Date: 29 October 2007
 To: T10 Technical Committee
 From: Ralph O. Weber
 Subject: ESP-SCSI for Parameter Data

This proposal defines a mechanism for applying SA parameter data to descriptors that are transferred in data-in buffer and/or data-out buffer parameter data.

Revision History

- r0 Original revision
- r1 Revise based on comments from April CAP Security WG, Matt Ball, and Paul Entzel
 Also increased the sequence count fields to 8 bytes (64 bits) and updated for combined encryption/integrity modes
- r2 Revised based on comments received from David Black, with reference to comments by Matt Ball.
- r3 Additional corrections made based on 29 October Security Conference Call review.

Change bars indicate the differences between r1 and r3.

Overview

The purpose of this proposal is to provide a way to transfer encrypted and/or data-origin authenticated parameter data in data-in buffers and/or data-out buffers using IETF's Encapsulating Security Payload (ESP) which is specified in RFC 4303. The version described here is called ESP-SCSI, and is slightly different than IETF's version of ESP to provide consistency with the proposed usage in SCSI parameter data instead of the frame-oriented basis that underlies the ESP design.

To comply with FIPS 140-2, it is necessary to enter a key into a cryptographic module (i.e., a SCSI device server) using an approved encryption algorithm. ESP-SCSI is one method for satisfying this requirement.

Proposed SPC-4 Changes

5.13.x ESP-SCSI for parameter data

5.13.x.1 Overview

Subclause 5.13.x defines a method for transferring encrypted and/or data origin authenticated parameter data in data-in buffers and/or data-out buffers. The method is based on the Encapsulating Security Payload (see RFC 4303) standard developed by the IETF. Because of the constrained usage of ESP-SCSI in parameter data in data-in buffers and/or data-out buffers, the method defined in this standard differs from the one found in RFC 4303.

5.13.x.2 ESP-SCSI required inputs

Prior to using the ESP-SCSI descriptors defined in 5.13.x, an SA shall be created (see 5.13.4, defined in 06-449) with SA parameters (see 5.13.2.2) that conform to the requirements defined in 5.13.2.3 and to the following:

- a) The USAGE_TYPE SA parameter shall be set to a value for which ESP-SCSI usage is defined (see table x45);
- b) The USAGE_DATA SA parameter shall contain at least the following:
 - A) The size in bytes of the initialization vector for the negotiated encryption algorithm; and
 - B) The size in bytes of the integrity check value for the:
 - a) If the negotiated encryption algorithm includes an integrity check value, the size for the negotiated encryption algorithm; or
 - b) The size for the negotiated integrity algorithm;
- and
- c) The KEYMAT SA parameter shall consist of the shared keys described in 5.13.4.9.6 (see 06-449r9 or its successors).

Each shared key in KEYMAT shall be taken, in order, from the KDF generated bits (see 5.13.4.9.6, see 06-449r9 or its successors). The size of each of the shared keys in KEYMAT is determined by the negotiated encryption algorithm and integrity algorithm as described in 5.13.4.4 (see 06-449r9 or its successors)

5.13.x.3 ESP-SCSI data format before encryption and after decryption

Before data bytes are encrypted and after they are decrypted, they have the format shown in table x1.

Table x1 — ESP-SCSI data format before encryption and after decryption

Bit Byte	7	6	5	4	3	2	1	0
0	UNENCRYPTED BYTES							
p-1								
p	PADDING BYTES							
l-1								
l	PAD LENGTH (l-p)							
l+1	MUST BE ZERO							

The UNENCRYPTED BYTES field contains the bytes that are to be protected via encryption or that have been decrypted.

Before encryption, the PADDING BYTES field contains zero to 255 bytes. The number of padding bytes is:

- a) Defined by the encryption algorithm; or

- b) The number needed to cause the length of all bytes prior to encryption (i.e., l+2) to be a whole multiple of the cipher block size for the encryption algorithm being used.

The contents of the padding bytes are:

- a) Defined by the encryption algorithm; or
- b) If the encryption algorithm does not define the padding bytes contents, a series of one byte binary values starting at one and incrementing by one in each successive byte (i.e., 01h in the first padding byte, 02h in the second padding byte, etc.).

If the encryption algorithm does not place requirements on the contents of the padding bytes (i.e., option b) is in effect), then after decryption the contents of the padding bytes shall be verified to match the series of one byte binary values described in this subclause. If this verification is not successful in a device server, the command shall be terminated with CHECK CONDITION status, with the sense key set to ILLEGAL REQUEST, the additional sense code set to INVALID FIELD IN PARAMETER LIST, the SKSV bit set to one, and SENSE KEY SPECIFIC field set to indicate the last byte in the encrypted data as defined in 4.5.2.4.2. If this verification is not successful in an application client, the decrypted data should be ignored.

The PAD LENGTH field contains the number of bytes in the PADDING BYTES field.

The MUST BE ZERO field contains zero. After decryption, the contents of the MUST BE ZERO field shall be verified to be zero. If this verification is not successful in a device server, the command shall be terminated with CHECK CONDITION status, with the sense key set to ILLEGAL REQUEST, the additional sense code set to INVALID FIELD IN PARAMETER LIST, the SKSV bit set to one, and SENSE KEY SPECIFIC field set to indicate the last byte in the encrypted data as defined in 4.5.2.4.2. If this verification is not successful in an application client, the decrypted data should be ignored.

5.13.x.4 ESP-SCSI data-out buffer parameter list data descriptors

5.13.x.4.1 Overview

When ESP-SCSI is used in parameter list data which appears in a data-out buffer, the parameter list data contains one or more descriptors selected based on the criteria shown in table x2.

Table x2 — ESP-SCSI data-out buffer parameter data descriptors

Descriptor name	External descriptor length ^a	Initialization vector	Reference
ESP-SCSI out	No	No	table x3 in 5.13.x.4.2
	No	Yes	table x4 in 5.13.x.4.2
ESP-SCSI out w/o length	Yes	No	table x5 in 5.13.x.4.3
	Yes	Yes	table x6 in 5.13.x.4.3

^a This is determined by the data format defined for the data-out buffer parameter data. If the format includes a length for the ESP-SCSI descriptor, then the answer to this question is yes.

5.13.x.4.2 ESP-SCSI data-out buffer parameter lists including a descriptor length

If the USAGE_DATA SA parameter (see 5.13.2.2) indicates an initialization vector size of zero, then the data-out buffer parameter list descriptor shown in table x3 contains the ESP-SCSI data.

Table x3 — ESP-SCSI data-out buffer parameter list descriptor without initialization vector

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB)	DESCRIPTOR LENGTH (n-1)						(LSB)
1								
2		Reserved						
3								
4	(MSB)	DS_SAI						(LSB)
7								
8	(MSB)	DS_SQN						(LSB)
15								
16		ENCRYPTED OR AUTHENTICATED DATA						
i-1								
i	(MSB)	INTEGRITY CHECK VALUE						(LSB)
n								

The DESCRIPTOR LENGTH field, DS_SAI field, DS_SQN field, ENCRYPTED OR AUTHENTICATED DATA field, and INTEGRITY CHECK VALUE field are defined after table x4 in this subclause.

If the USAGE_DATA SA parameter indicates an initialization vector size (i.e., s) is greater than zero, the data-out buffer parameter data descriptor shown in table x4 contains the ESP-SCSI data.

Table x4 — ESP-SCSI data-out buffer full parameter list descriptor

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB)	DESCRIPTOR LENGTH (n-1)						(LSB)
1		Reserved						
2								
3								
4	(MSB)	DS_SAI						(LSB)
7								
8	(MSB)	DS_SQN						(LSB)
15								
16	(MSB)	INITIALIZATION VECTOR						(LSB)
10+s-1								
10+s		ENCRYPTED OR AUTHENTICATED DATA						
i-1								
i	(MSB)	INTEGRITY CHECK VALUE						(LSB)
n								

The DESCRIPTOR LENGTH field specifies the number of bytes that follow in the ESP-SCSI data-out buffer parameter list descriptor.

The DS_SAI field contains the value in the DS_SAI SA parameter (see 5.13.2.2) for the SA that is being used to prepare the ESP-SCSI data-out buffer parameter list descriptor. If the DS_SAI value is not known to the device server, the command shall be terminated with CHECK CONDITION status, with the sense key set to ILLEGAL REQUEST, the additional sense code set to INVALID FIELD IN PARAMETER LIST, the sksv bit set to one, and SENSE KEY SPECIFIC field set as defined in 4.5.2.4.2.

The DS_SQN field should contain one plus the value in the application client's DS_SQN SA parameter (see 5.13.2.2) for the SA that is being used to prepare the ESP-SCSI data-out buffer parameter list descriptor. Before sending the ESP-SCSI data-out buffer parameter list, the application client should copy the contents of the DS_SQN field to its DS_SQN SA parameter.

The device server shall terminate the command with CHECK CONDITION status, with the sense key set to ILLEGAL REQUEST, the additional sense code set to INVALID FIELD IN PARAMETER LIST, the sksv bit set to one, and SENSE KEY SPECIFIC field set as defined in 4.5.2.4.2 if any of the following conditions are detected:

- a) The DS_SQN field is set to zero;
- b) The value in the DS_SQN field is less than or equal to the value in the device server's DS_SQN SA parameter; or
- c) The value in the DS_SQN field is greater than 32 plus the value in the device server's DS_SQN SA parameter.

If the command is not terminated due to sequence number errors, the device server shall copy the contents of the received DS_SQN field to its DS_SQN SA parameter.

If the DS_SQN SA parameter is equal to FFFF FFFF FFFF FFFFh, the device server shall delete the SA.

The INITIALIZATION VECTOR field, if any, contains a value that is used as an input into the encryption and/or data origin authentication algorithm specified by the SA specified by the DS_SAI field. The INITIALIZATION VECTOR field is not encrypted. The encryption and/or data origin authentication algorithm may define additional requirements for the INITIALIZATION VECTOR field.

The ENCRYPTED OR AUTHENTICATED DATA field contains:

- a) If an encryption algorithm is specified by the SA specified by the DS_SAI field, encrypted data bytes; or
- b) unencrypted data bytes in all other cases.

Unless otherwise specified by the encryption algorithm or authentication algorithm, the INTEGRITY CHECK VALUE field contains a value that is computed as specified by the algorithms specified by the SA specified by the DS_SAI field. The integrity check value is computed using the following bytes as inputs, in order:

- 1) The bytes in the DS_SAI field;
- 2) The bytes in the DS_SQN field;
- 3) If the authentication algorithm is not AUTH_COMBINED (see 7.7.3.6.4 defined in 07-437), then the bytes in the INITIALIZATION VECTOR field, if any; and
- 4) The following bytes based on whether encryption is being performed:
 - A) If an encryption algorithm is specified by the SA specified by the DS_SAI field:
 - 1) The bytes in the UNENCRYPTED BYTES field (see 5.13.x.3);
 - 2) The bytes in the PADDING BYTES field (see 5.13.x.3);
 - 3) The PAD LENGTH field byte (see 5.13.x.3); and
 - 4) The MUST BE ZERO field byte (see 5.13.x.3);or
 - B) If an encryption algorithm is not specified by the SA specified by the DS_SAI field:
 - 1) The bytes in the ENCRYPTED OR AUTHENTICATED DATA field.

Upon receipt of ESP-SCSI data-out buffer parameter data, the device server shall compute an integrity check value for the ESP-SCSI parameter data as specified by the algorithms specified by the SA specified by the DS_SAI field using the inputs shown in this subclause. If the computed integrity check value does not match the value in the INTEGRITY CHECK VALUE field, the command shall be terminated with CHECK CONDITION status, with the sense key set to ILLEGAL REQUEST, the additional sense code set to INVALID FIELD IN PARAMETER LIST, the sksv bit set to one, and SENSE KEY SPECIFIC field set as defined in 4.5.2.4.2.

5.13.x.4.3 ESP-SCSI data-out buffer parameter lists for externally specified descriptor length

If the USAGE_DATA SA parameter (see 5.13.2.2) indicates an initialization vector size of zero and the length of the ESC-SCSI data-out buffer parameter list descriptor appears elsewhere in the parameter list, then the data-out buffer parameter list descriptor shown in table x5 contains the ESP-SCSI data.

Table x5 — ESP-SCSI data-out buffer parameter list descriptor without length and initialization vector

Bit Byte	7	6	5	4	3	2	1	0	
0	(MSB)								
3		DS_SAI						(LSB)	
4	(MSB)								
11		DS_SQN						(LSB)	
12		ENCRYPTED OR AUTHENTICATED DATA							
i-1									
i	(MSB)	INTEGRITY CHECK VALUE							
n								(LSB)	

The DS_SAI field, DS_SQN field, ENCRYPTED OR AUTHENTICATED DATA field, and INTEGRITY CHECK VALUE field are defined in 5.13.x.4.2.

If the USAGE_DATA SA parameter indicates an initialization vector size (i.e., s) is greater than zero and the length of the ESC-SCSI data-out buffer parameter list descriptor appears elsewhere in the parameter list, the data-out buffer parameter list descriptor shown in table x6 contains the ESP-SCSI data.

Table x6 — ESP-SCSI data-out buffer parameter list descriptor without length

Bit Byte	7	6	5	4	3	2	1	0	
0	(MSB)								
3		DS_SAI						(LSB)	
4	(MSB)								
11		DS_SQN						(LSB)	
12	(MSB)	INITIALIZATION VECTOR							
8+s-1								(LSB)	
8+s		ENCRYPTED OR AUTHENTICATED DATA							
i-1									
i	(MSB)	INTEGRITY CHECK VALUE							
n								(LSB)	

The DS_SAI field, DS_SQN field, INITIALIZATION VECTOR field, ENCRYPTED OR AUTHENTICATED DATA field, and INTEGRITY CHECK VALUE field are defined in 5.13.x.4.2.

5.13.x.5 ESP-SCSI data-in buffer parameter data descriptors

5.13.x.5.1 Overview

A device server shall transfer ESP-SCSI parameter data descriptors in a data-in buffer only in response to a request that specifies an SA using the AC_SAI SA parameter and DS_SAI SA parameter values (see 5.13.2.2). If the specified combination of AC_SAI and DS_SAI values in a command that requests the transfer of ESP-SCSI parameter data descriptors is not known to the device server, the command shall be terminated with CHECK CONDITION status, with the sense key set to ILLEGAL REQUEST, the additional sense code set to INVALID FIELD IN PARAMETER LIST or to INVALID FIELD IN CDB, the SKSV bit set to one, and SENSE KEY SPECIFIC field set as defined in 4.5.2.4.2.

When ESP-SCSI is used in parameter data which appears in a data-in buffer, the parameter data contains one or more descriptors selected based on the criteria shown in table x7.

Table x7 — ESP-SCSI data-in buffer parameter data descriptors

Descriptor name	External descriptor length ^a	Initialization vector	Reference
ESP-SCSI in	No	No	table x8 in 5.13.x.5.2
	No	Yes	table x9 in 5.13.x.5.2
ESP-SCSI in w/o length	Yes	No	table x10 in 5.13.x.5.3
	Yes	Yes	table x11 in 5.13.x.5.3
^a This is determined by the data format defined for the data-in buffer parameter data. If the format includes a length for the ESP-SCSI descriptor, then the answer to this question is yes.			

5.13.x.5.2 ESP-SCSI data-in buffer parameter data including a descriptor length

If the USAGE_DATA SA parameter (see 5.13.2.2) indicates an initialization vector size of zero, then the data-in buffer parameter data descriptor shown in table x8 contains the ESP-SCSI data.

Table x8 — ESP-SCSI data-in buffer parameter data descriptor without initialization vector

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB)	DESCRIPTOR LENGTH (n-1)						(LSB)
1		Reserved						
2		AC_SAI						
3		AC_SAI						(LSB)
4	(MSB)	AC_SQN						(LSB)
7		AC_SQN						(LSB)
8	(MSB)	ENCRYPTED OR AUTHENTICATED DATA						(LSB)
15		ENCRYPTED OR AUTHENTICATED DATA						(LSB)
16		ENCRYPTED OR AUTHENTICATED DATA						(LSB)
i-1		ENCRYPTED OR AUTHENTICATED DATA						(LSB)
i	(MSB)	INTEGRITY CHECK VALUE						(LSB)
n		INTEGRITY CHECK VALUE						(LSB)

The DESCRIPTOR LENGTH field, AC_SAI field, AC_SQN field, ENCRYPTED OR AUTHENTICATED DATA field, and INTEGRITY CHECK VALUE field are defined after table x9 in this subclause.

If the USAGE_DATA SA parameter indicates an initialization vector size (i.e., s) is greater than zero, the data-in buffer parameter data descriptor shown in table x9 contains the ESP-SCSI data.

Table x9 — ESP-SCSI data-in buffer full parameter data descriptor

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB)	DESCRIPTOR LENGTH (n-1)						(LSB)
1								
2		Reserved						
3								
4	(MSB)	AC_SAI						(LSB)
7								
8	(MSB)	AC_SQN						(LSB)
15								
16	(MSB)	INITIALIZATION VECTOR						(LSB)
10+s-1								
10+s		ENCRYPTED OR AUTHENTICATED DATA						
i-1								
i	(MSB)	INTEGRITY CHECK VALUE						(LSB)
n								

The DESCRIPTOR LENGTH field specifies the number of bytes that follow in the ESP-SCSI data-in buffer parameter data descriptor.

The AC_SAI field contains the value in the AC_SAI SA parameter (see 5.13.2.2) for the SA that is being used to prepare the ESP-SCSI data-in buffer parameter data descriptor. If the AC_SAI value is not known to the application client, the ESP-SCSI data-in parameter data descriptor should be ignored.

The AC_SQN field contains one plus the value in the device server's AC_SQN SA parameter (see 5.13.2.2) for the SA that is being used to prepare the ESP-SCSI data-on buffer parameter data descriptor. Before sending the ESP-SCSI data-out buffer parameter list as part of a command that completes with GOOD status, the device server shall copy the contents of the AC_SQN field to its AC_SQN SA parameter.

If the AC_SQN SA parameter is equal to FFFF FFFF FFFF FFFFh, the device server shall delete the SA after the data-in buffer parameter data containing that value is sent.

The application client should ignore the ESP-SCSI data-in parameter data descriptor if any of the following conditions are detected:

- a) The AC_SQN field is set to zero;
- b) The value in the AC_SQN field is less than or equal to the value in the application client's AC_SQN SA parameter; or
- c) The value in the AC_SQN field is greater than 32 plus the value in the application client's AC_SQN SA parameter.

If the command completes with GOOD status, the application client should copy the contents of the AC_SQN field to its AC_SQN SA parameter.

The INITIALIZATION VECTOR field, if any, contains a value that is used as an input into the encryption and/or data origin authentication algorithm specified by the SA specified by the AC_SAI field. The INITIALIZATION VECTOR field is not encrypted. The encryption and/or data origin authentication algorithm may define additional requirements for the INITIALIZATION VECTOR field.

The ENCRYPTED OR AUTHENTICATED DATA field contains:

- a) If an encryption algorithm is specified by the SA specified by the AC_SAI field, encrypted data bytes; or
- b) unencrypted data bytes in all other cases.

Unless otherwise specified by the encryption algorithm or authentication algorithm, the INTEGRITY CHECK VALUE field contains a value that is computed as specified by the algorithms specified by the SA specified by the AC_SAI field. The integrity check value is computed using the following bytes as inputs, in order:

- 1) The bytes in the AC_SAI field;
- 2) The bytes in the AC_SQN field;
- 3) If the authentication algorithm is not AUTH_COMBINED (see 7.7.3.6.4 defined in 07-437), then the bytes in the INITIALIZATION VECTOR field, if any; and
- 4) The following bytes based on whether encryption is being performed:
 - A) If an encryption algorithm is specified by the SA specified by the AC_SAI field:
 - 1) The bytes in the UNENCRYPTED BYTES field (see 5.13.x.3);
 - 2) The bytes in the PADDING BYTES field (see 5.13.x.3);
 - 3) The PAD LENGTH field byte (see 5.13.x.3); and
 - 4) The MUST BE ZERO field byte (see 5.13.x.3);or
 - B) If an encryption algorithm is not specified by the SA specified by the AC_SAI field:
 - 1) The bytes in the ENCRYPTED OR AUTHENTICATED DATA field.

Upon receipt of ESP-SCSI data-in buffer parameter data, the application client should compute an integrity check value for the ESP-SCSI parameter data as specified by the algorithms specified by the SA specified by the AC_SAI field using the inputs shown in this subclause. If the computed integrity check value does not match the value in the INTEGRITY CHECK VALUE field, the results returned by the command should be ignored.

5.13.x.5.3 ESP-SCSI data-in buffer parameter data for externally specified descriptor length

If the USAGE_DATA SA parameter (see 5.13.2.2) indicates an initialization vector size of zero and the length of the ESC-SCSI data-in buffer parameter data descriptor appears elsewhere in the parameter data, then the data-in buffer parameter data descriptor shown in table x10 contains the ESP-SCSI data.

Table x10 — ESP-SCSI data-in buffer parameter data descriptor without length and initialization vector

Bit Byte	7	6	5	4	3	2	1	0	
0	(MSB)								
3		AC_SAI						(LSB)	
4	(MSB)								
11		AC_SQN						(LSB)	
12		ENCRYPTED OR AUTHENTICATED DATA							
i-1									
i	(MSB)	INTEGRITY CHECK VALUE							
n								(LSB)	

The AC_SAI field, AC_SQN field, ENCRYPTED OR AUTHENTICATED DATA field, and INTEGRITY CHECK VALUE field are defined in 5.13.x.5.2.

If the USAGE_DATA SA parameter indicates an initialization vector size (i.e., s) is greater than zero and the length of the ESC-SCSI data-in buffer parameter data descriptor appears elsewhere in the parameter data, the data-in buffer parameter data descriptor shown in table x11 contains the ESP-SCSI data.

Table x11 — ESP-SCSI data-in buffer parameter data descriptor without length

Bit Byte	7	6	5	4	3	2	1	0	
0	(MSB)								
3		AC_SAI						(LSB)	
4	(MSB)								
11		AC_SQN						(LSB)	
12	(MSB)	INITIALIZATION VECTOR							
8+s-1								(LSB)	
8+s		ENCRYPTED OR AUTHENTICATED DATA							
i-1									
i	(MSB)	INTEGRITY CHECK VALUE							
n								(LSB)	

The AC_SAI field, AC_SQN field, INITIALIZATION VECTOR field, ENCRYPTED OR AUTHENTICATED DATA field, and INTEGRITY CHECK VALUE field are defined in 5.13.x.5.2.

{{Modify the Annex C introduced by 07-437 as shown here.}}

Annex C

(Informative)

~~IKEv2 protocol details and variations for IKEv2-SCSI~~ Notes regarding security features

C.1 IKEv2 protocol details and variations for IKEv2-SCSI

{{No other changes in the 07-437 text.}}

C.2 ESP protocol details and variations for ESP-SCSI

{{All of C.2 is new. Changes markups suspended.}}

We should consider adding a list (perhaps in a note) that lists the important differences between ESP and ESP-SCSI. Here are the things I could find:

The IKEv2 protocol details and variations specified in RFC 4303 apply to ESP-SCSI (i.e., this standard) as follows:

- a) This standard requires an integrity check value (ICV field), whereas ESP allows support of confidentiality-only;
- b) This standard does not support traffic flow confidentiality;
- c) This standard does not support the TCP/IP aspects of ESP (e.g., IP addresses, multicast);
- d) This standard requires anti-replay detection using the sequence number, whereas ESP makes this optional;
- e) This standard does not support the Next Header field, but does reserve space for it in the MUST BE ZERO field (see table x1 in 5.13.x.3);
- f) This standard requires verification of the padding bytes, when possible;
- g) There is no provision in this standard for generating 'dummy packets'; and
- h) This standard does not support out-of-order parameter data.
