6G SAS
RX Tolerance, Reference RX & Reference TX

Mike Jenkins
LSI Corporation
Jitter Tolerance Table

Modify note k to something like:

“For 6 Gbps, TJ is measured at the reference RX output, then disconnected and connected to the RX under test”

<table>

</table>

- All DJ and TJ values are level 1 (see MJSQ).
- The jitter values given are normative for a combination of applied SJ, DJ, and TJ that receiver devices shall be able to tolerate without exceeding the required BER (see 5.3.3). Receiver devices shall tolerate applied SJ of progressively greater amplitude at lower frequencies, according to figure 116 (see 5.3.5.4), with the same DJ and RJ levels as were used in the high frequency sweep.
- Applied sinusoidal sweep frequency: 900 kHz to the minimum of 5 MHz and (3.75 x 2^generation - 1) MHz (e.g., 5 MHz for 1.5 Gbps and 7.5 MHz for 3 Gbps).
- Applied sinusoidal sweep frequency: 1600 kHz to the minimum of 5 MHz and (3.75 x 2^generation - 1) MHz (e.g., 5 MHz for 1.5 Gbps and 7.5 MHz for 3 Gbps).
- No value is given for RJ. For compliance with this standard, the actual RJ amplitude shall be the value that brings TJ to the stated value at a probability of 10^-6. The additional 0.1 UI of applied SJ is added to ensure the receiver device has sufficient operating margin in the presence of external interference.
- The measurement bandwidth shall be 900 kHz to 750 MHz.
- The measurement bandwidth shall be 1000 kHz to 1500 MHz.
- The DJ and TJ values in this table apply to jitter measured as described in 5.3.5.3. Values for DJ and TJ shall be calculated from the CDF for the jitter population using the calculation of level 1 jitter compliance levels method in MJSQ.
- Applied sinusoidal sweep frequency: 3600 kHz to 15 MHz.
- The measurement bandwidth shall be 3 800 kHz to 3 000 MHz.
- TJ for 6 Gbps is after equalization and not at the compliance point.
Open Issues

• Add CDR function to Reference RX?
• Which impairments to include in jitter tolerance?
  - Bounded uncorrelated jitter (BUJ)
    • DJ = BUJ + ISI from ref. channel
  - NEXT & FEXT
  - Sinusoidal jitter (SJ)
  - Req’d RX (post-EQ) eye opening vs. TX amplitude
Proposals & Interpretations

- DJ (including SJ) added at TX is BUJ
- Effect of NEXT & FEXT included in BUJ
- TJ at ref RX output is “noncompensable jitter”
- Increase VMA of ref TX to 800 mVppd to provide 100 mVppd vertical eye opening at ref RX output
