1 Overview

What follows is a flowchart that represents the transport layers handling of read data operations at the SCSI target that are handled in the ST_TTS1:Target_Start state, ST_TTS3:Prepare_Data_In state, and ST_TTS2:Target_Send_Frame state.

It is not intention of this proposal nor is this proposal requesting the inclusion of these flowcharts into the SAS-2 standard as these flowcharts do not represent all the operations handled by the transport layer. However, it is intended that any future proposal that would impact the area of the transport layer covered by these flowcharts will be required to use them to show how any proposed change would effect the these flowcharts. The source code of the flowcharts is Visio and will be available for modification.

In the process of converting the words that are currently in SAS-2 there were no errors found, however, some of the wording may be somewhat unclear. Also, it was discovered that one of the conditions described in ST_TTS3 can never happen and another is already checked in ST_TTS2 so this proposal is recommending that they be deleted. See below the flowcharts for the suggested changes.

2 ST_TTS transport layer read data flowcharts
Read Data Offset = Offset into read data buffer
Balance Point Read Data Offset = Offset into read data buffer for last data frame that was ACKed
Data-In Request Byte Count = The number of bytes requested to be transferred. Set by the device server.

ST_TTS1

Read Data Offset = 0
Balance Point Read Data Offset = 0

ST_TTS3

RETRANSMIT BIT = 0

No

Retry

Yes

CHANGING DATA POINTER = 0
DATA offset = Read Data Offset

Data-in Request Byte Count - Read Data Offset GT maximum size of DATA IU

No

Amount of Data to transfer = Data-In Request Byte Count - Read Data Offset

Yes

Transmission Status (Frame Transmitted) confirmation received

Read Data Offset = Read Data Offset + number of read data bytes in transmitted DATA frame

No

CHANGING DATA POINTER = 1
DATA offset = Balance Point Read Data Offset

Data-in Request Byte Count - Balance Point Read Data Offset GT maximum size of DATA IU

No

Amount of Data to transfer = Data-In Request Byte Count - Balance Point Read Data Offset

Yes

Transmission Status (ACK Received) confirmation received

Balance Point Read Data Offset = Balance Point Read Data Offset + number of read data bytes in associated transmitted DATA frame

No

ST_TTS2

Note: Any Transmission Status is passed to ST_TTS2

Figure 1 — Representation of transport layer (i.e., ST_TTS1 and ST_TTS3) read data operation
Read Data Offset = Offset into read data buffer
Balance Point Read Data Offset = Offset into read data buffer for last data frame that was ACKed
Data-In Request Byte Count = The number of bytes requested to be transferred. Set by the device server.

3 Recommended changes to SAS-2

9.2.6.3.3.4 ST_TTS3: Prepare_Data_In state

9.2.6.3.3.4.1 State description

This state retrieves the data from the Device Server Buffer and constructs a read DATA frame. This state shall construct a read DATA frame using the Data-In arguments as follows:

- FRAME TYPE field set to 01h (i.e., DATA frame);
- HASHED DESTINATION SAS ADDRESS field set to the hashed value of the Destination SAS Address Data-In argument;
- HASHED SOURCE SAS ADDRESS field set to the hashed value of the SSP target port’s SAS address;
- RETRY DATA FRAMES bit set to zero;
- RETRANSMIT bit set to zero;
- CHANGING DATA POINTER set as specified in this subclause;
- NUMBER OF FILL BYTES field set to the number of fill bytes needed for the specified read data;
- TAG field set to the Tag Data-In argument;
- TARGET PORT TRANSFER TAG field set to zero;
- DATA OFFSET field set as specified in this subclause;
- in the information unit, DATA field set as specified in this subclause; and
- fill bytes, if required.
If this state is entered without a Retry argument then this state shall:

a) set the CHANGING DATA POINTER bit set to zero;
b) set the DATA OFFSET field to the Read Data Offset state machine variable; and
c) in the information unit, DATA field set to the information that starts at the location in the specified
device server buffer pointed to by the Read Data Offset state machine variable and shall contain the
amount of data that is the lesser of:
   A) the Data-In Request Byte Count argument minus the Read Data Offset state machine variable;
   and
   B) the maximum size of the DATA information unit.

If this state is entered with a Retry argument then this state shall:

a) set the CHANGING DATA POINTER bit in the frame to one;
b) set the DATA OFFSET field to Balance Point Read Data Offset state machine variable; and
c) in the information unit, DATA field set to the information that starts at the location in the specified
device server buffer pointed to by the Balance Point Read Data Offset state machine variable and
shall contain the amount of data that is the lesser of:
   A) the Data-In Request Byte Count argument minus the Balance Point Read Data Offset state
   machine variable; and
   B) the maximum size of the DATA information unit.

If a confirmation of Transmission Status (Frame Transmitted) is received, then this state shall set the Read
Data Offset state machine variable to the current read data offset plus the number of read data bytes in the
transmitted read DATA frame.

If a Transmission Status (ACK Received) confirmation is received, and the Transmit Frame request was for a
read DATA frame, then this state shall set the Balance Point Read Data Offset state machine variable to the
current balance point read data offset plus the number of read data bytes transmitted in the read DATA frame
associated with Transmission Status (ACK Received) confirmation.

9.2.6.3.3 ST_TTS2:Target_Send_Frame state

If this state is entered from the ST_TTS3:Prepare_Data_In state for transmission of a read DATA frame, then
this state shall send a Transmit Frame (Non-Interlocked) request to the port layer.

If this state is entered from the ST_TTS4:Prepare_Xfer_Rdy state for transmission of an XFER_RDY frame,
then this state shall send a Transmit Frame (Interlocked) request to the port layer.

If this state is entered from the ST_TTS6:Prepare_Response state for transmission of a RESPONSE frame,
then this state shall send a Transmit Frame (Interlocked) request to the port layer.

All Transmit Frame requests from this state shall include the read DATA frame from the
ST_TTS3:Prepare_Data_In state, the XFER_RDY frame from the ST_TTS4:Prepare_Xfer_Rdy state, or the
RESPONSE frame from the ST_TTS6:Prepare_Response state and the following arguments to be used for
any OPEN address frame:

a) initiator port bit set to zero;
b) protocol set to SSP;
c) Connection Rate argument;
d) Initiator Connection Tag argument;
e) Destination SAS Address argument; and
f) Source SAS Address argument.

After sending a Transmit Frame request this state shall wait to receive a Transmission Status (Frame
Transmitted) confirmation.

If the confirmation or argument is Transmission Status (I_T Nexus Loss), then this state shall send a
Transmission Complete (I_T Nexus Loss) message to the ST_TFR state machine. The Transmission
Complete message shall include the tag as an argument.
If the confirmation or argument is not Transmission Status (Frame Transmitted) or Transmission Status (I_T Nexus Loss), then this state shall send the Transmission Complete message defined in table 1 to the ST_TFR state machine. The message shall include the following arguments:

a) tag; and
b) arguments received with the Transmission Status confirmation.

If the confirmation is Transmission Status (Frame Transmitted) and the Transmit Frame request was for:

a) an XFER_RDY frame; or
b) a RESPONSE frame,
then this state shall wait to receive one of the following confirmations:

a) Transmission Status (ACK Received);
b) Transmission Status (NAK Received);
c) Transmission Status (ACK/NAK Timeout); or
d) Transmission Status (Connection Lost Without ACK/NAK).

If the confirmation or argument is Transmission Status (Frame Transmitted), the Transmit Frame request was for a read DATA frame, and the Read Data Offset state machine variable is equal to the Request Byte Count Data-In argument, then this state shall wait to receive:

a) Transmission Status (ACK Received) confirmations or arguments for each outstanding read DATA frame; or
b) one of the following:
   A) Transmission Status (NAK Received);
   B) Transmission Status (ACK/NAK Timeout); or
   C) Transmission Status (Connection Lost Without ACK/NAK).

NOTE 1 - If the number of data bytes that have been transmitted for a Request (Send Data-In) message are fewer than the Data-In Request Byte Count argument, then this state transitions to the ST_TTS3:Prepare_Data_In state to construct the additional read DATA frames for the request before receiving a Transmission Status (ACK Received), Transmission Status (NAK Received), Transmission Status (ACK/NAK Timeout), or Transmission Status (Connection Lost Without ACK/NAK) confirmation.

When the number of Transmission Status (Frame Transmitted) confirmations for Transmit Frame (Non-Interlocked) requests equals the number of Transmission Status (ACK Received) confirmations and arguments, and the Transmit Frame request was for a read DATA frame, this state shall set the Balance Point Read Data Offset state machine variable to the current Read Data Offset state machine variable.

If the number of Transmission Status (Frame Transmitted) confirmations for Transmit Frame (Non-Interlocked) requests is not equal to the number of Transmission Status (ACK Received) confirmations and arguments, then if a Transmission Status (ACK Received) confirmation or argument is received, and the Transmit Frame request was for a read DATA frame, then this state shall set the Balance Point Read Data Offset state machine variable to the current balance point read data offset plus the number of read data bytes transmitted in the read DATA frame associated with Transmission Status (ACK Received) confirmation or argument.

If the Transmit Frame request was for a RESPONSE frame, the vendor-specific number of retries has not been reached, and this state receives one of the following confirmations:

a) Transmission Status (NAK Received);
b) Transmission Status (ACK/NAK Timeout); or
c) Transmission Status (Connection Lost Without ACK/NAK),
then this state shall:

a) set the RETRANSMIT bit to one; and
b) resend a Transmit Frame (Interlocked) request to the port layer for the failed RESPONSE frame.
If transport layer retries are enabled, the Transmit Frame request was for a XFER_RDY frame, the vendor-specific number of retries has not been reached, and this state receives one of the following confirmations:

a) Transmission Status (NAK Received);  
b) Transmission Status (ACK/NAK Timeout); or  
c) Transmission Status (Connection Lost Without ACK/NAK),

then this state shall:

a) set the RETRANSMIT bit to one;  
b) set the value in the TARGET PORT TRANSFER TAG field to a value that is different than the target port transfer tag in the previous XFER_RDY frame associated with the Data-out arguments and is different than any other target port transfer tag currently in use. If write data is received for a subsequent XFER_RDY frame for a command, then all target port transfer tags used for previous XFER_RDY frames for the command are no longer in use; and  
c) resend a Transmit Frame (Interlocked) request to the port layer for the failed XFER_RDY frame.
Table 1 defines the messages that this state shall send to the ST_TFR state machine upon receipt of the listed confirmations and arguments, based on the conditions under which each confirmation or argument was received.

**Table 1 — Messages sent to the ST_TFR state machine**

<table>
<thead>
<tr>
<th>Confirmation received from the port layer or argument received from ST_TTS3</th>
<th>Conditions under which confirmation was received</th>
<th>Message sent to the ST_TFR state machine</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transmission Status (ACK Received)</td>
<td>The Transmit Frame request was for an XFER_RDY frame.</td>
<td>Transmission Complete (Xfer_Rdy Delivered) with a Target Port Transfer Tag argument</td>
</tr>
<tr>
<td></td>
<td>Transmit Frame request was for a RESPONSE frame</td>
<td>Transmission Complete (Response Delivered)</td>
</tr>
<tr>
<td></td>
<td>The Transmit Frame request was for a read DATA frame and: a) the Read Data Offset state machine variable is equal to the Data-In Request Byte Count argument; and b) the Read Data Offset state machine variable is equal to the Balance Point Read Data Offset state machine variable.</td>
<td>Transmission Complete (Data-In Delivered)</td>
</tr>
<tr>
<td>Transmission Status (NAK Received), Transmission Status (ACK/NAK Timeout), or Transmission Status (Connection Lost Without ACK/NAK)</td>
<td>The Transmit Frame request was for a RESPONSE frame and the vendor-specific number of retries has been reached.</td>
<td>Transmission Complete (Response Failed)</td>
</tr>
<tr>
<td>Transmission Status (NAK Received)</td>
<td>The Transmit Frame request was for an XFER_RDY frame and: a) if transport layer retries are disabled; or b) if transport layer retries are enabled and the vendor-specific number of retries has been reached.</td>
<td>Transmission Complete (Xfer_Rdy Failed, NAK Received)</td>
</tr>
<tr>
<td>Transmission Status (ACK/NAK Timeout) or Transmission Status (Connection Lost Without ACK/NAK)</td>
<td>The Transmit Frame request was for a read DATA frame and: a) if transport layer retries are disabled; or b) if transport layer retries are enabled and the vendor-specific number of retries has been reached.</td>
<td>Transmission Complete (Data-In Failed, NAK Received)</td>
</tr>
</tbody>
</table>

If this state receives a Cancel message or a Cancel argument and this state has received confirmations for all Transmit Frame requests sent to the port layer, then this state shall send a Transmission Complete (Data Transfer Terminated) message to the ST_TFR state machine.
If this state receives a Cancel message or a Cancel argument and this state has not received confirmations for all Transmit Frame requests sent to the port layer, then this state shall send a Cancel request to the port layer to cancel previous Transmit Frame requests. The Cancel request shall include the following arguments:

a) destination SAS address; and
b) tag.

Upon receipt of a Transmission Status (Cancel Acknowledged) confirmation or argument this state shall send a Transmission Complete (Data Transfer Terminated) message to the ST_TFR state machine.

A Transmission Complete message to the ST_TFR state machine shall include the following arguments:

a) destination SAS address; and
b) tag.
