SATL implementations that support 1b shall also support this field as being changeable.
GLTSD	no	Shall be set to 1b. Log page translations are implemented as emulated pages based on ATA data that may not be saved by the attached ATA device.
RLEC	no	Shall be set to 0b
QUEUE ALGORITHM MODIFIER	no	Shall be set to 1b if the ATA device supports any form of command queuing, otherwise shall be set to 0b
QERR	no	If the SATL resubmits queued commands that did not fail to the drive on behalf of any I_T Nexus, this field shall be set to 00b. Otherwise, the SATL shall set this field to 01b and comply with the unit attention requirements for a task completed with CHECK CONDITION status (see SPC-3)
TAS	no	Shall be set to 0b
RAC	Unspecified	Unspecified (see 3.4.3)
UA_INTLCK_CTRL	no	Shall be set to 00b
SWP	no	Shall be set to 0b
ATO	Unspecified	Unspecified (see 3.4.3)
AUTOLOAD MODE	no	Shall be set to 000b
BUSY TIMEOUT PERIOD	no [b]	The default value shall be set to FFFFh. A SATL may support variable timeout periods and allow the application client to set a new value through a MODE SELECT operation for this mode page (see SPC-3)
EXTENDED SELF-TEST COMPLETION TIME	no	10.1.4.2

[a] SATL implementations shall not support ACA, therefore this field shall be 0b.
[b] If the SATL supports the optional behavior for this field, the SATL may support this field as changeable.

1 IDENTIFY DEVICE data for word 84, bit 1. If word 84, bit 1 is set to one, the device supports the SMART self-test. Under these conditions, the SATL shall set the EXTENDED SELF-TEST COMPLETION TIME field as follows:

1) The SATL shall obtain the device SMART data structure by sending a SMART READ DATA command to the attached device. The SATL may cache this information for future use when a subsequent MODE SENSE command requests the control mode page. If the SATL caches such data, it is not mandatory to send a SMART READ DATA more than one time.
2) If byte 373 of the SMART data structure is not FFh, the SATL shall set the extended self-test completion time to 60 times the contents of byte 373.
3) If byte 373 of the SMART data structure is FFh, the SATL shall set the extended self-test completion time to the lesser of FFFFh or the result of the following formula:

EXTENDED SELF-TEST COMPLETION TIME field = ((w x 256) + z) x 60;

where z is the contents of byte 375 and w is the contents of byte 376.

10.1.5 Read-Write Error Recovery mode page

The Read-Write Error Recovery mode page specifies the error recovery parameters the SATL shall use during any command that performs a read or write operation to the ATA device's medium (see SBC-2). Table 66 defines the translation for the Read-Write Error Recovery mode page.

Table 66 — Read-write error recovery mode page fields

Field	Changeable	Description or reference [a]
PS	n/a	Unspecified (see 3.4.3)
PAGE CODE	no	Set to 01h. This field value is specific to the Read-Write Error Recovery mode page.
PAGE LENGTH	no	See SBC-2.
ARRE	no	Shall be set to one (see SBC-2).
AWRE	no	Shall be set to zero (see SBC-2).
TB	n/a	Unspecified (see 3.4.3)
RC	no	Shall be set to zero (see SBC-2).
EER	no	Shall be set to zero (see SBC-2).
PER	no	Shall be set to zero (see SBC-2).
DTE	no	Shall be set to zero (see SBC-2).
DCR	no	Shall be set to zero (see SBC-2).
READ RETRY COUNT	n/a	Unspecified (see 3.4.3)
WRITE RETRY COUNT	n/a	Unspecified (see 3.4.3)
RECOVERY TIME LIMIT	no	Shall be set to 00h (see SBC-2).

[a] ~~If the SATL receives a MODE SELECT command with a value other than zero set in this field the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN PARAMETER LIST.~~

10.1.4.2 Extended self-test completion time
1st Paragraph, Continuation of 2nd Sentence

Change

"... IDENTIFY DEVICE data word 84, bit 1. If word 84, bit 1 is set to one, the ATA device supports the SMART self-test. Under these conditions, the SATL shall set the EXTENDED SELF-TEST COMPLETION TIME field as follows:

1) The SATL shall obtain the device SMART data structure by sending a SMART READ DATA command to the attached device. The SATL may cache this information for future use when a subsequent MODE SENSE command requests the control mode page. If the SATL caches such data, it is not mandatory to send a SMART READ DATA more than one time.

2) If byte 373 of the SMART data structure is not FFh, the SATL shall set the extended self-test completion time to 60 times the contents of byte 373.

3) If byte 373 of the SMART data structure is FFh, the SATL shall set the extended self-test completion time to the lesser of FFFFh or the result of the following formula:

EXTENDED SELF-TEST COMPLETION TIME field = ((w x 256) + z) x 60;

where z is the contents of byte 375 and w is the contents of byte 376."

to

"... ATA IDENTIFY DEVICE data for word 84, bit 1. If word 84, bit 1 is set to one, the ATA device supports the SMART self-test and shall obtain the ATA device SMART data structure by sending an ATA SMART READ DATA command to the ATA device. Then the SATL shall set the EXTENDED SELF-TEST COMPLETION TIME field as follows:

1) If byte 373 of the returned SMART data structure is not set to FFh, the SATL shall set the EXTENDED SELF-TEST COMPLETION TIME field to a value that is 60 times the contents of byte 373; or

3) If byte 373 of the returned SMART data structure is set to FFh, the SATL shall set the EXTENDED SELF-TEST COMPLETION TIME field to a value that is the lesser of FFFFh or the result of the following formula:

EXTENDED SELF-TEST COMPLETION TIME field = ((w x 256) + z) x 60;

where w is the contents of byte 376 and z is the contents of byte 375."

Discussed: < Should SAT require the SATL to retrieve the SMART data structure each time, or should a cached copy suffice?

RESOLUTION:s/b
"... ATA IDENTIFY DEVICE data word 84, bit 1. If ATA IDENTIFY DEVICE data word 84, bit 1 is set to one, the ATA device supports the SMART self-test and shall retrieve the ATA device SMART data structure from the ATA device by sending an ATA SMART READ DATA command to the ATA device. The SATL may cache this information for future use when a subsequent MODE SENSE command requests the control mode page. If the SATL caches such data, the SATL may reference the cached copy instead of sending a new ATA SMART READ DATA command. Then the SATL shall set the EXTENDED SELF-TEST COMPLETION TIME field as follows:

1) If byte 373 of the returned SMART data structure is not set to FFh, the SATL shall set the EXTENDED SELF-TEST COMPLETION TIME field to a value that is 60 times the contents of byte 373; or

2) If byte 373 of the returned SMART data structure is set to FFh, the SATL shall set the EXTENDED SELF-TEST COMPLETION TIME field to a value that is the lesser of FFFFh or the result of the following formula:

EXTENDED SELF-TEST COMPLETION TIME field = ((w x 256) + z) x 60;

where w is the contents of byte 376 and z is the contents of byte 375."

Discussed: What is the reasoning behind the specified values for ARRE and AWRE? LB comments from HPQ and LSI as well as 05-241r2 suggest AWRE should be "one", and ARRE should be "zero". My understanding is that an ATA device will auto-reallocate on an unrecoverable READ error, but that the reallocation is deferred until the next time that same logical sector is written. An ATA device does not check data consistency on a write, and there is no write-and-verify equivalent, so I don't see that an ATA device will auto-reallocate due to an error on a write command. But..., the data that ends up in the alternate sector is the data from the write, not the data from the read, so AWRE is one and ARRE is zero.

RESOLUTION:
ARRE - "Shall be set to zero (see SBC-2)."
AWRE - "Shall be set to one (see SBC-2)."

IDENTIFY DEVICE data for word 84, bit 1. If word 84, bit 1 is set to one, the device supports the SMART self-test. Under these conditions, the SATL shall set the EXTENDED SELF-TEST COMPLETION TIME field as follows:

1) The SATL shall obtain the device SMART data structure by sending a SMART READ DATA command to the attached device. The SATL may cache this information for future use when a subsequent MODE SENSE command requests the control mode page. If the SATL caches such data, it is not mandatory to send a SMART READ DATA more than one time.
2) If byte 373 of the SMART data structure is not FFh, the SATL shall set the extended self-test completion time to 60 times the contents of byte 373.
3) If byte 373 of the SMART data structure is FFh, the SATL shall set the extended self-test completion time to the lesser of FFFFh or the result of the following formula:

EXTENDED SELF-TEST COMPLETION TIME field = ((w x 256) + z) x 60;

where z is the contents of byte 375 and w is the contents of byte 376.

10.1.5 Read-Write Error Recovery mode page

The Read-Write Error Recovery mode page specifies the error recovery parameters the SATL shall use during any command that performs a read or write operation to the ATA device's medium (see SBC-2). Table 66 defines the translation for the Read-Write Error Recovery mode page.

Table 66 — Read-write error recovery mode page fields

Field	Changeable	Description or reference [a]
PS	n/a	Unspecified (see 3.4.3)
PAGE CODE	no	Set to 01h. This field value is specific to the Read-Write Error Recovery mode page.
PAGE LENGTH	no	See SBC-2.
ARRE	no	Shall be set to one (see SBC-2).
[21]RE	no	[20]all be set to zero (see SBC-2).
TB	n/a	Unspecified (see 3.4.3)
RC	no	Shall be set to zero (see SBC-2).
EER	no	Shall be set to zero (see SBC-2).
PER	no	Shall be set to zero (see SBC-2).
DTE	no	Shall be set to zero (see SBC-2).
DCR	no	Shall be set to zero (see SBC-2).
READ RETRY COUNT	n/a	Unspecified (see 3.4.3)
WRITE RETRY COUNT	n/a	Unspecified (see 3.4.3)
RECOVERY TIME LIMIT	no	Shall be set to 00h (see SBC-2).

~~[22]If the SATL receives a MODE SELECT command with a value other than zero set in this field the SATL [23]shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN PARAMETER LIST.~~

10.1.5 Read-Write Error Recovery mode page

MAXIMUM PRE-FETCH CEILING	no	Set to 0h. Any other value is not supported in this standard. [a]
FSW	no	Set to 0b. A value of 1b is not supported in this standard. [a]

[a] ~~If the SATL receives a MODE SELECT command with a value other than zero set in this field the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN PARAMETER LIST.~~

RESOLUTION: s/b
“When processing a MODE SENSE command, the SATL shall determine if the write cache of the ATA device is enabled from the ATA IDENTIFY DEVICE data word 85, bit 5. If the write cache of the ATA device is enabled the SATL shall return a value of one for the WCE bit. If the write cache of the ATA device is disabled the SATL shall return a value of zero for the WCE bit.

When processing a MODE SELECT command:
a) if the WCE bit is set to zero, the SATL shall disable the write cache of the ATA device by issuing an ATA SET FEATURES – Disable write cache command (i.e., with the Features register set to 82h); or
b) if the WCE bit is set to one, the SATL shall enable the write cache of the ATA device by issuing an ATA SET FEATURES – Enable write cache command (i.e., with the Features register set to 02h).”

Table 67 — Caching mode page fields (part 1 of 2) and Table 67 — Caching mode page fields (part 2 of 2)

1. In table change all the 0b and 1b to zero and one.
2. In table change all the "Set to .." to "Shall be set to ..." and remove second sentence about A value of x is not supported in this standard", as "Shall be set to " implies this.
3. Remove Footnote a, as this is standard response to MODE SELECT trying to change a non-changeable mode page parameter and already stated in 10.1.2. If this footnote is not removed, then it needs to be added to every mode page fields table.
4. Missing SPF bit (0b) Row

RESOLUTION: As suggested, except I don't find the SPF field defined in SBC-2's description of the Caching mode page.

While processing a MODE SELECT command, if the DEXCPT bit is :
a) set to zero, the SATL shall enable informational exceptions reporting by issuing an ATA SMART ENABLE OPERATIONS command (i.e.,Feature register value set to D8h) to the ATA device; or
b) set to one, the SATL shall disable informational exceptions reporting by issuing an ATA SMART DISABLE OPERATIONS command (i.e., Feature register value set to D9h) to the ATA device.”

RESOLUTION: s/b
"Unspecified (see 3.4.3)"

REASON: The DEXCPT bit does not specify what self-test capabilities are enabled, but only specifies the reporting of results. Disabling SMART ops causes a problem with SEND DIAGNOSTIC because the expectation is that if the self-test is supported, the test will be executed independent of whether DEXCPT is zero or one. So the SATL should rely on other information to determine if/when to enable/disable SMART OPS, and should treat the SMART OPS disabled state as "unsupported". SEND DIAGNOSTIC w/ SELFTEST set to one will terminate with CHECK CONDITION status if SMART OPS is disabled.

10.1.7 Informational Exceptions Control mode page

10.1.7.1 Informational Exceptions Control mode page overview

The Informational Exceptions Control mode page defines the methods used by the SATL to control the reporting and the operations of specific informational exception conditions. The Informational Exceptions Control mode page applies to informational exceptions that return an additional sense code of FAILURE PREDICTION THRESHOLD EXCEEDED or WARNING to the application client (see SPC-3).

Table 68 shows the translation of fields in the Informational Exceptions Control mode page.

Table 68 — Informational Exceptions Control mode page fields

Field	Changeable	Description or reference [a]
PS	n/a	Unspecified (see 3.4.3)
SPF	No	Unspecified (see 3.4.3)
PAGE CODE	No	Set to 1Ch. This field value is specific to the Informational Exceptions Control mode page. The SATL shall determine if the ATA SMART feature set is supported from the ATA IDENTIFY DEVICE data word 82, bit 0. If the ATA SMART feature set is not supported the SATL shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.
PAGE LENGTH	No	Unspecified (see 3.4.3)
PERF	No	Shall be set to zero (see SPC-3).
EBF	n/a	Unspecified (see 3.4.3)
EWASC	n/a	Unspecified (see 3.4.3)
DEXCPT	Yes	While processing a MODE SENSE command the SATL shall determine if the ATA SMART feature set is enabled or disabled from the ATA device ATA IDENTIFY DEVICE data word 85, bit 0. If the ATA SMART feature set is disabled the SATL shall return one for the DEXCPT bit. If the ATA SMART feature set is enabled the SATL shall return zero for the DEXCPT bit. While processing a MODE SELECT command, if the DEXCPT bit is : a) set to zero, then the SATL shall enable informational exceptions reporting by issuing an ATA SMART ENABLE OPERATIONS command (i.e., B0h with Feature register value of D8h) to the ATA device; or b) set to one, then the SATL shall disable informational exceptions reporting by issuing an ATA SMART DISABLE OPERATIONS command (i.e., B0h with Feature register value of D9h) to the ATA device.
TEST	No	Shall be set to zero (see SPC-3)
LOGERR	n/a	Unspecified (see 3.4.3)
MRIE	No	This field should be set to 6h (see 10.1.7.2).
INTERVAL TIMER	n/a	Unspecified (see 3.4.3)
REPORT COUNT	n/a	Unspecified (see 3.4.3)

[7] ~~When the SATL is processing a MODE SELECT command, if bits or fields are set to values other than those specified, the SATL shall terminate the command with CHECK CONDITION status with sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN PARAMETER LIST.~~

TSD	Unspecified (see 3.4.3)
ETC	Unspecified (see 3.4.3)
TMC	Shall be set to 00b.
LBIN	Unspecified (see 3.4.3)
LP	Unspecified (see 3.4.3)
PARAMETER LENGTH	Unspecified (see 3.4.3)
INFORMATIONAL EXCEPTION ADDITIONAL SENSE CODE	10.2.3.1
INFORMATIONAL EXCEPTION ADDITIONAL SENSE CODE QUALIFIER	10.2.3.1
MOST RECENT TEMPERATURE READING	10.2.3.2
Vendor Specific	Unspecified (see 3.4.3)

10.2.3.1 Additional sense code and additional sense code qualifier translations

Data received from a ATA device in response to an ATA SMART RETURN STATUS command shall be translated by the SATL into the informational exceptions general parameter data returned to the application client. Table 72 provides the parameter data translations for the INFORMATIONAL EXCEPTION ADDITIONAL SENSE CODE and INFORMATIONAL EXCEPTION ADDITIONAL SENSE CODE QUALIFIER fields.

Table 72 — ATA SMART RETURN STATUS translations

Data returned to SATL from the ATA device by the ATA SMART RETURN STATUS command	SMART condition	Informational exceptions general parameter data fields
LBA Mid = 4Fh LBA High = C2h	threshold not exceeded	INFORMATIONAL EXCEPTION ADDITIONAL SENSE CODE = 00h, INFORMATIONAL EXCEPTION ADDITIONAL SENSE CODE QUALIFIER = 00h
LBA Mid = F4h LBA High = 2Ch	threshold exceeded	INFORMATIONAL EXCEPTION ADDITIONAL SENSE CODE = 5Dh, INFORMATIONAL EXCEPTION ADDITIONAL SENSE CODE QUALIFIER = 10h

10.2.3.2 Most recent temperature reading translation

If the ATA device supports the SCT Feature Set (see SCT), the MOST RECENT TEMPERATURE READING field of the Informational Exceptions log page should be translated by the SATL as follows:

1) Issue an SCT Status Request to the ATA device;
2) If the HDA Temp field (see SCT) is less than zero, the SATL shall set the MOST RECENT TEMPERATURE READING field to zero;

Subject: Highlight
Date: 5/6/2006 3:05:00 PM

If you are defining the "general parameter data", SPC-3 defines this as always "0000h". If you use "unspecified" here you must change the table name and the statement above this table (which I don't think you can do since this is specific to the "first" parameter of the informational exceptions log page). See proposal 05-142r4. Furthermore, our applications will fail this out if the value is not "0000h".

RESOLUTION: s/b
"Shall be set to 0000h."

Note: The change from what was in 05-142r4 was made in an editing session. SPC-3's requirement that the value be 0000h is precisely why is was changed to "Unspecified" in SAT-r08 (i.e., meaning SAT doesn't specify it, another standard does, so go look at SPC-3 or SBC-2). There is a general rule of thumb to avoid having the same definitions duplicated between different standards documents. Every instance is a potential oversight if one of the standards changes the definition - requiring all other documents with duplicate definitions to be modified as well for consistency. There is also the potential for editors to make mistakes in copying definitions, which results in inconsistency between standards and actually promotes non-interoperable behavior. However, in the interest of getting through letter-ballot, the editor is willing to include the duplicate definition in this case.

Table 74 — Self-Test Results log parameters (part 1 of 2)

The translation of this log page looks incomplete in terms of mapping the self-test index/descriptor index to the PARAMETER CODE field , and the byte n + 1. This then makes the text in the SELF-TEST RESULTS, TIMESTAMP, and ADDRESS OF FIRST FAILURE translations confusing as there is no indication of which descriptor these values are coming form.

If the PARAMETER CODE is used to indicate the descriptor then with limited word changes, these fields would make sense.

DISCUSS: What text to add/modify to map the self-test index / descriptor index to the PARAMETER CODE field and the "n +1" byte?

Table 74 — Self-Test Results log parameters (part 2 of 2)

Field	Description or reference
TIMESTAMP	The SATL shall read the ATA log data as defined in 10.2.4.2. If the SATL reads the ATA log data using the READ LOG EXT command specifying the Extended SMART self-test log, then the SATL shall set the TIMESTAMP field to the values in the Life timestamp (most significant byte) and Life timestamp (least significant byte) of the Extended Self-test log descriptor entry. If the SATL reads the ATA log data using the SMART READ LOG command specifying the SMART self-test log, then the SATL shall set the TIMESTAMP field to the values in the Life timestamp (most significant byte) and Life timestamp (least significant byte) of the Self-test log descriptor entry.
ADDRESS OF FIRST FAILURE	The SATL shall read the ATA log data as defined in 10.2.4.2. If the SATL reads the ATA log data using the READ LOG command specifying the Extended SMART self-test log, then the SATL shall set the ADDRESS OF FIRST FAILURE field using the values in the Failing LBA (47:40), Failing LBA (39:32), Failing LBA (31:24), Failing LBA (23:16), Failing LBA (15:8), and Failing LBA (7:0) of the Extended Self-test log descriptor entry. If the SATL reads the ATA log data using the SMART READ LOG command specifying the SMART self-test log, then the SATL shall set the ADDRESS OF FIRST FAILURE field using the values in the Failing LBA (most significant byte), Failing LBA (next most significant byte), Failing LBA (next least significant byte), and Failing LBA (least significant byte) of the Self-test log descriptor entry.
SENSE KEY	10.2.4.3
ADDITIONAL SENSE CODE	10.2.4.3
ADDITIONAL SENSE CODE QUALIFIER	10.2.4.3

10.2.4.2 A method of determining ATA command selection for field translations

To translate the SELF-TEST RESULTS field, the TIMESTAMP field, the ADDRESS OF FIRST FAILURE field, the SENSE KEY field, the ADDITIONAL SENSE CODE field, and the ADDITIONAL SENSE CODE QUALIFIER field of Self-Test Results log parameters, the SATL shall:

1) Issue an IDENTIFY DEVICE command to the ATA device;
2) From the returned data the SATL shall determine if the ATA device supports the 48-bit Address feature set from bit 10 of word 83;
3) If the 48-bit Address feature set is supported the SATL shall issue a READ LOG EXT command with the Log address set to 07h (i.e., Extended SMART self-test log) to the ATA device; and
4) If the 48-bit Address feature set is not supported the SATL shall issue a SMART READ LOG command with the Log address set to 06h (i.e., SMART self-test log) to the ATA device.

10.2.4.3 Sense key and additional sense code

The SATL shall determine the sense key and additional sense code from the content of the self-test execution status byte returned from a READ LOG EXT command or SMART READ LOG command issued to the ATA

10.2.4.2 A method of determining ATA command selection for field translations

To translate the SELF-TEST RESULTS field, the TIMESTAMP field, the ADDRESS OF FIRST FAILURE field, the SENSE KEY field, the ADDITIONAL SENSE CODE field, and the ADDITIONAL SENSE CODE QUALIFIER field of Self-Test Results log parameters, the SATL shall:

1) Issue an IDENTIFY DEVICE command to the ATA device;
2) From the returned data the SATL shall determine if the ATA device supports the 48-bit Address feature set from bit 10 of word 83;
3) If the 48-bit Address feature set is supported the SATL shall issue a READ LOG EXT command with the Log address set to 07h (i.e., Extended SMART self-test log) to the ATA device; and
4) If the 48-bit Address feature set is not supported the SATL shall issue a SMART READ LOG command with the Log address set to 06h (i.e., SMART self-test log) to the ATA device.

10.2.4.3 Sense key and additional sense code

The SATL shall determine the sense key and additional sense code from the content of the self-test execution status byte returned from a READ LOG EXT command or SMART READ LOG command issued to the ATA

shall issue an IDENTIFY DEVICE command to the ATA device, and from the returned data the SATL shall determine if the ATA device supports the 48-bit Address feature set. If the 48-bit Address feature set is supported (i.e., bit 10 of word 83 of IDENTIFY DEVICE data is set to one), then the SATL shall issue a READ LOG EXT command with the Log address set to 07h (i.e., Extended SMART self-test log) to the ATA device. If the 48-bit Address feature set is not supported (i.e., bit 10 of word 83 of IDENTIFY DEVICE data is set to zero), then the SATL shall issue a SMART READ LOG command with the Log address set to 06h (i.e., SMART self-test log) to the ATA device."

10.2.4.2
This might be interpreted as requiring the 4 steps be run on each log page access. Really, the IDENTIFY DATA is cached by th SATL.

Remove the 1)4) list and just say:
If the IDENTIFY DEVICE data indicates the 48-bit Address feature set is supported (i.e., word 83 bit 10 is set to 1), the SATL shall use the READ LOG EXT command... . If the IDENTIFY DEVICE data indicates the 48-bit Address feature is not supported (i.e., word 83 bit 10 is set to 0), then the SATL shall use the SMART READ LOG command... .

RESOLUTION: See EDITOR comment

10.3 Vital product data parameters

10.3.1 Vital product data parameters overview

Table 77 provides a summary of the VPD page translations defined in this standard.

Table 77 — Summary of SCSI / ATA VPD page mapping

SCSI VPD page	Reference
Supported VPD Pages (i.e., 00h)	10.3.2
Unit Serial Number (i.e., 80h)	10.3.3
Device Identification (i.e., 83h)	10.3.4
ATA Information VPD page (i.e., 89h)	10.3.5

1

10.3.2 Supported VPD pages VPD page

Table 78 shows the fields of the Supported VPD pages VPD page.

Table 78 — Supported VPD pages VPD page fields

Field	Description or reference
PERIPHERAL DEVICE TYPE	The PERIPHERAL QUALIFIER field and the PERIPHERAL DEVICE TYPE field shall be set as described in 8.1.2.
PERIPHERAL QUALIFIER	
PAGE CODE	The SATL shall set the field to 00h.
PAGE LENGTH	The SATL shall set this field to indicate the length of the supported VPD page list returned in number of bytes.
SUPPORTED VPD LIST	This list shall contain the page codes of the pages supported by the SATL in ascending order of page codes beginning with page code 00h.

2

10.3.3 Unit Serial Number VPD page

Table 79 defines the Unit Serial Number VPD page (see SPC-3) returned by a SATL for an ATA device.

Why are the VPD page translation formats different than all the other translations, i.e. shown in Bit/Byte Format, instead of the Field/Description or Reference format?

Change to match format except for the ATA Information VPD.
DISCUSS: is the SAT WG OK with changing the format?

The PRODUCT SERIAL NUMBER field contains a representation of the SERIAL NUMBER field in the ATA IDENTIFY DEVICE data (i.e., words 10-19) last retrieved from the ATA device. Each pair of bytes in the SERIAL NUMBER field shall be swapped to create a valid ASCII string format in the PRODUCT SERIAL NUMBER field as described in table 80.

Table 80 — PRODUCT SERIAL NUMBER field

Byte	Contents
0	IDENTIFY DEVICE word 10 bits 15:8 (i.e., byte 1)
1	IDENTIFY DEVICE word 10 bits 7:0 (i.e., byte 0)
2	IDENTIFY DEVICE word 11 bits 15:8 (i.e., byte 3)
3	IDENTIFY DEVICE word 11 bits 7:0 (i.e., byte 2)
...	...
18	IDENTIFY DEVICE word 19 bits 15:8 (i.e., byte 19)
19	IDENTIFY DEVICE word 19 bits 7:0 (i.e., byte 18)

NOTE 8 - Although SPC-3 defines the PRODUCT SERIAL NUMBER field as right-aligned, ATA/ATAPI-7 does not require its SERIAL NUMBER field to be right-aligned. Therefore, the PRODUCT SERIAL NUMBER field for SAT may not be right-aligned.

10.3.4 Device Identification VPD page

10.3.4.1 Device Identification VPD page overview

The SATL shall return the Device Identification VPD page (see SPC-3) as defined in table 81.

Table 81 — Device Identification VPD page for SAT

Bit\Byte	7	6	5	4	3	2	1	0
0	PERIPHERAL QUALIFIER			PERIPHERAL DEVICE TYPE				
1	PAGE CODE (83h)							
2	Reserved							
3	PAGE LENGTH (n-3)							
4	Identification descriptor for the logical unit (see table 82 and table 84)							
15								
16	Additional identification descriptor(s) (if any)							
n								

The PERIPHERAL QUALIFIER field and the PERIPHERAL DEVICE TYPE field shall be set as described in 8.1.2.

The PAGE CODE field shall be set to 83h.

The PAGE LENGTH field contains the length of the remaining bytes of the VPD page.

One identification descriptor for a logical unit (i.e., a logical unit name) shall be included (see clause 10.3.4.2).

In some environments, one or more additional identification descriptors may be included (see clause 10.3.4.3).

10.3.4.2 Logical unit name

10.3.4.2.1 Logical unit name overview

If the ATA device returns word 87 bit 8 set to one in its IDENTIFY DEVICE data indicating that it supports the WORLD WIDE NAME field (i.e., words 108-111), the SATL shall include an identification descriptor containing a logical unit name as defined in 10.3.4.2.2.

If the ATA device returns word 87 bit 8 set to zero in its IDENTIFY DEVICE data indicating that it does not support the WORLD WIDE NAME field (i.e., words 108-111), the SATL shall include an identification descriptor containing a logical unit name as defined in 10.3.4.2.3.

10.3.4.2.2 Logical unit name derived from the world wide name

Table 82 defines the logical unit name derived from the ATA device world wide name.

Table 82 — Logical unit name derived from the world wide name

Byte\Bit	7	6	5	4	3	2	1	0

Figure 7 shows the identification descriptors returned by a SATL in a SCSI to ATA protocol bridge, where the ATA device is being accessed by an ATA host port, and the SATL is being accessed with a SCSI target port using a SCSI transport protocol (e.g, FCP-3 or iSCSI):

a) a logical unit name based on ATA IDENTIFY DEVICE data (see table 82 or table 84 in 10.3.4.2;
b) any target port identifiers specified by the SCSI transport protocol standard (e.g., for FCP-3, the SATL includes an identifier with identifier type 3h (i.e., NAA) containing the Port_Name, and may include an identifier with identifier type 4h (i.e., relative target port identifier)); and
c) any other identification descriptors supported by the protocol bridge (e.g., a target device name).

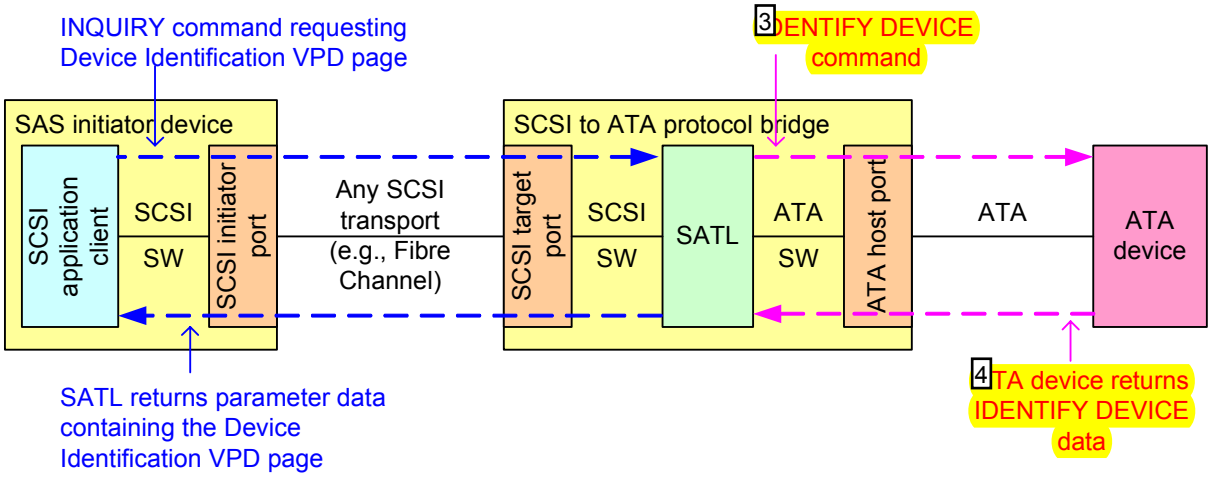

Figure 7 — Identification descriptors included by a SATL in a SCSI to ATA protocol bridge

10.3.5 ATA Information VPD page

The ATA Information VPD page shall contain:

a) information about the SATL;
b) Signature of the ATA or ATAPI device; and
c) IDENTIFY DEVICE or IDENTIFY PACKET DEVICE data from the ATA or ATAPI device.

Date: 5/7/2006 10:44:38 AM

Why isn't the **ATA Information VPD page in clause 12? Seems pretty SAT specific to me.**
RESOLUTION: Move the subclause, 10.3.5 ATA Information VPD page, to clause 12 as subclause 12.4.2, and add brief text to subclause 12.1 (SAT-Specific SCSI Extensions Overview) to introduce the subclause:
"VPD pages defined for SATL implementations include:
a) ATA Information VPD page (see 12.4.2)."

Also add to clause 12 appropriate subheadings to introduce the ATA Information VPD page:
"12.4 SAT-specific Vital Product Data
12.4.1 SAT-specific Vital Product Data overview
This subclause defines VPD pages specific to SAT implementations."

35								
36	1GNATURE							
55								
56	COMMAND CODE							
57	Reserved							
59								
60	3DENTIFY DEVICE or IDENTIFY PACKET DEVICE data							
571								

The PERIPHERAL QUALIFIER field and the PERIPHERAL DEVICE TYPE field shall be set as described in 8.1.2.

The PAGE CODE field shall be set to 89h.

The PAGE LENGTH field shall be set to 238h.

The SAT VENDOR IDENTIFICATION field shall contain an 8-byte ASCII string identifying the vendor of the SATL. The data shall be left aligned within the field. The vendor identification string shall be one assigned by INCITS for use in the Standard INQUIRY data VENDOR IDENTIFICATION field. A list of assigned vendor identification strings is in SPC-3 and on the T10 web site (http://www.t10.org).

The SAT PRODUCT IDENTIFICATION field shall contain sixteen bytes of ASCII data as defined by the vendor of the SATL. The data shall be left-aligned within the field.

The SAT PRODUCT REVISION LEVEL field shall contain four bytes of ASCII data as defined by the vendor of the SATL. The data shall be left-aligned within the field.

4 The SIGNATURE field shall contain the contents of the task file registers after the last power-on reset, hardware reset, software reset, or EXECUTE DEVICE DIAGNOSTIC command. It shall follow the format of the initial SATA Device-to-Host Register FIS (see ATA/ATAPI-7 V3). Table 3 defines the SIGNATURE field.

Location: Page 84, 10.3.5, SIGNATURE field description.

Comment:
The description for the SIGNATURE field indicates that the signature register values must be stored by the SATL so that they can be returned in the ATA Information VPD Page. For an HBA that may be communicating with a large number of attached targets this represents a potentially significant amount of storage space. Could the wording be changed to allow this data to be synthesized by the SATL given that the SATL must know the device type that is currently attached? This would allow the necessary storage requirements to be greatly reduced.

Preferred resolution:
We will be unable to support the storage of the signature FIS for each individual target. We either need a way to retrieve this information at command execution time, or must be able to create the data based on our knowledge of the attached device type.

REASON:
Most in the SAT WG advocate a general translation model that requires the SATL to maintain the results of the last ATA operation on a given ATA device until the results are retrieved or another ATA command is sent to the ATA device.

Subject: Highlight
Date: 5/25/2006 1:04:57 PM
Do we want signatures for SATA PM and SATA Encl Management device?
Do we want to change the ATA/ATAPI-7 V3 reference to SATA 2.5 (probably yes)?
Should we have a reference to an ATA/ATAPI-7 amendment that fixes a signature issue?
Reference is: ANSI INCITS 397-2005 ATA/ATAPI-7 Amendment (just passed T13 letter ballot to forward to INCITS for public review).

1st Paragraph after Table 88
change
"All fields within the SIGNATURE field are defined in ATA/ATAPI-7 V1 and ATA/ATAPI-7 V3."
to
"All fields within the signature data (table 88) are defined in ATA/ATAPI-7 V1 and ATA/ATAPI-7 V3."

The "PM PORT" is not defined in ATA/ATAPI-7, it is only defined in SATA-2.5. Additionally all the fields in Table 88 are from an editorial perspective not defined in ATA/ATAPI-7, for example STATUS is not, but Status is. Does the standard need a text/footnote saying STATUS=Status, etc.?

RESOLUTION:
Add a table footnote to Table 88: "These fields are fields with the same names defined in ATA8-ACS" Applies to fields in bytes2 through 13 (not byte 11).

11 Error handling and Sense Reporting

11.1 Error Translation – ATA device error to SCSI error map

ATA device errors are translated to the appropriate SCSI errors. The ATA Status register and Error register bit settings provide the information to be translated into SCSI sense key, additional sense code, and additional sense code qualifier for error reporting. Unless otherwise specified in the subclause describing the translation of particular SCSI command, the SATL shall translate ATA non-packed device errors to SCSI errors as shown in table 91.

Table 91 — Translation of ATA errors to SCSI errors

ATA Error Register		SCSI Error	
Status	**Error**	**Sense key**	**Additional sense code**
DF	n/a	HARDWARE ERROR	INTERNAL TARGET FAILURE
ERR	NM	NOT READY	MEDIUM NOT PRESENT
ERR	UNC	MEDIUM ERROR	UNRECOVERED READ ERROR
ERR	IDNF	MEDIUM ERROR	RECORD NOT FOUND
ERR	ABRT [a]	ABORTED COMMAND	NO ADDITIONAL SENSE INFORMATION
ERR	MC	UNIT ATTENTION	NOT READY TO READY CHANGE, MEDIUM MAY HAVE CHANGED
ERR	MCR	UNIT ATTENTION	OPERATOR MEDIUM REMOVAL REQUEST
ERR	IDCRC	ABORTED COMMAND	INFORMATION UNIT iuCRC ERROR DETECTED
CORR	n/a	This condition is not considered an error.	

[a] The ABRT bit is ignored if any other ATA error bit is set.

Add "to be" here. Should read, "ATA device errors are to be translated to the appropriate SCSI errors".

REASON: The "to be" form is a more directive form, but is not the correct T10 form for normative text. If the sentence were written in normative form, it would read, "The SATL shall translate ATA device errors to the appropriate SCSI errors." However the sentence as it appears currently is intentionally written as informative text, and so simple use of the present tense "are translated" is appropriate, as this text is descriptive, not normative. The "shalls" appear later in the text.

"AMNF" bit is missing from this table. This bit must be translated because it does in current products still get asserted. T13 participants had not thought this to be true, but this is actually happening now. The bit must be added and translated. Originally it was proposed to be translated to 03/13/00 - MEDIUM ERROR - ADDRESS MARK NOT FOUND FOR DATA FIELD. This is a high priority correction request.
RESOLUTION: Add table footnote (b) to the "Error" column heading:
"If the Error register has an obsolete bit set to one, the SATL may return a vendor-specific additional sense code (e.g., if the AMNF bit is set to one, return MEDIUM ERROR - ADDRESS MARK NOT FOUND FOR DATA FIELD)."

Not per 05-233r3. This table is missing the "WP" bit and its translation. This must be added to the table.
RESOLUTION:
Add WP back in per 05-233r3
After the third row (between UNC and IDNF rows) add under the indicated columns:

Status	Error	Sense key	Additional sense code
"ERR	WP	DATA PROTECT	WRITE PROTECTED"

Editor's note: I believe this was removed during draft review based on the contention that an ATA block storage device would not be write-protected.

11.1 Error Translation – ATA device error to SCSI error map

Table 91 — Translation of ATA errors to SCSI errors
Row: DF,n/a
Add a table footnote, "After an ATA device returns a DF bit set to one, the SATL processes any subsequent commands received for the emulated logical unit corresponding to the ATA device by terminating the command with CHECK CONDITION status with the sense key set to HARDWARE ERROR and the additional sense code set to INTERNAL TARGET FAILURE."

Comments from page 107 continued on next page

11 Error Handling and Sense Reporting

11.1 Error Translation – ATA device error to SCSI error map

ATA device errors are translated to the appropriate SCSI errors. The ATA Status register and Error register bit settings provide the information to be translated into SCSI sense key, additional sense code, and additional sense code qualifier for error reporting. Unless otherwise specified in the subclause describing the translation of particular SCSI command, the SATL shall translate ATA non-packed device errors to SCSI errors as shown in table 91.

Table 91 — Translation of ATA errors to SCSI errors

ATA Error Register		SCSI Error	
Status	**Error**	**Sense key**	**Additional sense code**
DF	n/a	HARDWARE ERROR	INTERNAL TARGET FAILURE
ERR	NM	NOT READY	MEDIUM NOT PRESENT
ERR	UNC	MEDIUM ERROR	UNRECOVERED READ ERROR
ERR	IDNF	MEDIUM ERROR	RECORD NOT FOUND
ERR	ABRT [a]	ABORTED COMMAND	NO ADDITIONAL SENSE INFORMATION
ERR	MC	UNIT ATTENTION	NOT READY TO READY CHANGE, MEDIUM MAY HAVE CHANGED
ERR	MCR	UNIT ATTENTION	OPERATOR MEDIUM REMOVAL REQUEST
ERR	11 CRC	ABORTED COMMAND	INFORMATION UNIT iuCRC ERROR DETECTED
CORR	n/a	This condition is not considered an error.	

[a] The ABRT bit is ignored if any other ATA error bit is set.

See LSI[OParry] comment on list-item 5 under subclause 8.11.2 TEST UNIT READY OPERATION CODE.

12 SAT-Specific SCSI Extensions

12.1 SAT-Specific SCSI Extensions Overview

This subclause defines additional SCSI commands, mode pages, and log pages that may be supported by a SATL to provide capabilities beyond those defined in the other SCSI command sets.

SCSI commands defined for SATL implementations include:

a) ATA PASS-THROUGH (12) command; and
b) ATA PASS-THROUGH (16) command.

Mode pages defined for SATL implementations include:

a) PATA Control mode page.

12.2 ATA PASS-THROUGH commands

12.2.1 ATA PASS-THROUGH commands overview

This standard provides for an application client to:

a) transmit an ATA command to an ATA device;
b) optionally transfer data between the application client and an ATA device; and
c) transfer completion status from an ATA device through the SATL.

This is accomplished by defining:

a) CDBs containing ATA command information (see 12.2.2 and 12.2.3); and
b) specific SCSI status and sense data usage for returning the results of an ATA command (see 12.2.4).

12.2.2 ATA PASS-THROUGH (12) command

Table 92 shows the CDB for the ATA PASS-THROUGH (12) command.

1 the SATL receives an ATA PASS-THROUGH (12) command it shall check the PROTOCOL field (see table 93) to determine the type of action requested.

Table 93 — PROTOCOL field

Code	Description
0	Hard Reset
1	SRST
2	Reserved
3	Non-data
4	PIO Data-In
5	PIO Data-Out
6	DMA
7	DMA Queued
8	Device Diagnostic
9	DEVICE RESET
10	UDMA Data In
11	UDMA Data Out
12	FPDMA [a]
13, 14	Reserved
15	Return Response Information

[a] See SATA 2.5.

The PROTOCOL field specifies the protocol to use when the ATA device executes the command. 2 TA/ATAPI-7 defines the meaning of protocol values ranging from 0 to 11.

3 PROTOCOL value in the range from 3 to 12 requests the SATL to send an ATA command to the ATA device.

4 the PROTOCOL field contains 15 (i.e., Return Response Information) the SATL shall not access the ATA device, but shall return the ATA Status Return Descriptor as 5 efined in subclause 12.2.5. The SATL shall ignore all other fields in the CDB.

If the value in the PROTOCOL field is inappropriate fo e command specified in the COMMAND field (see ATA/ATAPI-7 and SATA 2.5) the SATL may lose communication with the ATA device, and this standard does not specify the SATL behavior if this occurs.

If the value in the PROTOCOL field is set to zero (i.e., Hard Reset) and the ~~attached~~ device is a PATA device, then the SATL shall issue a pin 1 reset to the PATA device (see ATA/ATAPI-7). If the value in the PROTOCOL field is set to zero (i.e., Hard Reset) and the ~~attached~~ device is a SATA device, then the SATL shall issue a COMRESET to SATA device. When this protocol is selected, only the PROTOCOL and OFF_LINE fields are valid. The SATL shall ignore all other fields in the CDB.

If the PROTOCOL field is set to one the SATL shall issue a soft reset to the ~~attached~~ ATA device (see ATA/ATAPI-7). When this protocol is selected, only the PROTOCOL and OFF_LINE fields are valid. The SATL shall ignore all other fields in the CDB.

~~Some PROTOCOL values cause the SATL to reset the ATA device or to return information about the ATA device.~~

If the value in the PROTOCOL field requests the SATL to send a command to the ATA device, then the SATL shall use the FEATURES (7:0), SECTOR_C (7:0), LBA_LOW (7:0), LBA_MID (7:0), LBA_HIGH (7:0), DEVICE and the COMMAND fields to initiate a command in the ATA device. These fields correspond to the registers defined in ATA/ATAPI-7 volume 2 with the same names, and also to the FIS fields defined in ATA/ATAPI-7 volume 3 with the same names.

4th Paragraph after Table 93

What about if the command value is for a 48 bit command with the protocol set correctly? Subclause says the SATL does not look at command code, only puts it in the Command register. Does this follow the error handling in clause 11?

Note: This is a general disclaimer - that an application needs to use the command in a sensible way or the result is not specified (or perhaps even predictable?).
REASON: This condition can cause an undetectable error.

9	DEVICE RESET
10	UDMA Data In
11	UDMA Data Out
12	FPDMA [a]
13, 14	Reserved
15	Return Response Information

[a] See SATA 2.5.

The PROTOCOL field specifies the protocol to use when the ATA device executes the command. ATA/ATAPI-7 defines the meaning of protocol values ranging from 0 to 11.

A PROTOCOL value in the range from 3 to 12 requests the SATL to send an ATA command to the ATA device.

If the PROTOCOL field contains 15 (i.e., Return Response Information) the SATL shall not access the ATA device, but shall return the ATA Status Return Descriptor as defined in subclause 12.2.5. The SATL shall ignore all other fields in the CDB.

If the value in the PROTOCOL field is inappropriate for the command specified in the COMMAND field (see ATA/ATAPI-7 and SATA 2.5) the SATL may lose communication with the ATA device, and this standard does not specify the SATL behavior if this occurs.

If the value in the PROTOCOL field is set to zero (i.e., Hard Reset) and the ~~attached~~ device is a PATA device, then the SATL shall issue a pin 1 reset to the PATA device (see ATA/ATAPI-7). If the value in the PROTOCOL field is set to zero (i.e., Hard Reset) and the ~~attached~~ device is a SATA device, then the SATL shall issue a COMRESET to SATA device. When this protocol is selected, only the PROTOCOL and OFF_LINE fields are valid. The SATL shall ignore all other fields in the CDB.

If the PROTOCOL field is set to one the SATL shall issue a soft reset to the ~~attached~~ ATA device (see ATA/ATAPI-7). When this protocol is selected, only the PROTOCOL and OFF_LINE fields are valid. The SATL shall ignore all other fields in the CDB.

~~Some PROTOCOL values cause the SATL to reset the ATA device or to return information about the ATA device.~~

If the value in the PROTOCOL field requests the SATL to send a command to the ATA device, then the SATL shall use the FEATURES (7:0), SECTOR_COUNT (7:0), LBA_LOW (7:0), LBA_MID (7:0), LBA_HIGH (7:0), DEVICE and the COMMAND fields to initiate a command in the ATA device. These fields correspond to the registers defined in ATA/ATAPI-7 volume 2 with the same names, and also to the FIS fields defined in ATA/ATAPI-7 volume 3 with the same names.

8th Paragraph, after **Table 93 — PROTOCOL field**

1) Why Volume 2 for PATA and Vol 3 for SATA? Since these are the the register values associated with the COMMAND and PROTOCOL field, so I would argue that Vol 1 would be correct for both, with an additional note that for FPDMA see SATA 2.5.

2) Only if the command is 48 bit (EXT), which ATA PASS-THROUGH(12) does not support, does the (7:0) have meaning. So how can one say same names as in ATA/ATAPI-7?

proposed resolution:
change
"These fields correspond to the registers defined in ATA/ATAPI-7 volume 2 with the same names, and also to the FIS fields defined in ATA/ATAPI-7 volume 3 with the same names."
to
"These fields correspond to the fields defined in ATA8-ACS."
RESOLUTION: see 06-291 (deleted the sentence)

Comments from page 109 continued on next page

If the SATL receives an ATA PASS-THROUGH (12) command it shall check the PROTOCOL field (see table 93) to determine the type of action requested.

Table 93 — PROTOCOL field

Code	Description
0	Hard Reset
1	SRST
2	Reserved
3	Non-data
4	PIO Data-In
5	PIO Data-Out
6	DMA
7	DMA Queued
8	Device Diagnostic
9	DEVICE RESET
10	UDMA Data In
11	UDMA Data Out
12	FPDMA [a]
13, 14	Reserved
15	Return Response Information

[a] See SATA 2.5.

The PROTOCOL field specifies the protocol to use when the ATA device executes the command. ATA/ATAPI-7 defines the meaning of protocol values ranging from 0 to 11.

A PROTOCOL value in the range from 3 to 12 requests the SATL to send an ATA command to the ATA device.

If the PROTOCOL field contains 15 (i.e., Return Response Information) the SATL shall not access the ATA device, but shall return the ATA Status Return Descriptor as defined in subclause 12.2.5. The SATL shall ignore all other fields in the CDB.

If the value in the PROTOCOL field is inappropriate for the command specified in the COMMAND field (see ATA/ATAPI-7 and SATA 2.5) the SATL may lose communication with the ATA device, and this standard does not specify the SATL behavior if this occurs.

If the value in the PROTOCOL field is set to zero (i.e., Hard Reset) and the ~~attached~~ device is a PATA device, then the SATL shall issue a pin 1 reset to the PATA device (see ATA/ATAPI-7). If the value in the PROTOCOL field is set to zero (i.e., Hard Reset) and the ~~attached~~ device is a SATA device, then the SATL shall issue a COMRESET to SATA device. When this protocol is selected, only the PROTOCOL and OFF_LINE fields are valid. The SATL shall ignore all other fields in the CDB.

If the PROTOCOL field is set to one the SATL shall issue a soft reset to the ~~attached~~ ATA device (see ATA/ATAPI-7). When this protocol is selected, only the PROTOCOL and OFF_LINE fields are valid. The SATL shall ignore all other fields in the CDB.

~~Some PROTOCOL values cause the SATL to reset the ATA device or to return information about the ATA device.~~

If the value in the PROTOCOL field requests the SATL to send a command to the ATA device, then the SATL shall use the FEATURES (7:0), SECTOR_COUNT (7:0), LBA_LOW (7:0), LBA_MID (7:0), LBA_HIGH (7:0), DEVICE and the COMMAND fields to initiate a command in the ATA device. These fields correspond to the registers defined in ATA/ATAPI-7 volume 2 with the same names, and also to the FIS fields defined in ATA/ATAPI-7 volume 3 with the same names.

Status
rlsheffi Accepted 6/24/2006 3:51:58 PM

The SATL shall determine if a data transfer is necessary and how to perform the data transfer by examining values in the MULTIPLE_COUNT field, PROTOCOL field, OFF_LINE field, T_DIR bit, BYTE_BLOCK bit, and T_LENGTH field. The SATL shall ignore the COMMAND field in the CDB except to copy the COMMAND field in the CDB to the COMMAND field in the Register – Host to Device FIS or to the ATA Command register. If the ATA command completes with an error, then a copy of the PATA registers, or a copy of the SATA Register - Device to Host FIS shall be returned in the ATA Status Return Descriptor (see 12.2.5).

The SATL shall configure the ATA host and device for the PIO, DMA, and UDMA speeds that both the SATL and ATA device support. The COMMAND field of the CDB may specify the ATA SET FEATURES command. The ATA PASS-THROUGH (12) command should not be used to issue an ATA SET FEATURES command that changes the PIO/DMA/UDMA or other transfer modes of the ATA device. The result of a SET FEATURES command that changes the PIO/DMA/UDMA or other transfer modes of the ATA device is outside the scope of this standard and may cause communication to be lost with the ATA device; preventing the SATL from performing any action based on the contents of the CDB.

The BYTE_BLOCK (Byte/Block) bit indicates whether the transfer length in the location specified by the T_LENGTH field specifies the number of bytes to transfer or the number of blocks to transfer. If the value in the BYTE_BLOCK bit is set to zero the SATL shall transfer the number of bytes specified in the location specified by the T_LENGTH field. If the value in the BYTE_BLOCK bit is set to one the SATL shall transfer the number of blocks specified in the location specified by the T_LENGTH field. The SATL shall ignore the BYTE_BLOCK bit when the T_LENGTH field is set to zero.

The CK_COND (Check Condition) bit may be used to request the SATL to return a copy of ATA register information in the sense data upon command completion. If the CK_COND bit is set to one the SATL shall return a status of CHECK CONDITION when the ATA command completes, even if the command completes successfully. If the command completes successfully, the SATL shall set the sense key to NO SENSE and shall set the additional sense code to NO ADDITIONAL SENSE INFORMATION. The SATL shall return the ATA registers and related information in the sense data using the ATA Status Return Descriptor (see table 12.2.5).

If the CK_COND bit is set to zero, the SATL shall terminate the command with CHECK CONDITION status only if an error occurs in processing the command. See clause 11 for a description of ATA error conditions. If the CK_COND bit is set to one and the command completes successfully the SATL shall terminate the command with CHECK CONDITION status with a sense key of RECOVERED ERROR and an additional sense code of ATA PASS-THROUGH INFORMATION AVAILABLE (see SPC-4) status.

The DEVICE field specifies a value for the SATL to load into the ATA DEVICE register or the DEVICE field of the Register - Host to Device FIS. Table 94 shows the bits in the DEVICE field.

Table 94 — ATA PASS-THROUGH (12) command and ATA PASS-THROUGH (16) command DEVICE field

Bit							
7	**6**	**5**	**4**	**3**	**2**	**1**	**0**
Obsolete	Command Specific	Obsolete	DEV	Command Specific			

The SATL shall ignore the DEV bit in the DEVICE field of the CDB. If the ATA host has two devices attached, the SATL may represent them as two distinct logical units or as two distinct SCSI target devices. The SATL shall set the DEV bit in the ATA DEVICE register to the value corresponding to the LUN or SCSI target port for each ATA device.

~~The SATL shall set the ATA host registers or construct the Register - Host to Device FIS using the values from the CDB in the FEATURES (7:0) field, the SECTOR_COUNT (7:0) field, the LBA_LOW (7:0) field, the LBA_MID (7:0) field, the LBA_HIGH (7:0) field, the DEVICE field, and the COMMAND field.~~

If the PROTOCOL field specifies a PIO data transfer, the SATL shall perform a PIO type transfer. The MULTIPLE_COUNT field specifies the power of two for the number of sectors transferred per DRQ Data Block (e.g, if the field is set to 4, the SATL shall transfer 2^4 (i.e., 16) sectors of data in each DRQ Data Block). If the MULTIPLE_COUNT field is nonzero and the COMMAND field is not a READ MULTIPLE command, a READ MULTIPLE EXT command, a WRITE MULTIPLE command, a WRITE MULTIPLE EXT command, or a WRITE

12.2.2 ATA PASS-THROUGH (12) command
Second to last and third to last paragraphs.
DISCUSS:
These two paragraphs have several contradictions. One says if CK_COND is zero then return a CHECK CONDITION only if the command completes with an error, while the other says to return a CHECK CONDITION with RECOVERED ERROR sense key under the same conditions.

This may have been a result of a realization that if the command does not complete with CHECK CONDITION status, there is no way to fetch the results. But the text was never made fully consistent. It may be that this command has to complete with CHECK CONDITION status, regardless of the setting of the CK_COND bit?

These paragraphs need to define different but consistent behaviors for the following conditions:
a) ck_cond set to one and ATA command completes successfully
b) ck_cond set to one and ATA command completes with error
c) ck_cond set to zero and ATA command completes successfully
d) ck_cond set to zero and ATA command completes with error

Need to finish comment.

12th & 13th Paragraphs, - **Table 93 — PROTOCOL field**

These two paragraphs seem to conflict each other when CK_COND = 1. Not sure what the intended behavior is.

Is it NO SENSE or RECOVERED ERROR? Is it NO ADDITIONAL SENSE DATA INFORMATION OR ATA PASS-THROUGH INFORMATION AVAILIABLE (which is also stated in the in table 98 and 1st Paragraph after Table 98)

So I issue a pass thru command with ck_cond=1. The command completes with no error on the ATA side, the SATL then generates a check condition and if autosense autosense is supported return which sense/ASC + the ATA descriptor (assuming D_SENSE in control mode page is 1) is it No Sense for this, and if autosense is not supported, the response to

Comments from page 110 continued on next page

The SATL shall determine if a data transfer is necessary and how to perform the data transfer by examining values in the MULTIPLE_COUNT field, PROTOCOL field, OFF_LINE field, T_DIR bit, BYTE_BLOCK bit, and T_LENGTH field. The SATL shall ignore the COMMAND field in the CDB except to copy the COMMAND field in the CDB to the COMMAND field in the Register – Host to Device FIS or to the ATA Command register. If the ATA command completes with an error, then a copy of the PATA registers, or a copy of the SATA Register - Device to Host FIS shall be returned in the ATA Status Return Descriptor (see 12.2.5).

The SATL shall configure the ATA host and device for the PIO, DMA, and UDMA speeds that both the SATL and ATA device support. The COMMAND field of the CDB may specify the ATA SET FEATURES command. The ATA PASS-THROUGH (12) command should not be used to issue an ATA SET FEATURES command that changes the PIO/DMA/UDMA or other transfer modes of the ATA device. The result of a SET FEATURES command that changes the PIO/DMA/UDMA or other transfer modes of the ATA device is outside the scope of this standard and may cause communication to be lost with the ATA device; preventing the SATL from performing any action based on the contents of the CDB.

The BYTE_BLOCK (Byte/Block) bit indicates whether the transfer length in the location specified by the T_LENGTH field specifies the number of bytes to transfer or the number of blocks to transfer. If the value in the BYTE_BLOCK bit is set to zero the SATL shall transfer the number of bytes specified in the location specified by the T_LENGTH field. If the value in the BYTE_BLOCK bit is set to one the SATL shall transfer the number of blocks specified in the location specified by the T_LENGTH field. The SATL shall ignore the BYTE_BLOCK bit when the T_LENGTH field is set to zero.

The CK_COND (Check Condition) bit may be used to request the SATL to return a copy of ATA register information in the sense data upon command completion. If the CK_COND bit is set to one the SATL shall return a status of CHECK CONDITION when the ATA command completes, even if the command completes successfully. If the command completes successfully, the SATL shall set the sense key to NO SENSE and shall set the additional sense code to NO ADDITIONAL SENSE INFORMATION. The SATL shall return the ATA registers and related information in the sense data using the ATA Status Return Descriptor (see table 12.2.5).

If the CK_COND bit is set to zero, the SATL shall terminate the command with CHECK CONDITION status only if an error occurs in processing the command. See clause 11 for a description of ATA error conditions. [9] the CK_COND bit is set to [10]e and the command completes successfully the SATL shall terminate the command with CHECK CONDITION status with a sense key of RECOVERED ERROR and an additional sense code of ATA PASS-THROUGH INFORMATION AVAILABLE (see SPC-4) status.

[11]e DEVICE field specifies a value for the SATL to load into the ATA DEVICE register or the DEVICE field of the Register - Host to Device FIS. Table 94 shows the bits in the DEVICE field.

12.2.2

Why define the bit, in the brand new command, if the SATL is going to completely ignore it?

Note: The structure of this field mirrors that of the Device field in the ATA registers, and so, to some degree, it's informational rather than normative. The DEV bit is listed for informational purposes. How do we split out the informational versus normative elements of the Device register / DEVICE field?

REASON: The DEV bit is relevant because the SATL has to treat it differently from other bits in the DEVICE register.

The SATL shall determine if a data transfer is necessary and how to perform the data transfer by examining values in the MULTIPLE_COUNT field, PROTOCOL field, OFF_LINE field, T_DIR bit, BYTE_BLOCK bit, and T_LENGTH field. The SATL shall ignore the COMMAND field in the CDB except to copy the COMMAND field in the CDB to the COMMAND field in the Register – Host to Device FIS or to the ATA Command register. If the ATA command completes with an error, then a copy of the PATA registers, or a copy of the SATA Register - Device to Host FIS shall be returned in the ATA Status Return Descriptor (see 12.2.5).

The SATL shall configure the ATA host and device for the PIO, DMA, and UDMA speeds that both the SATL and ATA device support. The COMMAND field of the CDB may specify the ATA SET FEATURES command. The ATA PASS-THROUGH (12) command should not be used to issue an ATA SET FEATURES command that changes the PIO/DMA/UDMA or other transfer modes of the ATA device. The result of a SET FEATURES command that changes the PIO/DMA/UDMA or other transfer modes of the ATA device is outside the scope of this standard and may cause communication to be lost with the ATA device; preventing the SATL from performing any action based on the contents of the CDB.

The BYTE_BLOCK (Byte/Block) bit indicates whether the transfer length in the location specified by the T_LENGTH field specifies the number of bytes to transfer or the number of blocks to transfer. If the value in the BYTE_BLOCK bit is set to zero the SATL shall transfer the number of bytes specified in the location specified by the T_LENGTH field. If the value in the BYTE_BLOCK bit is set to one the SATL shall transfer the number of blocks specified in the location specified by the T_LENGTH field. The SATL shall ignore the BYTE_BLOCK bit when the T_LENGTH field is set to zero.

The CK_COND (Check Condition) bit may be used to request the SATL to return a copy of ATA register information in the sense data upon command completion. If the CK_COND bit is set to one the SATL shall return a status of CHECK CONDITION when the ATA command completes, even if the command completes successfully. If the command completes successfully, the SATL shall set the sense key to NO SENSE and shall set the additional sense code to NO ADDITIONAL SENSE INFORMATION. The SATL shall return the ATA registers and related information in the sense data using the ATA Status Return Descriptor (see table 12.2.5).

If the CK_COND bit is set to zero, the SATL shall terminate the command with CHECK CONDITION status only if an error occurs in processing the command. See clause 11 for a description of ATA error conditions. If the CK_COND bit is set to one and the command completes successfully the SATL shall terminate the command with CHECK CONDITION status with a sense key of RECOVERED ERROR and an additional sense code of ATA PASS-THROUGH INFORMATION AVAILABLE (see SPC-4) status.

The DEVICE field specifies a value for the SATL to load into the ATA DEVICE register or the DEVICE field of the Register - Host to Device FIS. Table 94 shows the bits in the DEVICE field.

Table 94 — ATA PASS-THROUGH (12) command and ATA PASS-THROUGH (16) command DEVICE field

Bit							
7	6	5	4	3	2	1	0
Obsolete	Command Specific	Obsolete	DEV	Command Specific			

13 The SATL shall ignore the DEV bit in the DEVICE field of the CDB. 14 If the ATA host has two devices attached, the SATL may represent them as two distinct logical units or as two distinct SCSI target devices. The SATL shall set the DEV bit in the ATA DEVICE register to the 15 value corresponding to the LUN or SCSI target port for each ATA device.

~~16 The SATL shall set the ATA host registers or construct the Register - Host to Device FIS using the values from the CDB in the FEATURES (7:0) field, the SECTOR_COUNT (7:0) field, the LBA_LOW (7:0) field, the LBA_MID (7:0) field, the LBA_HIGH (7:0) field, the DEVICE field, and the COMMAND field.~~

If the PROTOCOL field specifies a PIO data transfer, the SATL shall perform a PIO type transfer. The MULTIPLE_COUNT field specifies the power of two for the number of sectors transferred per DRQ Data Block (e.g, if the field is set to 4, the SATL shall transfer 2^4 (i.e., 16) sectors of data in each DRQ Data Block). If the MULTIPLE_COUNT field is nonzero and the COMMAND field is not a READ MULTIPLE command, a READ MULTIPLE EXT command, a WRITE MULTIPLE command, a WRITE MULTIPLE EXT command, or a WRITE

9.2.2

The units for DRQ data blocks are bytes or words, according to ATA8-AAM, not sectors.

Editor's comment: I don't see this in AAM, but the SET MULTIPLE MODE command defined in ATA8-ACS sets the number of sectors per block, and this is consistent with ATA/ATAPI-7 V1. It could be that the latest draft revision of ATA8-AAM could have it incorrect.

RESOLUTION: see 06-291

rlsheffi Accepted 6/24/2006 3:52:37 PM

MULTIPLE FUA EXT command, then the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST, and the additional sense code set to INVALID FIELD IN CDB.

The OFF_LINE field specifies the time period during which the ATA Status register and the ATA Alternate Status register may be invalid after command acceptance. In a SATL with a PATA device attached, some commands may cause the PATA device to place the ATA bus in an indeterminate state. This may cause the ATA host to see command completion before the command is completed. When the application client issues a command that is capable of placing the bus in an indeterminate state, it shall set the OFF_LINE field to a value that specifies the maximum number of seconds from the time a command is issued until the ATA Status register is valid. The SATL shall not use the ATA Status register or ATA Alternate Status register to determine ATA command completion status until this time has elapsed. The valid status is available (2^{off_line+1} - 2) seconds (i.e., 0, 2, 6, and 14 seconds) after the command register is stored.

NOTE 11 - If the application client specifies an off_line value that is too small, the results are indeterminate and may compromise the integrity of the data.

1 If the Transfer Direction (T_DIR) and the direction of the data transfer specified in the PROTOCOL field do not match, the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.

3 If T_DIR is set to zero the SATL shall transfer from the application client to the ATA device. If T_DIR is set to one the SATL shall transfer from the ATA device to the application client. The SATL shall ignore T_DIR if T_LENGTH is set to zero.

The Transfer Length (T_LENGTH) field specifies where in the CDB the SATL shall locate the transfer length for the command (see table 95). 4 ~~The transfer length is an unsigned integer in the range of 00h to FFh.~~

Table 95 — T_LENGTH field

Code	Description
00b	No data is transferred
01b	The transfer length is specified in the FEATURES (7:0) field
10b	The transfer length is specified in the SECTOR_COUNT (7:0) field
11b	The transfer length is specified in the STPSIU field

~~The FEATURES (7:0) field, the SECTOR_COUNT (7:0) field, the LBA_LOW (7:0) field, the LBA_MID (7:0) field, the LBA_HIGH (7:0) field, the DEVICE field, and the COMMAND field shall be copied to the corresponding fields or registers of the same name in the ATA host within the SATL (see ATA/ATAPI-7).~~

12.2.3 ATA PASS-THROUGH (16) command

Table 96 shows format of the ATA PASS-THROUGH (16) command.

If the EXTEND bit is set to zero, then the SECTOR_COUNT (15:8) field, the LBA_LOW (15:8) field, the LBA_MID (15:8) field, and the LBA_HIGH (15:8) field shall be ignored by the SATL, and the SATL shall process this command as specified in 12.2.2.

MULTIPLE FUA EXT command, then the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST, and the additional sense code set to INVALID FIELD IN CDB.

The OFF_LINE field specifies the time period during which the ATA Status register and the ATA Alternate Status register may be invalid after command acceptance. In a SATL with a PATA device attached, some commands may cause the PATA device to place the ATA bus in an indeterminate state. This may cause the ATA host to see command completion before the command is completed. When the application client issues a command that is capable of placing the bus in an indeterminate state, it shall set the OFF_LINE field to a value that specifies the maximum number of seconds from the time a command is issued until the ATA Status register is valid. The SATL shall not use the ATA Status register or ATA Alternate Status register to determine ATA command completion status until this time has elapsed. The valid status is available (2^{off_line+1} - 2) seconds (i.e., 0, 2, 6, and 14 seconds) after the command register is stored.

NOTE 11 - If the application client specifies an off_line value that is too small, the results are indeterminate and may compromise the integrity of the data.

If the Transfer Direction (T_DIR) and the direction of the data transfer specified in the PROTOCOL field do not match, the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.

If T_DIR is set to zero the SATL shall transfer from the application client to the ATA device. If T_DIR is set to one the SATL shall transfer from the ATA device to the application client. The SATL shall ignore T_DIR if T_LENGTH is set to zero.

The Transfer Length (T_LENGTH) field specifies where in the CDB the SATL shall locate the transfer length for the command (see table 95). ~~The transfer length is an unsigned integer in the range of 00h to FFh.~~

Table 95 — T_LENGTH field

Code	Description
00b	No data is transferred
01b	The transfer length is specified in the FEATURES (7:0) field
10b	The transfer length is specified in the SECTOR_COUNT (7:0) field
11b	The transfer length is specified in the TPSIU field

~~The FEATURES (7:0) field, the SECTOR_COUNT (7:0) field, the LBA_LOW (7:0) field, the LBA_MID (7:0) field, the LBA_HIGH (7:0) field, the DEVICE field, and the COMMAND field shall be copied to the corresponding fields or registers of the same name in the ATA host within the SATL (see ATA/ATAPI-7).~~

~~12.2.3~~ 12.2.3 ATA PASS-THROUGH (16) command

Table 96 shows format of the ATA PASS-THROUGH (16) command.

If the EXTEND bit is set to zero, then the SECTOR_COUNT (15:8) field, the LBA_LOW (15:8) field, the LBA_MID (15:8) field, and the LBA_HIGH (15:8) field shall be ignored by the SATL, and the SATL shall process this command as specified in 12.2.2.

1st Sentence after Table 96 — ATA PASS-THROUGH (16) command

"If the EXTEND bit is set to one and the value in the PROTOCOL field requests the SATL to send an ATA command to the device, then the SATL shall send a 48 bit ATA command to the ATA device."

Is this sentence necessary, since the command code field defines if it is 48 bit or not? It's not like the SATL gets to decide which command to use on pass thru.

REASON: Presumably the ATA PASS-THROUGH (16) command may be used to send various ATA commands, both the 48-bit variety as well as the shorter ones. Since the ATA PASS-THROUGH (16) command is not supposed to parse the ATA command itself, it needs the EXTEND bit to define which fields in the CDB are used to set the ATA registers for the specified command.

rlsheffi Accepted 6/24/2006 12:51:14 AM

The SATL shall determine the transfer length by the method specified in the T_LENGTH field (see table 97). ~~If EXTEND bit is set to zero, the transfer length shall be an unsigned integer in the range from 00h to FFh. If EXTEND bit is set to one, the transfer length shall be an unsigned integer in the range from 0000h to FFFFh.~~

Table 97 — EXTEND bit and T_LENGTH field

EXTEND	T_LENGTH	Description
0b	00b	No data is transferred.
	01b	The transfer length is specified in the FEATURES (7:0) field.
	10b	The transfer length is specified in the SECTOR_COUNT (7:0) field.
	11b	The transfer length is specified in the STPSIU field.
1b	00b	No data is transferred.
	01b	The transfer length is specified in the FEATURES (7:0) field and the FEATURES (15:8) field.
	10b	The transfer length is specified in the SECTOR_COUNT (7:0) field and the SECTOR_COUNT (15:8) field.
	11b	The transfer length is specified in the STPSIU field.

12.2.4 ATA PASS-THROUGH status return

Table 98 shows the possible results of ATA PASS-THROUGH (12) command or ATA PASS-THROUGH (16) command processing as reflected in the ATA ERR bit and DF bit in the ATA STATUS register or in the STATUS-HI field and the STATUS-LO field of the SATA Set Device Bits – Device to Host FIS.

Table 98 — ATA command results

ATA ERR	DF	sense data returned
zero	zero	No error, successful completion or command in progress. If the CK_COND bit is set to zero in the ATA PASS-THROUGH (12) command or the ATA PASS-THROUGH (16) command, then the SATL shall respond to a REQUEST SENSE command and shall return sense data with the sense key set to NO SENSE with the additional sense code set to NO ADDITIONAL SENSE INFORMATION. If the CK_COND bit is set to one in the ATA PASS-THROUGH (12) command or the ATA PASS-THROUGH (16) command, then the SATL shall terminate the command with CHECK CONDITION status with the sense key set to NO SENSE with the additional sense code set to ATA PASS-THROUGH INFORMATION AVAILABLE (see SPC-4). The sense data shall include the ATA Status Return Descriptor.
zero	one	The command was not accepted or otherwise failed to complete successfully. The SATL shall terminate the command with CHECK CONDITION status with the additional sense code set to ATA PASS-THROUGH INFORMATION AVAILABLE. The sense data shall include the ATA Status Return Descriptor.
one	zero	
one	one	Undefined

If the sense data is provided in response to an ATA PASS-THROUGH (12) command or ATA PASSTHROUGH (16) command in which the CK_COND bit was set to one, then the SATL shall set the additional sense code to ATA PASS- THROUGH INFORMATION AVAILABLE (see SPC-4), and shall include the ATA Status Return Descriptor (see 12.2.5) in the sense data.

NOTE 12 -This capability allows the host to retrieve the ATA register or field information with successful command completion by returning data in the ATA registers or fields.

1 Some ATA commands return information in the registers. ATA Register information may be retrieved by requesting the ATA Status Return Descriptor issuing the ATA PASS-THROUGH (12) command or ATA PASS-THROUGH (16) command with the PROTOCOL field set to 15 (i.e., Return Response Information).

12.2.5 ATA Status Return Descriptor

Table 99 shows the format of the ATA Status Return Descriptor returned in the sense data (see SPC-3 and SAM-3). The SATL shall return the ATA Status Return Descriptor if the PROTOCOL field in the ATA PASS-THROUGH (12) command or ATA PASS-THROUGH (16) command is set to 15 (i.e., Return Response Information).

The SATL shall support the ATA Status Return Descriptor if the SATL supports the ATA PASSTHROUGH (12) command or the ATA PASS-THROUGH (16) command. Each time the ATA Status Return Descriptor is requested; the SATL shall read the ATA regis2 and return those values in the sense data as shown in table 99. If the sense data is for an ATA PASS-THROUGH (12) command or for the ATA PASS-THROUGH (16) command with the EXTEND bit set to zero the SATL shall return the 28-bit extended status and shall set the EXTEND bit to zero. If the sense data is for an ATA PASS-THROUGH (16) command with the EXTEND bit set to one the SATL shall return the 48-bit extended status and shall set the EXTEND bit to one.

Table 99 — 3~~Extended~~ ATA Status Return Descriptor

Byte\Bit	7	6	5	4	3	2	1	0
0	DESCRIPTOR CODE (09h)							
1	ADDITIONAL DESCRIPTOR LENGTH (0Ch)

11	LBA_HIGH (7:0)							
12	DEVICE							
13	STATUS							

4 If the EXTEND bit is set to one the SECTOR_COUNT (7:0) field and SECTOR_COUNT (15:8) field specify the ATA Sector Count. If the EXTEND bit is set to zero the SECTOR_COUNT (7:0) field specifies the ATA Sector Count and SECTOR_COUNT (15:8) field shall be ignored.

If the EXTEND bit is set to one the LBA_LOW (7:0) field, LBA_MID (7:0) field, LBA_HIGH (7:0) field, LBA_LOW (15:8) field, LBA_MID (15:8) field, and LBA_HIGH (15:8) field specify the ATA LBA. If the EXTEND bit is set to zero the LBA_LOW (7:0) field, LBA_MID (7:0) field, and LBA_HIGH (7:0) field specify the ATA LBA, and the LBA_LOW (15:8) field, LBA_MID (15:8) field, and LBA_HIGH (15:8) field shall be ignored.

12.3 SAT-specific mode pages

12.3.1 SAT-specific mode pages overview

This subclause describes mode pages that the SATL may implement that are unique to the SCSI – ATA translation environment. These mode pages are for use by the SATL and are shown in table 100 and

Page: 114

Sequence number: 1
Author: ELX[KHirata]
Subject: Note
Date: 6/24/2006 1:18:31 AM

DISCUSS: Can we define it so that if, for any given emulated SCSI device, the next command following an ATA PASSTHROUGH command specifying a protocol other than protocol 15, and the next command is not an ATA PASSTROUGH command specifying a protocol of 15 to return the ATA status return descriptor, then the SATL can discard the ATA register content. If the SATL doesn't have the resources to hold the ATA register content when it receives an ATA PASSRHOUGH command, it may terminate the command with CHECK CONDITION and an appropriate additional sense code (to say insufficient resources were available) or return BUSY/TASK SET FULL. If the SATL receives an ATA PASSTHROUGH command and the SATL has no ATA register information to return in the ATA status return descriptor, it returns CHECK CONDITION status with an additional sense code to indicate the status was discarded (new ASC/ASCQ?).

Location: Page 94, 12.2.4,

Comment:
Support for PROTOCOL 15 seems to imply that the register FIS from a previous command needs to be stored by the SATL. This represents a potentially large storage burden for an HBA based translation that may be communicating with large numbers of target devices simultaneously. If autosense is supported is PROTOCOL 15 also required to be supported? Can pass-through be supported without support for PROTOCOL 15?

Preferred resolution:
Clarification. If I've misinterpreted the intent of PROTOCOL 15 then there is no problem. If my interpretation of PROTOCOL 15 is correct then it may be difficult for us to support because of the limited memory resources available in the HBA.

Comment on comment (rls): The contention of SAT WG members is that correctly managing SATA protocol requires the SATA host to maintain the current state of the Command Shadow Block registers for each device anyway.

escribed in this subclause. Support for these mode pages is optional. A SATL should support the appropriate mode page for the attached ATA environment (e.g., PATA).

able 100 — SCSI - ATA Translation specific mode pages

PAGE CODE	SUB PAGE CODE	Page name
0Ah	F1h	PATA Control Mode Page
0Ah	F2h	Reserved for SAT

2.3.2 PATA Control ~~mode~~ Page ~~(Page 0Ah, Sub Page F1h)~~

The PATA Control mode page provides PATA specific controls for a SATL to configure the underlying PATA host and to understand what parameters are communicated to the PATA device to ensure proper communication for specific transfer rates. This standard specifies the mode parameters that are provided for this mode page.

SATL implementations that support the attachment of PATA devices shall support this mode page when requested through MODE SENSE command. SATL implementations should allow application clients to configure alternate PATA timings using the MODE SELECT command.

Table 101 — PATA Control mode page

Byte\Bit	7	6	5	4	3	2	1	0
0	PS	SPF (1b)	PAGE CODE (0Ah)

7								

[a] MWDMA stands for Multi-Word Direct Memory Access and the MWDx bits specify a number of hardware-assisted data transfer modes defined in ATA/ATAPI-7.
[b] PIO stands for Programmed Input and Output and the PIOx bits specify transfer modes performed under program control defined in ATA/ATAPI-7.
[c] UDMA stands for Ultra Direct Memory Access and the UDMAx bits represent a number of hardware-assisted data transfer modes defined in ATA/ATAPI-7.

The parameters saveable (PS) bit is defined in SPC-3.

The SPF bit (see SPC-3) shall be set to one to access this mode page.

The PAGE CODE field shall be set to 0Ah.

The SUBPAGE CODE field shall be set to F1h.

SATL implementations may save the state of the timing parameters defined in this mode page. However, SATL implementations shall not use any saved parameters to configure the ATA host timing modes to an illegal configuration for the attached PATA device.

Application clients may use the MODE SENSE command for changeable values to determine the underlying ATA host support for a given ATA timing mode. The SATL shall support changeable mode parameters for this mode page.

Table 100 — SCSI - ATA Translation specific mode pages

change table title to
"Table 100 — SCSI/ATA Translation specific mode pages"

Additionally change 3rd column to "Mode page name"

Lastly I question having the "Reserved for SAT" in the table or at least just make it Reserved.

DISCUSS suggested resolution: As suggested, and change the page name for the "F2h" sub page code to "Unspecified (see 3.2.3)". The definition of Unspecified conveys the intent that the field may be used in a future version of SAT, though it also suggests it may be found in SBC-2 or SPC-3, which it won't. Perhaps it should be both Reserved and Unspecified.

RESOLUTION: see 06-291 change "Reserved for SAT" to "Reserved"

6th Paragraph after Table 101 — PATA Control mode page.

May save contradicts the Mode Sense material, which has a shall not, assuming my comment (changing saving to unspecified) is rejected.
REASON: Saving of mode pages is not prohibited by SAT (after LB comment resolution)

Status
rlsheffi Rejected 5/8/2006 12:51:18 AM

Sequence number: 20
Author: DELL[KMarks]
Subject: Note
Date: 6/24/2006 3:53:22 PM

6th Paragraph after Table 101 — PATA Control mode page.

This mode page shall support changeable parameters, does this imply that returning changeable parameters is required (PC=01b) as seems stated after table 102? If so this contradicts the text in the MODE SENSE command, but I think that changeable and saving should be unspecified for the other mode pages and shall for this mode page after the may/ should/shall supported is determined.
DISCUSS FLAG
RESOLUTION: see 06-291

When processing a MODE SENSE command, the SATL shall set the PIO3 bit and PIO4 bit as shown table 102 to identify the configured PIO mode.

Table 102 — PIO modes

PIO3	PIO4	PIO mode
0	0	Reserved
0	1	The ATA host shall use PIO mode 3 transfers.
1	0	The ATA host shall use PIO mode 4 transfers.
1	1	Reserved

When changeable values are requested, the PIO3 bit and the PIO4 bit indicate if the underlying ATA host supports those transfer modes. The PIO3 bit shall be set to one if the ATA host support PIO mode 3. The PIO3 bit and the PIO4 bit shall be set to one if the ATA host supports PIO mode 4.

If the SATL receives a MODE SELECT command and the PIO field indicates a change from the current setting, the SATL shall configure the ATA host to use the new PIO transfer rate, if supported. The application client shall not request a PIO mode setting that the ATA device is unable to support. If the application client requests a PIO setting that the ATA device is unable to support the SATL shall return a CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN PARAMETER LIST.

The MWD0 bit, the MWD1 bit, and the MWD2 bit are collectively referred to as the MWDMA field. If the ATA host in the SATL is currently configured to use multi word DMA (MWDMA) the MWDMA field is used to determine what mode is currently being used, what modes are supported by the ATA host, and control of the MWDMA mode.

If the SATL receives a MODE SENSE command requesting the current values of the PATA Control mode page, the MWD0 bit shall be set to one by the SATL when the host and device are configured to use MWDMA mode 0. The MWD1 bit shall be set to one by the SATL when the host and device are configured to use MWDMA mode1. The MWD2 bit shall be set to one by the SATL when the host and device are configured to use MWDMA mode 2.

If the SATL receives a MODE SENSE command requesting the changeable values of the PATA Control mode page, the MWD0 bit shall be set to one if the ATA host supports MWDMA mode 0. The MWD1 bit and MWD0 bit shall each be set to one if the ATA host supports MWDMA mode 1. The MWD2 bit, the MWD1 bit, and the MWD0 bit shall be each be set to one if the ATA host supports MWDMA mode 2.

Comments from page 116 continued on next page

When processing a MODE SENSE command, the SATL shall set the PIO3 bit and PIO4 bit as shown table 102 to identify the configured PIO mode.

Table 102 — PIO modes

PIO3	PIO4	PIO mode
0	0	Reserved
0	1	The ATA host shall use PIO mode 3 transfers.
1	0	The ATA host shall use PIO mode 4 transfers.
1	1	Reserved

When changeable values are requested, the PIO3 bit and the PIO4 bit indicate if the underlying ATA host supports those transfer modes. The PIO3 bit shall be set to one if the ATA host support PIO mode 3. The PIO3 bit and the PIO4 bit shall be set to one if the ATA host supports PIO mode 4.

If the SATL receives a MODE SELECT command and the PIO field indicates a change from the current setting, the SATL shall configure the ATA host to use the new PIO transfer rate, if supported. The application client shall not request a PIO mode setting that the ATA device is unable to support. If the application client requests a PIO setting that the ATA device is unable to support the SATL shall return a CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN PARAMETER LIST.

The MWD0 bit, the MWD1 bit, and the MWD2 bit are collectively referred to as the MWDMA field.[7] the ATA host in the SATL is currently configured to use multi word DMA (MWDMA).[8] The MWDMA field is used to determine what mode is currently being used, what modes are supported by the ATA host, and control of the MWDMA mode.

If the SATL receives a MODE SENSE command requesting the current values of the PATA Control mode page, the MWD0 bit shall be set to one by the SATL when the host and device are configured to use MWDMA mode 0. The MWD1 bit shall be set to one by the SATL when the host and device are configured to use MWDMA mode1. The MWD2 bit shall be set to one by the SATL when the host and device are configured to use MWDMA mode 2.

If the SATL receives a MODE SENSE command requesting the changeable values of the PATA Control mode page, the MWD0 bit shall be set to one if the ATA host supports MWDMA mode 0. The MWD1 bit and MWD0 bit shall each be set to one if the ATA host supports MWDMA mode 1. The MWD2 bit, the MWD1 bit, and the MWD0 bit shall be each be set to one if the ATA host supports MWDMA mode 2.

T3nd Paragraph, 1st Sentence after Table 102 — PIO modes
change
"...as the MWDMA field."
to
"... as the MWDMA bits." with MWDMA not in small CAPS.

Table 103 specifies values set by the SATL in the MWD0 bit, the MWD1 bit, and the MWD2 bit for current and changeable MWDMA settings.

Table 103 — MWDMA modes reported by MODE SENSE

MWDMA field			ATA host and device shared configuration settings returned as current values	ATA host support returned as changeable values
MWD0	MWD1	MWD2		
0	0	0	Configured not to use multiword DMA	Illegal combination
0	0	1	Configured to use MWDMA mode 1	
0	1	0	Configured to use MWDMA mode 2	
0	1	1	Configured to use MWDMA modes 1 and 2	
1	0	0	Configured to use MWDMA mode 0	MWDMA mode 0 supported
1	0	1	Configured to use MWDMA modes 0 and 2	Illegal combination
1	1	0	Configured to use MWDMA modes 0 and 1	MWDMA mode 1 supported
1	1	1	Configured to use MWDMA modes 0, 1 and 2	MWDMA mode 2 supported

[a] If the application client attempts to set a MWDMA mode that is not supported by the ATA host environment, the SATL shall return a CHECK CONDITION status with the sense key set to ILLEGAL REQUEST with the additional sense code set to INVALID FIELD IN PARAMETER LIST.

If the SATL receives a MODE SELECT command and the MWDMA field indicates a change from the current settings, the SATL shall:

1) issue a SET FEATURES, sub-command 03h (Set Transfer Mode) to the ATA device, to set the MWDMA mode on the device to the requested state;
2) check the status of the SET FEATURES command once completed, and if the command completes in error, the SATL shall not change any host timing modes and shall complete the MODE SELECT command with a CHECK CONDITION status with the sense key set to ABORTED COMMAND and the additional sense code set to ATA DEVICE FAILED SET FEATURES, and the SATL shall take no further action regarding this MWDMA mode request; or
   1) if the SET FEATURES command completes without error the SATL shall configure the ATA host to communicate with the device at the requested MWDMA mode; and
   2) complete the MODE SELECT command with good status.

The MWDMA field values to configure ATA hosts and ATA devices using MODE SELECT have the same meaning as the MWDMA field values returned by MODE SENSE when current values are requested as shown in table 103.

If the SATL receives a request to set a MWDMA mode that is not supported by the ATA host or the attached PATA device, the SATL shall return a CHECK CONDITION status with the sense key set to ILLEGAL REQUEST with the additional sense code set to INVALID FIELD IN PARAMETER LIST.

The UDMA0 bit, the UDMA1 bit, the UDMA2 bit, the UDMA3 bit, the UDMA4 bit, the UDMA5 bit, and the UDMA6 bit are collectively referred to as the UDMA field, and are used to determine support for, current use of, and control of Ultra DMA (UDMA) timings on the ATA host and device. The SATL shall determine the highest UDMA mode supported as being the lower of the ATA host maximum transfer mode and the device maximum transfer mode.

NOTE 13 - The ATA device returns the UDMA transfer mode specified in IDENTIFY DEVICE data, word 88, bits 6:0 (see ATA/ATAPI-7).

Comments from page 117 continued on next page

Table 103 specifies values set by the SATL in the MWD0 bit, the MWD1 bit, and the MWD2 bit for current and changeable MWDMA settings.

Table 103 — MWDMA modes reported by MODE SENSE

MWDMA [a] field			ATA host and device shared configuration settings returned as current values	ATA host support returned as changeable values
MWD0	MWD1	MWD2		
0	0	0	Configured not to use multiword DMA	Illegal combination
0	0	1	Configured to use MWDMA mode 1	
0	1	0	Configured to use MWDMA mode 2	
0	1	1	Configured to use MWDMA modes 1 and 2	
1	0	0	Configured to use MWDMA mode 0	MWDMA mode 0 supported
1	0	1	Configured to use MWDMA modes 0 and 2	Illegal combination
1	1	0	Configured to use MWDMA modes 0 and 1	MWDMA mode 1 supported
1	1	1	Configured to use MWDMA modes 0, 1 and 2	MWDMA mode 2 supported

[a] If the application client attempts to set a MWDMA mode that is not supported by the ATA host environment, the SATL shall return a CHECK CONDITION status with the sense key set to ILLEGAL REQUEST with the additional sense code set to INVALID FIELD IN PARAMETER LIST.

If the SATL receives a MODE SELECT command and the MWDMA field indicates a change from the current settings, the SATL shall:

1) issue a SET FEATURES, sub-command 03h (Set Transfer Mode) to the ATA device, to set the MWDMA mode on the device to the requested state;
2) check the status of the SET FEATURES command once completed, and if the command completes in error, the SATL shall not change any host timing modes and shall complete the MODE SELECT command with a CHECK CONDITION status with the sense key set to ABORTED COMMAND and the additional sense code set to ATA DEVICE FAILED SET FEATURES, and the SATL shall take no further action regarding this MWDMA mode request; or
   1) if the SET FEATURES command completes without error the SATL shall configure the ATA host to communicate with the device at the requested MWDMA mode; and
   2) complete the MODE SELECT command with good status.

The MWDMA field values to configure ATA hosts and ATA devices using MODE SELECT have the same meaning as the MWDMA field values returned by MODE SENSE when current values are requested as shown in table 103.

If the SATL receives a request to set a MWDMA mode that is not supported by the ATA host or the attached PATA device, the SATL shall return a CHECK CONDITION status with the sense key set to ILLEGAL REQUEST with the additional sense code set to INVALID FIELD IN PARAMETER LIST.

The UDMA0 bit, the UDMA1 bit, the UDMA2 bit, the UDMA3 bit, the UDMA4 bit, the UDMA5 bit, and the UDMA6 bit are collectively referred to as the UDMA field, and are used to determine support for, current use of, and control of Ultra DMA (UDMA) timings on the ATA host and device. The SATL shall determine the highest UDMA mode supported as being the lower of the ATA host maximum transfer mode and the device maximum transfer mode.

NOTE 13 - The ATA device returns the UDMA transfer mode specified in IDENTIFY DEVICE data, word 88, bits 6:0 (see ATA/ATAPI-7).

shall :
a) if the ATA SET FEATURES command completes with an error, then the SATL shall:
1) not change any host transfer modes;
2) complete the MODE SELECT command with a CHECK CONDITION status with the sense key set to ABORTED COMMAND with the additional sense code set to ATA DEVICE FAILED SET FEATURES; and
3) take no further action regarding this request to change the MWDMA transfer rate;
or
b) if the SET FEATURES command completes without error, then the SATL shall:
1) configure the ATA host to communicate with the device at the requested MWDMA transfer rate; and

Table 103 specifies values set by the SATL in the MWD0 bit, the MWD1 bit, and the MWD2 bit for current and changeable MWDMA settings.

Table 103 — MWDMA modes reported by MODE SENSE

MWDMA [a] field			ATA host and device shared configuration settings returned as current values	ATA host support returned as changeable values
MWD0	MWD1	MWD2		
0	0	0	Configured not to use multiword DMA	Illegal combination
0	0	1	Configured to use MWDMA mode 1	
0	1	0	Configured to use MWDMA mode 2	
0	1	1	Configured to use MWDMA modes 1 and 2	
1	0	0	Configured to use MWDMA mode 0	MWDMA mode 0 supported
1	0	1	Configured to use MWDMA modes 0 and 2	Illegal combination
1	1	0	Configured to use MWDMA modes 0 and 1	MWDMA mode 1 supported
1	1	1	Configured to use MWDMA modes 0, 1 and 2	MWDMA mode 2 supported

[a] If the application client attempts to set a MWDMA mode that is not supported by the ATA host environment, the SATL shall return a CHECK CONDITION status with the sense key set to ILLEGAL REQUEST with the additional sense code set to INVALID FIELD IN PARAMETER LIST.

If the SATL receives a MODE SELECT command and the MWDMA field indicates a change from the current settings, the SATL shall:

1) issue a SET FEATURES, sub-command 03h (Set Transfer Mode) to the ATA device, to set the MWDMA mode on the device to the requested state;
2) check the status of the SET FEATURES command once completed, and if the command completes in error, the SATL shall not change any host timing modes and shall complete the MODE SELECT command with a CHECK CONDITION status with the sense key set to ABORTED COMMAND and the additional sense code set to ATA DEVICE FAILED SET FEATURES, and the SATL shall take no further action regarding this MWDMA mode request; or
   1) if the SET FEATURES command completes without error the SATL shall configure the ATA host to communicate with the device at the requested MWDMA mode; and
   2) complete the MODE SELECT command with good status.

8 The MWDMA field values to configure ATA hosts and ATA devices using MODE SELECT have the same meaning as the MWDMA field values returned by MODE SENSE when current values are requested as shown in table 103.

If the SATL receives a request to set a MWDMA mode that is not supported by the ATA host or the attached PATA device, the SATL shall return a CHECK CONDITION status with the sense key set to ILLEGAL REQUEST with the additional sense code set to INVALID FIELD IN PARAMETER LIST.

The UDMA0 bit, the UDMA1 bit, the UDMA2 bit, the UDMA3 bit, the UDMA4 bit, the UDMA5 bit, and the UDMA6 bit are collectively referred to as the UDMA field, and are used to determine support for, current use of, and control of Ultra DMA (UDMA) timings on the ATA host and device. The SATL shall determine the highest UDMA mode supported as being the lower of the ATA host maximum transfer mode and the device maximum transfer mode.

Comments from page 117 continued on next page

If the SATL receives a MODE SENSE command requesting the changeable values of the PATA Control mode page, the UDMA field shall be set according to table 104.

Table 104 — UDMA Field Requirements for changeable MODE SENSE

Highest UDMA mode supported	UDMA0	UDMA1	UDMA2	UDMA3	UDMA4	UDMA5	UDMA6
UDMA Unsupported	0	0	0	0	0	0	0
0	1	0	0	0	0	0	0
1	1	1	0	0	0	0	0
2	1	1	1	0	0	0	0
3	1	1	1	1	0	0	0
4	1	1	1	1	1	0	0
5	1	1	1	1	1	1	0
6	1	1	1	1	1	1	1

If the SATL receives a MODE SENSE command requesting the current values of the PATA Control mode page, the SATL shall set the UDMA field as defined in table 105. Only one UDMA bit shall bet set to one at any time for such a request. If UDMA is not the current DMA transfer mode, all the bits in the UDMA field shall be set to zero. If a UDMA transfer mode is being used, all the bits in the MWDMA field shall be set to zero.

Table 105 — UDMA for current MODE SENSE settings

UDMA bit	Value	Description
UDMA0	0	ATA host and device are not communicating using UDMA Mode 0
	1	ATA host and device are communicating using UDMA Mode 0
UDMA1	0	ATA host and device are not communicating using UDMA Mode 1
	1	ATA host and device are communicating using UDMA Mode 1
UDMA2	0	ATA host and device are not communicating using UDMA Mode 2
	1	ATA host and device are communicating using UDMA Mode 2
UDMA3	0	ATA host and device are not communicating using UDMA Mode 3
	1	ATA host and device are communicating using UDMA Mode 3
UDMA4	0	ATA host and device are not communicating using UDMA Mode 4
	1	ATA host and device are communicating using UDMA Mode 4
UDMA5	0	ATA host and device are not communicating using UDMA Mode 5
	1	ATA host and device are communicating using UDMA Mode 5
UDMA6	0	ATA host and device are communicating using UDMA Mode 6
	1	ATA host and device are communicating using UDMA Mode 6

When the SATL receives a MODE SELECT command and the UDMA field indicates a change in the requested UDMA speed in the communications interface, the SATL shall:

1) issue a SET FEATURES, sub-command 03h, to set the UDMA timing mode on the device to the requested state;
2) check the status of the SET FEATURES command once completed, and if the command completes in error, the SATL shall not change any host timing modes and shall complete the MODE SELECT command with a CHECK CONDITION status with the sense key set to ABORTED COMMAND with the additional sense code set to ATA DEVICE FAILED SET FEATURES, and the SATL shall take no further action regarding this timing mode request; or

If the SATL receives a MODE SENSE command requesting the changeable values of the PATA Control mode page, the UDMA field shall be set according to table 104.

Table 104 — UDMA Field Requirements for changeable MODE SENSE

Highest UDMA mode supported	UDMA0	UDMA1	UDMA2	UDMA3	UDMA4	UDMA5	UDMA6
UDMA Unsupported	0	0	0	0	0	0	0
0	1	0	0	0	0	0	0
1	1	1	0	0	0	0	0
2	1	1	1	0	0	0	0
3	1	1	1	1	0	0	0
4	1	1	1	1	1	0	0
5	1	1	1	1	1	1	0
6	1	1	1	1	1	1	1

If the SATL receives a MODE SENSE command requesting the current values of the PATA Control mode page, the SATL shall set the UDMA field as defined in table 105. Only one UDMA bit shall bet set to one at any time for such a request. If UDMA is not the current DMA transfer mode, all the bits in the UDMA field shall be set to zero. If a UDMA transfer mode is being used, all the bits in the MWDMA field shall be set to zero.

Table 105 — UDMA for current MODE SENSE settings

UDMA bit	Value	Description
UDMA0	0	ATA host and device are not communicating using UDMA Mode 0
	1	ATA host and device are communicating using UDMA Mode 0
UDMA1	0	ATA host and device are not communicating using UDMA Mode 1
	1	ATA host and device are communicating using UDMA Mode 1
UDMA2	0	ATA host and device are not communicating using UDMA Mode 2
	1	ATA host and device are communicating using UDMA Mode 2
UDMA3	0	ATA host and device are not communicating using UDMA Mode 3
	1	ATA host and device are communicating using UDMA Mode 3
UDMA4	0	ATA host and device are not communicating using UDMA Mode 4
	1	ATA host and device are communicating using UDMA Mode 4
UDMA5	0	ATA host and device are not communicating using UDMA Mode 5
	1	ATA host and device are communicating using UDMA Mode 5
UDMA6	0	ATA host and device are communicating using UDMA Mode 6
	1	ATA host and device are communicating using UDMA Mode 6

When the SATL receives a MODE SELECT command and the UDMA field indicates a change in the requested UDMA speed in the communications interface, the SATL shall:

1) issue a SET FEATURES, sub-command 03h, to set the UDMA timing mode on the device to the requested state;
2) check the status of the SET FEATURES command once completed, and if the command completes in error, the SATL shall not change any host timing modes and shall complete the MODE SELECT command with a CHECK CONDITION status with the sense key set to ABORTED COMMAND with the additional sense code set to ATA DEVICE FAILED SET FEATURES, and the SATL shall take no further action regarding this timing mode request; or

12.3.2 PATA Control Mode page (Page 0Ah, Subpage F1h), paragraph following Table 105 – UDMA for current MODE SENSE settings: change the paragraph to:

When the SATL receives a MODE SELECT command and the UDMA bits requests a change in the UDMA transfer rate, then the SATL shall:

1) issue a SET FEATURES subcommand 03h to set the UDMA transfer mode on the device to the requested rate;
2) if the SET FEATURES command completes with an error, then the SATL shall:
A) not change any host transfer modes;
B) complete the MODE SELECT command with a CHECK CONDITION status with the sense key set to ABORTED COMMAND with the additional sense code set to ATA DEVICE FAILED SET FEATURES; and
C)take no further action regarding this request to change the UDMA transfer rate;
and
3) if the SET FEATURES command completes without error, then the SATL shall:
A) configure the ATA host to communicate with the device at the requested UDMA transfer rate; and
B) complete the MODE SELECT command with GOOD status.

DISCUSS suggested resolution: s/b
"When the SATL receives a MODE SELECT command and the UDMA bits request a change in the UDMA transfer rate, then the SATL shall issue a SET FEATURES - Set Transfer Mode (i.e., with the Features register set to 03h) to set the UDMA transfer mode on the device to the requested rate; and then:
1) if the SET FEATURES command completes with an error, then the SATL:
A) shall not change any host transfer modes;

Comments from page 118 continued on next page

If the SATL receives a MODE SENSE command requesting the changeable values of the PATA Control mode page, the UDMA field shall be set according to table 104.

Table 104 — UDMA Field Requirements for changeable MODE SENSE

Highest UDMA mode supported	UDMA0	UDMA1	UDMA2	UDMA3	UDMA4	UDMA5	UDMA6
UDMA Unsupported	0	0	0	0	0	0	0
0	1	0	0	0	0	0	0
1	1	1	0	0	0	0	0
2	1	1	1	0	0	0	0
3	1	1	1	1	0	0	0
4	1	1	1	1	1	0	0
5	1	1	1	1	1	1	0
6	1	1	1	1	1	1	1

If the SATL receives a MODE SENSE command requesting the current values of the PATA Control mode page, the SATL shall set the UDMA field as defined in table 105. Only one UDMA bit shall bet set to one at any time for such a request. If UDMA is not the current DMA transfer mode, all the bits in the UDMA field shall be set to zero. If a UDMA transfer mode is being used, all the bits in the MWDMA field shall be set to zero.

Table 105 — UDMA for current MODE SENSE settings

UDMA bit	Value	Description
UDMA0	0	ATA host and device are not communicating using UDMA Mode 0
	1	ATA host and device are communicating using UDMA Mode 0
UDMA1	0	ATA host and device are not communicating using UDMA Mode 1
	1	ATA host and device are communicating using UDMA Mode 1
UDMA2	0	ATA host and device are not communicating using UDMA Mode 2
	1	ATA host and device are communicating using UDMA Mode 2
UDMA3	0	ATA host and device are not communicating using UDMA Mode 3
	1	ATA host and device are communicating using UDMA Mode 3
UDMA4	0	ATA host and device are not communicating using UDMA Mode 4
	1	ATA host and device are communicating using UDMA Mode 4
UDMA5	0	ATA host and device are not communicating using UDMA Mode 5
	1	ATA host and device are communicating using UDMA Mode 5
UDMA6	0	ATA host and device are communicating using UDMA Mode 6
	1	ATA host and device are communicating using UDMA Mode 6

When the SATL receives a MODE SELECT command and the UDMA field[9] indicates a change in the requested UDMA speed in the communications interface, the SATL shall:

1) issue a SET FEATURES, sub-command 03h, to set the UDMA timing mode on the device to the requested state;[10]
2) check the status of the SET FEATURES command once completed, and if the command completes in error, the SATL shall not change any host timing modes and shall complete the MODE SELECT command with a CHECK CONDITION status with the sense key set to ABORTED COMMAND with the additional sense code set to ATA DEVICE FAILED SET FEATURES, and the SATL shall take no further action regarding this timing mode request; or[11]

B) shall complete the MODE SELECT command with a CHECK CONDITION status with the sense key set to ABORTED COMMAND with the additional sense code set to ATA DEVICE FAILED SET FEATURES; and
C)shall take no further action regarding this request to change the UDMA transfer rate;
and
2) if the SET FEATURES command completes without error, then the SATL shall:
A) configure the ATA host to communicate with the device at the requested UDMA transfer rate; and
B) complete the MODE SELECT command with GOOD status"

13 Translation for ATAPI devices

13.1 Overview

This subclause describes those elements of SCSI / ATA Translation that are specific to ATAPI devices.

13.2 Commands

13.2.1 INQUIRY command

13.2.1.1 INQUIRY command overview

For ATAPI devices, the SATL may support the ATA Information VPD page (see 13.2.1.3) to provide information about the SATL and provide the IDENTIFY PACKET DEVICE data from the ATAPI device.

If the SATL does not support the ATA Information VPD page, it shall pass through all INQUIRY commands and parameter data unaltered to the ATAPI device.

If the SATL supports the ATA Information VPD page, the SATL shall:

a) pass through INQUIRY commands requesting the standard INQUIRY data unaltered;
b) pass through INQUIRY commands requesting VPD pages other than the Supported VPD Pages VPD page and the ATA Information VPD page unaltered;
c) process INQUIRY commands requesting the Supported VPD Pages VPD page (see SPC-3) as described in 13.2.1.2; and
d) process INQUIRY commands requesting the ATA Information VPD page (see 10.3.5) as described in 13.2.1.3.

13.2.1.2 Supported VPD Pages VPD page

If the SATL supports the ATA Information VPD page, the SATL shall pass through an INQUIRY command requesting the Supported VPD Pages VPD page (see SPC-3) to the ATAPI device unaltered.

If the ATAPI device returns CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB, and the field pointer in the sense data points to the EVPD bit or the PAGE CODE field, the SATL shall return GOOD status and return parameter data containing the Supported VPD Pages VPD page with only two supported VPD page codes:

a) 00h (i.e., Supported VPD Pages); and
b) 89h (i.e., ATA Information).

If the ATAPI device returns GOOD status, the SATL shall modify the parameter data containing the Supported VPD Pages VPD page returned by the ATAPI device to add 89h (i.e., the ATA Information VPD page) into the supported VPD page code list.

13.2.1.3 ATA Information VPD page

If the SATL supports the ATA Information VPD page (see 10.3.5) and it receives an INQUIRY command requesting the ATA Information VPD page, the SATL shall process the command (i.e., return parameter data and status) itself.and shall not pass through the INQUIRY command to the ATAPI device.

The SATL shall use the IDENTIFY PACKET DEVICE command (A1h) rather than the IDENTIFY DEVICE command (ECh) to retrieve information for the ATA Information VPD page from the attached ATAPI device.

Subject: Replacement Text
Date: 3/9/2006 12:17:28 PM
This makes it look like we have spec'ed how to do ATAPI, but we really have not. There is a major piece of work missing. I would suggest that this clause be removed, or just limit it to the overview and state that this subclause will be developed in a future version of SAT. If you leave this in, you will be limiting SAT-2's ability to define ATAPI.
RESOLUTION:
change "13 Translation for ATAPI devices" to
"Annex A INQUIRY command translation considerations for ATAPI devices"

13 Translation for ATAPI devices

13.1 Overview

This subclause describes those elements of SCSI / ATA Translation that are specific to ATAPI devices.

13.2 Commands

13.2.1 INQUIRY command

13.2.1.1 INQUIRY command overview

For ATAPI devices, the SATL may support the ATA Information VPD page (see 13.2.1.3) to provide information about the SATL and provide the IDENTIFY PACKET DEVICE data from the ATAPI device.

If the SATL does not support the ATA Information VPD page, it shall pass through all INQUIRY commands and parameter data unaltered to the ATAPI device.

If the SATL supports the ATA Information VPD page, the SATL shall:

a) pass through INQUIRY commands requesting the standard INQUIRY data unaltered;
b) pass through INQUIRY commands requesting VPD pages other than the Supported VPD Pages VPD page and the ATA Information VPD page unaltered;
c) process INQUIRY commands requesting the Supported VPD Pages VPD page (see SPC-3) as described in 13.2.1.2; and
d) process INQUIRY commands requesting the ATA Information VPD page (see 10.3.5) as described in 13.2.1.3.

6

13.2.1.2 Supported VPD Pages VPD page

7 If the SATL supports the ATA Information VPD page, the SATL shall pass through an INQUIRY command requesting the Supported VPD Pages VPD page (see SPC-3) to the ATAPI device unaltered.

If the ATAPI device returns CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB, and the field pointer in the sense data points to the EVPD bit or the PAGE CODE field, the SATL shall return GOOD status and return parameter data containing the Supported VPD Pages VPD page with only two supported VPD page codes:

a) 00h (i.e., Supported VPD Pages); and
b) 89h (i.e., ATA Information).

If the ATAPI device returns GOOD status, the SATL shall modify the parameter data containing the Supported VPD Pages VPD page returned by the ATAPI device to add 89h (i.e., the ATA Information VPD page) into the supported VPD page code list.

8

13.2.1.3 ATA Information VPD page

9 If the SATL supports the ATA Information VPD page (see 10.3.5) and it receives an INQUIRY command requesting the ATA Information VPD page, the SATL shall process the command (i.e., return parameter data and status) itself.and shall not pass through the INQUIRY command to the ATAPI device.

10

11 The SATL shall use the IDENTIFY PACKET DEVICE command (A1h) rather than the IDENTIFY DEVICE command (ECh) to retrieve information for the ATA Information VPD page from the attached ATAPI device.

"If the SATL supports the ATA Information VPD page, then the SATL shall:

a) use the ATA PACKET Command feature set to pass all INQUIRY commands requesting standard INQUIRY data to an ATAPI device without altering the INQUIRY commands;
b) use the ATA PACKET Command feature set to pass all INQUIRY commands requesting VPD pages, other than the Supported VPD Pages VPD page and the ATA Information VPD page, to an ATAPI device without altering the INQUIRY commands;
c) process INQUIRY commands requesting the Supported VPD Pages VPD page (see SPC-3) as described in 13.2.1.2; and
d) process INQUIRY commands requesting the ATA Information VPD page (see 10.3.5) as described in 13.2.1.3."

Comments from page 120 continued on next page

13 Translation for ATAPI devices

13.1 Overview

This subclause describes those elements of SCSI / ATA Translation that are specific to ATAPI devices.

13.2 Commands

13.2.1 INQUIRY command

13.2.1.1 INQUIRY command overview

For ATAPI devices, the SATL may support the ATA Information VPD page (see 13.2.1.3) to provide information about the SATL and provide the IDENTIFY PACKET DEVICE data from the ATAPI device.

If the SATL does not support the ATA Information VPD page, it shall pass through all INQUIRY commands and parameter data unaltered to the ATAPI device.

If the SATL supports the ATA Information VPD page, the SATL shall:

a) pass through INQUIRY commands requesting the standard INQUIRY data unaltered;
b) pass through INQUIRY commands requesting VPD pages other than the Supported VPD Pages VPD page and the ATA Information VPD page unaltered;
c) process INQUIRY commands requesting the Supported VPD Pages VPD page (see SPC-3) as described in 13.2.1.2; and
d) process INQUIRY commands requesting the ATA Information VPD page (see 10.3.5) as described in 13.2.1.3.

13.2.1.2 Supported VPD Pages VPD page

If the SATL supports the ATA Information VPD page, the SATL shall pass through an INQUIRY command requesting the Supported VPD Pages VPD page (see SPC-3) to the ATAPI device unaltered.

If the ATAPI device returns CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB, and the field pointer in the sense data points to the EVPD bit or the PAGE CODE field, the SATL shall return GOOD status and return parameter data containing the Supported VPD Pages VPD page with only two supported VPD page codes:

a) 00h (i.e., Supported VPD Pages); and
b) 89h (i.e., ATA Information).

If the ATAPI device returns GOOD status, the SATL shall modify the parameter data containing the Supported VPD Pages VPD page returned by the ATAPI device to add 89h (i.e., the ATA Information VPD page) into the supported VPD page code list.

13.2.1.3 ATA Information VPD page

If the SATL supports the ATA Information VPD page (see 10.3.5) and it receives an INQUIRY command requesting the ATA Information VPD page, the SATL shall process the command (i.e., return parameter data and status) itself.and shall not pass through the INQUIRY command to the ATAPI device.

The SATL shall use the IDENTIFY PACKET DEVICE command (A1h) rather than the IDENTIFY DEVICE command (ECh) to retrieve information for the ATA Information VPD page from the attached ATAPI device.

12

Subject: Cross-Out
Date: 6/24/2006 4:15:36 AM

13.2.1.3 ATA Information VPD page

remove

"The SATL shall use the IDENTIFY PACKET DEVICE command (A1h) rather than the IDENTIFY DEVICE command (ECh) to retrieve information for the ATA Information VPD page from the attached ATAPI device."

The ATA Information VPD page material already takes care of ATA and ATAPI devices.
