American National Standards for Information Systems -

SCSI / ATA Translation - 2 (SAT-2)

Secretariat National Committee for Information Technology Standards

Approved mm dd yy

American National Standards Institute, Inc.

Abstract

This standard specifies a translation layer between SCSI and ATA protocols. This translation layer is used by storage controllers to emulate objects in a SCSI logical unit using an ATA device, providing capabilities defined by SCSI standards (e.g., the CSI Block Commands (BC-2) and SCSI Primary Commands (BPC-3) standards). For the purposes of this standard, ATA device capabilities are defined by ATA8-AAM, ATA8-ACS, ATA8-APT, ATA8-AST, and SATA-2.6.

American National Standard Approval of an American National Standard requires verification by ANSI that the requirements for due process, consensus, and other criteria for approval have been met by the standards developer. Consensus is established when, in the judgment of the ANSI Board of Standards Review, substantial agreement has been reached by directly and materially affected interests. Substantial agreement means much more than a simple majority, but not necessarily unanimity. Consensus requires that all views and objections be considered and that effort be made toward their resolution.

The use of American National Standards is completely voluntary; their existence does not in any respect preclude anyone, whether he or she has approved the standards or not, from manufacturing, marketing, purchasing, or using products, processes, or procedures not confirming to the standards.

The American National Standards Institute does not develop standards and shall in no circumstances give interpretation on any American National Standard in the name of the American National Standards Institute. Requests for interpretations should be addressed to the secretariat or sponsor whose name appears on the title page of this standard.

CAUTION NOTICE: This American National Standard may be revised or withdrawn at any time. The procedures of the American National Standards Institute require that action be taken periodically to reaffirm, revise, or withdraw this standard. Purchasers of American National Standards may receive current information on all standards by calling or writing the American National Standards Institute.

CAUTION: The developers of this standard have requested that holders of patents that may be required for the implementation of the standard, disclose such patents to the publisher. However, neither the developers nor the publisher have undertaken a patent search in order to identify which, if any, patents may apply to this standard. As of the date of publication of this standard, following calls for the identification of patents that may be required for the implementation of the standard, notice of one or more claims has been received. By publication of this standard, no position is taken with respect to the validity of this claim or of any rights in connection therewith. The known patent holder(s) has (have), however, filed a statement of willingness to grant a license under these rights on reasonable and nondiscriminatory terms and conditions to applicants desiring to obtain such a license. Details may be obtained from the publisher. No further patent search is conducted by the developer or the publisher in respect to any standard it processes. No representation is made or implied that licenses are not required to avoid infringement in the use of this standard.

Revision Information

R.0 SAT-2 r00 (22 February 2007)

Created revision 0 from original SAT final document. Updated references.

R.1 SAT-2 r01 (09 July 2007)

Incorporated 07-148r0 (SAT2 - Use something other than 'comprises', Robert Sheffield) as approved by the May 2007 plenary.

Incorporated 07-146r0 (SAT command summary for SEND DIAGNOSTIC, Robert Sheffield) as approved by the May 2007 plenary.

Incorporated 06-250r1 (SAT-2: Application Client Log Page Translation, Mark Overby)as approved by the March 2007 plenary.

Removed reference in command summary table to READ MEDIA SERIAL number as that was removed from SAT, but the table still contained the reference.

Corrected minor typographical errors pointed out by Rob Elliott (HP)

Changes all references to direct or indirect block mapping to direct or indirect logical block mapping to match SBC-3

R.1a SAT-2 r01a (11 July 2007)

Incorrectly stated in SAT-2 r01 that 06-250r1 was incorporated as approved. What was actually incorporated was 07-074r2 (SAT2 Translation of SECURITY PROTOCOL IN/OUT, Jim Hatfield) as approved in the May 2007 plenary.

Correctly incorporated 06-250r1 (SAT-2: Application Client Log Page Translation, Mark Overby) as approved by the March 2007 plenary.

R.2 SAT-2 r02 (20 February 2008)

Updated revision history to include proposal names and authors for tracking purposes.

Incorporated editorial comments from Rob Elliott (HP) for Control Mode Page table

Incorporated 07-298r0 (SAT-2: Error Translation Mapping for ATA IDNF, Jeff Wolford) as approved by the July 2007 plenary.

Incorporated 07-201r2 (SAT-2: Translation of large block sizes, Jim Hatfield) as approved by the July 2007 plenary. Updated previous revision history to include the names of the proposals.

Updated cover information to reflect change in Vice-Chair to Mark Evans of WD Updated copyright information to 2008

R.2a SAT-2 r02a (9 March 2008)

Fixed numbering problems

Fixed more 2006 copyright problems to 2008

Fixed various English language problems in Clauses 3, 4, and 5. (From Rob Elliott)

Fixed incorporation of 07-201. Added editors note that the diagram has not yet been provided to the editor for incorporation.

R.3 SAT-2 r03 (25 April 2008)

Accepted all change bars from previous revisions after draft review during working group meeting in March 2008. Incorporated 08-075r1 (SAT-2: ATA Device Security Password Feature, Curtis Stevens)

Incorporated 07-402r2 (SAT-2: SATA NCQ Priority Translation, Brad Besmer). An editorial change was made to match the SAM-4 letter ballot resolution that changes task priority to command priority.

Updated all references from SATA 2.5 to 2.6 (except for the diagram and for one with an editors note on it) Incorporated 08-041r1 (Use period as separator in T10 standards, Rob Elliott)

Corrected some long hexadecimal numbers to use xxxx_xxxh to be consistent with overall style.

T Nu	mber: 1	Author: LSI-Penokie	Subject: Highlight	Date: 8/19/2008 10:03:31 AM -07'00'

Status moverby Accepted

9/11/2008 11:18:06 AM -07'00'

Fixed style errors in TOC.

Incorporated 07-200r3 (WRITE LONG to WRITE UNCORRECTABLE translation, Rob Elliott)

R.4 SAT-2 r04 (05 May 2008)

Incorporated 08-016r1 (Block Characteristics VPD Page Translation, Brad Besmer)

Incorporated 08-019r2 (SAT-2 WRITE BUFFER MODE 7 to DOWNLOAD MICROCODE Mode 3, Jeff Wolford) Resolved editor's notes about previous incorporations that required changes (changes accepted) - some notes remain pending resolution

Removed changes from "task" to "command" due to SAM-4 letter ballot changes. This needs further discussion at the working group

All SATA 2.5 references are now SATA 2.6 references (save editor's noted items)

R.5 SAT-2-105

Added new editor's notes.

Corrected editor note numbering problems with help from Ralph Weber. Replaced Sector Count with either ATA Sector Count or Count field depending on context Incorporated 08-230r0 (Translation of zero-length security commands, Mark Overby) Incorporated 07-485r6 (Additional Power Management support, Fred Knight)

R.6 SAT-2 r06

Incorporated editorial changes from June WG meeting.

Replaced issue with send or sent whenever talking about the transmission of commands

Changed most references of SAM-3 to SAM-4. Added SAM-4 to list of standards

Revised figure 2 to include ATA8-AST and removed mention of not using the AST standard

Made clause 2 match SPC-4 for general text and where to buy standards

Revised ISO/ANSI numbering for references to match SPC-4 style

Incorporated 08-239r0 (SAT-2 Definition Cleanup, Mark Overby)

Made SAS definitions match SAS-2

Updated usage of task (when meaning a command) to read command per SAM-4

Added new clause to models section for large physical sector versus logical sector and revised definitions as per guidance from WG meetings in June and July

Number: 1 Author: HPQ-RElliott Subject: Highlight D Add dates to R.5 and R.6 and future revision history headers Date: 9/3/2008 9:42:24 AM -07'00'

Status moverby Rejected Author: moverby Noted for future SAT projects, but will reject as the next version will not have a revision history.

Foreword

This foreword is not part of American National Standard INCITS ***-200x.

This standard provides a common set of definitions and requirements to establish common behavior among implementations that emulate SCSI device behavior through the combined use of ATA devices and a SCSI / ATA Translation layer (SATL). The SATL may reside in a host-based driver or it may reside in a separate component (e.g., a host bus adapter or external controller) with a separate processing unit to effect be translation. A SATL and ATA device combination may provide a functional subset of common SCSI capabilities. There is also a range of optional emulated SCSI capabilities that may be supported are not, depending on the capabilities of the SATL.

This standard defines SATL capabilities in terms of SCSI capabilities as defined by the applicable SCSI standards and working drafts, and defines the elements and use of ATA protocol to provide those SCSI capabilities and services in a consistent manner among SAT implementations that implement according to this standard.

With any technical document there may arise questions of interpretation as new products are implemented. INCITS has established procedures to issue technical opinions concerning the standards developed by INCITS. These procedures may result in SCSI Technical Information Bulletins being published by INCITS.

These Bulletins, while reflecting the opinion of the Technical Committee that developed the standard, are intended solely as supplementary information to other users of the standard. This standard, ANSI BSR INCITS ***-2006, as approved through the publication and voting procedures of the American National Standards Institute, is not altered by these bulletins. Any subsequent revision to this standard may or may not reflect the contents of these Technical Information Bulletins.

Current INCITS practice is to make Technical Information Bulletins available through:

INCITS Online Store	http://www.techstreet.com/INCITS.html	
managed by Techstreet	Telephone: 1-734-302-7801 or	
1327 Jones Drive	1-800-699-9277	
Ann Arbor, MI 48105	Facsimile: 1-734-302-7811	

or

Global Engineering	http://global.ihs.com/
15 Inverness Way East	Telephone: 1-303-792-2181 or
Englewood, CO 80112-5704	1-800-854-7179
	Facsimile: 1-303-792-2192

Requests for interpretation, suggestions for improvement and addenda, or defect reports are welcome. They should be sent to the INCITS Secretariat, National Committee for Information Technology Standards, Information Technology Institute, 1250 Eye Street, NW, Suite 200, Washington, DC 20005-3922.

This standard was processed and approved for submittal to ANSI by the InterNational Committee for Information Technology Standards (INCITS). Committee approval of the standard does not necessarily imply that all committee members voted for approval.

Technical Committee T10 on Lower Level Interfaces, which developed and reviewed this standard, had the following members:

John B. Lohmeyer, Chair <mark>Seorge O. Penokie, Vice-Chair</mark> Ralph O. Weber, Secretary

Introduction

The SCSI / ATA Translation - 2 (SAT-2) standard is divided into the following clauses:

Clause 1 defines the scope of this standard.

- Clause 2 enumerates the normative references that apply to this standard.
- Clause 3 describes the definitions, symbols, abbreviations, and notation conventions used in this standard.
- Clause 4 describes the general framework for defining elements of translation between SCSI and ATA protocol.

Clause 5 describes elements of SCSI / ATA Translation that relate to the SCSI architecture model.

Ulause 6 describes the mapping of task [2] anagement functions in the SATL layer.

Clause 7 provide a summary of SCSI commands mapped to ATA in this standard.

Clause 8 describes the mapping between CCSI Primary Commands and ATA protocol.

Clause 9 describes the mapping between **CSI Block Commands** and ATA protocol.

Clause 10 describes the mapping of mode pages, log pages, and VPD page information to selected ATA protocol elements.

Clause 11 describes error reporting and sense data conventions for SCSI / ATA Translation.

Clause 12 describes SCSI commands and mode pages to support SCSI / ATA Translation.

Annex A describes the HQUIRY command translation for ATAPI devices.

AMERICAN NATIONAL STANDARD

BSR INCITS *** 2006

American National Standard for Information Systems -Information Technology -SCSI / ATA Translation

1 Scope

The set of SCSI standards specifies the interfaces, functions, and operations necessary to ensure interoperability between conforming SCSI implementations. This standard is a functional description. Conforming implementations may employ any design technique that does not violate interoperability.

This standard defines the protocol requirements of the SCSI / ATA Translation Layer (SATL) to allow conforming SCSI / ATA translating components to interoperate with ATA devices and SCSI application layers. The SATL covers the range of implementations that use ATA devices to emulate the behavior of SCSI devices as viewed by the SCSI application layer. The primary focus of this standard is to define SCSI / ATA Translation for an ATA device (see 3.1.9).

Where possible, this standard defines SCSI / ATA Translation in a manner that is consistent with the SAM-4, PC-3, and SBC-2 standards. In some instances, the defined function of an ATA device is different from corresponding functions defined for SCSI target devices . single ATA queued command). The translation defined in this standard, in such cases, may not be consistent with other SCSI standards. However, in such cases, this standard specifies the expected behavior, and in what manner it is inconsistent with the behavior specified in other SCSI standards.

The objective of this standard is to allow a complete set of SCSI functions while minimizing the complexity of the SATL and preserving compatibility with existing SCSI application clients.

The objectives of the SATL are:

- a) to provide host computers with device independence with respect to the ATA devices that have user storage capacity, and with respect to various implementations of the translation layer used to emulate the behavior of SCSI target devices;
- b) to define common features and functions representing a subset of the capabilities available in SCSI devices that apply to SCSI / ATA Translation implementations;
- c) to define common methods to manage aspects of ATA devices that do not map to previously defined features and functions of SCSI, with provision made for the addition of special features and functions; and
- d) to provide consistent means for discovery and control of optional SCSI features that may or may not be emulated in CSI / ATA translator implementations. These means are provided by specifying how transport specific features and functions are represented in a mixed-domain topology in a manner consistent with management of devices in a SCSI domain.

	Delete
	ISO/IEC 14776-413, SCSI Architecture Model - 3 (SAM-3) [ANSI INCITS 402-2005]
	and ungrade all references to SAM 4
	Status
	moverby Accepted 11/3/2006 11.12.32 PM
9	Following global comment on using SAM-4, SPC-4 and SBC-3, remove Approved References: ATA-7, since its based on 8 according to above, SAM-3, SPC-3, SBC-2
	Also SAS-2 missing, but referenced in definitions
	SAM 2 ok because of non autosense reference
	SAM-2 OK, because of non-autosense felerence.

2 Normative References

2.1 Normative references

The following standards contain provisions that, by reference in the text, constitute provisions of this standard. At the time of publication, the editions indicated were valid. All standards are subject to revision, and parties to agreements based on this standard are encouraged to investigate the possibility of applying the most recent editions of the standards listed below.

2.2 Approved references

Copies of the following documents may be obtained from ANSI, an ISO member organization:

- a) Approved ANSI standards;
- b) approved international and regional standards (ISO and IEC); and
- c) approved foreign standards (including JIS and DIN).

For further information, contact the ANSI Customer Service Department:

Phone: +1 212-642-4900 Fax: +1 212-302-1286 Web: http://www.ansi.org E-mail: ansionline@ansi.org

or the International Committee for Information Technology Standards (INCITS):

Phone: +1 202-626-5738 Web: http://www.incits.org E-mail: incits@itic.org

2.3 References under development

At the time of publication, the following referenced standards were still under development. For information on the current status of the document, or regarding availability, contact the relevant standards body or other organization as indicated.

AT Attachment-8 Architecture Model (ATA8-AAM) [T13/1700D] AT Attachment-8 ATA/ATAPI Command Set (ATA8-ACS) [T13/1699D] AT Attachment-8 Parallel Transport (ATA8-APT) [T13/1698D] ISO/IEC 14776-454, SCSI Primary Commands - 4 (SPC-4) [T10/1731-D] ISO/IEC 14776-323, SCSI Block Commands - 3 (SBC-3) [T10/1799-D] ISO/IEC 14776-414, SCSI Architecture Model - 4 (SAM-4) [13/10/1683-D]

2.4 Other references

For information on the current status of the listed document(s), or regarding availability, contact the indicated organization.

Serial ATA Revision 2.6 (SATA-2.6)

The SATA 2.6 document may be obtained from Serial ATA International Organization (SATA IO) at http://www.sata-io.org.

The international ISO/IEC 14776-414 is still "under development" so don't move this into 2.2.

Yes. Reference nee	ds to stay.	

3 Definitions, symbols, abbreviations, and conventions

3.1 Definitions

3.1.1 additional sense code: A combination of the ADDITIONAL SENSE CODE field and the ADDITIONAL SENSE CODE QUALIFIER field in the sense data $\frac{1}{1}$ see $\frac{2}{2}$ PC-3).

3.1.2 Advanced Power Management (APM): The Advanced Power Management feature set as defined in ATA8-ACS.

3.1.3 allocation length: A value in the ALLOCATION LENGTH field of a CDB that specifies the maximum number of bytes that an application client has allocated in the Data-In Buffe³ and that is used to limit the maximum amount of variable length data (e.g., mode data, log data, diagnostic data) returned to an application client (see⁴ PC-3).

3.1.4 application client: An object that is the source of SCSI commands (see SAM-4).

3.1.5 AT Attachment (ATA): A family of standards and specifications that define the attachment of storage devices to hosts (see ATA8-AAM, ATA8-ACS, ATA8-AP1⁵/₂ and SATA-2.6).

3.1.6 AT Attachment Packet Interface (ATAPI): The PACKET Command feature set, as defined in ATA standards, that provides the capability to encapsulate SCSI and other types of commands and pass them wrough an ATA transport.

3.1.7 ATA abort retry: A policy implemented by a SATL whereby the SATL retries ATA commands aborted by ATA collateral abort (see 3.1.8) once.

3.1.8 ATA collateral abort: An ATA command that is aborted as a result of a different command being aborted when an ATA device is processing queued commands (i.e., NCQ or TCQ).

3.1.9 ATA device: A device that is compliant with the Tara standards and implements the General feature set.

3.1.10 ATA device capacity: The ATA logical sector size, in bytes, (see 3.1.16) times one more than the ATA maximum LBA (see 3.1.17).

3.1.11 ATA domain: An I/O subsystem that is made up of one ATA host, a service delivery subsystem, and one or more ATA devices or ATAPI devices (see ATA8-AAM).

3.1.12 ATA flush command: A FLUSH CACHE command or a FLUSH CACHE EXT command (see ATA8-ACS).

3.1.13 ATA hardware reset: The routines performed by the ATA device server and the ATA device port in an ATA device after a hardware reset event occurs (see ATA8-AAM).

3.1.14 ATA host: An object that originates requests to be processed by an ATA device or an ATAPI device.

3.1.15 ATA LBA: A logical block address (see 3.1.48) used to reference a logical sector in an ATA device (see ATA8-ACS).

3.1.16 ATA logical sector size: The size of an ATA logical sector in bytes, Balculated as two times the value returned in ATA IDENTIFY DEVICE data words 118:117 (see ATA8-ACS) if the ATA device returns a value of one in ATA IDENTIFY DEVICE data word 106 bit 12 (i.e., the ATA device supports the Long Logical Sector feature set). The size of an ATA Logical Sector is 512 bytes if the ATA device returns a value of zero in ATA IDENTIFY DEVICE data word 106 bit 12 (i.e., the ATA device returns a value of zero in ATA IDENTIFY DEVICE data word 106 bit 12 (i.e., the ATA device returns a value of zero in ATA IDENTIFY DEVICE data word 106 bit 12 (i.e., the ATA device feature set). The size of an ATA Logical Sector is 512 bytes if the ATA device returns a value of zero in ATA IDENTIFY DEVICE data word 106 bit 12 (i.e., the ATA device does not support the Long Logical Sector feature set).

QOTE 1 The Logical Sector Size indicated by an ATA device is the presented in words; therefore, the number of bytes in an ATA device logical sector is two times the value indicated in the Logical Sector Size.

3.1.17 ATA maximum LBA: The maximum user LBA for the 48-bit ddress feature set deturned in ATA IDENTIFY DEVICE data words (103:100) minus one if the ATA device returns a value of one in ATA IDENTIFY DEVICE data word 86 bit 10 (i.e., the ATA device supports the 48-bit ddress feature set), or the total number of user addressable sectors returned in ATA IDENTIFY DEVICE data words (61:60) minus one if the ATA device returns a value of zero in ATA IDENTIFY DEVICE data word 86 bit 10 (i.e., the ATA IDENTIFY DEVICE data word 86 bit 10 (i.e., the ATA interview) device returns a value of zero in ATA IDENTIFY DEVICE data word 86 bit 10 (i.e., the ATA device does not support the 48-bit ddress feature set) (see ATA8-ACS),

3.1.18 ATA nexus loss event: A transport-specific event where an ATA host port is no longer in communication with an ATA device port (see ATA8-AAM, see 5.5).

3.1.19 ATA non-queued command: An ATA command that is not an ATA queued command (see 3.1.20).

- **3.1.20 ATA queued command:** A READ DMA QUEUED, READ DMA QUEUED EXT, WRITE DMA QUEUED, WRITE DMA QUEUED EXT, WRITE DMA QUEUED FUA EXT, READ FPDMA QUEUED ⁸/₇ or WRITE FPDMA QUEUED command (see ATA8-ACS).
- **3.1.21 ATA read command:** A READ DMA, READ DMA EXT, READ DMA QUEUED, READ DMA QUEUED EXT, READ MULTIPLE, READ MULTIPLE EXT, READ SECTOR(S), READ SECTOR(S) EXT[®] or READ FPDMA ULTIPLE (see ATA8-ACS).

3.1.22 ATA Sector Count: A count of ATA logical sectors to transfer or process, represented by the Count field in an ATA command (see ATA8-ACS).

- **3.1.23 ATA software reset:** A reset that is triggered by an ATA task management function request (see ATA8-AAM, see 5.6).
- **3.1.24 ATA verify command:** A READ VERIFY SECTOR(S) or ATA READ VERIFY SECTOR(S) LIXT (see ATA8-ACS).

3.1.25 ATA volatile settings: ATA device settings affecting the way an ATA device responds to ATA commands that are configurable using ATA commands (e.g., ATA SET FEATURES or ATA SET MAX¹²XT), and that are set by the SATL to correspond to SCSI mode parameters, log parameters, or INQUIRY data.

3.1.26 ATA write command: A WRITE DMA, WRITE DMA EXT, WRITE DMA FUA EXT, WRITE DMA QUEUED, WRITE DMA QUEUED EXT, WRITE DMA QUEUED FUA EXT, WRITE MULTIPLE, WRITE MULTIPLE EXT, WRITE MULTIPLE FUA EXT, WRITE SECTOR(S), WRITE SECTOR(S) EXT, or WRITE FPDMA QUEUED (see ATA8-ACS).

3.1.27 ATAPI device: A device that is compliant with the ATA standards and implements the PACKET command feature set (see ATA8-ACS).

3.1.28 auto-contingent allegiance (ACA): The task set condition established following the return of a CHECK CONDITION status when the NACA bit is set to one in the CONTROL byte (see SAM-4).

3.1.29 autosense: Sense data that is returned in the same I_T_L_Q nexus transaction as the CHECK CONDITION status (see SAM-4). The alternative to autosense (i.e., use of a REQUEST SENSE command) is defined in SAM-2.

NOTE 2 - SAM-4 specifies what SAM-2 defines as autosense as the only valid way of returning SENSE data, but does not refer to it as autosense.

3.1.30 big-endian: A format for storage or transmission of binary data in which the most significant byte appears first. In a multi-byte value, the byte containing the most significant bit is stored in the lowest memory address and transmitted first and the byte containing the least significant bit is stored in the highest memory

NOTE 1 The Logical Sector Size indicated by an ATA device is represented in words; therefore, the number of bytes in an ATA device logical sector is two times the value indicated in the Logical Sector Size.

3.1.17 ATA maximum LBA: The maximum user LBA for the 48-bit address feature set returned in ATA IDENTIFY DEVICE data words (103:100) minus one if the ATA device returns a value of one in ATA IDENTIFY DEVICE data word 86 bit 10 (i.e., the ATA device supports the 48-bit address feature set), or the total number of user addressable sectors returned in ATA IDENTIFY DEVICE data words (61:60) minus one if the ATA device returns a value of zero in ATA IDENTIFY DEVICE data word 86 bit 10 (i.e., the ATA IDENTIFY DEVICE data word 86 bit 10 (i.e., the ATA is a value of zero in ATA IDENTIFY DEVICE data word 86 bit 10 (i.e., the ATA device does not support the 48-bit address feature set) (see ATA8-ACS),

3.1.18 ATA nexus loss event: A transport-specific event where an ATA host port is no longer in communication with an ATA device port (see ATA8-AAM, see 5.5).

3.1.19 ATA non-queued command: An ATA command that is not an ATA queued command (see 3.1.20).

- **3.1.20 ATA queued command:** A READ DMA QUEUED, READ DMA QUEUED EXT, WRITE DMA QUEUED, WRITE DMA QUEUED EXT, WRITE DMA QUEUED FUA EXT, READ FPDMA QUEUED, or WRITE FPDMA QUEUED command (see ATA8-ACS).
- **3.1.21 ATA read command:** A READ DMA, READ DMA EXT, READ DMA QUEUED, READ DMA QUEUED EXT, READ MULTIPLE, READ MULTIPLE EXT, READ SECTOR(S), READ SECTOR(S) EXT, or READ FPDMA QUEUED (see ATA8-ACS).

3.1.22 ATA Sector Count: A count of ATA logical sectors to transfer or process, represented by the Count field in an ATA command (see ATA8-ACS).

- **3.1.23 ATA software reset:** A reset that is triggered by an ATA task management function request (see ATA8-AAM, see 5.6).
- **3.1.24 ATA verify command:** A READ VERIFY SECTOR(S) or ATA READ VERIFY SECTOR(S) EXT (see ATA8-ACS).

3.1.25 ATA volatile settings: ATA device settings affecting the way an ATA device responds to ATA commands that are configurable using ATA commands (e.g., ATA SET FEATURES or ATA SET MAX EXT), and that are set by the SATL to correspond to SCSI mode parameters, log parameters, or INQUIRY data.

3.1.26 ATA write command: A WRITE DMA, WRITE DMA EXT, WRITE DMA FUA EXT, WRITE DMA QUEUED, WRITE DMA QUEUED EXT, WRITE DMA QUEUED FUA EXT, WRITE MULTIPLE, WRITE MULTIPLE EXT, WRITE MULTIPLE FUA EXT, WRITE SECTOR(S), WRITE SECTOR(S) EXT, or WRITE FPDMA

3.1.27 ATAPI device: A device that is compliant with the ATA standards and implements the PACKET reasonable feature set (see ATA8-ACS).

3.1.28 auto-contingent allegiance (ACA): The task set condition established following the return of a CHECK CONDITION status when the NACA bit is set to one in the CONTROL byte (see SAM-4).

3.1.29 autosense: Sense data that is returned in the same I_T_L_Q nexus transaction as the CHECK CONDITION status (see SAM-4). The alternative to autosense (i.e., use of a REQUEST SENSE command) is defined in SAM-2.

NOTE 2 - SAM-4 specifies what SAM-2 defines as autosense as the only valid way of returning SENSE data, but does not refer to it as autosense.

3.1.30 big-endian: A format for storage or transmission of binary data in which the most significant byte appears first. In a multi-byte value, the byte containing the most significant bit is stored in the lowest memory address and transmitted first and the byte containing the least significant bit is stored in the highest memory

address and transmitted last (e.g., for the value 0080h, the byte containing 00h is stored in the lowest memory address and the byte containing 80h is stored in the highest memory address).

3.1.31 byte: A sequence of eight contiguous bits considered as a unit.

3.1.32 command: An object within the logical unit representing the work performed by a device server (see SAM-4).

3.1.33 command descriptor block (CDB): A structure used to communicate a command from a SCSI application client to a SCSI device server.

3.1.34 device server: An object within the logical unit that processes SCSI commands according to the rules for command management (see SAM-4).

3.1.35 direct logical block mapping: A SATL implementation that maps logical blocks on a logical unit one-for-one with ATA logical sectors on an ATA device, where the LBA of a logical block has the same value as the LBA of the corresponding ATA logical sector and the number of bytes in a logical block equals the number of bytes in an ATA logical sector (see 9.1.2).

3.1.36 domain: A SCSI domain (see SAM-4) or an ATA domain (see ATA8-AAM).

3.1.37 DRQ data block: A unit of data words associated with available status when using either the PIO data-in command protocol or the PIO data-out command protocol (see ATA8-ACS)

3.1.38 field: A group of one or more contiguous bits

3.1.39 indirect logical block mapping: A SATL implementation that does not follow the constraints of direct logical block mapping (see 3.1.35 and 9.1.3).

3.1.40 I_T nexus: A nexus between a SCSI initiator port and a SCSI target port (see SAM-4).

3.1.41 I_T_L nexus: A nexus between a SCSI initiator port, a SCSI target port, and a logical unit (see SAM-4).

3.1.42 I_T_L_Q nexus: A nexus between a SCSI initiator port, a SCSI target port, a logical unit; and a command (see SAM-4).

3.1.43 least significant bit (LSB): In a binary code, the bit or bit position with the smallest numerical weighting in a group of bits that, when taken as a whole, represent a numerical value (e.g., in the number 0001b, the bit that is set to one).

3.1.44 link reset: Performing the link reset sequence.

3.1.45 link reset sequence: A phy reset sequence (see SATA-2.6).

3.1.46 little-endian: A format for storage or transmission of binary data in which the least significant byte appears first. In a multi-byte value, the byte containing the least significant bit is stored in the lowest memory address and transmitted first and the byte containing the most significant bit is stored in the highest memory address and transmitted last (e.g., for the value 0080h, the byte containing 80h is stored in the lowest memory address and the byte containing 00h is stored in the highest memory address).

3.1.47 logical block: A set of user data 4 words accessed and referenced as a unit.

3.1.48 logical block address (LBA): The value used to reference a logical block.

3.1.49 logical unit: An externally addressable entity within a SCSI target device. See SAM-4 for a detailed definition of a logical unit.

Make the definition the same as the SBC definition.

3.1.50 logical unit capacity: The capacity of a logical unit in bytes calculated as length in bytes of each logical block times one more than the LBA of the last logical block on the logical unit.

3.1.51 logical unit number (LUN): An identifier for a logical unit.

3.1.52 logical unit reset event: An event that triggers a logical unit reset (see SAM-4).

3.1.53 logical unit reset: A condition resulting from a hard reset condition or a logical unit reset event in which the logical unit performs the logical unit reset operations described in SAM-4, ² PC-3, and this standard.

3.1.54 medium: The material on which data is stored (e.g., a magnetic disk).

3.1.55 most significant bit (MSB): In a binary code, the bit or bit position with the largest numerical weighting in a group of bits that, when taken as a whole, represent a numerical value (e.g., in the number 1000b, the bit that is set to one).

3.1.56 native command queuing (NCQ): A method by which a SATA device that does not implement the PACKET Command feature set may maintain and order the processing of up to 32 outstanding commands (see ATA8-ACS).

3.1.57 nexus: A relationship between a SCSI initiator port and a SCSI target port that may extend to a logical unit and a command (see SAM-4).

3.1.58 non-queued command: An ATA non-queued command (see 3.1.19).

3.1.59 object: An architectural abstraction or container that encapsulates data types, services, or other objects that are related in some way.

3.1.60 Parallel ATA (PATA): A parallel transport protocol (see ATA8-APT).

3.1.61 PATA bus: All of the conductors and connectors required to attain signal line continuity between every driver, receiver, and terminator for each signal between one PATA host and one or two PATA devices (see ATA8-APT).

3.1.62 PATA device: An ATA device or ATAPI device that uses the PATA transport protocol (see ATA8-APT).

3.1.63 PATA host: An ATA host that uses the PATA transport protocol (see ATA8-APT).

3.1.64 power on: Power being applied.

3.1.65 queued command: An ATA queued command (see 3.1.20), or a SCSI command received by the SATL from an application client for an emulated logical unit while the emulated logical unit is processing another SCSI command (see SAM-4).

3.1.66 reset event: A transport protocol specific event that results in a hard reset condition (see SAM-4) or a hardware reset (see ATA8-AAM).

3.1.67 SAS address: An identifier assigned to a SAS port or expander device (see SAS-2).

3.1.68 SAS initiator device: A device containing SSP, STP, and/or SMP initiator ports in a SAS domain (see SAS-2).

3.1.69 SAS initiator port: An SSP initiator port, STP initiator port, and/or SMP initiator port in a SAS domain (see SAS-2).

3.1.70 SATA device: An ATA device or ATAPI device that uses the Serial ATA transport protocol (see SATA-2.6).

TAB-ACS incorporates all NCO command-based material now		

3.1.71 SATA host: An ATA host that implements the Serial ATA transport protocol (see SATA-2.6).

3.1.72 SCSI / ATA Translation² (SATL): The functional layer defined in this standard that uses an ATA device to emulate objects in a SCSI logical unit, including the device server, task manager, and task set (see SAM-4).

3.1.73 SCSI device: A device that contains one or more SCSI ports that are connected to a service delivery subsystem and supports a SCSI application protocol.

3.1.74 SCSI hard reset: A condition resulting from a power on condition or a reset event in which the SCSI device performs the hard reset operations described in SAM-4, ³PC-3, and the appropriate command and transport standards.

3.1.75 SCSI initiator port: A SCSI initiator device object that acts as the connection between application clients and a service delivery subsystem through which requests and responses are routed (see SAM-4).

3.1.76 SCSI read command: A READ (6), REA

3.1.77 SCSI synchronize cache command: A SYNCHRONIZE CACHE(10), or SYNCHRONIZE CACHE (16) command (see SBC-2).

3.1.78 SCSI target port: A SCSI target device object that contains a task router and acts as the connection between device servers and task managers and a service delivery subsystem through which requests and responses are routed (see SAM-4).

3.1.79 SCSI verify command: A VERIFY (10), VERIFY (12), or VERIFY (16) command

1.80 SCSI write command: A WRITE (6), WRITE (10), WRITE (12, URITE (16) command (3ee) SBC-2).

3.1.81 SCSI write and verify command: A WRITE AND VERIFY (10), WRITE AND VERIFY (12), or WRITE AND VERIFY (16) command (see SBC-2).

3.1.82 Serial ATA (SATA): A serial transport protocol that serves as an ATA service delivery subsytem (see SATA-2.6).

3.1.83 Serial ATA Tunneled Protocol (STP): The protocol used by STP initiator ports to communicate with STP target ports in a SAS domain (see SAS-1.1)

3.1.84 Serial Attached SCSI (SAS): A set of protocols and the interconnect defined by SAS-1.1.

3.1.85 service delivery subsystem: That part of a SCSI I/O system that transmits service requests to a logical unit or SCSI target device and returns logical unit or SCSI target device responses to a SCSI initiator device (see SAM-4), or that part of an ATA I/O system that connects an ATA host port and one or more ATA/ATAPI device ports and is a single path for the transfer of requests and responses between a host and one or more devices (see ATA8-AAM).

3.1.86 service response: The device service response or SCSI transport protocol specific service response returned to an application client by the SATL on completion of a SCSI transport protocol service request (see SAM-4).

3.1.87 STP initiator port: A SAS initiator device object in a SAS domain that interfaces to a service delivery subsystem with STP (see SAS-1.1).

3.1.88 STP target port: A SAS target device object in a SAS domain that interfaces to a service delivery subsystem with STP (see SAS-1.1).

Comments from page 28 continued on next page

3.1.71 SATA host: An ATA host that implements the Serial ATA transport protocol (see SATA-2.6).

3.1.72 SCSI / ATA Translation layer (SATL): The functional layer defined in this standard that uses an ATA device to emulate objects in a SCSI logical unit, including the device server, task manager, and task set (see SAM-4).

3.1.73 SCSI device: A device that contains one or more SCSI ports that are connected to a service delivery subsystem and supports a SCSI application protocol.

3.1.74 SCSI hard reset: A condition resulting from a power on condition or a reset event in which the SCSI device performs the hard reset operations described in SAM-4, SPC-3, and the appropriate command and transport standards.

3.1.75 SCSI initiator port: A SCSI initiator device object that acts as the connection between application clients and a service delivery subsystem through which requests and responses are routed (see SAM-4).

3.1.76 SCSI read command: A READ (6), REA 10), READ (12), or READ (16) command (see SBC-2).

3.1.77 SCSI synchronize cache command: A SYNCHRONIZE CACHE(10), or SYNCHRONIZE CACHE (16) command (see SBC-2).

3.1.78 SCSI target port: A SCSI target device object that contains a task router and acts as the connection between device servers and task managers and a service delivery subsystem through which requests and responses are routed (see SAM-4).

3.1.79 SCSI verify command: A VERIFY (10), VERIFY (12), or VERIFY (16) command (see SBC-2).

3.1.80 SCSI write command: A WRITE (6), WRITE (10), WRITE (12), or WRITE (16) command (see SBC-2).

3.1.81 SCSI write and verify command: A WRITE AND VERIFY (10), WRITE AND VERIFY (12), Sr WRITE AND VERIFY (12), Sr WRITE AND VERIFY (16) command (See SBC-2).

3.1.82 Serial ATA (SATA): A serial transport protocol that serves as an ATA service delivery **3.1.82 Serial ATA** (SATA): A serial transport protocol that serves as an ATA service delivery **3.1.82** (see SATA-2.6).

3.1.84 Serial Attached SCSI (SAS): A set of protocols and the interconnect defined by AS-1.1.

3.1.85 service delivery subsystem: That part of a SCSI I/O system that transmits service requests to a logical unit or SCSI target device and returns logical unit or SCSI target device responses to a SCSI initiator device (see SAM-4)²⁰/₇, or that part of an ATA I/O system that connects an ATA host port and one or more ATA/ATAPI device ports and is a single path for the transfer of requests and responses between a host and one or more devices (see ATA8-AAM).

3.1.86 service response: The device service response or SCSI transport protocol specific service response returned to an application client by the SATL on completion of a SCSI transport protocol service request (see SAM-4).

3.1.87 STP initiator port: A SAS initiator device object in a SAS domain that interfaces to a service delivery subsystem with STP^[21] escape SAS-1.1).

3.1.88 STP target port: A SAS target device object in a SAS domain that interfaces to a service delivery subsystem with STP (22) = SAS-1.1).

I

3.1.89 STP/SATA bridge: An expander device object containing an STP target port, a SATA host port, and the functions required to forward information between the STP target port and SATA host port to enable STP initiator ports in a SAS domain to communicate with SATA devices in an ATA domain (see SAS-1.1).

3.1.90 task management function: A task manager service capable of being requested by an application client to affect the processing of one or more commands (3) see SAM-3).

3.1.91 task set: A group of commands within a device server whose interaction is dependent on the task management and auto-contingent allegiance rules (see SAM-4).

tagged command queuing (TCQ): A method that makes use of the ATA Tagged Command Queuing feature set, by which an ATA device may maintain and order the processing of up to 32 outstanding commands, identifying the context of each outstanding command with a unique tag (see ATA8-ACS).

3.1.93 Transport Protocol-Specific Information Unit (TPSIU): A transport-specific information unit used to transport information between initiator ports and target ports that may contain additional information needed by a service delivery subsystem to effect the requested information unit transfers (e.g., the Command Block Wrapper defined in USB-BOT)

3.1.94 word: A sequence of two contiguous bytes considered as a unit.

3.3 Keywords

⁴.3.1 expected: A keyword used to describe the behavior of the hardware or software in the design models assumed by this standard. Other hardware and software design models may also be implemented.

3.3.2 invalid: A keyword used to describe an illegal or unsupported bit, byte, word, field or code value. Receipt of an invalid bit, byte, word, field or code value shall be reported as an error.

3.3.3 mandatory: A keyword indicating an item that is required to be implemented as defined in this standard.

3.3.4 may: A keyword that indicates flexibility of choice with no implied preference.

3.3.5 may not: Keywords that indicates flexibility of choice with no implied preference.

3.3.6 obsolete: A keyword indicating that an item was defined in a previous version of a standard but has been removed from the most recent version of that standard.

3.3.7 optional: A keyword that describes features that are not required to be implemented by this standard. However, if any optional feature defined by this standards is implemented, it shall be implemented as defined in this standard.

3.3.8 reserved: A keyword referring to bits, bytes, words, fields and code values that are set aside for future standardization. Their use and interpretation may be specified by future extensions to this or other standards. A reserved bit, byte, word or field shall be set to zero, or in accordance with a future extension to this standard. Recipients are not required to check reserved bits, bytes, words or fields for zero values. Receipt of reserved code values in defined fields shall be reported as an error.

3.3.9 shall: A keyword indicating a mandatory requirement (equivalent to "is required"). Designers are required to implement all such requirements to ensure interoperability with other products that conform to this standard.

3.3.10 should: A keyword indicating flexibility of choice with a preferred alternative (equivalent to "it is strongly recommended").

3.3.11 vendor specific: A keyword indicating specification of the referenced item is determined by the SCSI device vendor.

3.4 SAT specific terminology

3.4.1 emulated: A term designating that the SATL is required to implement functions in addition to or in place of functions supported by an ATA device to provide a defined SCSI capability.

3.4.2 unspecified: A term designating that this version of this standard does not specify a translation for a SCSI field. A translation for an unspecified field may be specified by future versions of this standard. Translation of fields marked unspecified shall not conflict with other standards in the set of SCSI standards.

Rejected: As discussed in WG this is needed and appropriate (Curtis Stevens moved, Kevin Marks seconding, that this letter ballot comment be rejected. 8 were in favor, 1 opposed, 3 abstain)

3.5 Conventions

3.5.1 Overview

Certain words and terms used in this standard have a specific meaning beyond the normal English meaning. These words and terms are defined either in 3.1 or in the text where they first appear. Names of commands, statuses, sense keys, and additional sense codes are in all uppercase (e.g., REQUEST SENSE). Lowercase is used for words having the normal English meaning.

If there is more than one CDB length for a particular command (e.g., MODE SENSE (6) and MODE SENSE (10)) and the name of the command is used in a sentence without any CDB length descriptor (e.g., MODE SENSE), then the condition specified in the sentence applies to all CDB lengths for that command.

The names of fields are in small uppercase (e.g., ALLOCATION LENGTH). When a field name is a concatenation of acronyms, uppercase letter may be used for readability (e.g., NORMACA). Normal case is used when the contents of a field are being discussed. Fields containing only one bit are usually referred to as the NAME bit instead of the NAME field.

If a conflict arises between text, tables, or figures, the order of precedence to resolve the conflicts is text; then tables; and finally figures. Not all tables or figures are fully described in the text. Tables show data format and values. Notes do not constitute any requirements for implementors.

3.5.2 Numeric conventions

A binary number is represented in this standard by any sequence of digits consisting of only the Western-Arabic numerals 0 and 1 immediately followed by a lower-case b (e.g., 0101b). Underscores or spaces may be included in binary number representations to increase readability or delineate field boundaries (e.g., 0 0101 1010b or 0_0101_1010b).

A hexadecimal number is represented in this standard by any sequence of digits consisting of only the Western-Arabic numerals 0 through 9 and/or the upper-case English letters A through F immediately followed by a lower-case h (e.g., FA23h). Underscores or spaces may be included in hexadecimal number representations to increase readability or delineate field boundaries (e.g., B FD8C FA23h or B_FD8C_FA23h).

A decimal number is represented in this standard by any sequence of digits consisting of only the Western-Arabic numerals 0 through 9 not immediately followed by a lower-case b or lower-case h (e.g., 25).

When the value of the bit or field is not relevant, x or xx appears in place of a specific value.

This standard uses the following convention for representing decimal numbers:

- a) the decimal separator (i.e., separating the integer and fractional portions of the number) is a period;
- b) the thousands separator (i.e., separating groups of three digits in the portion of a number) is a space; and
- c) the thousands separator is used in both the integer and fractional portion of a number.

Table 1 shows some examples of decimal numbers using various conventions.

French	English	This Standard	
0,6	0.6	0.6	
3,141 592 65	3.14159265	3.141 592 65	
1 000	1,000	1 000	
1 323 462,95	1,323,462.95	1 323 462.95	

Table 1 — Numbering Conventions

Lists sequenced by letters (e.g., a-red, b-blue, c-green) show no ordering relationship between the listed items. Numbered lists (e.g., 1-red, 2-blue, 3-green) show an ordering relationship between the listed items.

^{(&}lt;del>)

Number: 1 Author: LSI-Besmer Subject: Note This text (from sas-2) should be added to this specification: Date: 8/26/2008 8:14:35 PM -07'00'

In the event of conflicting information the precedence for requirements defined in this standard is: 1) text; 2) tables; and 3) figures.

Notes do not constitute any requirements for implementers.

Status moverby Accepted 10/20/2008 11:19:36 AM -07'00'

3.5.3 Bit and byte ordering

In this standard, data structures may be defined by a table. A table defines a complete ordering of elements (i.e., bits, bytes, fields, and dwords) within the structure. The ordering of elements within a table does not in itself constrain the order of storage or transmission of the data structure, but in combination with other normative text in this standard, may constrain the order of storage or transmission of the structure.

In a table, any element that is presented in a row above another element in a lower row is more significant than the lower element, and any element presented to the left of another element in the same row is more significant than the element to the right.

11 a table shows bit numbering (see table 2), the least significant bit (LSB) is numbered 0 and each more significant bit has the next greater number than the immediately less significant bit. If a table shows numbering of bytes or characters (see table 3), the most significant byte or character is represented at the lowest number and each less significant byte or character has the next greater number than the immediately more significant byte.

In a field in a table consisting of more than one bit that contains a single value (e.g., a number), the least significant bit (LSB) is shown on the right and the most significant bit (MSB) is shown on the left (e.g., in a byte, bit 7 is the MSB and is shown on the left, bit 0 is the LSB and is shown on the right). The MSB and LSB are not labeled if the field consists of eight or fewer bits. The MSB and LSB are labeled if the field consists of more than eight bits and has no internal structure defined.

In a field in a table consisting of more than one byte that contains multiple fields each with their own values (e.g., a descriptor), there is no MSB and LSB of the field itself and thus there are no MSB and LSB labels. Each individual field has an MSB and LSB, but they are not labeled.

In a field containing a text string (e.g., ASCII or UTF-8), only the MSB of the first character and the LSB of the last character are labeled.

Multiple byte fields are represented with only two rows, with the non-sequentially increasing byte number denoting the presence of additional bytes.

A data dword consists of 32 bits. Table 2 shows a data dword containing a single value, where the MSB is on the upper left in bit 31 and the LSB is on the lower right in bit 0.

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB) Bit 31	Bit 30	Bit 29	Bit 28	Bit 27	Bit 26	Bit 25	Bit 24
1	Bit 23	Bit 22	Bit 21	Bit 20	Bit 19	Bit 18	Bit 17	Bit 16
2	Bit 15	Bit 14	Bit 13	Bit 12	Bit 11	Bit 10	Bit 9	Bit 8
3	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0 (LSB)

Table 3 — Example of ordering of bits and bytes within a multiple element

3.5.4 Notation for byte encoded character strings

When this standard requires one or more bytes to contain specific encoded character, the specific characters are enclosed in single quotation marks. The single quotation marks identify the start and end of the characters that are required to be encoded but are not themselves to encoded. The characters that are to be encoded are shown in exactly the case that is to be encoded.

An ASCII space character (i.e., 20h) may be represented in a string by the character '¬' (e.g., 'SCSI¬device').

The encoded characters and the single quotation marks that enclose them are preceded by text that specifies the character encoding methodology and the number of characters required to be encoded.

The encoded characters and the single quotation marks that enclose them are preceded by text that specifies the character encoding methodology and the number of characters required to be encoded.

EXAMPLE - Using the notation described in this subclause, stating that eleven ASCII characters 'SCSI device' are to be encoded would be the same writing out the following sequence of byte values: 53h 43h 53h 49h 20h 64h 65h 76h 69h 63h 65h.

3.5.5 Notation for command descriptions

3.5.5.1 Description

The description of each command begins with a subclause describing the general method applied in translating the SCSI command to the corresponding ATA command(s), as well as any constraints and special considerations that may apply to the translation applied.

The subclause describing the general translation method for each command contains a table formatted like table 4 with two columns as follows:

- a) the first column lists each of the fields in the SCSI CDB (see SPC-3 and SBC-2); and
- b) the second column is either a brief description of the corresponding ATA features and functions used to implement the identified SCSI field, or a reference to a subsequent subclause containing a more lengthy description of the method of emulation or implementation.

UNSPECIFIED FIELD	Unspecified (see 3.4.2)		

Table 4 — Format for translated command field descriptions

Tables listing fields in mode pages have an additional column that defines whether the field is changeable or not.

3.5.6 Use of field names defined in ATA standards and specifications

This standard discusses fields and values defined in other standards and specifications, in particular the ATA8-APT, ATA8-ACS, ATA8-AAM, and SCT standards developed by T13, and the SATA-2.6 specification. Such fields and values discussed in this standard are shown using the same notation conventions used in the standards where those fields and values are defined.

When this standard uses terms defined in T13 ATA standards or the SATA-2.6 specification, the following conventions apply:

- a) The names of abbreviations, commands, and acronyms used as signal names are in all uppercase (e.g., IDENTIFY DEVICE). Fields containing only one bit are usually referred to as the "name" bit instead of the "name" field;
- b) Names of device registers, fields in data structures, and other defined terms begin with an upper-case letter (e.g., ¹BA Mid register) and may be represented in mixed-case (e.g. PhyRdy);
- c) The expression "word n" or "bit n" shall be interpreted as indicating the content of word n or bit n;
- d) Bit names are shown in all uppercase letters; and
- e) Bit (n:m) denotes a set of bits, for example, bits (7:0).

"register" terminology no longer exists in ATA8-ACS, and LBA is now just LBA (47:0), not Low/Mid/High, so this is not a good example any more.

Status moverby Accepted 10/20/2008 11:22:33 AM -07'00' Subject: Sticky Note Date: 10/20/2008 11:22:31 AM -07'00' Will replace with LBA field.

4 General

This standard defines a translation layer (i.e., the SATL) that provides a method for a SCSI application layer (see SAM-4) to access erial ATA or Parallel ATA devices by representing ATA devices as SCSI direct-access block devices.

Implementations of SCSI / ATA Translation may provide varying levels of SCSI functionality.

EXAMPLE 1 - The SATL may provide a level of SCSI emulation that is indistinguishable from native SCSI devices in terms of reported capabilities. Such SATL implementations need little guidance from this standard to effect interoperability since other SCSI protocol standards define all that is required to establish interoperability.

EXAMPLE 2 - 3 SCSI / ATA Translation implementation may implement a subset of SCSI, have limited or no capability to maintain persistent information about the characteristics or state of the emulated SCSI device, have limited capability to manage device state information that carries forward from one command to the next, and maintain little or no capability to coordinate between multiple commands outstanding at a time. The characteristics and behavior of the underlying ATA devices in these minimal implementations of the SATL are expected to be more visible to the SCSI application clients.

This standard provides a set of definitions, conventions, and guidelines for:

- a) the consistent reporting by the SATL of capabilities of emulated SCSI devices; and
- b) the consistent identification of the attached devices by the application clients.

These provisions allow application clients to observe consistent behavior whether or not the application clients recognize the presence of a SATL in a system.

By defining expected behavior in terms of the SCSI commands dent, corresponding activity in the ATA domain, and expected SCSI responses based on the results of activity in the ATA domain, this standard eliminates

- a) incompatibility between legacy SCSI / ATA Translation implementations; and
- b) SCSI application client levice interdependence.

This standard refers to behaviors for SCSI devices defined in SBC-3 and $^{[2]}PC-3$. Unless otherwise specified, any behaviors that are optional in SBC-3 or $^{[3]}PC-3$ are optional for devices implementing SCSI / ATA Translation. Any optional behaviors referred to in this standard and implemented by the SATL shall be implemented as described in this standard.

If the SATL receives a SCSI request specifying any value in any field of the CDB that the SATL does not support, unless greater specified in the description of the command, the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB (see DPC-3).

If the SATL receives a SCSI re the SATL specifying any value in any field of the parameter data that the SATL does not support, unless oterwise specified in the description of the parameter, the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN PARAMETER LIST (see SPC-3).

4 General

This standard defines a translation layer (i.e., the SATL) that provides a method for a SCSI application layer (see SAM-4) to access Serial ATA or Parallel ATA devices by representing ATA devices as SCSI direct-access block devices.

Implementations of SCSI / ATA Translation may provide varying levels of SCSI functionality.

EXAMPLE 1 - The SATL may provide a level of SCSI emulation that is indistinguishable from native SCSI devices in terms of reported capabilities. Such SATL implementations need little guidance from this standard to effect interoperability since other SCSI protocol standards define all that is required to establish interoperability.

EXAMPLE 2 - A SCSI / ATA Translation implementation may implement a subset of SCSI, have limited or no capability to maintain persistent information about the characteristics or state of the emulated SCSI device, have limited capability to manage device state information that carries forward from one command to the next, and maintain little or no capability to coordinate between multiple commands outstanding at a time. The characteristics and behavior of the underlying ATA devices in these minimal implementations of the SATL are expected to be more visible to the SCSI application clients.

This standard provides a set of definitions, conventions, and guidelines for:

- a) the consistent reporting by the SATL of capabilities of emulated SCSI devices; and
- b) the consistent identification of the attached devices by the application clients.

These provisions allow application clients to observe consistent behavior whether or not the application clients recognize the presence of a SATL in a system.

By defining expected behavior in terms of the SCSI commands sent, corresponding activity in the ATA domain, and expected SCSI responses based on the results of activity in the ATA domain, this standard eliminates:

- a) incompatibility between legacy SCSI / ATA Translation implementations; and
- b) SCSI application client /device interdependence.

This standard refers to behaviors for SCSI devices defined in SBC-3 and SPC-3. Unless otherwise specified, any behaviors that are optional in SBC-3 or SPC-3 are optional for devices implementing SCSI / ATA Translation. Any optional behaviors referred to in this standard and implemented by the SATL shall be implemented as described in this standard.

If the SATL receives a SCSI request specifying any value in any field of the CDB that the SATL does not support, unless oterwise specified in the description of the command, the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB (see SPC-3).

If the SATL receives a SCSI re t specifying any value in any field of the parameter data that the SATL does not support, unless description of the parameter, the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN PARAMETER LIST (3 e SPC-3).

5 SCSI architecture

5.1 Overview

This clause defines SCSI / ATA translation of features and functions that impact the representation of the domains defined in SAM-4 and ATA8-AAM. Figure 4 shows a SATL providing a communication path between a SCSI application client and an TA8-AAM.

Figure 4 — Example of a SATL between a SCSI application client and an ATA or ATAPI device

The SATL provides the communication path between a SCSI application client and an ATA device or ATAPI device by:

- a) emulating a SCSI logical unit;
- b) integrating an ATA host; and

c) providing the translation that links them together.

This standard defines SCSI / ATA translation using SCSI and ATA command sets. This standard does not define the mapping of transport capabilities as defined at the SCSI transport protocol layer and the ATA protocol interconnect layer.

An implementation utilizing a SATL may include a SCSI transport. A SATL may appear in different configurations:

4 XAMPLE 1 – Figure 5 shows a SATL contained within a SCSI to ATA protocol bridge, where the ATA device is being accessed by an ATA host port, and the SATL is being accessed with a SCSI target port using a SCSI transport protocol transport protocol transport protocol to the second second

5.3 Unit attention condition

The SATL shall report events affecting the state of the emulated SCSI device to the SCSI application clients by emulating unit attention conditions (see SAM-4).

A SATL that detects a link reset for a derive or initiates any reset of an ATA device shall establish a unit attention condition on behalf of the logical unit corresponding to the ATA device with the sense key set to UNIT ATTENTION and the additional sense code set to POWER ON, RESET, OR BUS DEVICE RESET OCCURRED for the SCSI initiator port associated with each I_T nexus. The method a SATL uses to detect a link reset on the device at the sense set of the sense to be additional sense to detect a link reset on the sense to the sense to be additional sense to be additional sense to be additional sense to power of the sense to be additional sense to power of the sense to be additional sense to be additional sense to power of the sense to powe

The SATL shall report unit attention conditions, in accordance with SAM-4, regardless of whether the condition results from accessing an ATA device or a condition internal to the SATL.

5.4 Handling errors in ATA commands

When a SCSI command is translated into one or more ATA commands and one of the ATA commands completes with an error, the SATL shall terminate processing of the SCSI command and report the error as described in clause 11.

When interpreting data from an ATA command, the SATL shall use the data only if no error was reported for the command. In addition:

- a) when interpreting DEVICE data, if the Integrity word contains the Signature value defined in ATA8-ACS (i.e., word 255 bits 7:0), then the SATL shall use the data only if the Checksum is correct;
- when interpreting SMART READ DATA data for the Summary SMART error log (i.e., log address 01h), the Comprehensive SMART error log (i.e., log address 02h), the SMART self-test log (i.e., log address 06h), or the Selective self-test log (i.e., log address 09h) (see ATA8-ACS), the SATL shall use the data only if the data structure checksum (i.e., byte 511) is correct; and
- (b) when interpreting READ LOG EXT data for the Extended Comprehensive SMART error log (i.e., log address 03h) or Extended SMART self-test log (i.e., log address 07h) (see ATA8-ACS), the SATL shall use the data only if the data structure checksum (i.e., byte 511) is correct.

5.5 ATA nexus loss

An ATA nexus loss event occurs when the SATL loses communication with the ATA device. If an ATA nexus loss event loss event

- a) the SATL shall terminate all commands being processed for the corresponding logical unit; and
- b) the SATL shall establish a unit attention condition for each Light swith the additional sense code set to:
 - A) if the SATL is able to determine that the ATA device is no longer physically present, REPORTED LUNS DATA HAS CHANGED or DRIVE NOT PRESENT;
 - B) if the SATL is unable to determine if the ATA device is physically present or not, INQUIRY DATA HAS CHANGED; or
 - C) if the SATL is able to determine that the ATA device is present, INTERNAL TARGET FAILURE.

TE 3 - The method by which the SATL determines physical presence or absence of the ATA device is outside the scope of this standard (e.g., using cold presence detect, (see SATA-2.6), or a change in the ELEMENT STATUS CODE field in the Device or Array Device element (see SES-2).

NOTE 4 - SAM-4 and SPC-3 define how the SATL processes subsequent commands when the logical unit is no longer available (i.e., incorrect logical unit selection).

If the ATA nexus is restored or the SATL detects a power-on condition for an ATA device, the SATL shall perform the processing described in 5.6 for those events.

5.3 Unit attention condition

The SATL shall report events affecting the state of the emulated SCSI device to the SCSI application clients by emulating unit attention conditions (see SAM-4).

A SATL that detects a link reset for a Serial ATA device or initiates any reset of an ATA device shall establish a unit attention condition on behalf of the logical unit corresponding to the ATA device with the sense key set to UNIT ATTENTION and the additional sense code set to POWER ON, RESET, OR BUS DEVICE RESET OCCURRED for the SCSI initiator port associated with each I_T nexus. The method a SATL uses to detect a link reset on the Serial ATA link is vendor specific.

The SATL shall report unit attention conditions, in accordance with SAM-4, regardless of whether the condition results from accessing an ATA device or a condition internal to the SATL.

5.4 Handling errors in ATA commands

When a SCSI command is translated into one or more ATA commands and one of the ATA commands completes with an error, the SATL shall terminate processing of the SCSI command and report the error as described in clause 11.

When interpreting data from an ATA command, the SATL shall use the data only if no error was reported for the command. In addition:

- a) when interpreting **IDENTIFY DEVICE data**, if the Integrity word contains the Signature value defined in ATA8-ACS (i.e., word 255 bits 7:0), then the SATL shall use the data only if the Checksum is correct;
- b) when interpreting SMART READ DATA data for the Summary SMART error log (i.e., log address 01h), the Comprehensive SMART error log (i.e., log address 02h), the SMART self-test log (i.e., log address 06h), or the Selective self-test log (i.e., log address 09h) (see ATA8-ACS), the SATL shall use the data only if the data structure checksum (i.e., byte 511) is correct; and
- c) when interpreting READ LOG EXT data for the Extended Comprehensive SMART error log (i.e., log address 03h) or Extended SMART self-test log (i.e., log address 07h) (see ATA8-ACS), the SATL shall use the data only if the data structure checksum (i.e., byte 511) is correct.

5.5 ATA nexus loss

An ATA nexus loss event occurs when the SATL loses communication with the ATA device. If an ATA nexus loss event occurs:

- a) the SATL shall terminate all commands being processed for the corresponding logical unit; and
- b) the SATL shall establish a unit attention condition for each LT nexus with the additional sense code set to:
 - A) if the SATL is able to determine that the ATA device is no longer physically present, REPORTED LUNS DATA HAS CHANGED or DRIVE NOT PRESENT;
 - B) if the SATL is unable to determine if the ATA device is physically present or not, INQUIRY DATA HAS CHANGED; or
 - C) if the SATL is able to determine that the ATA device is present, INTERNAL TARGET FAILURE.

NOTE 3 - The method by which the SATL determines physical presence or absence of the ATA device is outside the scope of this standard $\frac{13}{12}$.g., using cold presence detect $\frac{11}{12}$ see SATA-2.6, $\frac{12}{12}$ r a change in the ELEMENT STATUS CODE field in the Device or Array Device element (see SES- $\frac{214}{12}$.

NOTE 4 - SAM-4 and the C-3 define how the SATL processes subsequent commands when the logical unit is no longer available (i.e., incorrect logical unit selection).

If the ATA nexus is restored or the SATL detects a power-on condition for an ATA device, the SATL shall perform the processing described in 5.6 for those events.

5.6 ATA hardware and software reset processing

The hardware reset routines performed by the $\frac{1}{2}$ TA device include the actions performed by the ATA device for an ATA software reset $\frac{3}{3}$ see 3.1.23 and ATA8-AAM), and the actions defined in ATA8-ACS and the applicable ATA transport standards.

An ATA hardware reset may be caused either by the SATL or by the ATA device. If an ATA hardware reset or an ATA software reset occurs except as part of processing a SCSI task management function (see 6.3), then the SATL shall:

- a) terminate processing of all commands for each logical unit affected by the reset;
- b) restore the ATA volatile settings (see 3.1.25) of the ATA device (e.g., by sending an ATA SET FEATURES command) to values consistent with the saved values of mode pages if savable mode pages are supported and available, or default values if savable mode pages are not supported or are not available; and
- c) establish a unit attention condition for each I_T_L nexus with the additional sense code set to POWER ON, RESET, OR BUS DEVICE RESET OCCURRED.

5.7 Translation of Large Physical Sectors

For SCSI large physical sector operation, see SBC-3 for information on the:

- a) Logical Blocks model;
- b) Physical Blocks model; and
- c) READ CAPACITY(16) command.

For ATA large physical sector operation, see ATA8-ACS for information on the:

- a) Long Logical Sector (LLS) feature set;
- b) Long Physical Sector (LPS) feature set;
- <u>c)</u> <u>IDENTIFY</u> DEVICE command;
- () <mark>오nnex C; and</mark>
- e) Annex E.

Table 5 describes parameters used in the translation and operation of large physical sectors and where the values for those parameters are found in both SCSI and ATA environments.

Parameter	SCSI	ATA	
Logical Sector Size	11EAD CAPACITY (16) LENGTH IN BYTES field	ATA IDENTIFY DEVICE data words 117 to 118	
Logical Sectors Per Physical Sector Exponent	READ CAPACITY (16) LOGICAL BLOCKS PER PHYSICAL BLOCK field	ATA IDENTIFY DEVICE data words 106, bits 3:0	
Logical Sectors Per Physical Sector	2SCSI Logical sponent	2ATA Logical Sectors Per Physical Sector Exponent	
Logical Sector Alignment	READ CAPACITY (16) LOWEST ALIGNED LOGICAL BLOCK ADDRESS field	ATA IDENTIFY DEVICE data word 209	

¹⁰ Table 5 — Large Physical Block Geometry Parameters

It is important to note that

- a) SCSI Logical Sector Size is measured in bytes, whereas ATA Logical Sector size is measured in words.
- b) See ATA IDENTIFY DEVICE for details on when the data contained in words 106, 117-118, and 209 are valid.
- c) The relation between the SCSI and ATA logical sector alignment is:

5.6 ATA hardware and software reset processing

The hardware reset routines performed by the ATA device include the actions performed by the ATA device for an ATA software reset (see 3.1.23 and ATA8-AAM), and the actions defined in ATA8-ACS and the applicable ATA transport standards.

An ATA hardware reset may be caused either by the SATL or by the ATA device. If an ATA hardware reset or an ATA software reset occurs except as part of processing a SCSI task management function (see 6.3), then the SATL shall:

- a) terminate processing of all commands for each logical unit affected by the reset;
- b) restore the ATA volatile settings (see 3.1.25) of the ATA device (e.g., by sending an ATA SET FEATURES command) to values consistent with the saved values of mode pages if savable mode pages are supported and available, or default values if savable mode pages are not supported or are not available; and
- c) establish a unit attention condition for each I_T_L nexus with the additional sense code set to POWER ON, RESET, OR BUS DEVICE RESET OCCURRED.

5.7 Translation of Large Physical Sectors

For SCSI large physical sector operation, see SBC-3 for information on the:

- a) Logical Blocks model;
- b) Physical Blocks model; and
- c) READ CAPACITY(16) command.

For ATA large physical sector operation, see ATA8-ACS for information on the:

- a) Long Logical Sector (LLS) feature set;
- b) Long Physical Sector (LPS) feature set;
- c) IDENTIFY DEVICE command;
- d) Annex C; and
- e) Annex E.

Table 5 describes parameters used in the translation and operation of large physical sectors and where the values for those parameters are found in both SCSI and ATA environments.

\sim		
c.	_	
7		

Parameter	SCSI	ATA
Logical Sector Size	READ CAPACITY (16) LENGTH IN BYTES field	ATA IDENTIFY DEVICE data words 117 to 118
Logical Sectors Per Physical Sector Exponent	READ CAPACITY (16) LOGICAL BLOCKS PER PHYSICAL BLOCK field	ATA IDENTIFY DEVICE data words 106, bits 3:0
Logical Sectors Per Physical Sector	2SCSI Logical F s Per Physical Sector Exponent	2ATA Logical Sectors Per Physical Sector Exponent
Logical Sector Alignment	READ CAPACITY (16) LOWEST ALIGNED LOGICAL BLOCK ADDRESS field	ATA IDENTIFY DEVICE data word 209

Table 5 — Large Physical Block Geometry Parameters

14 is important to note that

- a) SCSI Logical Sector Size is measured in bytes, whereas ATA Logical Sector size is measured in ¹⁰/₁₀ ords¹⁷/₁
- b) ¹³be ATA IDENTIFY DEVICE for details on when the data contained in words 106, ¹³7-118, and 209 are ²⁰ are ²⁰ are ²⁰
- c) The relation between the SCSI and ATA logical sector alignment is:

6 Command management model

6.1 Overview

A SATL may support the full task management model or the basic task management model as well as specific features of the task management model (e.g. SIMPLE and ORDERED task attributes) depending on the task management capabilities of the SATL and whether the SATL supports (NCQ) or the ATA Tagged Command Queuing (TCQ) feature set.

6.2.2 Mapping of SCSI commands to ATA gueued commands

A SATL that translates SCSI commands to an ATA device using NCQ or TCQ, whether or not the SATL also queues commands internally, shall either:

3 -indicate support for the basic task management model in standard INQUIRY data (i.e., the BQUE bit is set to one and CMDQUE bit is set to zero), and follow the rules for the basic task management model (see SAM-3): or

- b) indicate support for the full task management model in standard INQUIRY data (⁴.e., the BQUE bit is set to zero and CMDQUE bit is set to one $\frac{15}{7}$ and set the QERR (i.e., queue error management) field of the Control mode page (see 10.1.5) as follows:
 - A) a value of 01b if the SATL does not resend ATA queued commands aborted by the ATA device due to an error condition on any one of the ATA gueued commands; or
 - B) a value other than 01b if the SATL resends all other ATA queued commands (i.e., except the one in error) aborted by the ATA device due to an error condition on any one of the ATA queued commands.

For each SCSI command that the SATL translates to ATA queued commands (see 3.1.20), the SATL shall allocate an available tag value (e.g., for NCQ, the value corresponding to the position of a bit set to zero in the SActive register). The SATL shall maintain a mapping between allocated ATA queued command tags and the corresponding CSI command identifier.

The SATL shall use the maximum queue depth supported by the ATA device (i.e., indicated 比v IDENTIFY) DEVICE data word 75), and may either:

- a) return a status of TASK SET FULL in response to a SCSI command sent to the corresponding emulated SCSI logical unit when the ATA device represented has the maximum number of ATA queued commands outstanding; or
- b) queue the SCSI command and return TASK SET FULL status when the SATL exhausts internal queueing resources.

Delitor's Note 1: The basic task management model and full task management mode in SAM 4 are gone.

6.2.3 Commands the SATL gueues internally

¹²the translation of a SCSI command requires the SATL to send a non-queued command to the ATA device, then the SATL shall not send the non queued command to the ATA device until all commands outstanding in the ATA device have returned command complete (i.e., with or without error).

¹³the ATA device corresponding to a logical unit has not returned command complete for all ATA commands the SATL has previously sent to the ATA device, and the SATL receives a SCSI command that requires the SATL to send a non-queued command to the ATA device, the SATL shall:

- a) suspend processing of the SCSI command, maintain the SCSI command in a task set, and resume processing when the ATA device returns command complete for all ATA commands the SATL has previously sent to the ATA device;
- b) return TASK SET FULL status for the SCSI command; or
- c) return BUSY status for the SCSI command.

The SATL shall perform task management in accordance with the task management model (see SAM-3) indicated in standard INQUIRY data and the Control mode page (see SPC-3).

6.2.4 Command queuing with multiple I_T nexuses

In some configurations the SATL may receive SCSI requests from multiple I_T nexuses. If the SATL receives SCSI requests from multiple I_T nexuses (e.g., the configuration shown in figure 5), as specified in SAM-4, the command tags maintained in the SATL mapping of command tags to NCQ tags or TCQ tags shall be qualified by the I T nexus from which the command was received. When translating from an NCQ tag or TCQ tag to the corresponding SCSI command tag, the SATL shall determine the correct I_T nexus using the qualification

~	Number: 1 Author: moverby	Subject: Sticky Note	Date: 10/20/2008 3:53:53 PM -07'00'
	Insert new subclause (overview):		
	A SATL that translates SCSI comr	mands to an ATA device u	using NCQ or TCQ should implement the SAM-4 task management functions. If the SAM-4 task management
	functions are not implemented, the	e SATL shall implement the	ne basic task management model from SAM-3 (see xxxx).
	The SATL may implement internal	queuing regardless of the	e version of the SCSI architecture model supported.

If the translation of a SCSI command requires the SATL to send a non-queued command to the ATA device, then the SATL shall:

Comments from page 45 continued on next page
6.2.2 Mapping of SCSI commands to ATA queued commands

A SATL that translates SCSI commands to an ATA device using NCQ or TCQ, whether or not the SATL also gueues commands internally, shall either:

- a) indicate support for the basic task management model in standard INQUIRY data (i.e., the BQUE bit is set to one and CMDQUE bit is set to zero), and follow the rules for the basic task management model (see SAM 3); or
- b) indicate support for the full task management model in standard INQUIRY data (i.e., the BQUE bit is set to zero and CMDQUE bit is set to one), and set the QERR (i.e., queue error management) field of the Control mode page (see 10.1.5) as follows:
 - A) a value of 01b if the SATL does not resend ATA queued commands aborted by the ATA device due to an error condition on any one of the ATA queued commands; or
 - B) a value other than 01b if the SATL resends all other ATA queued commands (i.e., except the one in error) aborted by the ATA device due to an error condition on any one of the ATA queued commands.

For each SCSI command that the SATL translates to ATA queued commands (see 3.1.20), the SATL shall allocate an available tag value (e.g., for NCQ, the value corresponding to the position of a bit set to zero in the SActive register). The SATL shall maintain a mapping between allocated ATA queued command tags and the corresponding SCSI command identifier.

The SATL shall use the maximum queue depth supported by the ATA device (i.e., indicated by IDENTIFY DEVICE data word 75), and may either:

- a) return a status of TASK SET FULL in response to a SCSI command sent to the corresponding emulated SCSI logical unit when the ATA device represented has the maximum number of ATA queued commands outstanding; or
- b) queue the SCSI command and return TASK SET FULL status when the SATL exhausts internal queueing resources.

Editor's Note 1: The basic task management model and full task management mode in SAM 4 are gone.

6.2.3 Commands the SATL queues internally

If the translation of a SCSI command requires the SATL to send a non-queued command to the ATA device, then the SATL shall not send the non-queued command to the ATA device until all commands outstanding in the ATA device have returned command complete (i.e., with or without error).

If the ATA device corresponding to a logical unit has not returned command complete for all ATA commands the SATL has previously sent to the ATA device, and the SATL receives a SCSI command that requires the SATL to send a non-queued command to the ATA device, the SATL shall:

- a) descent all and the SCSI command, maintain the SCSI command in a task set, and resume processing when the ATA device returns command complete for all ATA commands the SATL has previously sent to the ATA device;
- b) return TASK SET FULL status for the SCSI command; or
- c) return BUSY status for the SCSI command.

The SATL shall perform task management in accordance with the task management model $\frac{17}{13}$ ee SAM-3) indicated in standard INQUIRY data and the Control mode page $\frac{18}{13}$ ee SPC-3).

6.2.4 Command queuing with multiple I_T nexuses

In some configurations the SATL may receive SCSI requests from multiple I_T nexuses. If the SATL receives SCSI requests from multiple I_T nexuses (e.g., the configuration shown in figure 5), as specified in ¹⁹AM-4, the command tags maintained in the SATL mapping of command tags to NCQ tags or TCQ tags shall be qualified by the I_T nexus from which the command was received. When translating from an NCQ tag or TCQ tag to the ²⁰Corresponding SCSI command tag, the SATL shall determine the correct I_T nexus using the qualification

information associated with the CSI command tag. The SATL may teturn TASK SET FULL even if the ATA device has available NCQ tags or TCQ tags in order to maintain tags available for other I_T nexuses.

6.2.5 Collateral abort with queued commands

Error conditions with outstanding commands to an ATA device terminate all outstanding ATA commands being processed by the ATA device. An ATA host determines the status and error for each outstanding ATA queued command affected by the error condition and which ATA command(s) caused the error(s) (see ATA8-ACS or SATA-2.6). The SATL shall process aborted ATA commands as shown in table 7.

6.4 Task management functions

6.4.1 Task management functions overview

<mark>생.4</mark> describes the translation of SCSI task management functions to ATA equivalents.

6.4.2 Aborting ATA queued commands

Some task management functions processed by the SATL may result in ATA commands aborted by ATA collateral abort (see 3.1.8) affecting an $L_T_L_Q$ nexus other than the $L_T_L_Q$ nexus(es) specified in the task management function request. The subclause defining the translation for each task management function defines how the SATL processes the $L_T_L_Q$ nexuses the task management function.

Processing some task management functions requires the SATL to abort one or more ATA commands being processed by an ATA device.

三哆ATL shall abort an ATA queued command being processed by an ATA device by sending <mark>题n ATA</mark> どHECK POWER MODE command to the ATA device.

NOTE 5 - The ATA CHECK POWER MODE command is used to abort ATA queued commands because it is an ATA non-queued command that does not transfer data. The ATA CHECK POWER MODE command does not affect ATA volatile settings.

To abort an ATA non-queued command the SATL shall:

- a) send an ATA software reset to the ATA device; and
- b) restore ATA volatile settings (see 3.1.25) to values consistent with current mode parameter settings.

6.4.4 ABORT TASK

The service request for the ABORT TASK task management function is (see SAM-4):

Service Response = ABORT TASK (IN (I_T_L_Q nexus)).

If no ATA commands associated with the I_T_L_Q nexus specified in the ABORT TASK task management function are outstanding to the ATA device, then the SATL shall abort the command for the specified I_T_L_Q nexus from the SATL internal context and respond to the ABORT TASK task management function with a service response of FUNCTION COMPLETE (see SAM-4).

If the ATA device is processing one or more ATA commands that are related to the specified I_T_L_Q nexus, then the SATL shall either:

- a) allow the ATA command(s) to complete as follows:
 - 1) wait until the ATA device returns command complete for the ATA command(s);
 - 2) if the completed ATA command completes processing of the specified I_T_L_Q nexus, then return completion status for the I_T_L_Q nexus; and
 - return a service response of FUNCTION COMPLETE for the ABORT TASK task management function regardless of whether or not completion status was returned for the I_T_L_Q nexus;
 - or
- b) abort the ATA command(s) (see 6.4.2) for the specified I_T_L_Q nexus and respond to the ABORT TASK task management function with a service response of FUNCTION COMPLETE.

If aborting the ATA commands related to the specified I_T_L_Q nexus results in one or more other ATA commands being aborted by ATA collateral abort (see 3.1.8), then the SATL shall:

- a) if the SATL supports ATA abort retry (see 3.1.7), then re-send all ATA commands aborted by ATA collateral abort (see 3.1.8) and continue processing the affected I_T_L_Q nexuses; or
- b) if the SATL does not support ATA abort retry, then for each I_T nexus affected by an ATA command aborted by ATA collateral abort:

6.4 needs to mention how TMFs for ATAPI devices are handled or not handled.
Just defining that all TMFs are replied to with FUNCTION REJECTED would suffice.
Status
moverby Rejected 10/20/2008 4:56:58 PM -07'00'
Rejected as the ATAPI annex covers all TMF's as being unspecified (which would allow the FUNCTION REJECTED)

an ATA CHECK POWER MODE command to the ATA device
An alternative that gives more information is READ LOG EXT (log page 0x10). This additionally gets status information for the ATA command that is aborted.
suggest rewording to CHECK POWER MODE command to the ATA device or READ LOG EXT (log page 0x10) to the ATA device.

Probably so. But I don't see any language here that implies otherwise.
Author: moverby Subject: Sticky Note Date: 10/20/2008 4:57:37 PM -07'00'
As well 3.1.20 allows for this as PACKET falls under ATA non-queued command.

- 1) terminate all but one of the SCSI commands without returning a function result; and
- Complete processing of the remaining SCSI command by returning CHECK CONDITION status with the sense key set to UNIT ATTENTION and additional sense code set to COMMANDS CLEARED BY DEVICE SERVER.

6.4.5 ABORT TASK SET

The service request for the ABORT TASK SET task management function (see SAM-4) is:

Service Response = ABORT TASK SET (IN (I_T_L nexus)).

If the ATA device is not processing ATA commands for SCSI commands associated with the specified I_T_L nexus, then the SATL shall abort all commands for the specified I_T_L nexus from the SATL internal context and respond to the ABORT TASK SET task management function with a service response of FUNCTION COMPLETE.

If the ATA device is processing any ATA commands related to the specified I_T_L nexus, then the SATL shall either:

- a) allow the ATA command(s) to complete as follows:
 - 1) wait until the ATA device returns command complete for the ATA command(s);
 - 2) if the completed ATA command completes processing a SCSI command in the task set, return completion status for the SCSI command; and
 - 3) after all ATA commands return completion status, return a service response of FUNCTION COMPLETE for the ABORT TASK SET task management function;

or

b) abort outstanding ATA command(s) (see 6.4.2) for the specified I_T_L nexus, and respond to the ABORT TASK SET task management function with a service response of FUNCTION COMPLETE.

If aborting ATA commands for the specified I_T_L nexus results in ATA commands aborted by ATA collateral abort (see 3.1.8) that are related to processing SCSI commands in an I_T_L nexus other than the specified I_T_L nexus, then:

- a) if the SATL supports ATA abort retry (see 3.1.7), then the SATL shall re-send all ATA commands aborted by ATA collateral abort and continue processing of the affected I_T_L_Q nexuses; or
- b) if the SATL does not support ATA abort retry, then for each I_T_L nexus other than the specified I_T_L nexus that had one or more SCSI commands affected due to ATA commands aborted by ATA collateral abort, the SATL shall abort all commands for each affected I_T_L nexus and establish a UNIT ATTENTION condition with the additional sense code set to COMMANDS CLEARED BY ANOTHER INITIATOR.

NOTE 6 - A SATL that does not support ATA abort retry (see 3.1.7) is not able to comply with the SAM-4 requirement that ABORT TASK SET not abort commands other than those in the specified I_T_L nexus.

6.4.6 CLEAR ACA

The service request for the CLEAR ACA task management function (see SAM-4) is:

Service Response = CLEAR ACA (IN $(I_T_L nexus)$).

The SATL² hall process the CLEAR ACA task management function as defined in SAM-4.

OTE 7 - The SATL responds to a LEAR TA task management function with a service response of FUNCTION REJECTED, as the SATL reports a NORMACA bit set to zero in standard INQUIRY data (see 8.1.2).

6.4.7 CLEAR TASK SET

The service request for the CLEAR TASK SET task management function (see SAM-4) is:

Service Response = CLEAR TASK SET (IN (I_T_L nexus)).

22 June 2008

the SATL indicates support for the full task management model (see 6.2.2), then the SATL shall process the CLEAR TASK SET task management function in accordance with a single task set that includes SCSI commands for all I T L nexuses (i.e., the TST field in the Control mode page is set to 000h, see 10.1.5).

If the ATA device is processing any ATA commands, then the SATL shall:

- a) abort all outstanding ATA command(s);
- b) abort all SCSI commands in the task set; and
- c) respond to the CLEAR TASK SET task management function with a service response of FUNCTION COMPLETE.
- If the SATL aborts commands in the task set for an I_T_L nexus other than the specified I_T_L nexus, then for each other I_T_L nexus, the SATL shall establish a unit attention condition with the additional sense code set to COMMANDS CLEARED BY ANOTHER INITIATOR.

6.4.8 LOGICAL UNIT RESET

The service request for the LOGICAL UNIT RESET task management function (see SAM-4) is:

Service Response = LOGICAL UNIT RESET (IN (I_T_L nexus)).

The SATL shall:

- 1) reset the ATA device as follows:
 - 1) optionally send an ATA software reset (see 3.1.23) to the ATA device; and
 - 2) if the ATA software reset is not successful or not sent, then send an ATA hardware reset (see 3.1.13) to the ATA device;

NOTE 8 - It is vendor-specific how the SATL determines if the ATA software reset is successful.

- 2) abort all commands in the task set from the SATL internal context;
 - restore ATA volatile settings (see 3.1.25) to values consistent with the emulation of saved or default values of mode parameters, log parameters, and INQUIRY data (see SPC-3); and
- 4) return a service response of FUNCTION COMPLETE for the LOGICAL UNIT RESET task management function.

NOTE 9 - If more than one PATA device is present on a PATA bus, issuing an ATA software reset causes both Sevices to be reset.

6.4.9 QUERY TASK

The service request for the QUERY TASK task management function (see SAM-4) is:

Service Response = QUERY TASK (IN (I_T_L_Q nexus)).

If the SATL supports the QUERY TASK task management function, the SATL shall return a service response of FUNCTION SUCCEEDED if the specified I_T_L_Q nexus is in the task set, or the SATL shall return a service response of FUNCTION COMPLETE if the specified I_T_L_Q nexus is not in the task set.

If the SATL does not support the QUERY TASK task management function the SATL shall return a service response of FUNCTION REJECTED.

6.4.10 bsolete reset task management functions

The bootete TARGET RESET task management function is sometimes used by a SCSI application client to cause a hard reset (i.e., similar to a power-on condition) for each logical unit of a specified target device. The SATL may process the TARGET RESET task management function by issuing an ATA hardware reset (see 3.1.13) to the ATA device(s) associated with the target device.

Comments from page 49 continued on next page

If the SATL indicates support for the full task management model (see 6.2.2), then the SATL shall process the CLEAR TASK SET task management function in accordance with a single task set that includes SCSI commands for all I T L nexuses (i.e., the TST field in the Control mode page is set to 000h, see 10.1.5).

If the ATA device is processing any ATA commands, then the SATL shall:

- a) abort all outstanding ATA command(s);
- b) abort all SCSI commands in the task set; and
- c) respond to the CLEAR TASK SET task management function with a service response of FUNCTION COMPLETE.
- If the SATL aborts commands in the task set for an I_T_L nexus other than the specified I_T_L nexus, then for each other I_T_L nexus, the SATL shall establish a unit attention condition with the additional sense code set to COMMANDS CLEARED BY ANOTHER INITIATOR.

6.4.8 LOGICAL UNIT RESET

The service request for the LOGICAL UNIT RESET task management function (see SAM-4) is:

Service Response = LOGICAL UNIT RESET (IN (I_T_L nexus)).

The SATL shall:

- 1) reset the ATA device as follows:
 - 1) optionally send an ATA software reset (see 3.1.23) to the ATA device; and
 - 2) if the ATA software reset is not successful or not sent, then send an ATA hardware reset (see 3.1.13) to the ATA device;

NOTE 8 - It is vendor-specific how the SATL determines if the ATA software reset is successful.

- 2) abort all commands in the task set from the SATL internal context;
 - restore ATA volatile settings (see 3.1.25) to values consistent with the emulation of saved or default values of mode parameters, log parameters, and INQUIRY data (see SPC-3); and
 - 4) return a service response of FUNCTION COMPLETE for the LOGICAL UNIT RESET task management function.

NOTE 9 - If more than one PATA device is present on a PATA bus, issuing an ATA software reset causes both devices to be reset.

6.4.9 QUERY TASK

The service request for the QUERY TASK task management function (see SAM-4) is:

Service Response = QUERY TASK (IN (I_T_L_Q nexus)).

If the SATL supports the QUERY TASK task management function, the SATL shall return a service response of FUNCTION SUCCEEDED if the specified I_T_L_Q nexus is in the task set, or the SATL shall return a service response of FUNCTION COMPLETE if the specified I_T_L_Q nexus is not in the task set.

If the SATL does not support the QUERY TASK task management function the SATL shall return a service response of FUNCTION REJECTED.

6.4.10 Obsolete reset task management functions

The obsolete TARGET RESET task management function is sometimes used by a SCSI application client to cause a hard reset (i.e., similar to a power-on condition) for each logical unit of a specified target device. The SATL may process the TARGET RESET task management function by issuing an ATA hardware reset (see 3.1.13) to the ATA device(s) associated with the target device.

6.5 CONTROL Byte

2.5.1 CONTROL byte overview

Table 9 describes SATL handling of the CDB CONTROL byte. See SAM-4 for CONTROL byte details.

,	
Field	Description
Vendor specific	The SATL may use this field for vendor-specific purposes.
NACA	If set to one, the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.
LINK	4 set to one, the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to

Table 9 — CONTROL byte fields

6<u>61</u> nexus loss

I

I

The SATL may detect an I_T nexus loss event (see SAM-4). If the SATL detects an I_T nexus loss event the SATL handles the I_T nexus loss event differently depending on whether the SATL provides multiple I_T <mark>Rexusus</mark> access to the emulated SCSI logical unit.

- abort any outstanding ATA command(s) (see 6.4.2);
- 2) delete all commands in the task set from the SATL internal context; and
- 3) establish a unit attention condition for each affected I_T nexus with the additional sense code set to I_T NEXUS LOSS OCCURRED.

If the SATL provides multiple I_T nexusus access to the emulated SCSI logical unit, the SATL shall handle the I_T nexus loss as follows:

- 1) allow any outstanding ATA command(s) for each I_T nexus that is not lost to complete;
- 2) abort any remaining ATA command(s) (see 6.4.2 and 6.4.3);
- 3) delete all commands in the task set from the SATL internal context for commands associated with the I_T nexus that the I_T nexus loss event occured; and
- 4) establish a unit attention with the additional sense code set to I_T NEXUS LOSS OCCURRED for the SCSI initiator port associated with the I_T nexus that was lost.

	The SATL doesn't abort commands with CHECK POWER MODE 6.4.3 should cover that. Item 3) does not apply, however, as the	in that case; it should use the ATA hardware reset or software reset only. In the first list, changing 1) to refer to ATAPI device establishes its own unit attention condition.

Status moverby Rejected 11/4/2008 10:39:54 AM

Comments from page 50 continued on next page

6.5 CONTROL Byte

6.5.1 CONTROL byte overview

Table 9 describes SATL handling of the CDB CONTROL byte. See SAM-4 for CONTROL byte details.

Table 9 — CONTROL byte fields	
-------------------------------	--

Field	Description	
Vendor specific	The SATL may use this field for vendor-specific purposes.	
NACA	If set to one, the SATL shall terminate the command with CHECK CONDITION state with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.	
LINK If set to one, the SATL shall terminate the command with CHECK CONDITION with the sense key set to ILLEGAL REQUEST and the additional sense code s INVALID FIELD IN CDB.		

6월 T nexus loss

The SATL may detect an I T nexus loss event (see SAM-4). If the SATL detects an I T nexus loss event the SATL handles the I T nexus loss event differently depending on whether the SATL provides multiple I T nexusus access to the emulated SCSI logical unit.

If the SATL does not provide multiple I T nexusus access to the emulated SCSI logical unit, the SATL shall handle the I T nexus loss as follows:

- 1) abort any outstanding ATA command(s)
- 2) delete all commands in the task set from the SATL internal context; and
 3) establish a unit attention condition for ¹³/₁₃ ch affected I_T nexus with the additional sense code set to I T NEXUS LOSS OCCURRED.

If the SATL provides multiple I The xusus access to the emulated SCSI logical unit, the SATL shall handle the I T nexus loss as follows:

- allow any outstanding ATA command(s) for each I_T nexus that is not lost to complete;
- 2) abort any remaining ATA command(s) (see 6.4.2 and 6.4.3);
- delete all commands in the task set from the SATL internal context for commands associated with the I_T nexus that the I_T nexus loss event ¹⁶/₁₀ cured; and
- 4) establish a unit attention with the additional sense code set to I T NEXUS LOSS OCCURRED for the SCSI initiator port associated with the I T nexus that was lost.

Add more 6.x sections describing what the SATL does if it detects every SCSI event defined in SAM-4 on the front side, just like 6.6 describes handling of I_T nexus loss on the front side. (e.g. if the SATL is in a FC to SATA bridge, and there is a hard reset, etc. on the FC side).
Make them subsections of one "6.x SCSI events" section
a) power on: <not say="" sure="" to="" what=""></not>
b) hard reset: abort outstanding ATA commands, delete commands in the internal context, establish unit attention condition. Should it send an ATA hardware reset in all cases rather than a software reset?
c) logical unit reset: move the functional description from 6.4.8 into here.
c) power loss expected: abort outstanding ATA commands like with I_T nexus loss (or like hard reset?), delete commands in the internal context, establish unit attention condition.
Resolution: Add table listing all events and a cross-reference to clauses describing handling of the events. Mark all but IT_nexus loss and logical unit reset as unspecified.

Status moverby Accepted Author: moverby Dealt with in Brad Besmers proposal for extensions to TMF

7 Summary of SCSI / ATA command mappings

7.1 Translated and emulated commands

In the event of a discrepancy between the contents of this clause and the description of individual commands, description of individual commands shall apply.

Clause 7, clause 8, and clause 9 describe the 같CSI to ATA command mapping for ATA devices, ^Qranslation for ATAPI devices is described in Annex A.

The SATL shall not send more than one ATA command to the ATA device representing the logical unit with the exception of ATA queued commands (see 3.1.20). The SATL shall queue received SCSI commands as necessary to enforce this.

Table 10 lists the SCSI / ATA command mappings defined in this standard. A SATL may implement commands defined in ⁴PC-3 and SBC-3, but not listed in table 10. Translation of commands not listed in table 10 is vendor-specific.

SCSI command	ATA command(s)	Reference
ATA PASS-THROUGH (12)		12.2.2
ATA PASS-THROUGH (16)	Any	12.2.3
FORMAT UNIT	READ VERIFY SECTORS, READ VERIFY SECTORS EXT, WRITE SECTORS, WRITE SECTORS EXT	9.2
INQUIRY	IDENTIFY DEVICE	8.1
LOG SENSE	Log page dependent (see 10.2)	8.2
MODE SELECT (6)		8.3
MODE SELECT (10)		8.4
MODE SENSE (6)	Mode page dependent (see To. T)	8.5
MODE SENSE (10)		8.6
READ (6)		9.3
READ (10)		9.5
READ (12)	- See 9.1	9.6
READ (16)		9.7
READ BUFFER	READ BUFFER	8.7
READ CAPACITY (10)		9.8
READ CAPACITY (16)		9.9
REASSIGN BLOCKS	READ VERIFY SECTOR(S), READ VERIFY SECTOR(S) EXT, WRITE DMA, WRITE DMA EXT, WRITE DMA FUA EXT, WRITE DMA QUEUED, WRITE DMA QUEUED EXT, WRITE DMA QUEUED FUA EXT, and WRITE FPDMA QUEUED	9.10
REPORT LUNS	n/a	SPC-3
PEQUEST SENSE	SMART RETURN STATUS	8.8
	SMART EXECUTE OFF-LINE IMMEDIATE	8.9
START STOP UNIT	FLUSH CACHE, FLUSH CACHE EXT, STANDBY, READ VER SEC R(S), or MEDIA EJECT	9.11
SYNCHRONIZE CACHE (10)	FLUSH CACHE or	9.12
SYNCHRONIZE CACHE (16)	FLUSH CACHE EXT	9.13

7 Summary of SCSI / ATA command mappings

7.1 Translated and emulated commands

In the event of a discrepancy between the contents of this clause and the description of individual commands, description of individual commands shall apply.

Clause 7, clause 8, and clause 9 describe the SCSI to ATA command mapping for ATA devices. Translation for ATAPI devices is described in Annex A.

The SATL shall not send more than one ATA command to the ATA device representing the logical unit with the exception of ATA queued commands (see 3.1.20). The SATL shall queue received SCSI commands as necessary to enforce this.

Table 10 lists the SCSI / ATA command mappings defined in this standard. A SATL may implement commands defined in SPC-3 and SBC-3, but not listed in table 10. Translation of commands not listed in table 10 is vendor-specific.

SCSI command	ATA command(s)	Reference
ATA PASS-THROUGH (12)		12.2.2

8 SCSI Primary Commands (SPC) mapping

8.1 INQUIRY command

8.1.1 INQUIRY command overview

The INQUIRY command requests general information about a logical unit and target device. The INQUIRY command and selected data pages shall be emulated using information from the ATA IDENTIFY DEVICE command and other information (see 8.1.2). Table 11 describes the emulation of fields in the INQUIRY CDB.

Field	Description or reference	
OPERATION CODE	Set to 12h. The SATL shall send an ATA IDENTIFY DEVICE command to the ATA device.	
EVPD	The SATL shall implement this field as defined in ³³ PC-3 (see 10.3).	
PAGE CODE ^a	 The SATL: a) shall support the Supported VPD Pages VPD page (00h) (see 10.3.2); b) may support the Unit Serial Number VPD page (80h) (see 10.3.3); c) shall support the Device Identification VPD page (83h) (see 10.3.4); d) should support the Mode Page Policy VPD page (87h) (see 10.3.5); e) shall support the ATA Information VPD page (89h) (see 12.4.2); and f) may support the Block Device Characteristics VPD page (B1h) (see 10.3.6). 	
ALLOCATION LENGTH	The SATL shall implement this field as defined in <mark>缗PC-3</mark> .	
CONTROL	6.5	
a VPD page translations are defined in 10.3

8.1.2 Standard INQUIRY data

Table 12 describes the standard INQUIRY data fields supported by the SATL.

Field	Description or reference
PERIPHERAL QUALIFIER	The SATL shall set this field to 000b to indicate that the peripheral device is currently connected to this logical unit. ^a
PERIPHERAL DEVICE TYPE	The SATL shall set this field to 00h to indicate that the peripheral device is a direct access block device. ^a
RMB	The SATL shall set this bit to the value of bit 7 of the general configuration word of the ATA IDENTIFY DEVICE data retrieved from the ATA device.
VERSION	The VERSION field indicates the version of SPC to which the SATL complies (see SPC-3) (e.g., 05h for SPC-3).
NormACA	The SATL shall set this bit to zero to indicate the SATL does not support the NACA bit in the CONTROL byte (see 6.5).
HISUP	Unspecified (see 3.4.2)
RESPONSE DATA FORMAT	The SATL shall set this field to 2h.
ADDITIONAL LENGTH	The SATL shall set this field to the length of the INQUIRY data that follows.
SCCS	Unspecified (see 3.4.2)
ACC	Unspecified (see 3.4.2)
TPGS	Unspecified (see 3.4.2)
3PC	Unspecified (see 3.4.2)
PROTECT	Unspecified (see 3.4.2)
	Unspecified (see 3.4.2)
ENCSERV	Unspecified (see 3.4.2)
ΜυιτιΡ	Unspecified (see 3.4.2)
MCHNGR	⁴ he SATL shall set this bit to zero to indicate the peripheral device is not attached to a medium transport element.
ADDR16	Unspecified (see 3.4.2)
WBUS16	Unspecified (see 3.4.2)
 ^a If the INQUIRY command is sent to an incorrect logical unit the SATL shall set the PERIPHERAL QUALIFIER field to 011b and shall set the PERIPHERAL DEVICE TYPE field to 1Fh. ^b See 3.5.4. ^c The full ATA IDENTIFY DEVICE data Model number field contents and the Firmware Revision field contents are returned in the ATA Information VPD page (see 12.4.2). ^d The second incompatible of the PERIPHERAL DEVICE TYPE field to 110 and the firmware returned in the ATA Information VPD page (see 12.4.2). 	

Table 12 — Standard INQUIRY data fields (part 1 of 3)

^d The encoding used by the SPC-3 standard for INQUIRY version descriptors and the encoding used by the ATA8-ACS standard for BENTIFY DEVICE major and minor version numbers differ. The two standards may not define values for the same revisions.

Field	Description or reference
SYNC	Unspecified (see 3.4.2)
CMDQUE	Unspecified (see 3.4.2)
T10 VENDOR IDENTIFICATION	The SATL shall set the T10 VENDOR IDENTIFICATION field to 'ATA'
PRODUCT IDENTIFICATION ^C	The SATL shall set the PRODUCT IDENTIFICATION field to a representation of the first 16 bytes of the ATA IDENTIFY DEVICE data Model number field, where each pair of bytes are swapped to create a valid ASCII string format: 1) byte 0 contains ATA IDENTIFY DEVICE word 27 bits 15:8 (i.e., byte 1); 2) byte 1 contains ATA IDENTIFY DEVICE word 27 bits 7:0 (i.e., byte 0); 3) byte 2 contains ATA IDENTIFY DEVICE word 28 bits 15:8 (i.e., byte 3); 4) byte 3 contains ATA IDENTIFY DEVICE word 28 bits 7:0 (i.e., byte 2); 15) byte 14 contains ATA IDENTIFY DEVICE word 34 bits 15:8 (i.e., byte 15); and 16) byte 15 contains ATA IDENTIFY DEVICE word 34 bits 7:0 (i.e., byte 14).
PRODUCT REVISION LEVEL ^C	The SATL shall set the PRODUCT REVISION LEVEL field to a four byte ASCII character representation of the ATA IDENTIFY DEVICE data Firmware revision field. Each pair of bytes are swapped to create a valid ASCII string format. Since the ATA IDENTIFY DEVICE data Firmware revision field contains eight ASCII characters and the standard INQUIRY data PRODUCT REVISION LEVEL field is four ASCII characters, the SATL shall select four of the eight ASCII characters from the ATA IDENTIFY DEVICE data Firmware revision field to return in the PRODUCT REVISION LEVEL field as follows: a) If the ATA IDENTIFY DEVICE data words 26:25 are set to four ASCII spaces (i.e., 2020_2020h), then the four ASCII characters selected shall contain: 1) byte 0 contains ATA IDENTIFY DEVICE data word 23 bits 15:8 (i.e., byte 1); 2) byte 1 contains ATA IDENTIFY DEVICE data word 23 bits 7:0 (i.e., byte 0); 3) byte 2 contains ATA IDENTIFY DEVICE data word 24 bits 7:0 (i.e., byte 3); and 4) byte 3 contains ATA IDENTIFY DEVICE data words 26:25 are not set to four ASCII spaces (i.e., 2020_2020h), then the four ASCII characters selected shall contain: 1) byte 0 contains ATA IDENTIFY DEVICE data word 24 bits 7:0 (i.e., byte 3); and 4) byte 3 contains ATA IDENTIFY DEVICE data word 24 bits 7:0 (i.e., byte 2); b) If the ATA IDENTIFY DEVICE data words 26:25 are not set to four ASCII spaces (i.e., 2020_2020h), then the four ASCII characters selected shall contain: 1) byte 0 contains ATA IDENTIFY DEVICE data word 25 bits 15:8 (i.e., byte 5); 2) byte 1 contains ATA IDENTIFY DEVICE data word 25 bits 15:8 (i.e., byte 5); 2) byte 1 contains ATA IDENTIFY DEVICE data word 25 bits 7:0 (i.e., byte 4); 3) byte 2 contains ATA IDENTIFY DEVICE data word 26 bits 7:0 (i.e., byte 7); and 4) byte 3 contains ATA IDENTIFY DEVICE data word 26 bits 15:8 (i.e., byte 7); and 4) byte 3 contains ATA IDENTIFY DEVICE data word 26 bits 7:0 (i.e., byte 7); and 4) byte 3 contains ATA IDENTIFY DEVICE data word 26 bits 7:0 (i.e., byte 6).
CLOCKING	Unspecified (see 3.4.2)
QAS	Unspecified (see 3.4.2)
IUS Unspecified (see 3.4.2)	
 ^a If the INQUIRY command is sent to an incorrect logical unit the SATL shall set the PERIPHERAL QUALIFIER field to 011b and shall set the PERIPHERAL DEVICE TYPE field to 1Fh. ^b See 3.5.4. ^c The full ATA IDENTIFY DEVICE data Model number field contents and the Firmware Revision field contents are returned in the ATA Information VPD page (see 12.4.2). ^d The encoding used by the 2PC-3 standard for INQUIRY version descriptors and the encoding used by the ATA8-ACS standard for 3DENTIFY DEVICE major and minor version numbers differ. VERSION DESCRIPTOR 1 to VERSION DESCRIPTOR 8	 The SATL shall include version descriptors (see SPC-3) for: a) the SCSI Architecture Model standard (e.g., SAM-4); b) this standard; c) the SCSI Primary Commands standard (e.g., SPC-3); d) the SCSI Block Commands standard (se.g., SBC-2); e) if the SATL receives SCSI commands through a SCSI target port (see figure 5 in 5.1), the version of the transport protocol to which the SCSI target port was designed; f) if the SATL sends ATA commands through a SAS STP initiator port (see figure 7 in 5.1), the version of SAS (sec., SAS-1.1) to which the SAS STP initiator port (see figure 7 in 5.1), the version of SAS (sec., SAS-1.1) to which the SAS STP initiator port (sec figure 7 in 5.1), the version of SAS (sec., SAS-1.1) to which the SAS STP initiator port (sec figure 7 in 5.1), the version of SAS (sec., SAS-1.1) to which the SAS STP initiator port (sec figure 7 in 5.1), the version of SAS (sec., SAS-1.1) to which the SAS STP initiator port (sec figure 7 in 5.1), the version of SAS (sec., SAS-1.1) to which the SAS STP initiator port (sec figure 7 in 5.1), the version of SAS (sec., SAS-1.1) to which the SAS STP initiator port (sec figure 7 in 5.1), the version of SAS (sec., SAS-1.1) to which the SAS STP initiator port (sec figure 7 in 5.1), the version of SAS (sec., SAS-1.1) to which the SAS STP initiator port (sec figure 7 in 5.1), the version of SAS (sec., SAS-1.1) to which the SAS STP initiator port (sec figure 7 in 5.1), the version of SAS (sec., SAS-1.1) to which the SAS STP initiator port (sec figure 7 in 5.1), the version of SAS (sec., SAS-1.1) to which the SAS STP initiator port (sec figure 7 in 5.1), the version of SAS (sec., SAS-1.1) to which the SAS STP initiator port (sec figure 7 in 5.1), the version (sec., SAS-1.1) to which the SAS STP initiator port (sec figure 7 in 5.1), the version (sec., SAS-1.1) to which the SAS STP initiator port (sec figure 7 in 5.1), the version (sec., SAS-1.1) to which the SAS STP initiator port (sec figure 7 in 5.1), th
Vendor specific parameters Unspecified (see 3.4.2)	
 ^a If the INQUIRY command is sent to an incorrect logical unit the SATL shall set the PERIPHERAL QUALIFIER field to 011b and shall set the PERIPHERAL DEVICE TYPE field to 1Fh. ^b See 3.5.4. ^c The full ATA IDENTIFY DEVICE data Model number field contents and the Firmware Revision field contents are returned in the ATA Information VPD page (see 12.4.2). ^d The encoding used by the SPC-3 standard for INQUIRY version descriptors and the encoding used by the ATA8-ACS standard for The SPC major and minor version numbers differ. The two standards may not define values for the same revisions. 	

Table 12 — Standard INQUIRY data fields (part 3 of 3)

8.2 LOG SENSE command

8.2.1 LOG SENSE command overview

The LOG SENSE command provides a means for the application client to retrieve statistical or other operational information maintained by the SCSI target device about the SCSI target device or its logical units. Table 13 shows the translation for fields specified in the LOG SENSE CDB.

Field Field	Description or reference
OPERATION CODE	Set to 4Dh. The SATL shall implement support for this field by returning the log page data for the particular page requested.
PPC	Unspecified (see 3.4.2)
SP	Unspecified (see 3.4.2)
PC	8.2.2
PAGE CODE	8.2.3
PARAMETER POINTER	Unspecified (see 3.4.2)
ALLOCATION LENGTH	The SATL shall implement support for this field as defined in <mark>솅PC-3.</mark>

8.2.2 PC (page control) field

The SATL shall implement this field as defined in ^[]PC-3. The SATL interpretation and support of the page control values is shown in table 14.

Table	14 —	PC field
-------	------	----------

Code	Description
00b	Threshold values: unspecified (see 3.4.2)
01b	Cumulative values: supported
10b	Default threshold values: unspecified (see 3.4.2)
11b	Default cumulative values: unspecified (see 3.4.2)

4.2.3 PAGE CODE field

The SATL shall support this field as defined in <mark>용PC-3.</mark> The SATL emulation for support of the PAGE CODE Relation is provided in table 15.

Code	Description
00h	Supported Log Pages log page: The SATL shall implement this page by returning a list of supported log pages (see 10.2.3).
10h	Self-Test Results log page: The SATL shall determine if the ATA SMART self-test is supported from the ATA IDENTIFY DEVICE data word 84 bit 1. If the ATA SMART self-test is not supported (i.e., word 84 bit 1 is set to zero) the SATL shall return a CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and additional sense code set to INVALID FIELD IN CDB. If the ATA SMART self-test is supported (i.e., word 84 bit 1 is set to one) the SATL shall return the translated Self-Test Results log page to the application client (see 10.2.4).
2Fh	Informational Exceptions log page: The SATL shall determine if the ATA SMART feature set is supported from the ATA IDENTIFY DEVICE data word 82 bit 0. If the ATA SMART feature set is not supported (i.e., word 82 bit 0 is set to zero) the SATL shall return a CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and additional sense code set to INVALID FIELD IN CDB. If the ATA SMART feature set is supported (i.e., word 82 bit 0 is set to one) the SATL shall determine if the ATA SMART feature set is enabled or disabled from the ATA IDENTIFY DEVICE data word 85 bit 0. If the ATA SMART feature set is disabled (i.e., word 85 bit 0 is set to zero) the SATL shall return a CHECK CONDITION status with the sense key set to ABORTED COMMAND and additional sense code set to ATA DEVICE FEATURE NOT ENABLED. If the ATA SMART feature set is enabled (i.e., word 85 bit 0 is set to one) the SATL shall return the translated Informational Exceptions log page to the application client (see 10.2.5.1).
All others	Unspecified (see 3.4.2)

8.3 MODE SELECT (6) command

8.3.1 MODE SELECT (6) command overview

The MODE SELECT(6) command (see SPC-3) provides a means for an application client to specify medium, logical unit, or peripheral device parameters to a device server in the SATL. Device servers that implement the MODE SELECT (6) command shall also implement the MODE SENSE (6) command. Application clients should send a MODE SENSE (6) command prior to each MODE SELECT (6) command to determine supported mode pages, page lengths, and other parameters.

The Mode Page Policy VPD page should be implemented (see 10.3.5). After a logical unit reset, the SATL shall set all mode page values to saved or default values. See clause 10 for supported mode pages.

8.3.2 MODE SELECT (6) CDB fields

The SATL shall support MODE SELECT (6) CDB fields as shown in table 16.

Field	Description or reference
OPERATION CODE	Set to 15h. The SATL shall modify logical unit, or peripheral device parameters for supported mode pages and parameters as specified in mode pages received from the application client. Some operational parameters in individual pages are provided via ATA. See clause 10 for specific requirements.
SP	Unspecified (see 3.4.2)
PF	If this bit is set to zero (i.e., specifes that mode pages are vendor specific), then the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB. The SATL shall support this bit being set to one (i.e., specifies that all mode page formats ⁴ orrespond to SPC-3 and SBC-2 mode page formats).
PARAMETER LIST LENGTH	⁵ his field should be set to the length of the mode parameter list to be transferred from the application client.
CONTROL	6.5

Table 16 — MODE SELECT (6) CDB field translations

8.4 MODE SELECT (10) command

The MODE SELECT (10) command (See SPC-3) provides a means for an application client to set parameters in the device server in a SATL. It is a complementary command to the MODE SENSE(10) command.

The SATL shall implement the MODE SELECT (10) command using the translation described in 8.3. Device servers that implement the MODE SELECT (10) command shall also implement the MODE SENSE (10) command. See 10.1 for supported mode pages.

8.5 MODE SENSE (6) command

8.5.1 MODE SENSE (6) command overview

The MODE SENSE (6) command ^[8]/_{See SPC-3}) provides a means for a device server in a SATL to report parameters to an application client. It is a complementary command to the MODE SELECT(6) command. Device servers that implement the MODE SENSE (6) command shall also implement the MODE SELECT(6) command. See 10.1 for supported mode pages.

8.5.2 MODE SENSE (6) CDB fields

The SATL shall support MODE SENSE (6) CDB fields as shown in table 17.

Field	Description or reference
OPERATION CODE	Set to 1Ah. The SATL shall return the requested mode pages to the application client. Some operational parameters in individual pages are gathered by issuing ATA commands (see 10.1).
DBD	A DBD bit set to zero specifies that zero or more block descriptors may be returned in MODE SENSE data. The SATL shall support only the mode parameter block descriptor format for direct-access block devices.
PC	Current values (i.e., the PC field is set to 00b) shall be supported. Reporting changeable, saveable, and default values is unspecified (see 3.4.2).
PAGE CODE	This field specifies the particular mode page requested (see 10.1). If the SATL does not support the specified mode page, the SATL shall terminate the command with CHECK CONDITION status, with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.
SUB PAGE CODE	This field specifies the sub page code within the page code specified by PAGE CODE field that is requested by the application client (see 10.1).
ALLOCATION LENGTH	The SATL shall implement this field as defined in $\frac{1}{15}$ PC-3 (see 3.1.3).
CONTROL	6.5

Table 17 — MODE SENSE (6) CDB field translations

8.6 MODE SENSE (10) command

The MODE SENSE (10) command (3) provides a means for a device server in a SATL to report parameters to an application client. It is a complementary command to the MODE SELECT(10) command.

The SATL shall implement the MODE SENSE (10) command using the translation described in 8.5. Device servers that implement the MODE SENSE (10) command shall also implement the MODE SELECT(10) command. See 10.1 for supported mode pages.

8.7 READ BUFFER command

8.7.1 READ BUFFER command overview

The READ BUFFER command (See SPC-3) is used in conjunction with the WRITE BUFFER command as a diagnostic function for testing memory in the SCSI device and the integrity of a service delivery subsystem. This command shall not alter the medium. Table 18 shows the translation for fields specified in the CDB for the READ BUFFER command.

Field	Description or reference
OPERATION CODE	Set to 3Ch. the SATL shall send the ATA READ BUFFER command to the ATA device.
MODE	8.7.2
BUFFER ID	If the the BUFFER ID field is set to 00h then the SATL shall return information describing or data read from the sector buffer in the ATA device, depending on the value in the MODE field (see 8.7.2). If the the BUFFER ID field is set to a value other than 00h then the translation is unspecified (see 3.4.2), and the SATL shall process the READ BUFFER command as defined in $\frac{49}{2}$ PC-3.
BUFFER OFFSET	⁵ he meaning of this field depends on the contents of the MODE field (see 8.7.2).
ALLOCATION LENGTH	⁶ he meaning of this field depends on the contents of the MODE field (see 8.7.2).
CONTROL	6.5

Table 18 —	- READ BUFF	ER CDB field	translations
------------	-------------	--------------	--------------

The logical sector buffer in a ATA device shall be used to emulate the READ BUFFER command, so the size of the buffer is limited to 512 bytes for data buffer and echo buffers.

8.7.2 MODE field

8.7.2.1 MODE field overview

Table 19 describes values of the MODE field that the SATL shall support.

Code	Description or reference
02h (i.e., Data)	If BUFFER ID field is set to 00h, then the translation shall be to the ATA READ BUFFER command (see 8.7.2.2). Otherwise, the translation is unspecified (see 3.4.2).
03h (i.e., Descriptor)	8.7.2.3
All others	Unspecified (see 3.4.2)

Table 19 — MODE field

8.7.2.2 Data mode

If the BUFFER ID field is set to 00h, the BUFFER OFFSET field is set to 00h, and the ALLOCATION LENGTH field is set to 512, then the SATL shall return 512 bytes of data.

If the BUFFER ID field is set to 00h, the BUFFER OFFSET field is set to 00h, and the ALLOCATION LENGTH field is set to a value other than 512, then the SATL shall either:

- a) return the the lesser of 512 bytes of data or the number of bytes specified in the ALLOCATION LENGTH field from the buffer in the ATA device by sending an ATA READ BUFFER command to the ATA device; or
- b) terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST with the additional sense code set to INVALID FIELD IN CDB.

Status Status 11/3/2008 5:06:02 PM

If the BUFFER ID field is set to 00h and the BUFFER OFFSET field is set to a value other than 00h then the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST with the additional sense code set to INVALID FIELD IN CDB.

The SATL may support a value other than 00h in the BUFFER ID field, If the SATL supports a value other than 00h in the BUFFER ID field the implementation shall be as defined in UPC-3.

A WRITE BUFFER command may be sent to the same buffer ID before it is read with the READ BUFFER command.

8.7.2.3 Descriptor mode

If the ALLOCATION LENGTH field is set to less than four, the SATL shall return CHECK CONDITION status with the sense key set to INVALID FIELD IN CDB.

If the ALLOCATION LENGTH field is set to four or greater, the SATL shall return four bytes of data describing the requested buffer, including the OFFSET BOUNDARY field and the BUFFER CAPACITY field.

If the BUFFER ID field is set to zero then the SATL shall return:

- a) ³ffset boundary set to 9h (i.e., 512 bytes); and
 b) BUFFER CAPACITY ⁴et to 200h (i.e., 512 bytes).

The SATL may support a value other than zero in the BUFFER ID field and the implementation is unspecified..

8.8 REQUEST SENSE command

8.8.1 REQUEST SENSE command overview

The REQUEST SENSE command requests any available sense data to be returned to the application client.

If the SCSI transport protocol for the SATL supports autosense (see 9.1.29), the SATL shall beturn sense data using autosense. Otherwise, the SATL shall beturn sense data in response to the REQUEST SENSE command (see SAM-2).

The SATL shall determine if there sense data to return to the application client. To determine if there is power condition sense data to return, the SATL shall send the ATA CHECK POWER MODE command to the ATA device. ¹⁰ the ATA CHECK POWER MODE command does not complete with success then no power condition sense data shall be returned. If the SATL has no sense data to return, then the SATL shall complete the REQUEST SENSE command with GOOD status with the sense key set to NO SENSE and the additional sense code set to NO ADDITIONAL SENSE DATA the SATL has sense data to return.

Emulated device state	Reference
Status other than GOOD to return	SPC-3
FORMAT UNIT in progress	8.8.2
SMART threshold exceeded condition	8.8.3
Stopped power condition (i.e., ATA device in standby power management state)	8.8.4
Unit attention condition established	8.8.5

Comments from page 61 continued on next page

If the BUFFER ID field is set to 00h and the BUFFER OFFSET field is set to a value other than 00h then the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST with the additional sense code set to INVALID FIELD IN CDB.

The SATL may support a value other than 00h in the BUFFER ID field. If the SATL supports a value other than 00h in the BUFFER ID field the implementation shall be as defined in SPC-3.

A WRITE BUFFER command may be sent to the same buffer ID before it is read with the READ BUFFER command.

8.7.2.3 Descriptor mode

If the ALLOCATION LENGTH field is set to less than four, the SATL shall return CHECK CONDITION status with the sense key set to ILLEGIAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.

If the ALLOCATION LENGTH field is set to four or greater, the SATL shall return four bytes of data describing the requested buffer, including the OFFSET BOUNDARY field and the BUFFER CAPACITY field.

If the BUFFER ID field is set to zero then the SATL shall return:

- a) offset boundary set to 9h (i.e., 512 bytes); and
- b) BUFFER CAPACITY set to 200h (i.e., 512 bytes).

The SATL may support a value other than zero in the BUFFER ID field and the implementation is unspecified..

8.8 REQUEST SENSE command

8.8.1 REQUEST SENSE command overview

The REQUEST SENSE command requests any available sense data to be returned to the application client.

If the SCSI transport protocol for the SATL supports autosense (see 3.1.29), the SATL shall return sense data using autosense. Otherwise, the SATL shall return sense data in response to the REQUEST SENSE command (see SAM-2).

The SATL shall determine if there is sense data to return to the application client. To determine if there is power condition sense data to return, the SATL shall send the ATA CHECK POWER MODE command to the ATA device. If the ATA CHECK POWER MODE command does not complete with success then no power condition sense data shall be returned. If the SATL has no sense data to return, then the SATL shall complete the REQUEST SENSE command with GOOD status with the sense key set to NO SENSE and the additional sense code set to NO ADDITIONAL SENSE DATA (see SPC-3). Table 20 lists examples of conditions where the SATL has sense data to return.

Emulated device state	Reference
tatus other than GOOD to return	15 <mark>0C-3</mark>
FORMAT UNIT in progress	8.8.2
SMART threshold exceeded condition	8.8.3
Stopped power condition	8.8.4
Unit attention condition established	8.8.5

¹³rable 20 — Special Request Sense behavior reference

Table 20 — Special Request Sense behavior reference

Need to add sections 8.8.6 and 8.8.7 (idle and standby). Would also suggest rearranging 8.8.4 with 8.8.6 and 8.8.7 Status moverby Accepted 11/3/2008 5:11:04 PM Number: 14Author: ENDL Texas Subject: Cross-Out Date: 9/2/2008 9:24:53 AM -07'00' Ŧ _T_Delete the first row in table 20. Its function is already covered by the text which introduces the table. Besides, the reference should be SAM-2, not SPC-3. Table 21 shows the fields in the REQUEST SENSE CDB.

Field	Description or reference
OPERATION CODE	Set to 03h. The SATL shall return any available sense data to the application client.
DESC ²	the SATL supports the ATA PASS-THROUGH command (see 12.2), then the SATL shall support returning descriptor format sense data (i.e., specified by the DESC bit set to one) otherwise this field is unspecified (see 3.4.2).
ALLOCATION LENGTH	Unspecified (see 3.4.2)
CONTROL	6.5
^[4] If the SATL supports the ATA PASS-THROUGH command (see 12.2), then the SATL shall support returning descriptor format sense data (i.e., specified by the DESC bit set to one).	

Table 21 — REQUEST SENSE CDB field translation
--

8.8.2⁵FORMAT UNIT in progress

If the SATL is processing a FORMAT UNIT command and the SATL receives a REQUEST SENSE command, the SATL shall return GOOD status with the sense key set to NOT READY with the additional sense code set to LOGICAL UNIT NOT READY, FORMAT IN PROGRESS. The sense key specific bytes shall be set to progress indication as defined in BC-2 and SPC-3.

8.8.3 SMART threshold exceeded condition

lf:

- a) the ATA device has the SMART feature set enabled (i.e., DEVICE data word 85 bit 0 is set to one);
- b) the MRIE field in the Informational Exceptions Control mode page is set to 6h (see 10.1.8.2);
- c) the DEXCPT bit in the Informational Exceptions Control mode page is set to zero; and
- d) the most recent ATA SMART RETURN STATUS command to the ATA device indicates that the error threshold has been exceeded;

then the SATL shall:

- a) return parameter data containing sense data with the sense key set to NO SENSE with the additional sense code set to HARDWARE IMPENDING FAILURE GENERAL HARD DRIVE FAILURE; and
- b) complete the REQUEST SENSE command with GOOD status.

8.8.4 Stopped power condition

If the emulated logical unit is in the stopped power condition the ATA device is in the Standby power management state) and there is no sense data to return for a previously returned CHECK CONDITION status, then the SATL shall:

- 1) ¹¹turn parameter data containing sense data with the sense key set to NO SENSE with the additional sense code set to NO ADDITIONAL SENSE DATA; and
- 2) complete the REQUEST SENSE command with GOOD status.

Sense data returned for a previously returned CHECK CONDITION status resulting from a media access command or a TEST UNIT READY command received when the logical unit is in the stopped power condition is described in 8.12 (i.e., the TEST UNIT READY command) and 9.11 (i.e., the START STOP UNIT command).

8.8.5 Unit attention condition established

The SATL shall:

1) return parameter data containing sense data describing the unit attention condition (see SPC-3); and

Comments from page 62 continued on next page

Table 21 shows the fields in the REQUEST SENSE CDB.

Field	Description or reference
OPERATION CODE	Set to 03h. The SATL shall return any available sense data to the application client.
DESC ^a	If the SATL supports the ATA PASS-THROUGH command (see 12.2), then the SATL shall support returning descriptor format sense data (i.e., specified by the DESC bit set to one) otherwise this field is unspecified (see 3.4.2).
ALLOCATION LENGTH	Unspecified (see 3.4.2)
CONTROL	6.5
^a If the SATL supports returning descriptor for	the ATA PASS-THROUGH command (see 12.2), then the SATL shall support prmat sense data (i.e., specified by the DESC bit set to one).

Table 21 — REQUEST SENSE CDB field translations	Table 21 —	REQUEST	SENSE	CDB	field	translations
---	------------	---------	-------	-----	-------	--------------

8.8.2 FORMAT UNIT in progress

If the SATL is processing a FORMAT UNIT command and the SATL receives a REQUEST SENSE command, the SATL shall return GOOD status with the sense key set to NOT READY with the additional sense code set to LOGICAL UNIT NOT READY, FORMAT IN PROGRESS. The sense key specific bytes shall be set to progress indication as defined in SBC-2 and SPC-3.

8.8.3 SMART threshold exceeded condition

lf:

- a) the ATA device has the SMART feature set enabled (i.e., **IDENTIFY DEVICE data** word 85 bit 0 is set to one);
- b) the MRIE field in the Informational Exceptions Control mode page is set to 6h (see 10.1.8.2);
- c) the DEXCPT bit in the Informational Exceptions Control mode page is set to zero; and
- d) the most recent ATA SMART RETURN STATUS command to the ATA device indicates that the error threshold has been exceeded;

then the SATL shall:

- a) return parameter data containing sense data with the sense key set to NO SENSE with the additional sense code set to HARDWARE IMPENDING FAILURE GENERAL HARD DRIVE FAILURE; and
- b) complete the REQUEST SENSE command with GOOD status.

8.8.4 Stopped power condition

If the emulated logical unit is in the stopped power condition (i.e., the ATA device is in the Standby power management state) and there is no sense data to return for a previously returned CHECK CONDITION status, then the SATL shall:

- 1) return parameter data containing sense data with the sense key set to NO SENSE with the additional sense code set to NO ADDITIONAL SENSE DATA; and
- 2) complete the REQUEST SENSE command with GOOD status.

Sense data returned for a previously returned CHECK CONDITION status resulting from a media access command or a TEST UNIT READY command received when the logical unit is in the stopped power condition is described in 8.12 (i.e., the TEST UNIT READY command) and 9.11 (i.e., the START STOP UNIT command).

8.8.5 Unit attention condition established

The SATL shall:

1) return parameter data containing sense data describing the unit attention condition (13) and

 Number: 12 Author: HPQ-RElliott
 Subject: Note
 Date: 9/3/2008 9:42:24 AM -07'00'

 Keep 8.8.4, 8.8.6, and 8.8.7 together since they're all power conditions.
 8.8.5 belongs elsewhere.

Status moverby Accepted 11/3/2008 5:16:57 PM Number: 13 Author: Kevin_Marks Subject: Highlight (see SPC-3); Date: 8/14/2008 8:33:02 AM -07'00' s/b (see SPC-4);

Status moverby Accepted 11/3/2008 5:17:02 PM 2) complete the REQUEST SENSE command with GOOD status.

1.8.6²DLE power condition

If the emulated logical unit is in the BLE power condition (e.g., after returning GOOD status to a START STOP UNIT command with the Hower condition field set to DLE) then the SATL shall return GOOD status with the sense key set to NO SENSE with the additional sense code set to:

- a) LOW POWER CONDITION ON if the reason for the entry into the idle power condition is unknown;
- b) POW ONDITION CHANGE TO IDLE if the ATA CHECK POWER MODE command indicates by power condition; or
- c) IDLE CONDITION ACTIVATED BY COMMAND if the logical unit entered the idle power condition due to a START STOP UNIT command or receipt of a command requiring the idle power condition.

10.8.7¹¹ TANDBY power condition

If the emulated logical unit is in the TANDBY power condition (e.g., after returning GOOD status to a START STOP UNIT command with the power condition field set to STANDBY) then the SATL shall return GOOD status with the sense key set to NO SENSE with the additional sense code set to:

- a) LOW POWER CONDITION ON if the reason for the entry into the standby power condition is unknown;
- b) POWER CONDITION CHANGE TO STANDBY if the ATA CHECK POWER MODE command indicates with the standard power condition; or
- c) STANDBY CONDITION ACTIVATED BY COMMAND if the logical unit entered the standby power condition due to a START STOP UNIT command or receipt of a command requiring the standby power condition.

8.9 SECURITY PROTOCOL IN command

9.1 SECURITY PROTOCOL IN command overview

The SECURITY PROTOCOL IN command provides a means for the application client to retrieve security information from a SCSI target device. Table 22 shows the translation for fields specified in the SECURITY PROTOCOL IN CDB.

Field	Description or Reference
OPERATION CODE	Set to A2h. The SATL shall send the ATA TRUSTED RECEIVE command or the ATA TRUSTED RECEIVE DMA command to the ATA device.
SECURITY PROTOCOL	8.9.1.1
SECURITY PROTOCOL SPECIFIC	8.9.1.2
INC_512	8.9.1.3
ALLOCATION LENGTH	8.9.1.3
CONTROL	6.5

Table 22 — SECURITY PROTOCOL IN CDB field translation

8.9.1.1 SECURITY PROTOCOL field

The SECURITY PROTOCOL field shall be copied to the ATA Security_Protocol field.

8.9.1.2 SECURITY PROTOCOL SPECIFIC field

The SECURITY PROTOCOL SPECIFIC field shall be copied to the ATA SP_Specific field.

Comments from page 63 continued on next page

2) complete the REQUEST SENSE command with GOOD status.

8.8.6 IDLE power condition

If the emulated logical unit is in the IDLE power condition (e.g., after returning GOOD status to a START STOP UNIT command with the power condition field set to IDLE) then the SATL shall return GOOD status with the sense key set to NO SENSE with the additional sense code set to:

- a) LOW POWER CONDITION ON if the reason for the entry into the idle power condition is unknown;
- b) POW CONDITION CHANGE TO IDLE if the ATA CHECK POWER MODE command indicates idle power condition; or
- c) IDLE CONDITION ACTIVATED BY COMMAND if the logical unit entered the idle power condition due to a START STOP UNIT command or receipt of a command requiring the idle power condition.

8.8.7 STANDBY power condition

If the emulated logical unit is in the STANDBY power condition (e.g., after returning GOOD status to a START STOP UNIT command with the power condition field set to 44 FANDBY) then the SATL shall return GOOD status with the sense key set to NO SENSE with the additional sense code set to:

- a) LOW POWER CONDITION ON if the reason for the entry into the standby power condition is unknown;
- b) POWER CONTINITION CHANGE TO STANDBY if the ATA CHECK POWER MODE command indicates with the standard power condition; or
- c) STANDBY CONDITION ACTIVATED BY COMMAND if the logical unit entered the standby power condition due to a START STOP UNIT command or receipt of a command requiring the standby power condition.

8.9 SECURITY PROTOCOL IN command

→ 0.9.1 SECURITY PROTOCOL IN command overview

The SECURITY PROTOCOL IN command provides a means for the application client to retrieve security information from a SCSI target device. Table 22 shows the translation for fields specified in the SECURITY PROTOCOL IN CDB.

Field	Description or Reference
20 ERATION CODE	Set to A2h. The SATL shall send the ATA TRUSTED RECEIVE command or the ATA TRUSTED RECEIVE DMA command to the ATA device.
SECURITY PROTOCOL	8.9.1.1
SECURITY PROTOCOL SPECIFIC	8.9.1.2
INC_512	8.9.1.3
ALLOCATION LENGTH	8.9.1.3
CONTROL	6.5

Table 22 — SECURITY PROTOCOL IN CDB field translation

8.9.1.1 SECURITY PROTOCOL field

The SECURITY PROTOCOL field shall be copied to the ATA

8.9.1.2 SECURITY PROTOCOL SPECIFIC field

The SECURITY PROTOCOL SPECIFIC field shall be copied to the ATA²²P_Specific field.

8.9.1.3.1 ALLOCATION LENGTH field translation overview

The Panslation of ALLOCATION LENGTH Paries based on the Palue of SECURITY ROTOCOL. If Illocation length is zero, the SATL shall use the ATA TRUSTED NON-DATA command with bit 24 of the LBA field set to one, instead of TRUSTED RECEIVE or TRUSTED RECEIVE DMA.

12 0.9.1.3.2 11 CURITY PROTOCOL 00h - 06h

8.9.1.3 ALLOCATION LENGTH field

If INC_512 is set to one:

- a) If ALLOCATION LENGTH is greater than FFFFh, then the SATL shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB;
- b) Otherwise, the ATA Transfer_Length field shall be set to ALLOCATION LENGTH (15:0). After completion of the ATA TRUSTED RECEIVE or ATA TRUSTED RECEIVE DMA command, the data shall be transferred to the SCSI application client.

If INC_512 is set to zero:

- a) If ALLOCATION LENGTH is greater than 1FF_FE00h, then the SATL shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB;
- b) otherwise, the ATA Transfer_Length field shall be translated from bytes to a number of padded 512-byte units from the result of the following calculation:

ATA Transfer_Length(15:0) = ((ALLOCATION LENGTH + 511) / 512)

After successful completion of the ATA TRUSTED RECEIVE or ATA TRUSTED RECEIVE DMA command, the data shall be transferred to the SCSI application client up to the specified ALLOCATION LENGTH number of bytes.

8.9.1.3.3 SECURITY PROTOCOL values 07h - FFh

4 The translation of this field is unspecified (see 3.4.2).

8.10 SECURITY PROTOCOL OUT command

8.10.1 SECURITY PROTOCOL OUT command overview

The SECURITY PROTOCOL OUT command provides a means for the application client to send security information to a SCSI target device. Table 23 shows the translation for fields specified in the SECURITY PROTOCOL OUT CDB.

Table 23 — SECURITY PROTOCOL OUT CDB field translation

Field	Description or Reference
OPERATION CODE	Set to A2h. The SATL shall send the ATA TRUSTED RECEIVE command or the ATA TRUSTED RECEIVE DMA command to the ATA device.

	INC_512 was proposed as necessary to ease SAT translations. SAT-2 has no problem defining that the SATL multiply by 512 when needed, however. I suggest the SAT WG consider if INC 512 should be dropped from SPC-4.

Comments from page 64 continued on next page

8.9.1.3 ALLOCATION LENGTH field

8.9.1.3.1 ALLOCATION LENGTH field translation overview

The translation of ALLOCATION LENGTH varies based on the value of SECURITY PROTOCOL. If allocation length is zero, the SATL shall use the ATA TRUSTED NON-DATA command with bit 24 of the LBA field set to one, instead of TRUSTED RECEIVE or TRUSTED RECEIVE DMA.

8.9.1.3.2 SECURITY PROTOCOL 00h - 06h

1314 1314 C_512 is set to one:

- a) If Incontion LENGTH B greater than FFFFh, then the SATL shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB;
- b) Otherwise? the ATA Transfer_Length field shall be set to concern to the ATA TRUSTED RECEIVE or ATA TRUSTED RECEIVE DMA command, the data shall be transferred to the SCSI application client.

²¹²²C_512 is set to zero:

- a) If 24 LOCATION LENGTH 23 greater than 1FF_FE00h, then the SATL shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB;
- b) otherwise, the ATA Transfer_Length field shall be translated from bytes to a number of padded 512-byte units from the result of the following calculation:

ATA Transfer_Length(15:0) = ((ALLOCATION LENGTH + 511) / 512)

After successful completion of the ATA TRUSTED RECEIVE or ATA TRUSTED RECEIVE DMA command, the data shall be transferred to the SCSI application client up to the specified ALLOCATION LENGTH number of bytes.

8.9.1.3.3 SECURITY PROTOCOL values 07h - FFh

4 The translation of this field is unspecified (see 3.4.2).

8.10 SECURITY PROTOCOL OUT command

8.10.1 SECURITY PROTOCOL OUT command overview

The SECURITY PROTOCOL OUT command provides a means for the application client to send security information to a SCSI target device. Table 23 shows the translation for fields specified in the SECURITY PROTOCOL OUT CDB.

Comments from page 64 continued on next page

8.9.1.3 ALLOCATION LENGTH field

8.9.1.3.1 ALLOCATION LENGTH field translation overview

The translation of ALLOCATION LENGTH varies based on the value of SECURITY PROTOCOL. If allocation length is zero, the SATL shall use the ATA TRUSTED NON-DATA command with bit 24 of the LBA field set to one, instead of TRUSTED RECEIVE or TRUSTED RECEIVE DMA.

8.9.1.3.2 SECURITY PROTOCOL 00h - 06h

If INC_512 is set to one:

- a) If ALLOCATION LENGTH is greater than FFFFh, then the SATL shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB;
- b) Otherwise, the ATA Transfer_Length field shall be set to ALLOCATION LENGTH (15:0). After completion of the ATA TRUSTED RECEIVE or ATA TRUSTED RECEIVE DMA command, the data shall be transferred to the SCSI application client.

If INC_512 is set to zero:

- a) If <u>ALLOCATION LENGTH</u> is greater than 1FF_FE00h, then the SATL shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB; [25]
- b) otherwise, the ATA Transfer_Length field shall be translated from bytes to a number of padded 512-byte units from the result of the following calculation:

ATA Transfer_Length(15:0) = ((ALLOCATION LENGTH + 511) / 512)

After successful completion of the ATA TRUSTED RECEIVE or ATA TRUSTED RECEIVE DMA command, the data shall be transferred to the SCSI application client up to the specified ALLOCATION LENGTH number of bytes.

8.9.1.3.3 SECURITY PROTOCOL values 07h - FFh

Appendix App

8.10 SECURITY PROTOCOL OUT command

8.10.1 SECURITY PROTOCOL OUT command overview

The SECURITY PROTOCOL OUT command provides a means for the application client to send security information to a SCSI target device. Table 23 shows the translation for fields specified in the SECURITY PROTOCOL OUT CDB.

Table 23 — SECURITY PROTOCOL OUT CDB field translation

Field	Description or Reference		
OPERATION CODE	Set to A2h. The SATL shall send the ATA TRUSTED RECEIVE command or the ATA TRUSTED RECEIVE DMA command to the ATA device.		
SECURITY PROTOCOL	8.9.1.1		
SECURITY PROTOCOL SPECIFIC	8.9.1.2		
INC_512	8.9.1.3		
TRANSFER LENGTH	8.9.1.3		
CONTROL	6.5

Status moverby Accepted Author: moverby Subject: Sticky Note Suggest collapsing into paragraph without a) b) list. Date: 11/3/2008 5:57:49 PM

8.10.1.1 SECURITY PROTOCOL field

The SECURITY PROTOCOL field shall be copied to the ATA Security_Protocol field.

8.10.1.2 SECURITY PROTOCOL SPECIFIC field

The SECURITY PROTOCOL SPECIFIC field shall be copied to the ATA SP_Specific field.

8.10.1.3 TRANSFER LENGTH field 🦯

8.10.1.3.1 SECURITY PROTOCOL field translation overview

The translation of TRANSFER LENGTH varies based on the value of SECURITY PROTOCOL. If transfer length is zero, the SATL shall use the ATA TRUSTED NON-DATA command with bit 24 of the LBA field set to zero, instead of TRUSTED SEND or TRUSTED SEND DMA.

8.10.1.3.2 SECURITY PROTOCOL values 00h - 06h

If the INC_512 is set to one:

- a) If TRANSFER LENGTH is greater than FFFFh, then the SATL shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB;
- b) Otherwise, the ATA Transfer_Length field shall be set to ALLOCATION LENGTH (15:0). The ATA TRUSTED SEND or ATA TRUSTED SEND DMA command shall transfer the data.

If the INC_512 bit is set to zero:

- a) If TRANSFER LENGTH is greater than 1FF_FE00h, then the SATL shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB;
- b) Otherwise, the ATA Transfer_Length field shall be translated from bytes to a number of padded 512-byte units from the result of the following calculation:

ATA Transfer_Length(15:0) = ((TRANSFER LENGTH + 511) / 512)

The final data block may be padded (see SPC-4). The ATA TRUSTED SEND or ATA TRUSTED SEND DMA command shall transfer the padded data for ATA Transfer_Length number of data blocks.

8.10.1.3.3 SECURITY PROTOCOL values 07h - FFh

The translation of this field is unspecified (see 3.4.2).

8.9.1.3 ALLOCATION LENGTH field

8.9.1.3.1 ALLOCATION LENGTH field translation overview

The translation of ALLOCATION LENGTH varies based on the value of SECURITY PROTOCOL. If allocation length is zero, the SATL shall use the ATA TRUSTED NON-DATA command with bit 24 of the LBA field set to one, instead of TRUSTED RECEIVE or TRUSTED RECEIVE DMA.

8.9.1.3.2 SECURITY PROTOCOL 00h - 06h

If INC_512 is set to one:

- a) If ALLOCATION LENGTH is greater than FFFFh, then the SATL shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB;
- b) Otherwise, the ATA Transfer_Length field shall be set to ALLOCATION LENGTH (15:0). After completion of the ATA TRUSTED RECEIVE or ATA TRUSTED RECEIVE DMA command, the data shall be transferred to the SCSI application client.

If INC_512 is set to zero:

- a) If ALLOCATION LENGTH is greater than 1FF_FE00h, then the SATL shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB;
- b) otherwise, the ATA Pransfer_Length field shall be translated from bytes to a number of padded 512-byte units from the result of the following calculation:

ATA²ransfer_Length(15:0) = (⁴ALLOCATION LENGTH + 511) / 512)

After successful completion of the ATA TRUSTED RECEIVE or ATA TRUSTED RECEIVE DMA command, the data shall be transferred to the SCSI application client up to the pecified ALLOCATION LENGTH number of bytes.

8.9.1.3.3 CURITY PROTOCOL values 7h - FFh

 $\sqrt{3}$ he $\frac{11}{12}$ he station of this field is unspecified (see 3.4.2).

8.10 SECURITY PROTOCOL OUT command

8.10.1 SECURITY PROTOCOL OUT command overview

The SECURITY PROTOCOL OUT command provides a means for the application client to send security information to a SCSI target device. Table 23 shows the translation for fields specified in the SECURITY PROTOCOL OUT CDB.

Table 23 — SECURITY PROTOCOL OUT CDB field translation

Comments from page 64 continued on next page

8.9.1.3 ALLOCATION LENGTH field

8.9.1.3.1 ALLOCATION LENGTH field translation overview

The translation of ALLOCATION LENGTH varies based on the value of SECURITY PROTOCOL. If allocation length is zero, the SATL shall use the ATA TRUSTED NON-DATA command with bit 24 of the LBA field set to one, instead of TRUSTED RECEIVE or TRUSTED RECEIVE DMA.

8.9.1.3.2 SECURITY PROTOCOL 00h - 06h

If INC_512 is set to one:

- a) If ALLOCATION LENGTH is greater than FFFFh, then the SATL shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB;
- b) Otherwise, the ATA Transfer_Length field shall be set to ALLOCATION LENGTH (15:0). After completion of the ATA TRUSTED RECEIVE or ATA TRUSTED RECEIVE DMA command, the data shall be transferred to the SCSI application client.

If INC_512 is set to zero:

- a) If ALLOCATION LENGTH is greater than 1FF_FE00h, then the SATL shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB;
- b) otherwise, the ATA Transfer_Length field shall be translated from bytes to a number of padded 512-byte units from the result of the following calculation:

ATA Transfer_Length(15:0) = ((ALLOCATION LENGTH + 511) / 512)

After successful completion of the ATA TRUSTED RECEIVE or ATA TRUSTED RECEIVE DMA command, the data shall be transferred to the SCSI application client up to the specified ALLOCATION LENGTH number of bytes.

8.9.1.3.3 SECURITY PROTOCOL values 07h - FFh

A translation of this field is unspecified (see 3.4.2).

8.10 SECURITY PROTOCOL OUT command

8.10.1 SECURITY PROTOCOL OUT command overview

The SECURITY PROTOCOL OUT command provides a means for the application client to send security information to a SCSI target device. Table 23 shows the translation for fields specified in the SECURITY PROTOCOL OUT CDB.

Table 23 — SECURITY PROTOCOL OUT CDB field translation

Field	Description or Reference

8.10.1.1 SECURITY PROTOCOL field

The SECURITY PROTOCOL field shall be copied to the ATA decurity_Protocol field.

8.10.1.2 SECURITY PROTOCOL SPECIFIC field

The SECURITY PROTOCOL SPECIFIC field shall be copied to the ATA P_Specific field.

8.10.1.3 TRANSFER LENGTH field

8.10.1.3.1 SECURITY PROTOCOL Held translation overview

The translation of ANSFER LENGTH Varies based on the Value of SECURITY COTOCOL. In the Inster length is zero, the SATL shall use the ATA TRUSTED NON-DATA command with bit 24 of the LBA field set to zero, instead of TRUSTED SEND or TRUSTED SEND DMA.

8.10.1.3.2 SECURITY PROTOCOL values 00h - 06h

If the INC_512 is set to one:

- a) If TRANSFER LENGTH is greater than FFFFh, then the SATL shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB;
- b) Otherwise, the ATA Transfer_Length field shall be set to ALLOCATION LENGTH (15:0). The ATA TRUSTED SEND or ATA TRUSTED SEND DMA command shall transfer the data.

If the INC_512 bit is set to zero:

- a) If TRANSFER LENGTH is greater than 1FF_FE00h, then the SATL shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB;
- b) Otherwise, the ATA Transfer_Length field shall be translated from bytes to a number of padded 512-byte units from the result of the following calculation:

ATA Transfer_Length(15:0) = ((TRANSFER LENGTH + 511)/512)

The final data block may be padded (see SPC-4). The ATA TRUSTED SEND or ATA TRUSTED SEND DMA command shall transfer the padded data for ATA Transfer_Length number of data blocks.

8.10.1.3.3 SECURITY PROTOCOL values 07h - FFh

The translation of this field is unspecified (see 3.4.2).

Comments from page 65 continued on next page

the TRANSFER LENGTH field

8.10.1.1 SECURITY PROTOCOL field

The SECURITY PROTOCOL field shall be copied to the ATA Security_Protocol field.

8.10.1.2 SECURITY PROTOCOL SPECIFIC field

The SECURITY PROTOCOL SPECIFIC field shall be copied to the ATA SP_Specific field.

8.10.1.3 TRANSFER LENGTH field 🦯

8.10.1.3.1 SECURITY PROTOCOL field translation overview

The translation of TRANSFER LENGTH varies based on the value of SECURITY PROTOCOL. If transfer length is zero, the SATL shall use the ATA TRUSTED NON-DATA command with bit 24 of the LBA field set to zero, instead of TRUSTED SEND or TRUSTED SEND DMA.

8.10.1.3.2 SECURITY PROTOCOL values 00h - 06h

If the INC_512 is set to one:

- a) If ANSFER LENGTH is greater than FFFFh, then the SATL shall return CHECK CONDITION status [24] the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB;
- b) Otherwise, the ATA Transfer_Length field shall be set to ALLOCATION LENGTH (15:0). The ATA TRUSTED SEND or ATA TRUSTED SEND DMA command shall transfer the data.

If the INC_512 bit is set to zero:

- a) If TRANSFER LENGTH is greater than 1FF_FE00h, then the SATL shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB;
- b) Otherwise, the ATA Transfer_Length field shall be translated from bytes to a number of padded 512-byte units from the result of the following calculation:

ATA Transfer_Length(15:0) = ((TRANSFER LENGTH + 511) / 512)

The final data block may be padded (see SPC-4). The ATA TRUSTED SEND or ATA TRUSTED SEND DMA command shall transfer the padded data for ATA Transfer_Length number of data blocks.

8.10.1.3.3 SECURITY PROTOCOL values 07h - FFh

The translation of this field is unspecified (see 3.4.2).

8.9.1.3 ALLOCATION LENGTH field

8.9.1.3.1 ALLOCATION LENGTH field translation overview

The translation of ALLOCATION LENGTH varies based on the value of SECURITY PROTOCOL. If allocation length is zero, the SATL shall use the ATA TRUSTED NON-DATA command with bit 24 of the LBA field set to one, instead of TRUSTED RECEIVE or TRUSTED RECEIVE DMA.

8.9.1.3.2 SECURITY PROTOCOL 00h - 06h

If INC_512 is set to one:

- a) If ALLOCATION LENGTH is greater than FFFFh, then the SATL shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB;
- b) Otherwise, the ATA Transfer_Length field shall be set to ALLOCATION LENGTH (15:0). After completion of the ATA TRUSTED RECEIVE or ATA TRUSTED RECEIVE DMA command, the data shall be transferred to the SCSI application client.

If INC_512 is set to zero:

- a) If ALLOCATION LENGTH is greater than 1FF_FE00h, then the SATL shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB;
- b) otherwise, the ATA Transfer_Length field shall be translated from bytes to a number of padded 512-byte units from the result of the following calculation:

ATA Transfer_Length(15:0) = ((ALLOCATION LENGTH + 511) / 512)

After successful completion of the ATA TRUSTED RECEIVE or ATA TRUSTED RECEIVE DMA command, the data shall be transferred to the SCSI application client up to the specified ALLOCATION LENGTH number of bytes.

8.9.1.3.3 SECURITY PROTOCOL values 07h - FFh

4 The translation of this field is unspecified (see 3.4.2).

8.10 SECURITY PROTOCOL OUT command

8.10.1 SECURITY PROTOCOL OUT command overview

The SECURITY PROTOCOL OUT command provides a means for the application client to send security information to a SCSI target device. Table 23 shows the translation for fields specified in the SECURITY PROTOCOL OUT CDB.

Table 23 — SECURITY PROTOCOL OUT CDB field translation

Field	Description or Reference
OPERATION CODE	Set to A2h. The SATL shall send the ATA TRUSTED RECEIVE command or the ATA TRUSTED RECEIVE DMA command to the ATA device.
SECURITY PROTOCOL	8.9.1.1
SECURITY PROTOCOL SPECIFIC	8.9.1.2
INC_512	8.9.1.3
TRANSFER LENGTH	8.9.1.3
CONTROL	6.5

8.10.1.1 SECURITY PROTOCOL field

The SECURITY PROTOCOL field shall be copied to the ATA Security_Protocol field.

8.10.1.2 SECURITY PROTOCOL SPECIFIC field

The SECURITY PROTOCOL SPECIFIC field shall be copied to the ATA SP_Specific field.

8.10.1.3 TRANSFER LENGTH field 🦯

8.10.1.3.1 SECURITY PROTOCOL field translation overview

The translation of TRANSFER LENGTH varies based on the value of SECURITY PROTOCOL. If transfer length is zero, the SATL shall use the ATA TRUSTED NON-DATA command with bit 24 of the LBA field set to zero, instead of TRUSTED SEND or TRUSTED SEND DMA.

8.10.1.3.2 SECURITY PROTOCOL values 00h - 06h

If the INC_512 is set to one:

- a) If TRANSFER LENGTH is greater than FFFFh, then the SATL shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB;
- b) Otherwise, the ATA Transfer_Length field shall be Set to ALLOCATION LENGTH (15:0). The ATA TRUSTED SEND or ATA TRUSTED SEND DMA command shall transfer the data.

If the 5NC_512 bit is set to zero:

- a) If PRANSFER LENGTH B greater than FF_FE00h, then the SATL shall return CHECK CONDITION
- b) Otherwise, the ATA Hansfer_Length field shall be translated from $\frac{12}{12}$ to a number of padded 512-byte units from the result of the following calculation:

ATA Transfer_Length(15:0) = ((TRANSFER LENGTH + 511) / 512)

The final data block may be padded (see SPC-4). The ATA TRUSTED SEND or ATA TRUSTED SEND DMA command shall transfer the padded data for ATA Transfer_Length number of data blocks.

8.10.1.3.3 SECURITY PROTOCOL values 07h - FFh

The translation of this field is unspecified (see 3.4.2).

8.11 SEND DIAGNOSTIC command

8.11.1 SEND DIAGNOSTIC command overview

The SEND DIAGNOSTIC command provides a mechanism for an application client to request diagnostic operations to be performed on the target device, logical unit, or both. The SATL shall implement the default self-test feature (see SPC-3). Table 24 shows the translation for fields specified in the SEND DIAGNOSTIC CDB.

Field	Description or reference
OPERATION CODE	Set to 1Dh. See 8.11.2.
SELF-TEST CODE	8.11.2 and 8.11.3.
PF	Unspecified (see 3.4.2)
SELFTEST	8.11.3
DevOffL	If the DEVOFFL bit is set to zero, then the SATL shall process the command as specified in <mark>PC-3.</mark> If the DEVOFFL bit is set to one, then the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.
UNITOFFL	If the UNITOFFL bit is set to zero, then the SATL shall process the command as specified in ³ PC-3. If the UNITOFFL bit is set to one, then the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.
PARAMETER LIST LENGTH	If the PARAMETER LIST LENGTH field is set to zero, then the SATL shall process the command as specified in ⁴ PC-3. If the PARAMETER LIST LENGTH field is not set to zero, then the SATL shall terminate the command with a CHECK CONDITION status with sense key set to ILLEGAL REQUEST and additional sense code set to INVALID FIELD IN CDB.

8.11.2 SELF-TEST CODE field

The SATL shall determine if the value in the SELF-TEST CODE field is valid depending on the value of the SELFTEST bit and ¹¹/_{what} is reported by the ATA device with respect to the ATA SMART EXECUTE OFF-LINE IMMEDIATE command (see 8.11.3).

If the value of the SELF-TEST CODE field is valid, then the SATL shall process the command as described in table 25.

Code	Name of test	Description of test
000b	Default self-test	Used when the SELFTEST bit is set to one.
001b	Background short self-test	 The SATL shall perform the following: 1) return status for the SEND DIAGNOSTIC command as soon as the CDB has been validated and initialize the Self-Test Results log page (see 10.2.4 and 2PC-3); and 2) send an ATA SMART EXECUTE OFF-LINE IMMEDIATE command with the BA Low register set to 1 (i.e., Execute SMART Short self-test routine immediately in off-line mode) to the ATA device.
010Ь	Background extended self-test	 The SATL shall perform the following: 1) return status for the SEND DIAGNOSTIC command as soon as the CDB has been validated and initialize the Self-Test Results log page (see 10.2.4 and ⁴PC-3); and 2) send an ATA SMART EXECUTE OFF-LINE IMMEDIATE command with the ⁵BA Low register set to 2 (i.e., Execute SMART Extended self-test routine immediately in off-line mode) to the ATA device.
011b		Reserved
100Ь	Abort background self-test	If a previous SEND DIAGNOSTIC command specified a background self-test function and that self-test has not completed (see SPC-3), then the SATL shall send an ATA SMART EXECUTE OFF-LINE IMMEDIATE command with the BA Low register set to 127 (i.e., Abort off-line mode self-test routine) to the ATA device. If the ATA SMART EXECUTE OFF-LINE IMMEDIATE command completes without Trror, the SATL shall return GOOD status. If the ATA command completes with an error the SATL shall respond as defined in PC-3.
101b	Foreground short self-test	The SATL shall send an ATA SMART EXECUTE OFF-LINE IMMEDIATE command with the ¹⁰ BA Low register set to 129 (i.e., Execute SMART Short self-test routine immediately in captive mode) to the ATA device. If the ATA SMART EXECUTE OFF-LINE IMMEDIATE command completes without error, the SATL shall update the Self-Test Results log page prior to returning GOOD status. If the ATA command completes with an ¹¹ error the SATL shall first update the Self-Test Results log page (i.e., if supported, see ¹² PC-3), and terminate the command with CHECK CONDITION status with the sense key set to HARDWARE ERROR and the additional sense code set to LOGICAL UNIT FAILED SELF-TEST.

Table 26 — SELFTEST bit

Code	ATA SMART EXECUTE OFF-LINE IMMEDIATE command ^a		SATL emulation
	supported	enabled	
	no	n/a	The SATL shall terminate the SEND DIAGNOSTIC command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.
0	yes	no	The SATL shall terminate the SEND DIAGNOSTIC command with CHECK CONDITION status with the sense key set to ABORTED COMMAND and the additional sense code set to ATA DEVICE FEATURE NOT ENABLED.
		yes	Phe SELF-TEST CODE field is valid, and the SATL shall process the SEND DIAGNOSTIC command according to the value specified in the SELF-TEST CODE field as defined in 8.11.2.
	no	n/a	The SATL shall send three ATA verify commands (see 3.1,24) to the ATA device with the Boy Section and the BA field set to: zero; the maximum user-addressable LBA; and an arbitrary number between zero and the maximum user-addressable LBA.
1	yes	no	If any of the three ATA verify commands ends with an error, then the SATL shall terminate the SEND DIAGNOSTIC command with a CHECK CONDITION status with the sense key set to HARDWARE ERROR and the additional sense code set to LOGICAL UNIT FAILED SELF-TEST. If all three ATA verify commands complete without error ^b , then the SATL shall return GOOD status.
	yes		The SATL shall send an ATA SMART EXECUTE OFF-LINE IMMEDIATE command with the BA Low register set to 129 (i.e., Execute SMART Short self-test routine immediately in captive mode) to the ATA device. If the ATA EXECUTE OFF-LINE IMMEDIATE command completes without error, the SATL shall return GOOD status. If the ATA EXECUTE OFF-LINE IMMEDIATE command completes with an error, the SATL shall terminate the SEND BIAGNOSITC command with a CHECK CONDITION status with the sense key set to HARDWARE ERROR and the additional sense code set to LOGICAL UNIT FAILED SELF-TEST.
^a The SATL shall determine if the ATA SMART EXECUTE OFF-LINE IMMEDIATE command is supported and enabled based on the ATA IDENTIFY DEVICE data word 84 bit 1, and word 85 bit 0 (see ATA8-ACS).			

^b The SATL may retry any of the three ATA Verify commands if an ATA Verify command fails on the first attempt, and the retried command may specify an alternate LBA. If the retried command completes without error, the SATL may consider the ATA Verify command as having completed without error.

8.12 TEST UNIT READY command

8.12.1 TEST UNIT READY command overview

The TEST UNIT READY command is used to determine whether the device is ready (see table 27).

Field	Description or reference
OPERATION CODE	Set to 09h. See 8.12.2.
CONTROL	6.5

Table 27 — TEST UNIT READY CDB field translations

8.12.2 TEST UNIT READY command translation

The SATL processes the TEST UNIT READY command as follows:

- 1) If any condition exists that prevents the SATL from issuing commands to the ATA device, the SATL should terminate the TEST UNIT READY command with CHECK CONDITION status with the sense key set to NOT READY with the additional sense code of LOGICAL UNIT NOT READY, CAUSE NOT REPORTABLE;
- 2) If the device is in the stopped state as the result of processing a START STOP UNIT command (see 9.11), then the SATL shall terminate the TEST UNIT READY command with CHECK CONDITION status with the sense key set to NOT READY and the additional sense code of LOGICAL UNIT NOT READY, INITIALIZING COMMAND REQUIRED;
- 3) If the ATA device is the foreground is a self-test in the foreground is SATL shall terminate the command with CHECK CONDITION status, with the sense key set to NOT READY, and the additional sense code set to LOGICAL UNIT NOT READY, SELF-TEST IN PROGRESS;
- 4) If the SATL is processing a FORMAT UNIT command for the emulated device (see 9.2), then the SATL shall terminate the TEST UNIT READY command with CHECK CONDITION status with the sense key set to NOT READY and the additional sense code set to LOGICAL UNIT NOT READY, FORMAT IN PROGRESS;
- 5) If the ATA device supports the Removable Media feature set (i.e., ATA IDENTIFY DEVICE data word 82 bit 2 is set to one), then the SATL shall send an ATA GET MEDIA STATUS command to the ATA device. If the ATA device completes the command with the NM bit set to one in the Error register, then the SATL shall terminate the TEST UNIT READY command with CHECK CONDITION status with the sense key set to NOT READY and the additional sense code of MEDIUM NOT PRESENT; and
- 6) If the ATA device completed the most recent ATA command with the DF bit set to one in the Status register, then the SATL shall terminate the TEST UNIT READY command with CHECK CONDITION status with the sense key set to HARDWARE ERROR and the additional sense code of LOGICAL UNIT FAILURE.

If none of the conditions defined in items through 6 exist, then the SATL shall send an ATA CHECK POWER MODE command to the ATA device, and:

- a) If the ATA CHECK POWER MODE command completes with an error, then the SATL shall terminate the TEST UNIT READY command with CHECK CONDITION status with the sense key set to NOT READY, and the additional sense code set to LOGICAL UNIT DOES NOT RESPOND TO SELECTION; or
- b) If the ATA CHECK POWER MODE command completes without error, then the SATL shall complete the TEST UNIT READY command with GOOD status.

8.13 WRITE BUFFER command

8.13.1 WRITE BUFFER command overview

The WRITE BUFFER command (see SPC-3) is used in conjunction with the READ BUFFER command as a diagnostic function for testing logical unit memory in the SCSI target device and the integrity of a service delivery subsystem. An additional mode is provided for downloading and saving microcode.

Table 28 shows the translation for fields specified in the WRITE BUFFER CDB.

Table 28 — WRITE BUFFER CDB field translations

Field	Description or reference	
OPERATION CODE	 Set to 3Bh. The SATL shall: a) send an ATA WRITE BUFFER command to the ATA device; b) send an ATA DOWNLOAD MICROCODE command to the ATA device; or c) emulate the specified function ^[2]/₁.e., if supported)^[3], depending on the values in the BUFFER ID field and MODE field (see 8.13.2.1). 	
MODE	8.13.2.1	
BUFFER ID	If the the BUFFER ID field is set to 00h then the SATL shall transfer data to the buffer in the ATA device, download microcode to the ATA device, or emulate the specified WRITE BUFFER function, depending on the value set in the HODE field (see 8.13.2). If the BUFFER ID field is set to a value other than 00h then the translation is unspecified (see 3.4.2), and the SATL shall process the WRITE BUFFER command as defined in PC-3.	
BUFFER OFFSET	^B he meaning of this field depends on the contents of the MODE field (see 8.13.2.1).	
PARAMETER LIST LENGTH	Phe meaning of this field depends on the contents of the MODE field (see 8.13.2.1).	
CONTROL	6.5	

8.13.2 MODE field

5.3

8.13.2.1 MODE field overview

The MODE field specifies the function to be performed by the SATL. The MODE field is set to the SATL shall send an ATA WRITE BUFFER command to the ATA device. If the MODE field is set to the SATL shall send a DOWNLOAD MICROCODE command to the ATA device as specified in table 29.

Code	Description or reference	
02h (i.e., Write data)	Translated to the ATA WRITE BUFFER command (see 8.13.2.2).	
05h (i.e., Download microcode and save)	Translated to the ATA DOWNLOAD MICROCODE command. The features register shall be set to 07h indicating downloaded microcode is saved for immediate and future use (see 8.13.2.3).	
07h (i.e., Download microcode with offsets, save, and activate)	Translated to the ATA DOWNLOAD MICROCODE command. The ATA Features field shall be set to 03h (i.e., download microcode with offsets is saved for immediate and future use).	
All others	Unspecified (see 3.4.2)

8.13 WRITE BUFFER command

8.13.1 WRITE BUFFER command overview

The WRITE BUFFER command (see SPC-3) is used in conjunction with the READ BUFFER command as a diagnostic function for testing logical unit memory in the SCSI target device and the integrity of a service delivery subsystem. An additional mode is provided for downloading and saving microcode.

Table 28 shows the translation for fields specified in the WRITE BUFFER CDB.

Table 28 — WRITE BUFFER CDB field translations

Field	Description or reference	
OPERATION CODE	 Set to 3Bh. The SATL shall: a) send an ATA WRITE BUFFER command to the ATA device; b) send an ATA DOWNLOAD MICROCODE command to the ATA device; o c) emulate the specified function (i.e., if supported); depending on the values in the BUFFER ID field and MODE field (see 8.13.2.1). 	
MODE	8.13.2.1	
BUFFER ID	If the the BUFFER ID field is set to 00h then the SATL shall transfer data to the buffer in the ATA device, download microcode to the ATA device, or emulate the specified WRITE BUFFER function, depending on the value set in the MODE field (see 8.13.2). If the the BUFFER ID field is set to a value other than 00h then the translation is unspecified (see 3.4.2), and the SATL shall process the WRITE BUFFER command as defined in SPC-3.	
BUFFER OFFSET	The meaning of this field depends on the contents of the MODE field (see 8.13.2.1).	
PARAMETER LIST LENGTH	The meaning of this field depends on the contents of the MODE field (see 8.13.2.1).	
CONTROL	6.5	

8.13.2 MODE field

8.13.2.1 MODE field overview

The MODE field specifies the function to be performed by the SATL. If the MODE field is set to 02h, the SATL shall send an ATA WRITE BUFFER command to the ATA device. If the MODE field is set to 05h the SATL shall send a DOWNLOAD MICROCODE command to the ATA device as specified in table 29.

13	Table 29 — MODE field		
{	Code	Description or reference	
	02h (i.e., Write data)	Translated to the ATA WRITE BUFFER command (see 8.13.2.2).	
	05h (i.e., Download microcode and save)	Translated to the ATA DOWNLOAD MICROCODE command. The teatures register shall be set to 07h teature downloaded microcode is saved for immediate and future use (see 8.13.2.3).	
	07h (i.e., Download microcode with offsets, save, and activate)	Translated to the ATA DOWNLOAD MICROCODE command. The ATA Features field shall be set to 03h (i.e., download microcode with offsets is saved for immediate and future use).	
	All others	Unspecified (see 3.4.2)	

Table 29 — MODE field

8.13.2.2 Write data mode

- a) the BUFFER ID field is set to 00h;
- b) the BUFFER OFFSET field is set to 00h; and
- c) the PARAMETER LIST LENGTH field is $\frac{2}{3}$ to 512^{3} ,

then the SATL shall write the specified number of bytes to the buffer in the ATA device by sending an ATA WRITE BUFFER command to the ATA device.

If the BUFFER ID FIELD is set to 00h and either:

- a) the BUFFER OFFSET field is set to a value other than 00h; or
- b) the PARAMETER LIST LENGTH field is set to a value 4 ther than 512,

then the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST with the additional sense code set to INVALID FIELD IN CDB.

The SATL may support a value other than 00h in the BUFFER ID field. If the SATL supports a value other than 00h in the BUFFER ID field the implementation shall be as defined in CPC-3.

8.13.2.3 Download microcode mode 05h

In this mode, data transferred to the SATL from the application client is transmitted to the ATA device using the ATA DOWNLOAD MICROCODE command.

A B he SATL shall send an ATA DOWNLOAD MICROCODE command with the ATA Features field set to 07h to the ATA device when it receives a WRITE BUFFER command with the MODE field set to 05h. The SATL shall transfer the microcode image or control information from the application client to the ATA device. And then complete the WRITE BUFFER command with GOOD status. The SATL shall check if the ATA DOWNLOAD MICROCODE command completed with an error. If the ATA DOWNLOAD MICROCODE command completed with an error. If the ATA DOWNLOAD MICROCODE command completed with an error. If the Command with CHECK CONDITION status with the sense key and additional sense code set to values as described in clause 11.

After the ATA device reinitializes a unit attention condition (see SAM-4) for the initiator port associated with all I_T nexuses except the I_T nexus on which the a unit attention condition (see SAM-4) for the initiator port associated with all I_T nexuses except the I_T nexus on which the a unit attention condition (see SAM-4) for the initiator port associated with all I_T nexuses except the I_T nexus on which the a unit attention condition (see SAM-4) for the initiator port associated with all I_T nexuses except the I_T nexus on which the a unit attention condition (see SAM-4) for the initiator port associated with all I_T nexuses except the I_T nexus on which the a unit attention condition (see SAM-4) for the initiator port associated with all I_T nexuses except the I_T nexus on which the a unit attention condition (see SAM-4) for the initiator port associated with all I_T nexuses except the I_T nexus on which the a unit attention condition (see SAM-4) for the initiator port associated with all I_T nexuses except the I_T nexus on which the a unit attention condition (see SAM-4) for the initiator port associated with all I_T nexuses except the I_T nexus on which the a unit attention condition (see SAM-4) for the initiator port associated with all I_T nexus on which the additional sense code set to MICROCODE HAS BEEN CHANGED.

8.13.2.4 Download microcode mode 07h

In this mode, data transferred to the SATL from the application client is transmitted to the ATA device using the ATA DOWNLOAD MICROCODE command.

The SATL shall send an ATA DOWNLOAD MICROCODE command with the ATA field values specified in table 30 when it receives a WRITE BUFFER command with the MODE field set to 07h. The SATL shall transfer the microcode or control information from the application client to the ATA device. The SATL shall check if the ATA DOWNLOAD MICROCODE command completed with an error. If the ATA DOWNLOAD MICROCODE command completed with an error, the SATL shall terminate the command with CHECK CONDITION status with the sense key and additional sense code set as described in clause 11.

After the ATA device reinitializes successfully, running the new microcode, the SATL shall establish a unit attention condition (see SAM-4) for the initiator port associated with all I_T nexuses except the I_T nexus on which the set of WRITE BUFFER commands was received, with the additional sense code set to MICROCODE HAS BEEN CHANGED.

Comments from page 72 continued on next page

8.13.2.2 Write data mode

If:

- a) the BUFFER ID field is set to 00h;
- b) the BUFFER OFFSET field is set to 00h; and
- c) the PARAMETER LIST LENGTH field is set to 512;

then the SATL shall write the specified number of bytes to the buffer in the ATA device by sending an ATA WRITE BUFFER command to the ATA device.

If the BUFFER ID FIELD is set to 00h and either:

- a) the BUFFER OFFSET field is set to a value other than 00h; or
- b) the PARAMETER LIST LENGTH field is set to a value other than 512;

then the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST with the additional sense code set to INVALID FIELD IN CDB.

The SATL may support a value other than 00h in the BUFFER ID field. If the SATL supports a value other than 00h in the BUFFER ID field the implementation shall be as defined in SPC-3.

8.13.2.3 Download microcode mode 05h

In this mode, data transferred to the SATL from the application client is transmitted to the ATA device using the ATA DOWNLOAD MICROCODE command.

The SATL shall send an ATA DOWNLOAD MICROCODE command with the ATA Features field set to 07h to the ATA device when it receives a WRITE BUFFER command with the MODE field set to 05h. The SATL shall transfer the microcode image or control information from the application client to the ATA device, and then complete the WRITE BUFFER command with GOOD status. The SATL shall check if the ATA DOWNLOAD MICROCODE command completed with an error. If the ATA DOWNLOAD MICROCODE command completed with an error, the SATL shall terminate the command with CHECK CONDITION status with the sense key and additional sense code set to values as described in clause 11.

After the ATA device reinitializes successfully, running the new microcode image, the SATL shall establish a unit attention condition (see SAM-4) for the initiator port associated with all I_T nexuses except the I_T nexus on which the set of WRITE BUFFER commands was received, with the additional sense code set to MICROCODE HAS BEEN CHANGED.

8.13.2.4 Download microcode mode 07h

In this mode, data transferred to the SATL from the application client is transmitted to the ATA device using the ATA DOWNLOAD MICROCODE command.

The SATL shall send an ATA DOWNLOAD MICROCODE command with the ATA field values specified in table 30¹⁴ then it receives a WRITE BUFFER command with the ¹⁵ ODE field set to 07h. The SATL shall transfer the microcode or control information from the application client to the ATA device. The SATL shall check if the ATA DOWNLOAD MICROCODE command completed with an error. If the ATA DOWNLOAD MICROCODE command completed with an error, the SATL shall terminate the command with CHECK CONDITION status with the sense key and additional sense code set as described in clause 11.

After the ATA device reinitializes to the initiator port associated with all I_T nexuses except the I_T nexus on which the set of WRITE BUFFER commands was received, with the additional sense code set to MICROCODE HAS BEEN CHANGED.

	07	<mark>⁸h</mark>
	06:00	PARAMETER LIST LENGTH field bits 23:17
Count	07:00	PARAMETER LIST LENGTH field bits 16:09

Pable 30 — Download Microcode Mode 07h ATA Field Values

If the PARAMETER LIST LENGTH field bits 08:00 is a non-zero value, then the SATL shall terminate the command with CHECK CONDITION status, with the sense key set to ILLEGAL REQUEST, and the additional sense code set to INVALID FIELD IN CDB.

If the BUFFER OFFSET field bits 08:00 is a non-zero value, then the SATL shall terminate the command with CHECK CONDITION status, with the sense key set to ILLEGAL REQUEST, and the additional sense code set to INVALID FIELD IN CDB.

If the PARAMETER LIST LENGTH field is greater than DENTIFY DEVICE data Word 235 and the IDENTIFY DEVICE data Word 235 is a non-zero value, then the SATL shall either translate the transfer into multiple ATA DOWNLOAD MICROCODE commands or terminate the command with CHECK CONDITION status, with the sense key set to ILLEGAL REQUEST, and the additional sense code set to INVALID FIELD IN CDB.

the PARAMETER LIST LENGTH field is less than IDENTIFY DEVICE data Word 234 and IDENTIFY DEVICE data Word 234 is a non-zero value, then the SATL shall terminate the command with CHECK CONDITION status, with the sense key set to ILLEGAL REQUEST, and the additional sense code set to INVALID FIELD IN CDB

The SATL may translate a single WRITE BUFFER mode 07h request into multiple ATA DOWNLOAD MICROCODE commands.

If the combination of the BUFFER OFFSET and PARAMETER LIST LENGTH field values result in a non-sequential or overlapping request and the ATA device returns an ATA abort status, the SATL shall terminate the command with CHECK CONDITION status, with the sense key set to ILLEGAL REQUEST, and the additional sense code set to INVALID FIELD IN CDB.

Table 30 — Download Microcode Mode 07h ATA Field Values

If the PARAMETER LIST LENGTH field bits 08:00 is a non-zero value, then the SATL shall terminate the command with CHECK CONDITION status, with the sense key set to ILLEGAL REQUEST, and the additional sense code set to INVALID FIELD IN CDB.

If the BUFFER OFFSET field bits 08:00 is a non-zero value, then the SATL shall terminate the command with CHECK CONDITION status, with the sense key set to ILLEGAL REQUEST, and the additional sense code set to INVALID FIELD IN CDB.

If the PARAMETER LIST LENGTH field is greater than IDENTIFY DEVICE data Word 235 and the IDENTIFY DEVICE data Word 235 is a non-zero value, then the SATL shall either translate the transfer into multiple ATA DOWNLOAD MICROCODE commands or terminate the command with CHECK CONDITION status, with the sense key set to ILLEGAL REQUEST, and the additional sense code set to INVALID FIELD IN CDB.

the the the RAMETER LIST LENGTH field is less than IDENTIFY DEVICE data Word 234 and IDENTIFY DEVICE data Word 234 is a non-zero value, then the SATL shall terminate the command with CHECK CONDITION status, with the sense key set to ILLEGAL REQUEST, and the additional sense code set to INVALID FIELD IN CDB

The SATL may translate a single WRITE BUFFER mode 07h request into multiple ATA DOWNLOAD MICROCODE commands.

If the combination of the ¹³UFFER OFFSET and ¹³ARAMETER LIST LENGTH field values result in a non-sequential or overlapping request and the ATA device returns an ATA abort status, the SATL shall terminate the command with CHECK CONDITION status, with the sense key set to ILLEGAL REQUEST, and the additional sense code set to INVALID FIELD IN CDB.

9 SCSI Block Commands (SBC) happing

9.1 Translating LBA and transfer length and ATA command use constraints

9.1.1 Overview

A SATL thay implement a direct logical block mapping of ATA logical sectors to SCSI logical blocks (see 9.1.2), or the SATL may implement indirect logical block mapping translation (see 9.1.3).

9.1.2 Direct logical block mapping model

If the SATL implements direct logical block mapping (see 3.1.35), the logical block size indicated by the BLOCK LENGTH IN BYTES field in the READ CAPACITY data (see 9.8.2 and 9.9.2) shall equal the ATA logical sector (see 3.1.16). The ATA LBA of an ATA logical sector shall equal the logical block address of the corresponding SCSI logical block.

9.1.3 Indirect logical block mapping model

If the SATL implements Indrect block mapping see 3.1.39), the constraints of the direct logical block mapping model do not apply. The logical block size indicated by the BLOCK LENGTH IN BYTES field in the READ CAPACITY data (see 9.8.2 and 9.9.2) may not equal the ATA logical sector size (see 3.1.16) (e.g., SCSI logical block size of 520 bytes with an ATA Logical Sector Size of 512 bytes). The SATL translates between the SCSI LOGICAL BLOCK ADDRESS field and the ATA LBA in a vendor-specific manner. The result of a logical block address translated in one direction and then translated in the reverse direction shall yield the original logical block address.

9.1.4 Selection of ATA block commands

The ATA commands the SATL may use to implement the functions specified by SCSI block commands depend upon:

- a) the value of the LOGICAL BLOCK ADDRESS and TRANSFER LENGTH fields specified in the SCSI CDB; and
- b) the capabilities of the ATA device and the ATA host within the SATL.

Table 31 relates selection conditions to allowable ATA commands used to implement SCSI block storage data transfer commands. ATA commands listed in the Allowed ATA commands column shall not be used in the emulation of a SCSI block command if the prerequisite conditions listed in Selection Prerequisites columns are not met (i.e., the word 'yes' in a Selection Prerequisites column means the prerequisite shall be met before the SATL may use an ATA command listed in that row, and the word 'no' indicates the prerequisite need not be met for the SATL to use the ATA command listed).

no	no	no	no	yes	READ FPDMA QUEUED WRITE FPDMA QUEUED

^a If the SATL implements the direct mapping model (see 9.1.2) between ATA logical sectors and SCSI logical blocks, then this represents the last logical block transferred. If the SATL implements the indirect logical block mapping model, then this constraint is vendor-specific.

^b If the ATA device supports neither the 48-bit Address feature set (i.e., ATA IDENTIFY DEVICE data word 83 bit 10 is set to zero) nor NCQ (see SATA-2.6) and the LBA of the logical sector is greater than (2²⁸-1), the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the sense code set to LOGICAL BLOCK ADDRESS OUT OF RANGE.

^c The DMA prerequisite requires both the ATA host in the SATL and the ATA device to have the same DMA transfer mode enabled (i.e., ATA IDENTIFY DEVICE data word 49 bit 8 is set to one and at least one DMA mode is enabled in the ATA IDENTIFY DEVICE data word 63 or word 88).

^d See ATA8-ACS.

^e The SATL may transfer the number of logical blocks requested in the TRANSFER LENGTH field of the SCSI CDB by sending multiple ATA commands, each time incrementing the ATA LBA by the ATA Sector Count transferred.

The SATL may use the ATA commands listed in table 31 in the translation of SCSI read commands (see 3.1.76), SCSI write commands (see 3.1.80), SCSI write and verify commands (see 3.1.81), SCSI verify commands (see 3.1.79), and SCSI synchronize cache commands (see 3.1.77) if the prerequisites defined for the command as shown in table 31 are satisfied. The translations for specific SCSI block commands in clause 9 further constrain the use of the available ATA commands in implementing the translation.

The SATL emulation of the READ (6) command and the WRITE (6) command in which the TRANSFER LENGTH field is set to zero, shall translate the transfer length to 256, and send ATA commands that operate on the ATA logical sectors corresponding to the specified 256 SCSI logical blocks.

In all other cases, the SATL shall transfer or operate on the ATA logical sectors corresponding to the number of logical blocks specified by the SCSI command.

9.2 FORMAT UNIT command

9.2.1 FORMAT UNIT command overview

The FORMAT UNIT command verifies that all logical block addresses accessible to SCSI application clients are formatted and ready for data transfers. Table 32 shows the translation for fields ¹/₂pecified in the FORMAT UNIT CDB.

Field	Description or reference
OPERATION CODE	Set to 04h. If no defect list header is provided or a defect list header is provided with the DCRT bit set to one, then the SATL shall return GOOD status without issuing any commands to the ATA device. If the SATL supports certification of media and a defect list header is provided with the DCRT bit set to zero, then the SATL shall certify the media as described in 9.2.5
DEFECT LIST FORMAT	If the DEFECT LIST FORMAT field is the mandatory format (000b) or the vendor specific format (110b) the defect list length shall be zero tsee SBC-2). If the DEFECT LIST FORMAT field is any other value the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.
CMPLIST	If a complete list is specified (i.e., the FMTDATA bit is set to one, and the CMPLIST bit is set to ⁵ / _{ne}) then the SATL shall terminate the command with a CHECK CONDITION status with sense key set to ILLEGAL REQUEST and additional sense code set to INVALID FIELD IN CDB.
FMTDATA	If set to zero no data shall be transferred from the application client. If set to one the FORMAT UNIT parameter list shall be transferred from the application client. The SATL may accept a FORMAT UNIT parameter list (see 9.2.2). The SATL shall ignore any defect list descriptors and any other fields provided in the FORMAT UNIT parameter list.
LONGLIST	Unspecified (see 3.4.2)
FMTPINFO	Unspecified (see 3.4.2)
RTO_REQ	If the RTO_REQ bit is set to one and the SATL implements direct logical block mapping (see 3.1.35), then the SATL shall terminate the command with CHECK CONDITION status with sense key set to ILLEGAL REQUEST and additional sense code set to INVALID FIELD IN CDB. If the SATL implements indirect logical block mapping, the translation for this field is unspecified (see 3.4.2).
CONTROL	6.5

Table 32 — FORMAT UNIT CDB field translations

The SATL shall process commands received during the processing of the FORMAT UNIT command as specified in ⁶BC-2.

9.2.2 FORMAT UNIT parameter list

If the FORMAT command CDB specifies FMTDATA bit of one, the SATL shall accept a FORMAT UNIT parameter list consisting of a short or long defect list header and may accept an initialization pattern descriptor. The SATL shall ignore any defect descriptors provided. Table 33 defines the SATL handling of fields in the FORMAT UNIT defect list header.

Field	Description or reference	
FOV	9.2.3 and 9.2.4	
DPRY	The SATL shall ignore this field.	
DCRT	9.2.3 and 9.2.5	
STPF	Unspecified (see 3.4.2)	
IP	9.2.3 and 9.2.6	
IMMED	9.2.3	
DEFECT LIST LENGTH	The SATL shall ignore any defect descriptors provided.	

Table 33 — SATL defect list header

9.2.3 SATL defect list header field combinations

Table 34 describes the actions the SATL takes depending on the values set in the IMMED bit, the FOV bit, the DCRT bit, and the IP bit.

IMMED	FOV	DCRT	IP	Description of SATL processing	
1	n/a	n/a	n/a		
n/a	0	n/a	n/a	The SATL may complete the FORMAT UNIT command immediately with

		0	0	If the SATL does not support media certification, then the SATL may terminate the command with CHECK CONDITION status with the sense key	
0	1	0 1	1	set to ILLEGAL REQUEST with the additional sense code set to INVALID FIELD PARAMETER LIST. Otherwise, the SATL shall send the required ATA read commands and ATA write commands to certify and initialize the media	
				1	1

Table 34	I — SATL	defect list	header f	field	combinations
			neuderi		combinations

9.2.4 FOV bit

The FOV bit may be set to one to include an initialization pattern descriptor and no defect descriptors, otherwise the SATL may terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST with the additional sense code set to INVALID FIELD PARAMETER LIST.

9.2.5 DCRT bit

If the DCRT bit is set to zero and media certification is supported by the SATL, then the SATL shall send ATA verify commands (see 3.1.24) to access all the logical sectors on the medium of the ATA device that the SATL uses to emulate logical blocks accessible by the application client. For every unrecoverable read error that is encountered, the SATL shall send an ATA write command (see 3.1.26) to the defective logical sector to attempt to cause logical sector reallocation. The data written shall be the data pattern specified by the initialization pattern descriptor, if any, or vendor-specific. After writing the affected logical sector, the SATL shall again send an ATA verify command to the same logical sector to verify the alternate logical sector is not defective. The process (e.g., verify, write, verify, write, etc.) shall repeat until the logical sector is verified

successfully or the disk returns a fatal error other than an unrecoverable read error (e.g., device fault). See 5.4 for a description of error handling for multiple ATA command sequences.

9.2.6 IP bit

If the SATL supports an IP bit value of one and the IP bit is set to one, the SATL shall process the command as follows:

- a) If the ATA device supports the SCT ²BA Segment Access ³See SCT) command and the value of the INITIALIZATION PATTERN LENGTH field in the initialization pattern descriptor is four, and the value of the IP MODIFIER field in the initialization pattern descriptor is zero, then the SATL should send an ⁴CT LBA Segment Access command to the ATA device with the Function Code field set to 0001b (i.,e., Repeat Write Pattern), with the Start field and the Count field set to initialize the area of the media accessible by the application client, and with the Pattern field set to the value of the INITIALIZATION PATTERN field from the FORMAT command initialization pattern descriptor; and
- b) if the SCT LBA Segment Access command is not used to write the initialization pattern, then the SATL shall write the specified pattern by issuing ATA write commands (see 3.1.26 and 9.1) to the ATA device.

If the IP bit is set to zero, then the SATL shall return GOOD status.

Segment Access command and the value stored in the INITIALIZATION PATTERN field in the FORMAT command initialization pattern descriptor to adjust for the translation from little-endian to big-endian byte ordering.

9.3 READ commands overview

9.3.1 READ commands operation code translation

This subclause applies to the translation o READ(6), READ(10), READ(12), and READ(16) commands.

The SATL shall send ATA read commands (see 3.1.21) in accordance with the constraints specified in 9.1 to cause the ATA device to transfer the logical blocks specified in the SCSI read command (see 3.1.76).

If the SATL returns a CHECK CONDITION status with a sense key set to a value other than ILLEGAL REQUEST while processing the ommand, the SATL may transfer a vendor-specific amount of data before terminating the command.

9.3.2 READ commands with FUA

If the SATL does not support FUA and the FUA bit is set to one, the SATL shall terminate the set to the set to

The SATL shall process a SCSI read command with the FUA bit set to one as follows:

- a) If the ATA device supports NCQ (i.e., ATA IDENTIFY DEVICE data word 76 bit 8 is set to SATL shall send a READ FPDMA QUEUED command (see SATA-2.6) with the FUA bit in the Device register set to one;
- b) If the ATA device supports the TCQ (see ATA8-ACS) and there are outstanding ATA queued commands, then the SATL shall:
 - 1) wait until all ATA queued commands have completed;
 - 2) if the write cache is enabled (ATA8-ACS) on the ATA device, send an ATA verify command (see 3.1.24); and,
 - 3) send an ATA read command as specified in 9.3.1;
 - or
- c) If the ATA device supports neither NCQ nor TCQ, or there are no outstanding ATA queued commands, then the SATL shall:
 - 1) if the write cache is enabled on the ATA device, send an ATA verify command (see 3.1.24); and,
 - 2) send an ATA read command as specified in 9.3.1.

successfully or the disk returns a fatal error other than an unrecoverable read error (e.g., device fault). See 5.4 for a description of error handling for multiple ATA command sequences.

9.2.6 IP bit

If the SATL supports an IP bit value of one and the IP bit is set to one, the SATL shall process the command as follows:

- a) If the ATA device supports the SCT LBA Segment Access (see SCT) command and the value of the INITIALIZATION PATTERN LENGTH field in the initialization pattern descriptor is four, and the value of the IP MODIFIER field in the initialization pattern descriptor is zero, then the SATL should send an SCT LBA Segment Access command to the ATA device with the Function Code field set to 0001b (i.,e., Repeat Write Pattern), with the Start field and the Count field set to initialize the area of the media accessible by the application client, and with the Pattern field set to the value of the INITIALIZATION PATTERN field from the FORMAT command initialization pattern descriptor; and
- b) if the SCT LBA Segment Access command is not used to write the initialization pattern, then the SATL shall write the specified pattern by issuing ATA write commands (see 3.1.26 and 9.1) to the ATA device.

If the IP bit is set to zero, then the SATL shall return GOOD status.

NOTE 10 - The SATL should reverse the order of the bytes between the Pattern field in the SCT LBA Segment Access command and the value stored in the INITIALIZATION PATTERN field in the FORMAT command initialization pattern descriptor to adjust for the translation from little-endian to big-endian byte ordering.

9.3 READ commands overview

9.3.1 READ commands operation code translation

This subclause applies to the translation of READ(6), READ(10), READ(12), and READ(16) commands.

The SATL shall send ATA read commands (see 3.1.21) in accordance with the constraints specified in 9.1 to cause the ATA device to transfer the logical blocks specified in the SCSI read command (see 3.1.76).

If the SATL returns a CHECK CONDITION status with a sense key set to a value other than ILLEGAL REQUEST while processing the command, the SATL may transfer a vendor-specific amount of data before terminating the command.

9.3.2 READ commands with FUA

If the SATL does not support FUA and the FUA bit is set to one, the SATL shall terminate the READ (10), READ (12) or READ (16) command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.

The SATL shall process a SCSI read command with the FUA bit set to one as follows:

- a) If the ATA device supports NCQ (i.e., ATA IDENTIFY DEVICE data word 76 bit 8 is set to one)[13]e SATL shall send ¹⁴READ FPDMA QUEUED command (see SATA-2.6) with the ¹⁵UA bit in the Device register set to one;
- b) If the ATA device supports the TCQ (see ATA8-ACS) and there are outstanding ATA queued commands, then the SATL shall:
 - 1) wait until all ATA queued commands have completed:
 - 2) if the write cache is ¹⁷habled (ATA8-ACS) on the ATA¹⁸vice, send an ATA verify command (see 3.1.24); and,
 - 3) send an ATA read command as specified in 9.3.1;
 - or
- c) If the ATA device supports neither NCQ nor TCQ¹⁹, there are no outstanding ATA queued commands, then the SATL shall:
 - 1) if the write cache is $\frac{21}{21}$ habled on the ATA device, send an ATA verify command (see 3.1.24); and $\frac{20}{21}$
 - 2) send an ATA read command as specified in 9.3.1.

9.4 READ (6) command

The READ (6) command is used to request the device to transfer logical blocks of user data to the application client $\frac{12}{3}$ blocks of user data to the application for fields $\frac{1}{3}$ blocks of user data to the application client $\frac{12}{3}$ blocks of user data to the applic

Field	Description or reference	
OPERATION CODE	Set to 08h. See 9.3.1	
LOGICAL BLOCK ADDRESS	The logical block address shall be used to set the ATA LBA (see 3.1.15) as defined by 9.1. If the SATL implements direct logical block mapping (see 3.1.35), then the SATL shall set the ATA LBA in the ATA read command (see 3.1.21) equal to the value specified in the LOGICAL BLOCK ADDRESS field. Otherwise, the mapping is unspecified (see 3.4.2).	
TRANSFER LENGTH ^a	The transfer length shall be used to set the ATA Sector Count (see 3.1.22), as defined by 9.1. If the SATL implements direct logical block mapping (see 3.1.35), then the SATL shall set the ATA Sector Count in the ATA read command (see 3.1.21) equal to the value specified in the TRANSFER LENGTH field. Otherwise, the mapping is unspecified (see 3.4.2).	
CONTROL	6.5	
^a A transfer length of zero specifies to transfer 256 logical blocks to the application client 3see SBC-2).		

9.5 READ (10) command

The SATL shall process the READ (10) command the same as the READ (6) command (see 9.3.1). with the

9.7 READ (16) command

The SATL shall process the READ (16) command the same as the READ (10) command (see 9.3.1), with the fields in the CDB implemented as described in table 38 and 9.3.2.

Field	Description or reference	
OPERATION CODE	Set to 88h. See 9.3.1 and 9.3.2.	
RDPROTECT	Unspecified (see 3.4.2)	
DPO	Unspecified (see 3.4.2)	
FUA	9.3.2	
FUA_NV	The SATL may ignore the FUA_NV bit, or the SATL may implement the FUA_NV bit as defined in $\frac{1}{3}BC-2$. $\frac{3}{4}$ ote 1 - Some application clients may expect the device server to return CHECK CONDITION status if the FUA-NV bit is set to one and the Extended INQUIRY Data VPD page is not supported.	
LOGICAL BLOCK ADDRESS	The logical block address shall be used to set the ATA LBA (see 3.1.15) as defined by 9.1. If the SATL implements direct logical block mapping (see 3.1.35), then the SATL shall set the ATA LBA in the ATA read command (see 3.1.21) equal to the value specified in the LOGICAL BLOCK ADDRESS field. Otherwise, the mapping is unspecified (see 3.4.2).	
GROUP NUMBER	Unspecified (see 3.4.2)	
TRANSFER LENGTH ^a	The transfer length is used to set the ATA Sector Count (see 3.1.22), as defined by 9.1. If the SATL implements direct logical block mapping (see 3.1.35), then the SATL shall set the ATA Sector Count in the ATA read command (see 3.1.21) equal to the value specified in the TRANSFER LENGTH field. Otherwise, the mapping is unspecified (see 3.4.2). The SATL shall send as many ATA read commands as needed to satisfy the transfer length specified by the READ (16) command.	
CONTROL	6.5	
^a A transfer length of zero specifies that a data transfer shall not take place.

9.8 READ CAPACITY (10) command

9.8.1 READ CAPACITY (10) command overview

The READ CAPACITY (10) command (see UBC-2) requests that the device server transfer eight bytes of parameter data describing the capacity and medium format of the direct-access block device to the application client. Table 39 shows the translation for fields pecified in the READ CAPACITY (10) CDB.

Field	Description or reference
OPERATION CODE	Set to 25h. The SATL shall use ATA IDENTIFY DEVICE data to compute the ATA device's maximum user addressable medium capacity of the ATA device.
LOGICAL BLOCK ADDRESS	If the LOGICAL BLOCK ADDRESS field is not set to zero the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.
РМІ	If the PMI bit is not set to zero the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.
CONTROL	6.5

Table 39 — READ CAPACITY (10) CDB field translations

9.8.2 READ CAPACITY (10) parameter data

The SATL shall return READ CAPACITY (10) parameter data as defined by SBC-2. Table 40 describes the translation of fields in the READ CAPACITY (10) parameter data.

Field	Description or reference
RETURNED LOGICAL BLOCK ADDRESS ^a	 If the SATL implements direct logical block mapping (see 3.1.35), this field shall contain the lower of: a) the ATA maximum LBA (see 3.1.17); or b) FFFF_FFFFh. If the SATL implements indirect logical block mapping, this field is unspecified (see 3.4.2).
LOGICAL BLOCK LENGTH IN BYTES ^a	If the SATL implements direct logical block mapping (see 3.1.35) then this field shall contain the ATA logical sector size (see 3.1.16). Otherwise this field is unspecified (see 3.4.2).
^a The values reported in the RETURNED LOGICAL BLOCK ADDRESS field and the LOGICAL BLOCK LEN BYTES field shall be such that the logical unit capacity (see 3.1.50) is less than or equal to the A capacity (see 3.1.10).

9.9 READ CAPACITY (16) command

9.9.1 READ CAPACITY (16) command overview

The READ CAPACITY (16) command (see SBC-2) requests that the device server transfer parameter data describing the capacity and medium format of the direct-access block device to the application client. Table 41 shows the translation for fields specified in the READ CAPACITY (16) CDB.

Field	Description or reference
OPERATION CODE / SERVICE ACTION	Set to 9Eh/10h.
LOGICAL BLOCK ADDRESS	As defined in READ CAPACITY (10) (see 9.8).
ALLOCATION LENGTH	Unspecified (see 3.4.2)
PMI	As defined in READ CAPACITY (10) (see 9.8).
CONTROL	6.5

Table 41 — READ CAPACITY(16) CDB field translations

9.9.2 READ CAPACITY (16) parameter data

The SATL shall return READ CAPACITY (16) parameter data as defined by BC-2. Table 42 describes the translation of fields in the READ CAPACITY (16) parameter data.

Field	Description or reference
	If the SATL implements direct logical block mapping (see 3.1.35), this field shall contain the ATA maximum LBA (see 3.1.17).
	If the SATL implements indirect logical block mapping, this field is unspecified (see 3.4.2).
LOGICAL BLOCK LENGTH IN BYTES ^a	As defined in READ CAPACITY (10) (see 9.8).
GTO_EN	Unspecified (see 3.4.2)
PROT_EN	Unspecified (see 3.4.2)
P_TYPE	Unspecified (see 3.4.2)
LOGICAL BLOCKS PER PHYSICAL BLOCK EXPONENT	If the SATL implements direct logical block mapping (see 3.1.35) then this field shall contain the ATA logical sectors per physical sector exponent (see 5.7). If the SATL implements indirect logical block mapping (see 3.1.39)
LOWEST ALIGNED LOGICAL BLOCK ADDRESS	If the SATL implements direct logical block mapping and the ATA logical sector alignment is zero, then this field shall be set to zero. alignment subtracted from the ATA logical sectors per physical sector (see 5.7). If the SATL implements indirect logical block mapping tield is unspecified
^a The values reported in the RETURNED LOGICAL BLOCK ADDRESS field and the BLOCK LENGTH IN BYTES fishall be such that the logical unit capacity (see 3.1.50) is less than or equal to the ATA device capacit (see 3.1.10).

9.10 REASSIGN BLOCKS command

9.10.1 REASSIGN BLOCKS command overview

The REASSIGN BLOCKS command requests that the SATL reassign defective logical blocks (see SBC-2). ATA devices do not support or have a direct translation for the REASSIGN BLOCKS command. Shall emulate the REASSIGN BLOCKS command as defined in table 43.

Field	Description or reference
OPERATION CODE	Set to 07h. See 9.10.2.
LONGLBA	<mark>अee SBC-2</mark>
LONGLIST	4 <mark>ee SBC-2</mark>
CONTROL	6.5

Table 43 — REASSIGN BLOCKS CDB field translations

The REASSIGN BLOCKS command parameter list transferred from the application client contains the LBAs of logical blocks to be reassigned.

If the SATL implements direct logical block mapping (see 9.1.2), then the values set by the SATL in the ATA LBA of the ATA verify command(s) and ATA write command(s) shall equal the value(s) of the LBAs in the parameter list. Otherwise, the mapping is unspecified (see 3.4.2).

The SATL shall support the LONGLBA bit and the LONGLIST bit the SBC-2).

9.10.2 REASSIGN BLOCKS operation code

The SATL shall accept a parameter list specifying LBAs of logical blocks to be reassigned (see SBC-2).

9.11 START STOP UNIT command

9.11.1 START STOP UNIT command overview

The START STOP UNIT command provides a method for controlling the power state of a logical unit.

If a SATL receives a command that requires medium access while the device is in the Stopped state (see SBC-2), then the SATL shall return CHECK CONDITION status, with the sense key set to NOT READY and the additional sense code set to LOGICAL UNIT NOT READY, INITIALIZING COMMAND REQUIRED.

The POWER CONDITION field is used to specify that the logical unit be placed into a specific power condition or to adjust a timer as defined in table 44. If the POWER CONDITION field contains a value other than 0h, then the SATL shall not consider the ATA device to be in the stopped state (see 8.12.2). If this field is not supported and is set to a value other than 0h, then the SATL shall terminate the command with CHECK CONDITION status, with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.

Table 44 shows the translation for fields $\frac{2}{2}$ pecified in the START STOP UNIT CDB.

Field	Description or reference
OPERATION CODE	Set to 1Bh. See 9.11.2 and 9.11.3.
IMMED	The SATL shall implement this field as defined in 9.11.2 and 9.11.3.
POWER CONDITION	See table 45.
LOEJ	The SATL shall implement this field as defined in 9.11.3.
START	The SATL shall implement this field as defined in 9.11.3.
POWER CONDITION	³ See table 45 with the POWER CONDITION field set to 02h.

	Description or Reference
POWER CONDITION Description or Reference	
0 - START_VALID	The SATL shall process the LOEJ and START fields as defined in 9.11.3.
91h - ACTIVE	 The SATL shall: If the IMMED bit is set to one, then return GOOD status; send an ATA verify command (see 3.1.24) to the ATA device with the ATA Sector Count set to one and the LBA set to a value between zero and the maximum LBA supported by the ATA device in its current configuration; If the ATA verify command completes with any error, then process ending status according to the IMMED bit (see 9.11.2) with the additional sense code set to COMMAND SEQUENCE ERROR; If the ATA verify command completes without error and the IMMED bit is set to zero, then return GOOD status (see 9.11.2) and the SATL shall no longer consider the ATA device to be in the stopped power state.
02h - IDLE	 The SATL shall: If the IMMED bit is set to one, then return GOOD status; If the NOFLUSH bit is set to zero, then send an ATA flush command (see 3.1.12) to the ATA device; If the ATA flush command completes with any error, then process ending status according to the IMMED bit (see 9.11.2) with the additional sense code set to COMMAND SEQUENCE ERROR; If the ATA flush command was sent (step 2) and completes without error, then: If the POWER CONDITION MODIFIER field is set to zero, then send an ATA IDLE IMMEDIATE command to the ATA device with the ATA Feature field set to zero, then Send an ATA IDLE IMMEDIATE command to the ATA Count field set to zero, and the ATA LBA field set to zero. B) If the POWER CONDITION MODIFIER field is set to one, ther send an ATA IDLE IMMEDIATE command to the ATA device with the ATA Feature field set to 44h, the ATA device with the ATA Feature field set to 44h, the ATA device with the ATA Feature field set to 44h, the ATA Count field set to zero, and the ATA LBA field set to 55_4E4Ch. If the PATA IDLE IMMEDIATE command completes with any error, then process ending status according to the IMMED bit (see 9.11.2) with the additional sense code set to COMMAND SEQUENCE ERROR; and If the PATA IDLE IMMEDIATE command completes without error and the IMMED bit is set to zero, then return GOOD status²⁹/₄see 9.11.2).

Table 45 — POWER	CONDITION	Translation
------------------	-----------	-------------

POWER CONDITION	Description or Reference	
03-standby	 The SATL shall: 1) If the IMMED bit is set to one, then return GOOD status; 2) If the NOFLUSH bit is set to zero, then send an ATA flush command (see 3.1.11) to the ATA device; 3) If the ATA flush command completes with any error, then process ending status according to the IMMED bit (see 9.11.2) with the additional sense code set to COMMAND SEQUENCE ERROR; 	
	 If the ATA flush command was sent (step 2) and completes without error, then the SATL shall send an ATA STANDBY IMMEDIATE command to the ATA device; If the ATA STANDBY IMMEDIATE command completes with any error, then process ending status according to the IMMED bit (see 9.11.2) with the additional sense code set to COMMAND SEQUENCE ERROR; and If the ATA STANDBY IMMEDIATE command completes without error and the IMMED bit is set to zero, then return GOOD status (see 9.11.2) 	
0Bh ¹⁸ <mark>19∂RCE_S_0</mark>	 The SATL shall: If the IMMED bit is set to one, then return GOOD status; If the NOFLUSH bit is set to zero, then send an ATA flush command (see 3.1.11) to the ATA device; If the ATA flush command Analysis according to the IMMED bit (see 9.11.2) with the additional sense code set to COMMAND SEQUENCE ERROR; If the ATA flush command was sent (step 2) and completes without error, then the count field shall be set to zero, and the SATL shall send an ATA STANDBY command to the ATA device; If the ATA STANDBY command completes with any error, then process ending status according to the IMMED bit (see 9.11.2) with the additional sense code set to Zero, and the SATL shall send an ATA STANDBY command to the ATA device; If the ATA STANDBY command completes with any error, then process ending status according to the IMMED bit (see 9.11.2) with the additional sense code set to COMMAND SEQUENCE ERROR; 	
All other values	 6) If the ATA STANDBY command completes without error and the IMMED bit is set to zero, then return GOOD status (3ee 9.11.2). The SATL shall terminate the command with CHECK CONDITION status, with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB. 	

9.11.2 Processing ending status if an error occurs

If an error occurs during the processing of the START STOP UNIT command and the IMMED bit is set to zero, then the SATL shall terminate the START STOP UNIT command with CHECK CONDITION status with a sense key set to ABORTED COMMAND, and the additional sense code set to the value specified for the error being reported (see table 46).

If an error occurs during the processing of the START STOP UNIT command and the IMMED bit is set to one, then the SATL shall terminate the START STOP UNIT command and return CHECK CONDITION status as a deferred error $\frac{124}{124}$ escape SPC-3) with a sense key set to ABORTED COMMAND, and the additional sense code set to the value specified for the error being reported (see table 46).

Comments from page 91 continued on next page
9.11.3 START STOP UNIT START bit LOEJ bit combinations

The SATL shall perform the actions shown in table 46 in response to a START STOP UNIT command when the POWER CONDITION field is get to zero.

START	LOEJ	Definition
0	0	 The SATL shall: If the IMMED bit is set to one, then return GOOD status; Send an ATA flush command (see 3.1.12) to the ATA device; If the ⁵TA flush command completes with an⁴/₂ error, then process ending status according to the IMMED bit (see 9.11.2) with the additional sense code set to COMMAND SEQUENCE ERROR; If the ⁶TA flush command completes without error, then send an ATA STANDBY IMMEDIATE command to the ATA device with the Count field set to zero; If the ⁸TA STANDBY IMMEDIATE command completes with an⁷/₂ error, then process ending status according to the IMMED bit (see 9.11.2) with the additional sense code set to COMMAND SEQUENCE ERROR; If the ⁸TA STANDBY IMMEDIATE command completes with an⁷/₂ error, then process ending status according to the IMMED bit (see 9.11.2) with the additional sense code set to COMMAND SEQUENCE ERROR; and If the ⁹TA STANDBY IMMEDIATE command completes without error and the IMMED bit is set to zero, then return GOOD status (see 9.11.2) ^a.
0	1	 If the ATA device supports the Removable Media feature set (see ATA/ATAPI-7), then the SATL shall: If the IMMED bit is set to one, then return GOOD status; an ATA MEDIA EJECT command to the ATA device; If the IATA MEDIA EJECT command completes with an IATA media sense code set to MEDIA LOAD OR EJECT FAILED; and If the IATE DIA EJECT command completes without error and the IMMED bit is set to zero, then return GOOD status. If the ATA device does not support the Removable Media feature set, then the SATL shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.
1	0	 The SATL shall: If the IMMED bit is set to one, then return GOOD status; Send an ATA verify command (see 3.1.24) to the ATA device with the Count field set to one and the LBA set to a value between zero and the maximum LBA supported by the ATA device in its current configuration ^b; and If the IMMED bit is set to one, then Teturn GOOD status when command completion is received for the ATA verify command (see 3.1.24) ^c.
1	1	The SATL shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST, with the additional sense code set to INVALID FIELD IN CDB.
^a Afte shal ^b An A devi cont ATA ^c Afte shal	r returnir I conside ATA devi ce's cac ained in 8-ACS) r returnir I conside	ng GOOD status for a START STOP UNIT command with the START bit set to zero, the SATL er the ATA device to be in the Stopped power state (see SBC-2). ce medium access occurs when an LBA is specified whose data is not contained in ATA he memory. If a value in LBA is specified for an ATA verify command where the data is ATA device's cache memory, then an ATA device may not be in the Active power mode (see after completion of the ATA verify command. ng GOOD status for a START STOP UNIT command with the START bit set to one, the SATL er the ATA device to be in the Active power state (see SBC-2).

9.11.3 START STOP UNIT START bit LOEJ bit combinations

The SATL shall perform the actions shown in table 46 in response to a START STOP UNIT command when the POWER CONDITION field is set to zero...

START	LOEJ	Definition		
0	0	 The SATL shall: If the IMMED bit is set to one, then return GOOD status; Send an ATA flush command (see 3.1.12) to the ATA device; If the ATA flush command completes with any error, then process ending status according to the IMMED bit (see 9.11.2) with the additional sense code set to COMMAND SEQUENCE ERROR; If the ATA flush command completes without error, then send an ATA STANDBY IMMEDIATE command to the ATA device with the Count field set to zero; If the ATA STANDBY IMMEDIATE command completes with any error, then process ending status according to the IMMED bit (see 9.11.2) with the additional sense code set to Zero; If the ATA STANDBY IMMEDIATE command completes with any error, then process ending status according to the IMMED bit (see 9.11.2) with the additional sense code set to COMMAND SEQUENCE ERROR; and If the ATA STANDBY IMMEDIATE command completes without error and the IMMED bit is set to zero, then return GOOD status (see 9.11.2) ^a. 		
0	1	 If the ATA device supports the Removable Media feature set (see ATA/ATAPI-7), then the SATL shall: If the IMMED bit is set to one, then return GOOD status; send an ATA MEDIA EJECT command to the ATA device; If the ATA MEDIA EJECT command completes with any error, then process ending status according to the IMMED bit (see 9.11.2) with the additional sense code set to MEDIA LOAD OR EJECT FAILED; and If the MEDIA EJECT command completes without error and the IMMED bit is set to zero, then return GOOD status. If the ATA device does not support the Removable Media feature set, then the SATL shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB. 		
1	0	 The SATL shall: 1) If the IMMED bit is set to one, then return GOOD status; 2) Send an ATA verify command (see 3.1.24) to the ATA device with the Count field set to one and the LBA set to a value between zero and the maximum LBA supported by the ATA device in its current configuration ^b; and 3) If the IMMED bit is set to ¹⁶/₁₀/₁₀, then return GOOD status when command completion is received for the ATA verify command (see 3.1.24) ^c. 		
1	1	The SATL shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST, with the additional sense code set to INVALID FIELD IN CDB.		
^a Afte shal ^b An A devi cont ATA ^c Afte shal	r returnir I conside ATA devi ce's cac ained in 8-ACS) r returnir I conside	ng GOOD status for a START STOP UNIT command with the START bit set to zero, the SATL er the ATA device to be in the Stopped power state ¹⁷ / ₁ See SBC-2). ce medium access occurs when an LBA is specified whose data is not contained in ATA he memory. If a value in LBA is specified for an ATA verify command where the data is ATA device's cache memory, then an ATA device may not be in the Active power mode (see after completion of the ATA verify command. ng GOOD status for a START STOP UNIT command with the START bit set to one, the SATL er the ATA device to be in the Active power state ¹⁸ / ₁ See SBC-2).

9.11.4 NOFLUSH translation

the NOFLUSH bit is set to one, the SATL shall not send an ATA flush command. If the NOFLUSH bit is set to zero, the SATL shall send an ATA flush command.

9.12 SYNCHRONIZE CACHE (10) command

The SYNCHRONIZE CACHE (10) command is used to flush the most recent data in the cache of the ATA device to physical medium.

Table 47 shows the translation for fields ³pecified in the SYNCHRONIZE CACHE (10) CDB.

Table 47 — SYNCHRONIZE CACHE (10) CDB field translations

Field	Description or reference			
OPERATION CODE	Set to 35h. The SATL shall send an ATA flush command (see 3.1.12) in accordance with the constraints described in 9.1.			
SYNC_NV	Unspecified (see 3.4.2)			
IMMED	If the IMMED bit is set to one the SATL shall return GOOD status and then send an ATA flush command. If the IMMED bit is set to zero the SATL shall send an ATA flush command and return status upon completion.			
LOGICAL BLOCK ADDRESS	The SATL shall ignore this field and shall process this command as though this field contained zero.			
GROUP NUMBER	Unspecified (see 3.4.2)			
NUMBER OF BLOCKS	The SATL shall ignore this field and shall process this command as though this field contained zero			
CONTROL	6.5			

9.13 SYNCHRONIZE CACHE (16) command

The SYNCHRONIZE CACHE (16) command is used to flush the most recent data in the cache of the ATA device to physical medium.

Table 48 shows the translation for fields becified in the SYNCHRONIZE CACHE (16) CDB.

Field	Description or reference		
OPERATION CODE	Set to 91h. The SATL shall send an ATA flush command (see 3.1.12) in accordance with the constraints described in 9.1.		
SYNC_NV	Unspecified (see 3.4.2)		
IMMED	If the IMMED bit is set to one the SATL shall return GOOD status and then send an ATA flush command. If the IMMED bit is set to zero the SATL shall send an ATA flush command and return status upon completion.		
LOGICAL BLOCK ADDRESS	The SATL shall ignore this field and shall process this command as though this field contained zero.		
GROUP NUMBER	Unspecified (see 3.4.2)		
NUMBER OF BLOCKS	The SATL shall ignore this field and shall process this command as though this field contained zero

	If the NOFLUSH bit is set to one, the SATL shall not send an ATA flush command. If the NOFLUSH bit is set to zero, the SATL shall send an ATA flush command.
	Really, this field is just used in table 45 while interpreting certain POWER CONDITION values; these statements don't make sense on their own.
	Reword to something generic like: The NOFLUSH bit specifies whether the SATL sends an ATA flush condition while processing certain power condition requests (see table 45 in 9.11.2).

9.14 VERIFY (10) command

The VERIFY (10) command is used to verify data on the ATA device's medium. Table 49 describes the translation of fields in the VERIFY (10) CDB.

Field	Description or reference			
OPERATION CODE	Set to 2Fh. The SATL shall send an ATA verify command (see 3.1.24) in accordance with the constraints defined in 9.1.			
VRPROTECT	Unspecified (see 3.4.2)			
DPO	Unspecified (see 3.4.2)			
<mark>2утснк</mark>	If the SATL supports a BYTCHK bit set to one and if the BYTCHK bit is set to one, then the SATL shall perform a byte-by-byte comparison of the data transferred from the application client to the SATL with data read from the ATA device the SATL, and return completion status reflecting the results of the comparison as described in $\frac{4}{2}$			
LOGICAL BLOCK ADDRESS	The logical block address shall be used to set the ATA LBA (see 3.1.15) as defined by 9.1. If the SATL implements direct logical block mapping (see 3.1.35), then the SATL shall set the ATA LBA in the ATA verify command (see 3.1.24) equal to the value specified in the LOGICAL BLOCK ADDRESS field. Otherwise, the mapping is unspecified (see 3.4.2).			
GROUP NUMBER	Unspecified (see 3.4.2)			
VERIFICATION LENGTH	The verification length shall be used to set the ATA Sector Count as defined in 9.1. If the SATL implements direct logical block mapping (see 3.1.35), then the SATL shall set the ATA Sector Count (see 3.1.16) in the ATA verify command (see 3.1.24) equal to the value specified in the VERIFICATION LENGTH field. Otherwise, the mapping is unspecified (see 3.4.2).

9.17 WRITE commands overview

9.17.1 WRITE commands operation code translation

This subclause applies to the translation of SCSI WRITE(6), WRITE(10), WRITE(12), and WRITE(16) commands.

The SATL shall transfer the logical blocks specified in the SCSI write command (see 3.1.80) from the SCSI application client to the ATA device. The SATL shall send ATA write commands (see 3.1.26) in accordance with the constraints specified in 9.1.

9.17.2 WRITE commands with FUA

This subclause applies to the translation of WRITE (10), WRITE (12), and WRITE (16) commands.

If the FUA bit is set to zero in the SCSI write command CDB, then the SATL shall process this command as described in 9.17.1.

If the FUA bit is set to one in the SCSI write command CDB, then the SATL shall send the following, in accordance with the constraints described in 9.1:

) two ATA commands as follows:

- 1) an ATA write command (see 3.1.26) excluding WRITE DMA FUA EXT, WRITE DMA QUEUED FUA EXT, WRITE MULTIPLE FUA EXT, and WRITE FPDMA QUEUE; and
- 2) an ATA verify command (see 3.1.24);
- b) one of the following ATA commands (see ATA8-ACS):
 - A) WRITE DMA FUA EXT;
 - B) WRITE DMA QUEUED FUA EXT; or
 - C) WRITE MULTIPLE FUA EXT;
 - or
- c) an ATA WRITE FPDMA QUEUED command (see SATA-2.6) with the FUA bit in the Device field set to one.

See 5.4 for a description of multiple command sequence error handling.

9.18 WRITE (6) command

The WRITE (6) command is used to request the SATL to transfer user data from the application client to the ATA device. Data may be written to the medium or to the cache of the ATA device.

Table 52 shows the translation of fields pecified in the WRITE (6) CDB.

Field	Description or reference
OPERATION CODE	Set to 0Ah. See 9.17.1.
LOGICAL BLOCK ADDRESS	The logical block address shall be used to set the ATA LBA (see 3.1.15) as defined by 9.1. If the SATL implements direct logical block mapping (see 3.1.35), then the SATL shall set the ATA LBA in the ATA write command (see 3.1.26) equal to the value specified in the LOGICAL BLOCK ADDRESS field. Otherwise, the mapping is unspecified (see 3.4.2).
TRANSFER LENGTH ^a	The transfer length shall be used to set the ATA Sector Count (see 3.1.22), as defined by 9.1. If the SATL implements direct logical block mapping (see 3.1.35), then the SATL shall set the ATA Sector Count (see 3.1.22) in the ATA write command (see 3.1.26) equal to the value specified in the TRANSFER LENGTH field. Otherwise, the mapping is unspecified (see 3.4.2).
CONTROL	6.5
^a A TRANSFER LENGTH field set to zero specifies a transfer of 256 logical blocks (see SBC-2).

9.19 WRITE (10) command

The WRITE (10) command is used to request the SATL to transfer user data from the application client to the ATA device. Data may be written to the medium or to the cache of the ATA device.

Table 53 shows the translation of fields $\frac{1}{2}$ pecified in the WRITE (10) CDB.

Field	Description or reference	
OPERATION CODE	Set to 2Ah. See 9.17.1 and 9.17.2.	
WRPROTECT	Unspecified (see 3.4.2)	
DPO	Unspecified (see 3.4.2)	
FUA	9.17.2	
FUA_NV	The SATL may ignore the FUA_NV bit as defined in BC-2. Hote 1 - Some application clients may expect the device server to return CHECK CONDITION status if the FUA-NV bit is set to one and the Extended INQUIRY Data VPD page is not supported.	
LOGICAL BLOCK ADDRESS	The logical block address shall be used to set the ATA LBA (see 3.1.15), as defined by 9.1. If the SATL implements direct logical block mapping (see 3.1.35), then the SATL shall set the ATA LBA in the ATA write command (see 3.1.26) equal to the value specified in the LOGICAL BLOCK ADDRESS field. Otherwise, the mapping is unspecified (see 3.4.2).	
GROUP NUMBER	Unspecified (see 3.4.2)	
TRANSFER LENGTH ^a	The transfer length is used to set the ATA Sector Count (see 3.1.22), as defined by 9.1. If the SATL implements direct logical block mapping (see 3.1.35), then the SATL shall set the ATA Sector Count in the ATA write command (see 3.1.26) equal to the value specified in the TRANSFER LENGTH field. Otherwise, the mapping is unspecified (see 3.4.2). The SATL shall send as many ATA write commands (see 3.1.26) as needed to satisfy the transfer length specified by the WRITE (10) command.	
CONTROL	6.5	
^a A transfer length of zero specifies that a data transfer shall not take place.

9.21 WRITE (16) command

The WRITE (16) command is used to request the SATL to transfer user data from the application client to the ATA device. Data may be written to the medium or to the cache of the ATA device.

Table 55 shows the translation of fields pecified in the WRITE (16) CDB.

Field	Description or reference	
OPERATION CODE	Set to 8Ah. See 9.17.1 and 9.17.2.	
WRPROTECT	Unspecified (see 3.4.2)	
DPO	Unspecified (see 3.4.2)	
FUA	9.17.2	
FUA_NV	The SATL may ignore the FUA_NV bit, or the SATL may implement the FUA_NV bit as defined in BC-2.	
LOGICAL BLOCK ADDRESS	The logical block address shall be used to set the ATA LBA (see 3.1.15), as defined by 9.1. If the SATL implements direct logical block mapping (see 3.1.35), then the SATL shall set the ATA LBA in the ATA write command (see 3.1.26) equal to the value specified in the LOGICAL BLOCK ADDRESS field. Otherwise, the mapping is unspecified (see 3.4.2).	
GROUP NUMBER	Unspecified (see 3.4.2)	
TRANSFER LENGTH ^b	The transfer length is used to set the ATA Sector Count (see 3.1.22), as defined by 9.1. If the SATL implements direct logical block mapping (see 3.1.35), then the SATL shall set the ATA Sector Count in the ATA write command (see 3.1.26) equal to the value specified in the TRANSFER LENGTH field. Otherwise, the mapping is unspecified (see 3.4.2). The SATL shall send as many ATA write commands (see 3.1.26) as needed to satisfy the transfer length specified by the WRITE (16) command.	
CONTROL	6.5	
^a Some application clients may expect the device server to return CHECK CONDITION status if the bit is set to one and the Extended INQUIRY Data VPD page is not supported.

9.22 WRITE AND VERIFY commands overview

This subclause applies to the translation of WRITE AND VERIFY (10), WRITE AND VERIFY (12), and WRITE AND VERIFY (16) commands.

The SATL shall send:

- an ATA write command (see 3.1.26) in accordance with the constraints defined in 9.1; and
 an ATA verify command see 3.1.24).

9.23 WRITE AND VERIFY (10) command

The WRITE AND VERIFY (10) command requests that the SATL to transfer the specified logical blocks from the application client to the ATA device, and then verify that the data was written correctly to the medium of the ATA device.

Table 56 shows the translation of fields pecified in the WRITE AND VERIFY (10) CDB.

Description or reference
Set to 2Eh. See 9.22.
Unspecified (see 3.4.2)
Unspecified (see 3.4.2)
If the SATL supports a BYTCHK bit set to one and the BYTCHK bit is set to one, then after writing the data to the medium the SATL shall read the data from the medium and perform a byte-by-byte comparison of the data transferred from the application client to the SATL with data read from the ATA device, and then shall return completion status reflecting the results of the comparison $\frac{3}{3}$ see SBC-2).
The logical block address shall be used to set the ATA LBA (see 3.1.15), as defined by 9.1. If the SATL implements direct logical block mapping (see 3.1.35), then the SATL shall set the ATA LBA in the ATA write command (see 3.1.26) and the ATA verify command (see 3.1.24) equal to the value specified in the LOGICAL BLOCK ADDRESS field. Otherwise, the mapping is unspecified (see 3.4.2).
Unspecified (see 3.4.2)
The transfer length is used to set the ATA Sector Count (see 3.1.22), as defined by 9.1. If the SATL implements direct logical block mapping (see 3.1.35), then the SATL shall set the ATA Sector Count in the ATA write command (see 3.1.26) and the ATA verify command (see 3.1.24) equal to the value specified in the TRANSFER LENGTH field. Otherwise, the mapping is unspecified (see 3.4.2). The SATL shall send as many ATA write commands and ATA verify commands as needed to satisfy the transfer length specified by the WRITE AND VERIFY (10) command.

9.28 WRITE SAME (10) command

9.28.1 WRITE SAME (10) command overview

The WRITE SAME (10) command (see table 62) requests that the SATL transfer a single logical block from the application ^[3]lientand write the contents of that single logical block, with modifications based on the LBDATA bit and the PBDATA bit, to the specified range of logical block addresses on the ATA device.

Table 62 — WRITE SAME (10) CDB field translations

Field	Description or reference
OPERATION CODE	Set to 41h. If the ATA device supports the ATA SCT Write Same command (see ATA8 ACS), the SATL should send the ATA SCT Write Same command to repeatedly write the data block transferred from the application client to the ATA device. If the ATA device does not implement ATA SCT Write Same command then the SATL shall send ATA write commands as defined in 9.17.1.
WRPROTECT	Unspecified (see 3.4.2)
LBDATA	9.28.2
PBDATA	9.28.2
LOGICAL BLOCK ADDRESS	The logical block address shall be used to set the ATA LBA (see 3.1.15), as defined by 9.1. If the SATL implements direct logical block mapping (see 3.1.35), then the SATL shall set the Start in the ATA SCT Write Same command or the ATA LBA in the ATA write command (see 3.1.26) equal to the value specified in the LOGICAL BLOCK ADDRESS field. Otherwise, the mapping is unspecified (see 3.4.2).
GROUP NUMBER	Unspecified (see 3.4.2)
	A UMBER OF BLOCKS field set to zero specifies that the SATL shall repeatedly write the logical block transferred from the application client to the range of ATA logical sectors corresponding to the range of logical block addresses specified by the LOGICAL BLOCK ADDRESS field through the LBA of the last logical block on the logical unit. If the UMBER OF BLOCKS field is set to a value other than ero, the SATL shall repeatedly write the data block transferred from the application client to the medium of the ATA device for the number of logical blocks specified to the corresponding logical sectors on the ATA device. The SATL shall send as many ATA commands as required to satisfy the number of blocks specified by the WRITE SAME (10) command.

9.28.2 LBDATA bit and PBDATA bit

The SATL shall write data to the specified logical block addresses according to the values in the LBDATA and PBDATA bits as shown in table 63.

LBDATA	PBDATA	Description		
0	0	The SATL shall write the block of data transferred from the application client to the range of blocks specified n LOGICAL BLOCK ADDRESS field and UMBER OF BLOCKS field, repeatedly, on the medium of the ATA device. If the ATA device supports the ATA SCT Write Same command, then the SATL should use the ATA SCT Write Same command, with the Function Code set to 202h or 004h for writing the data. Otherwise, the SATL shall use ATA write commands as defined in 9.17.2 See SBC-2).		
1 0 The SATL shall replace the first four bytes of the lo application client with the least significant four byte being written to the media, ending with the least sig 7766_5544_3322_1100h, 3322_1100h is written w last). The SATL shall use ATA write commands as define		The SATL shall replace the first four bytes of the logical block received from the application client with the least significant four bytes of the LBA of the logical block being written to the media, ending with the least significant byte (e.g., if the LBA is 7766_5544_3322_1100h, 3322_1100h is written with 33h written first and 00h written last). The SATL shall use ATA write commands as defined in 9.17.2 See SBC-2).		
0	1	The SATL shall terminate the command with CHECK CONDITION status with the		
1	1	sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.

9.29 WRITE SAME (16) command

The WRITE SAME (16) command (see table 64) requests that the SATL transfer a single logical block from the application ¹²lientand write the contents of that single logical block, with modifications based on the LBDATA bit and the PBDATA bit, to the specified range of logical block addresses on the ATA device.

Field	Description or reference
OPERATION CODE	Set to 93h. If the ATA device supports the ATA SCT Write Same command (see ATA8 ⁴⁴ CS), the SATL should send the ATA SCT Write Same command to repeatedly write the data block transferred from the application client to the ATA device. If the ATA device does not implement ATA SCT Write Same command then the SATL shall send ATA write commands as defined in 9.17.1.
WRPROTECT	Unspecified (see 3.4.2)
LBDATA	9.28.2
PBDATA	9.28.2
LOGICAL BLOCK ADDRESS	The logical block address shall be used to set the ATA LBA (see 3.1.15), as defined by 9.1. If the SATL implements direct logical block mapping (see 3.1.35), then the SATL shall set the Start in the ATA SCT Write Same command or the ATA LBA in the ATA write command (see 3.1.26) equal to the value specified in the LOGICAL BLOCK ADDRESS field. Otherwise, the mapping is unspecified (see 3.4.2).
GROUP NUMBER	Unspecified (see 3.4.2)
BUMBER OF BLOCKS	A NUMBER OF BLOCKS field set to zero specifies that the SATL shall repeatedly write the logical block transferred from the application client to the range of ATA logical sectors corresponding to the range of logical block addresses specified by the LOGICAL BLOCK ADDRESS field through the LBA of the last logical block on the logical unit. If the NUMBER OF BLOCKS field is set to a value other than ⁷ / ₂ ero, the SATL shall repeatedly write the data block transferred from the application client to the medium of the ATA device for the number of logical blocks specified to the corresponding logical sectors on the ATA device. The SATL shall send as many ATA commands as required to satisfy the number of blocks specified by the WRITE SAME (16) command.

10 Parameters for SAT implementations

10.1 Mode parameters

40.1.1 General information

SCSI mode parameters provide a mechanism to set operating parameters for SCSI devices and logical units. The MODE SENSE command obtains operating parameters while the MODE SELECT command sets operating parameters. This standard does not define the content of most operating parameters defined in mode pages due to lack of equivalent operations or features defined for ATA devices. The SATL emulates a SCSI device server for all MODE SENSE and MODE SELECT commands, and emulates the mode pages listed in 10.1.2.

The Mode Page Policy VPD page (see 10.3) should be implemented. If implemented, the MODE PAGE POLICY field in each mode page policy descriptor should be det to 00b (shared) for each mode page, and only one copy of mode page values should be maintained for all logical units within a target device to each mode page policy descriptor).

If the Mode Page Policy VPD page is not implemented, the SATL shall maintain shared mode pages for all I_T nexuses and shall share mode pages across all logical units within a target device.

10.1.2 Commonly used SCSI mode pages overview

This standard defines translations for the mode pages listed in table 65.

SCSI mode page	Reference	
Mode parameter header	10.1.3	
Mode parameter block descriptor	10.1.4	
Control (i.e., 0Ah)	10.1.5	
Read-Write Error Recovery (i.e., 01h)	10.1.6	
Caching (i.e., 08h)	10.1.7	
Informational Exceptions Control (i.e., 1Ch)	10.1.8	
All others	Gee SPC-3 and SBC-2 Unspecified (see 3.4.2)

10.1.3 Mode parameter headers

Table 66 shows the fields in the mode parameter header for the MODE SELECT (6) command and the MODE SENSE (6) command.

Field	Description or reference		
MODE DATA LENGTH	Unspecified (see 3.4.2)		
MEDIUM TYPE	This field should be set to 00h. When processing a MODE SELECT command, if the MEDIUM TYPE field is set to a value other than 00h, the SATL shall terminate the command with CHECK CONDITION status, with the sense key set to ILLEGAL REQUEST, and the additional sense code set to INVALID FIELD IN PARAMETER LIST.		
	Unspecified (see 3.4.2) for the MODE SELECT command. For the MODE SENSE command, the DEVICE SPECIFIC PARAMETER field for direct-access block devices contains the DPOFUA bit and the WP bit (see BC-2).		
DEVICE SPECIFIC PARAMETER	A DPOFUA bit set to zero indicates that the SATL supports neither the DPO bit nor the FUA bit. A DPOFUA bit set to one indicates that the SATL supports both the DPO bit and the FUA bit. A WP bit set to zero indicates that the medium is not write-protected. A WP bit set to one indicates that the medium is write-protected.		
BLOCK DESCRIPTOR LENGTH	This value is obtained by multiplying the number of block descriptors by eight 3see SPC-3). The SATL shall support zero or one mode parameter block descriptors.		

Table 67 shows the fields in the mode parameter header for the MODE SELECT (10) command and the MODE SENSE (10) command.

Field	Description or reference	
MODE DATA LENGTH	(see table 66)	
MEDIUM TYPE	(see table 66)	
DEVICE SPECIFIC PARAMETER	(see table 66)	
LONGLBA	Describes the length of the block descriptors. a) If set to zero, the mode parameter block bescriptor is eight bytes long. b) If set to one, the mode parameter block descriptor is 16 bytes long.	
BLOCK DESCRIPTOR LENGTH	This field specifies (i.e., for a MODE SELECT command) or indicates (i.e., for a MODE SENSE command) the length of the mode parameter block descriptor. This value is obtained by multiplying the number of block descriptors by eight if LONGLBA bit is set to zero or by 16 if LONGLBA bit is set to one. The SATL shall support zero or one mode parameter block descriptors.

10.1.4 Mode parameter block descriptor fields

The SATL may support the direct-access short LBA mode parameter block descriptor or the long LBA mode parameter block descriptor. Table 68 describes the translation of fields in the short LBA mode parameter block descriptor and the long LBA mode parameter block descriptor supported by the SATL.

Field	Description or reference	
NUMBER OF BLOCKS ^a Unspecified (see 3.4.2)		
BLOCK LENGTH ^a	When processing a MODE SELECT command, if the SATL implements direct logical block mapping (see 3.1.35) and the value of the BLOCK LENGTH field is not the same as the ATA logical sector size (see 3.1.16), then the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN PARAMETER LIST. If the SATL supports indirect logical block mapping this field is unspecified (see 3.4.2). When processing the MODE SENSE command, if the SATL implements direct logical block mapping (see 3.1.35) then the SATL shall return the same block length for the entire logical unit and the BLOCK LENGTH field shall contain the ATA logical sector size (see 3.1.16). Otherwise the BLOCK LENGTH field is unspecified (see 3.4.2).	
^a The values reported in the NUMBER OF BLOCKS field and the BLOCK LENGTH field shall be such that the logical unit capacity (see 3.1.50) is less than or equal to the ATA device capacity (see 3.1.10).		

Table 68 — N	Node parameter	block desc	riptor fields
--------------	----------------	------------	---------------

10.1.5 Control mode page

10.1.5.1 General translation

The Control mode page provides controls and information about behavior of the emulated SCSI device.

This page contains no comments

Table 69 describes the translation of the Control mode page for an ATA device.

Field	Changeable	Description or reference				
PS	n/a	Unspecified (see 3.4.2)				
SPF	<mark>위/a</mark>	Inspecified (see 3.4.2)				
PAGE CODE	no	<mark>화his field</mark> shall be set to 0Ah.				
PAGE LENGTH	no	Shall be set to 0Ah.				
TST	no	Shall be set to 000b to indicate that a SCSI representation of an ATA device has one task set for all initiators				
TMF_ONLY	no	Shall be set to zero ^a				
D_SENSE Unspecified		Shall be set to zero ^a A SATL shall support a D_SENSE bit set to zero indicating that the logical unit returns the fixed sense data format, and a SATL may support a D_SENSE bit set to one indicating logical unit returns the descriptor sense data format. The SATL shall return sense data in the format indicated when returning CHECK CONDITION status for any commands except the ATA PASS-THROUGH (12) command and the ATA PASS-THROUGH (16) command. The SATL shall return sense data for a CHECK CONDITION status returned by an ATA PASS-THROUGH (12) command or an ATA PASS-THROUGH				
GLTSD	Unspecified	Unspecified (see 3.4.2)				
RLEC	no	Shall be set to zero				
QUEUE ALGORITHM MODIFIER	no	The QUEUE ALGORITHM MODIFIER bit shall be set to one.				
QERR no		If the SATL supports the full task management model and ATA abort retry (see 3.1.7) of ATA queued commands (see 3.1.20) aborted by ATA collateral abort (see 3.1.8), the SATL shall set this field to 00b. Otherwise, the SATL shall set this field to 01b and comply with the unit attention condition requirements for a command completed with CHECK CONDITION status (see SPC-3).				
TAS NO		Shall be set to zero				
RAC Unspecified		Unspecified (see 3.4.2)				
JA_INTLCK_CTRL (no)		Shall be set to 00b				
SWP	no	Shall be set to zero				
ATO	Unspecified	Unspecified (see 3.4.2)				
AUTOLOAD MODE no		Shall be set to 000b				
BUSY TIMEOUT PERIOD Unspecified		The default value shall be set to FFFFh. A SATL may support variable timeout periods and allow the application client to set a new value through a MODE SELECT operation for this mode page (see SPC-3).				
EXTENDED SELF-TEST COMPLETION TIME	no	10.1.5.2				
^a SATL implementations	^a SATL implementations shall not support ACA.

10.1.5.2 Extended self-test completion time

A SATL implementation shall set the EXTENDED SELF-TEST COMPLETION TIME field to 0000h unless the ATA device supports SMART self-tests and the SATL supports a value other than 000b for the SELF-TEST CODE field for a SEND DIAGNOSTIC command. The SATL determines if the ATA device supports SMART self-test by examining the value of ATA IDENTIFY DEVICE data word 84 bit 1. If ATA IDENTIFY DEVICE data word 84 bit 1 is set to the ATA device supports the SMART self-test and shall retrieve the ATA device SMART data structure from the ATA device by sending an ATA SMART READ DATA command to the ATA device. The SATL may cache this information for future use when a subsequent MODE SENSE command requests the control mode page. If the SATL caches such data, the SATL may reference the cached copy instead of sending a new ATA SMART READ DATA the SATL may reference the EXTENDED SELF-TEST COMPLETION TIME field as follows:

- 1) If byte 373 of the returned SMART data structure is not set to FFh, the SATL shall set the EXTENDED SELF-TEST COMPLETION TIME field to a value that is 60 times the contents of byte 373; or
- 2) If byte 373 of the returned SMART data structure is set to FFh, the SATL shall set the EXTENDED SELF-TEST COMPLETION TIME field to a value that is the lesser of FFFFh or the result of the following formula:

EXTENDED SELF-TEST COMPLETION TIME field = ((w x 256) + z) x 60^{5}

where:

- w is the contents of byte $376\frac{6}{,and}$
- z is the contents of byte 375^{7}

10.1.6 Read-Write Error Recovery mode page

The Read-Write Error Recovery mode page specifies the error recovery parameters the SATL shall use during a command that performs a read or write operation to the medium of the ATA device (Bee SBC-2). Table 70 defines the translation for the Read-Write Error Recovery mode page.

	Field	Changeable	Description or reference
	PS	n/a	Unspecified (see 3.4.2)
Ę		0	
,	PAGE CODE	no	Shall be set to 01h

Comments from page 114 continued on next page

10.1.5.2 Extended self-test completion time

A SATL implementation shall set the EXTENDED SELF-TEST COMPLETION TIME field to 0000h unless the ATA device supports SMART self-tests and the SATL supports a value other than 000b for the SELF-TEST CODE field for a SEND DIAGNOSTIC command. The SATL determines if the ATA device supports SMART self-test by examining the value of ATA IDENTIFY DEVICE data word 84 bit 1. If ATA IDENTIFY DEVICE data word 84 bit 1 is set to one, the ATA device supports the SMART self-test and shall retrieve the ATA device SMART data structure from the ATA device by sending an ATA SMART READ DATA command to the ATA device. The SATL may cache this information for future use when a subsequent MODE SENSE command requests the control mode page. If the SATL caches such data, the SATL may reference the cached copy instead of sending a new ATA SMART READ DATA command. Then the SATL shall set the EXTENDED SELF-TEST COMPLETION TIME field as follows:

- 1) If byte 373 of the returned SMART data structure is not set to FFh, the SATL shall set the EXTENDED SELF-TEST COMPLETION TIME field to a value that is 60 times the contents of byte 373; or
- 2) If byte 373 of the returned SMART data structure is set to FFh, the SATL shall set the EXTENDED SELF-TEST COMPLETION TIME field to a value that is the lesser of FFFFh or the result of the following formula:

EXTENDED SELF-TEST COMPLETION TIME field = ((w x 256) + z) x 60;

where:

- w is the contents of byte 376; and
- z is the contents of byte 375-

10.1.6 Read-Write Error Recovery mode page

The Read-Write Error Recovery mode page specifies the error recovery parameters the SATL shall use during a command that performs a read or write operation to the medium of the ATA device (see SBC-2). Table 70 defines the translation for the Read-Write Error Recovery mode page.

10.1.8 Informational Exceptions Control mode page

10.1.8.1 Informational Exceptions Control mode page overview

The Informational Exceptions Control mode page defines the methods used by the SATL to control the reporting and the operations of specific informational exception conditions. The Informational Exceptions Control mode page applies to informational exceptions that return an additional sense code of FAILURE PREDICTION THRESHOLD EXCEEDED or WARNING to the application client (see SPC-3).

Table 72 shows the translation of fields in the Informational Exceptions Control mode page.

Field	Changeable	Description or reference		
PS	n/a	Unspecified (see 3.4.2)		
SPF	no	Shall be set to zero		
PAGE CODE	no	Shall be set to 1Ch. The SATL shall determine if the ATA SMART feature set is supported from the ATA IDENTIFY DEVICE data word 82 bit 0. If the ATA SMART feature set is not supported, then the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB for a MODE SENSE command or INVALID FIELD IN PARAMETER LIST for a MODE SELECT command.		
PAGE LENGTH	no	Shall be set to 0Ah		
PERF	no	Shall be set to zero		
EBF	n/a	Unspecified (see 3.4.2)		
EWASC	n/a	Unspecified (see 3.4.2)		
DEXCPT	yes	Unspecified (see 3.4.2)		
TEST	no	Shall be set to zero		
LOGERR	n/a	Unspecified (see 3.4.2)		
MRIE	no ^a	Should be set to 6h (see 10.1.8.2).		
INTERVAL TIMER	n/a	Unspecified (see 3.4.2)		
REPORT COUNT	n/a	Unspecified (see 3.4.2)		
^a The MRIE field should be set to 6h, however if the SATL supports other settings of the MRIE field, the SATL should permit the MRIE field to be changeable.				

Table 72 — Informationa	I Exceptions	Control mode	page fields
-------------------------	--------------	---------------------	-------------

10.1.8.2 Method of reporting informational exceptions (MRIE)

The SATL should support 6h. Support for any other value is unspecified (see 3.4.2).

When the MRIE field is set to 6h and the SATL receives a REQUEST SENSE command, the SATL shall send an ATA SMART RETURN STATUS command to the ATA device and return status to the application client as defined in PC-3 (see 10.2.5.2). If the result of the ATA SMART RETURN STATUS command indicates a threshold Acceeded condition the SATL shall set the additional sense code to HARDWARE IMPENDING FAILURE GENERAL HARD DRIVE FAILURE.

10.1.9 Power Condition⁵Mode Pages

10.1.9.1 Power Condition Hode Pages Overview

The SCSI START STOP UNIT command explicitly changes power condition. The Power Condition mode pages allow changing of the ATA APM mode setting, and the ATA STANDBY timer value. They also provide information about the current power condition settings.

10.1.9.2 ATA Power Condition Mode Page

The ATA Power Condition Mode page is ATA specific and defined in 12.3.3.

10.1.9.3 Power Condition²Mode Page

The Power Condition mode page translation (see table 73) allows setting and examining the ATA STANDBY timer value (see ATA8-ACS). Values in the STANDBY TIMER field for the MODE SENSE command shall be translated as defined in table 74. Values in the STANDBY TIMER field for the MODE SELECT command shall be translated as defined in table 75.

I

Field		Description or Reference	
PS	n/a	Unspecified (see 3.4.2)	
SPF	No	Shall be set to zero	
PAGE CODE	No	Shall be set to 1Ah	
PAGE LENGTH	No	Shall be <mark>4eto</mark> to 0Ah	
IDLE No When processing a MODE SENSE commany returned as zero. IDLE No When processing a MODE SELECT commany one, then the SATL shall terminate the common conditional sense code set to INVALID FUNCTION status, with the sense key set to the additional sense code set to INVALID FUNCTION		When processing a MODE SENSE command, the IDLE bit shall be returned as zero. When processing a MODE SELECT command, if the IDLE bit is set to one, then the SATL shall terminate the command with CHECK CONDITION status, with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN PARAMETER LIST.	
STANDBY	Yes	 When processing a MODE SENSE command, if ATA IDENTIFY DEVICE data word 49, bit 13 is set to the translated as one. If ATA IDENTIFY DEVICE data word 49, bit 13 is set to the set of the translated as zero. When processing a MODE SELECT command, if the TANDBY bit is set to one, then: If the ATA IDENTIFY DEVICE data word 49, bit 13 is set to to the set to one, then: If the ATA IDENTIFY DEVICE data word 49, bit 13 is set to to the set to one, then: If the ATA IDENTIFY DEVICE data word 49, bit 13 is set to to the set to one, then: If the ATA IDENTIFY DEVICE data word 49, bit 13 is set to the set to the set to additional sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN TARAMETER TO THE SET. The SATL shall send the ATA STANDBY command to the ATA device, and the value in the STANDBY command to set the Timer period value (TPV) (i.e., ATA Count field). 	
IDLE CONDITION TIMER	No	When processing a MODE SENSE command, this field shall be returned as zero. When processing a MODE SELECT command, this field shall be ignored.	
STANDBY CONDITION TIMER	Yes	When processing a MODE SENSE command: If the ATA IDENTIFY DEVICE data word 49, bit 13 is set to zero, then the STANDBY CONDITION TIMER shall return zero. If the ATA IDENTIFY DEVICE data word 49, bit 13 is set to one, then the ATA standby timer value shall be translated as defined in table 74 and returned in this field. When processing a MODE SELECT command: If STANDBY is set to one, then the value in this field shall be translated as defined in table 75 and used to set the Timer period value (TPV) (i.e., COUNT field). The SATL may retain this value for return when processing a MODE SENSE command.

10.2.2 Application Client log page

10.2.2.1 Translation Overview

The Application Client log page provides a location for application clients to store information. A SATL translates a²OG SELECT or LOG SENSE command to the application client log page to accesses to the ATA host vendor-specific log pages. Table 77 describes the translation of the general usage application client parameter data for the application client log page.

The SATL determines if the attached ATA device supports host vendor specific log pages by Heading log page address 00h using READ LOG EXT, READ LOG DMA EXT, or SMART READ LOG.

If the attached ATA device:

- a) does not support the general purpose logging feature set and the SMART feature set is disabled; or b) bees not support host vendor-specific be pages

^Bhen the SATL shall complete the LOG SENSE ^Br LOG SELECT command for the application client specific log page with a CHECK CONDITION status, a sense key of ILLEGAL REQUEST, and an additional sense code of INVALID FIELD IN CDB.

Field	Description or Reference

GENERAL USAGE PARAMETER BYTES	10.2.2.2

Table 77 — General usage application client parameter data fields

10.2.2.2 LOG SELECT translation

The SATL stores the application client parameter for a LOG SELECT command in the ATA device host vendor-specific log page. The SATL stores the application client parameter data at the ATA log address as specified in table 2.

Within an ATA log address, the SATL shall store each parameter code in ascending order within the sixteen 512-byte data blocks for each ATA log address. For example, parameter code 0000h is stored at offset 0 of the first 512-byte block of data at log address 90h and parameter code 0001h is stored at offset 256 in the first 512-byte block of data at log address 90h. The SATL stores this information by issuing a SMART WRITE LOG, WRITE LOG EXT, or WRITE LOG DMA EXT command to the device.

The SATL shall ensure that any previously stored data at the log address is preserved when writing to the log address for the requested parameter data.

Comments from page 121 continued on next page

10.2.2 Application Client log page

10.2.2.1 Translation Overview

The Application Client log page provides a location for application clients to store information. A SATL translates a LOG SELECT or LOG SENSE command to the application client log page to accesses to the ATA host vendor-specific log pages. Table 77 describes the translation of the general usage application client parameter data for the application client log page.

The SATL determines if the attached ATA device supports host vendor specific log pages by reading log page address 00h using READ LOG EXT, READ LOG DMA EXT, or SMART READ LOG.

If the attached ATA device:

- a) **Does** not support the general purpose logging feature set and the SMART feature set is disabled; or
- b) **Does** not support host vendor-specific log pages

Then the SATL shall complete the LOG SENSE or LOG SELECT command for the application client specific log page with a CHECK CONDITION status, a sense key of ILLEGAL REQUEST, and an additional sense code of INVALID FIELD IN CDB.

Field	Description or Reference
PARAMETER CODE	10.2.2.2
DU	Shall be 1b (see SPC-4)
TSD	Shall be 0b (see SPC 4)
ETC	Shall be 0b (see SPC-4)
ТМС	This field is ignored (see SPC-4)
FORMAT AND LINKING	Shall be 11b (see SPC 4)
PARAMETER LENGTH	Chall be Cabe SPC-4)
GENERAL USAGE PARAMETER BYTES	10.2.2.2

Table 77 — General usage application client parameter data fields

29.2.2.2 LOG SELECT translation

The SATL stores the application client parameter for a LOG SELECT command in the ATA device host vendor-specific log page. The SATL stores the application client parameter data at the ATA log address as specified in trable 2.

Within an ATA log address, the SATL shall store each parameter code in ascending order within the sixteen 512-byte data blocks for each ATA log³³ ddress. For example, parameter code 0000h is stored at offset 0 of the first 512-byte block of data at log address 90h and parameter code 0001h is stored at offset 256 in the first 512-byte block of data at log address 90h. The SATL stores this information by issuing³⁵ SMART WRITE LOG, WRITE LOG EXT, or WRITE LOG DMA EXT command to the device.

The SATL shall ensure that any previously stored data at the log address is preserved when writing to the log address for the requested parameter data.

Field	Description or reference
	The SATL shall read the ATA log data as defined in 10.2.4.2.
SELF-TEST CODE	If the SATL reads the ATA log data using the ATA READ LOG EXT command specifying the Extended SMART self-test log, then the SATL shall check if the value contained in the Self-test descriptor index field in the first block of data (i.e., bytes 2 and 3) is set to zero. If the value contained in the Self-test descriptor index field is set to zero, then the SATL shall set the SELF-TEST CODE field to zero for each of the log parameters returned. If the value contained in the Self-test descriptor index field is set to a non-zero value, then the SELF-TEST CODE field is unspecified (see 3.4.2). If the SATL reads the ATA log data using the ATA SMART READ LOG command specifying the SMART self-test log, then the SELF-TEST CODE field is unspecified (see 3.4.2).
	The SATL shall read the ATA log data as defined in 10.2.4.2.
	If the SATL reads the ATA log data using the ATA READ LOG EXT command specifying the Extended SMART self-test log, then the SATL shall check if the value contained in the Self-test descriptor index field in the first block of data (i.e., bytes 2 and 3) is set to zero. If the value contained in the Self-test descriptor index field is set to zero, then the SATL shall set the SELF-TEST RESULTS field to zero for each log parameter returned. If the value contained in the Self-test descriptor index field is set to a nonzero value,
	then the SATL shall set the SELF-TEST RESULTS field to:
SELF-TEST RESULTS	a) the value contained in the Self-test Execution Status bits of the content of the self-test execution status byte field of the n th descriptor entry, where n is equal to the result of the value contained in the Self-test descriptor index field minus the value contained in the PARAMETER CODE field for the log parameter being returned plus one, if the result of the value contained in the PARAMETER CODE field for the log parameter being returned plus one is greater than zero (e.g., for a log parameter with the PARAMETER CODE field of 0002h and a value contained in the Selftest descriptor index field of 6h, then the fourth descriptor entry is used); or
	 b) zero, if the result of the value contained in the Self-test descriptor index field minus the value contained in the PARAMETER CODE field for the log parameter being returned plus one is less than or equal to zero.
	If the SATL reads the ATA log data using the ATA SMART READ LOG command specifying the SMART self-test log, then the SATL shall set the SELF-TEST RESULTS field to the value contained in the Self-test Execution Status bits of the content of the self-test execution status byte field of the nth descriptor entry, where n is equal to the value contained in the PARAMETER CODE field for the log parameter being returned (e.g., for a log parameter with the PARAMETER CODE field of 0002h, then the second descriptor entry is used).

s/b ACCUMULATED POWER ON HOURS

Status moverby Accepted Author: moverby I don't think this translation works any longer with ACCUMULATED POWER ON HOURS

Field	Description or reference
	The SATL shall read the ATA log data as defined in 10.2.4.2.
	If the SATL reads the ATA log data using the ATA READ LOG EXT command specifying the Extended SMART self-test log, then the SATL shall check if the value contained in the Self-test descriptor index field in the first block of data (i.e., bytes 2 and 3) is set to zero. If the value contained in the Self-test descriptor index field is set to zero, then the SATL shall set the ADDRESS OF FIRST FAILURE field to zero for each log parameter returned.
	If the value contained in the Self-test descriptor index field is set to a nonzero value, then the SATL shall set the ADDRESS OF FIRST FAILURE field to:
ADDRESS OF FIRST FAILURE	a) the values contained in the Failing LBA (47:40) field, Failing LBA (39:32) field, Failing LBA (31:24) field, Failing LBA (23:16) field, Failing LBA (15:8) field, and Failing LBA (7:0) field of the n th descriptor entry, where n is equal to the result of the value contained in the Self-test descriptor index field minus the value contained in the PARAMETER CODE field for the log parameter being returned plus one, if the result of the value contained in the Self-test descriptor index field minus the value contained in the PARAMETER CODE field for the log parameter being returned plus one is greater than zero (e.g., for a log parameter with the PARAMETER CODE field of 0002h and a value contained in the Self-test descriptor index field of 6h, then the fourth descriptor entry is used); or
	 b) zero, if the result of the value contained in the Self-test descriptor index field minus the value contained in the PARAMETER CODE field for the log parameter being returned plus one is less than or equal to zero.
	If the SATL reads the ATA log data using the ATA SMART READ LOG command specifying the SMART self-test log, then the SATL shall set the ADDRESS OF FIRST FAILURE field to the values contained in the Failing LBA (27:24) field, Failing LBA (23:16) field, Failing LBA (15:8) field, and Failing LBA (7:0) field of the n th descriptor entry, where n is equal to the value contained in the PARAMETER CODE field for the log parameter being returned (e.g., for a log parameter with the PARAMETER CODE field of 0002h, then the second descriptor entry is used).
SENSE KEY	10.2.4.3
ADDITIONAL SENSE CODE	10.2.4.3
ADDITIONAL SENSE CODE QUALIFIER	10.2.4.3

Table 81 — Self-Test Results log parameters (part 4 of 4)

10.2.4.2 A method of determining ATA command selection for field translations

To translate the SELF-TEST CODE field, the SELF-TEST RESULTS field, the TIMESTAMP field, the ADDRESS OF FIRST FAILURE field, the SENSE KEY field, the ADDITIONAL SENSE CODE field, and the ADDITIONAL SENSE CODE QUALIFIER field of Self-Test Results log parameters, the SATL shall send an ATA IDENTIFY DEVICE command to the ATA device, and from the returned data the SATL shall determine if the ATA device supports the 48-bit Address feature set. If the 48-bit Address feature set is supported (i.e., bit 10 of word 83 of ATA IDENTIFY DEVICE data is set to one), then the SATL shall send an ATA READ LOG EXT command with the Log address set to 07h (i.e., Extended SMART self-test log) to the ATA device. If the 48-bit Address feature set is not supported (i.e., bit 10 of word 83 of ATA IDENTIFY DEVICE data is set to zero), then the SATL shall send

This page contains no comments

an ATA SMART READ LOG command with the Log address set to 06h (i.e., SMART self-test log) to the ATA device.

10.2.4.3 Sense key and additional sense code

The SATL shall determine the SENSE KEY field, the ADDITIONAL SENSE CODE field, and the ADDITIONAL SENSE CODE QUALIFIER field returned in each log parameter from the content of the self-test execution status byte returned from a ATA READ LOG EXT command or ATA SMART READ LOG command sent to the ATA device (see 10.2.4.2). The values returned in each log parameter shall be translated into sense data for the sense key, and additional sense code as shown in table 82.

Table 82 — ATA Self-test execution status values translated to SCSI sense keys and sense codes

10.2.5 Informational Exceptions log page

10.2.5.1 Informational Exceptions log page overview

The Informational Exceptions log page provides detail about informational exceptions. Table 83 shows the log page header fields.

Field =	Description or reference
PAGE CODE	Shall be set to 2Fh. ² his field value is specific to the Informational Exceptions log page. The SATL shall send the ATA SMART RETURN STATUS command to the ³ on-packet device. Data returned from the ⁴ on-packet device shall be translated into the appropriate log sense parameter data (see 10.2.5.2) to be returned to the application client.
PAGE LENGTH	Unspecified (see 3.4.2)

Table 83 — Informational Exceptions log page header fields

10.2.5.2 Additional sense code and additional sense code qualifier translations

Data received from a ATA device in response to an ATA SMART RETURN STATUS command shall be translated by the SATL into the informational exceptions general parameter data returned to the application client. Table 85 provides the parameter data translations for the INFORMATIONAL EXCEPTION ADDITIONAL SENSE CODE field and the INFORMATIONAL EXCEPTION ADDITIONAL SENSE CODE QUALIFIER field.

Data returned to SATL from the ATA device by the ATA SMART RETURN STATUS command	SMART condition	Informational exceptions general parameter data fields
LBA Mid = 4Fh LBA High = C2h	threshold not exceeded	INFORMATIONAL EXCEPTION ADDITIONAL SENSE CODE = 00h, INFORMATIONAL EXCEPTION ADDITIONAL SENSE CODE QUALIFIER = 00h
LBA Mid = F4h LBA High = 2Ch	threshold exceeded	INFORMATIONAL EXCEPTION ADDITIONAL SENSE CODE = 5Dh, INFORMATIONAL EXCEPTION ADDITIONAL SENSE CODE QUALIFIER = 10h

10.2.5.3 Most recent temperature reading translation

If the ATA device supports the SCT Feature Set (see SCT), then to translate the MOST RECENT TEMPERATURE READING field of the Informational Exceptions log page, the SATL shall send an SCT Status Request to the ATA device; and then:

- a) if the HDA Temp field (see SCT) is less than zero, the SATL shall set the MOST RECENT TEMPERATURE READING field to zero;
- b) if the HDA Temp field is equal to 80h, the SATL shall set the MOST RECENT TEMPERATURE READING field to FFh; or
- c) the SATL shall set the MOST RECENT TEMPERATURE READING FIELD to the value in the HDA Temp field.

If the ATA device does not support the SCT feature set, then the SATL shall set the MOST RECENT TEMPERATURE READING field to FFh.

10.3 Vital product data parameters

10.3.1 Vital product data parameters overview

Table 86 provides a summary of the VPD page translations defined in this standard.

SCSI VPD page	Reference
Supported VPD Pages VPD page (i.e., 00h)	10.3.2
Unit Serial Number VPD page (i.e., 80h)	10.3.3
Device Identification VPD page (i.e., 83h)	10.3.4
Mode Page Policy VPD page (i.e., 87h)	10.3.5
ATA Information VPD page (i.e., 89h)	12.4.2
Block Device Characteristics VPD Page (i.e., B1h)	10.3.6
All others	dee SPC-3 and SBC-2 Unspecified (see 3.4.2)

Table 86 — Summary of SCSI / ATA VPD page mapping

10.3.2 Supported VPD pages VPD page

Table 87 shows the fields of the Supported VPD pages VPD page.

Table 87 — Supported VPD pages VPD page fields

1	Field	Description or reference
9	PERIPHERAL DEVICE TYPE	The PERIPHERAL QUALIFIER field and the PERIPHERAL DEVICE TYPE field shall be
	PERIPHERAL QUALIFIER	set as described in 8.1.2.
	PAGE CODE	The SATL shall set this field to 00h.
	PAGE LENGTH	The SATL shall set this field to indicate the length of the supported VPD page list returned in number of bytes.
		⁶ his list shall contain the page codes of the pages supported by the SATL in ascending order of page codes beginning with page code 00h.

10.3.3 Unit Serial Number VPD page

Table 88 defines the Unit Serial Number VPD page (see SPC-3) returned by a SATL for an ATA device.

Bit\Byte	7	6	5	4	3	2	1	0	
0	PERI	PHERAL QUAL	IFIER	PERIPHERAL DEVICE TYPE					
1		PAGE CODE (80h)							
2		Reserved							
3		PAGE LENGTH (14h)							
4									
23	PRODUCT SERIAL NUMBER								

2able 88 — Unit Serial Number VPD page for SAT

The PERIPHERAL QUALIFIER field and the PERIPHERAL DEVICE TYPE field shall be set as described in 8.1.2.

The PAGE CODE field shall be set to 30h.

The PAGE LENGTH field shall be set to 44h.

The PRODUCT SERIAL NUMBER field contains a representation of the Serial number field in the ATA IDENTIFY DEVICE data [5].e., words 19:10⁶/₇ last retrieved from the ATA device. Each pair of bytes in the Serial number field shall be swapped to create a valid ASCII string format in the PRODUCT SERIAL NUMBER field as described in table 89.

Byte	Contents
0	IDENTIFY DEVICE word 10 bits 15:8 (i.e., byte 1)
1	IDENTIFY DEVICE word 10 bits 7:0 (i.e., byte 0)
2	IDENTIFY DEVICE word 11 bits 15:8 (i.e., byte 3)
3	IDENTIFY DEVICE word 11 bits 7:0 (i.e., byte 2)
18	IDENTIFY DEVICE word 19 bits 15:8 (i.e., byte 19)
19	IDENTIFY DEVICE word 19 bits 7:0 (i.e., byte 18)

Table 89 — PRODUCT SERIAL NUMBER field

NOTE 11 - Although BPC-3 defines the PRODUCT SERIAL NUMBER field as right-aligned, ATA8-ACS does not require its SERIAL NUMBER field to be right-aligned. Therefore, the PRODUCT SERIAL NUMBER field for SAT may not be right-aligned.

10.3.4 Device Identification VPD page

10.3.4.1 Device Identification VPD page overview

The SATL shall return the Device Identification VPD page $\frac{1}{15}$ see SPC-3) as defined in table 90.

Pable 90 — Device Identification VPD page for SAT

	Bit Byte	7	6	5	4	3	2	1	0		
	0	PERI	PERIPHERAL QUALIFIER PERIPHERAL DEVICE T						TYPE		
	1				PAGE CO	de (83h)					
	2	(MSB)									
	3 3		PAGE LENGTH (N-3) (LS						(LSB)		
	4		5 tontificat	ion doporinto	r for the logi	ool unit (ooo	table 01 and	table 02)			
~	15		- recentification descriptor for the logical unit (see table 91 and table 93)								
	16										
	n										

The PERIPHERAL QUALIFIER field and the PERIPHERAL DEVICE TYPE field shall be set as described in 8.1.2.

The PAGE CODE field shall be set to 73h.

The PAGE LENGTH field contains the length of the remaining bytes of the VPD page.

One elementification descriptor for a logical unit (i.e., a logical unit name) shall be included (see 10.3.4.2).

In some environments, one or more additional descriptors may be included (see 10.3.4.3).

10.3.4.2 Logical unit name

10.3.4.2.1 Logical unit name overview

If the ATA IDENTIFY DEVICE data returned by the ATA device word 87 bit 8 is set to zero, indicating that the ATA device does not supports the support the World wide name field (i.e., ATA IDENTIFY DEVICE data words 111:108), the SATL shall include an identification descriptor containing a logical unit name as defined in 10.3.4.2.3.

10.3.4 Device Identification VPD page

10.3.4.1 Device Identification VPD page overview

1

The SATL shall return the Device Identification VPD page (see SPC-3) as defined in table 90.

Bit Byte	7	6	5	4	3	2	1	0	
0	PERI	PHERAL QUAL	IFIER	PERIPHERAL DEVICE TYPE					
1	PAGE CODE (83h)								
2	(MSB)

15		- Identification descriptor for the logical unit (see table 91 and table 93)							
16			Additiono	l identificatio	n deseriater				
n	Additional <mark>identification</mark> descriptor(s) (if any)								

lable 90 — I	Device	Identification	VPD page	for SAT
			1 · · · · · ·	

The PERIPHERAL QUALIFIER field and the PERIPHERAL DEVICE TYPE field shall be set as described in 8.1.2.

The PAGE CODE field shall be set to 83h.

The PAGE LENGTH field contains the length of the remaining bytes of the VPD page.

One identification descriptor for a logical unit (i.e., a logical unit name) shall be included (see 10.3.4.2).

In some environments, one or more additional identification descriptors may be included (see 10.3.4.3).

10.3.4.2 Logical unit name

10.3.4.2.1 Logical unit name overview

If the ATA device returns the ATA IDENTIFY DEVICE data word 87 bit 8 is set to one indicating that the ATA device supports the World wide name field (i.e., ATA IDENTIFY DEVICE data words 111:108), the SATL shall include an the transmission descriptor containing a logical unit name as defined in 10.3.4.2.2.

If the ATA IDENTIFY DEVICE data returned by the ATA device word 87 bit 8 is set to zero, indicating that the ATA device does not supports the support the World wide name field (i.e., ATA IDENTIFY DEVICE data words 111,428), the SATL shall include an identification descriptor containing a logical unit name as defined in 10.3.4.2.3.

Rumber: 1 Author: Kevin_Marks Subject: Highlight Date: 8/27/2008 11:24:08 AM -07'00'
Table 91 — Logical unit name derived from the world wide name
Why are the VPD pages shown in this format, instead of field/description or reference table?
For a VPD only defined in this standard, such as ATA page this format would be correct.

22 June 2008

10.3.4.3 Examples of additional descriptors

10.3.4.3.1 Identification descriptors included by a SATL in an ATA host

Figure 9 shows the descriptor returned by a SATL in an ATA host (i.e., where the ATA device is being accessed with an ATA host port) containing a logical unit name based on ATA IDENTIFY DEVICE data (see table 91 or table 93 in 10.3.4.2).

Figure 9 — ³dentification descriptors included by a SATL in an ATA host

10.3.4.3.2 ⁴dentification descriptors included by a SATL in a SAS initiator device

Figure 10 shows the device (i.e., where the ATA device is being accessed by a SAS STP initiator port through an STP BATA bridge):

- a) a logical unit name based on ATA IDENTIFY DEVICE data (see table 91 or table 93 in 10.3.4.2);
- b) a target port identifier based on the SAS STP target port SAS address (see table 95); and
 c) a relative target port identifier set to 0001h (see SPC-3).

4										
11				SAS ADI	DRESS					

4 he CODE SET field is set to^⑤h (i.e., binary).

The PIV bit is set to one.

The ASSOCIATION field is set to 71b (i.e., target port).

The DENTIFIER TYPE field is set to the (i.e., NAA).

The SAS ADDRESS field is set to the SAS address of the STP target port providing the STP/SATA bridge functionality (i.e., the SAS address of the SATA device).

10.3.4.3.3 Identification descriptors included by a SATL in a SCSI to ATA protocol bridge

Figure 11 shows the identification descriptors returned by a SATL in a SCSI to ATA protocol bridge, where the ATA device is being accessed by an ATA host port, and the SATL is being accessed with a SCSI target port using a SCSI transport protocol (e.g, FCP-3 or iSCSI):

- a) a logical unit name based on ATA IDENTIFY DEVICE data (see table 91 or table 93 in 10.3.4.2);
- any target port identifiers specified by the SCSI transport protocol standard (e.g., for FCP-3, the SATL includes an identifier with identifier type 3h (i.e., NAA) containing the Port_Name, and may include an identifier with identifier type 4h (i.e., relative target port identifier); and
- c) any other identification descriptors supported by the protocol bridge (e.g., a target device name).

Comments from page 135 continued on next page

The SATL includes a target port identifier as defined in table 95.

Table 95 — Target port identifier for SAS

Byte\Bit	7	6	5	4	3	2	1	0			
0		PROTOCOL IDE	ENTIFIER (6h)		CODE SET (1h)					
1	PIV (1b)	Reserved	ASSOCIAT	ion (01b)		IDENTIFIER TYPE (3h)					
2		Reserved									
3		IDENTIFIER LENGTH (08h)									
4											
11		SAS ADDRESS									

The CODE SET field is set to 1h (i.e., binary).

The PIV bit is set to one.

The ASSOCIATION field is set to 01b (i.e., target port).

The IDENTIFIER TYPE field is set to 3h (i.e., NAA).

The SAS ADDRESS field is set to the SAS address of the STP target port providing the STP/SATA bridge functionality (i.e., the SAS address of the SATA device).

10.3.4.3.3 ¹²entification descriptors included by a SATL in a SCSI to ATA protocol bridge

Figure 11 shows the $\frac{13}{14}$ entification descriptors returned by a SATL in a SCSI to ATA protocol bridge, where the ATA device is being accessed by an ATA host port, and the SATL is being accessed with a SCSI target port using a SCSI transport $\frac{15}{12}$ rotocol $\frac{14}{12}$, FCP-3 or iSCSI.

- a) a logical unit name based on ATA IDENTIFY DEVICE data (see table 91 or table 93 in 10.3.4.2);
- b) any target port identifiers specified by the SCSI transport protocol standard ¹⁶.g., for FCP-3, the SATL includes an ¹⁷-battifier with ¹⁸-battifier type 3h (i.e., NAA) containing the Port_Name, and may include an ¹⁹-battifier with ²⁰-battifier type 4h (i.e., relative target port identifier); and
- c) any other $\frac{21}{10}$ entification descriptors supported by the protocol bridge (e.g., a target device name).

Figure 11 $-\frac{22}{10}$ entification descriptors included by a SATL in a SCSI to ATA protocol bridge

Comments from page 135 continued on next page

The SATL includes a target port identifier as defined in table 95.

Table 95 — Target port identifier for SAS

Byte\Bit	7	6	5	4	3	2	1	0	
0		PROTOCOL IDE	DCOL IDENTIFIER (6h)			CODE SET (1h)			
1	PIV (1b)	Reserved	ASSOCIATION (01b)			IDENTIFIER TYPE (3h)			
2		Reserved							
3		IDENTIFIER LENGTH (08h)							
4									
11	SAS ADDRESS								

The CODE SET field is set to 1h (i.e., binary).

The PIV bit is set to one.

The ASSOCIATION field is set to 01b (i.e., target port).

The IDENTIFIER TYPE field is set to 3h (i.e., NAA).

The SAS ADDRESS field is set to the SAS address of the STP target port providing the STP/SATA bridge functionality (i.e., the SAS address of the SATA device).

10.3.4.3.3 Identification descriptors included by a SATL in a SCSI to ATA protocol bridge

Figure 11 shows the identification descriptors returned by a SATL in a SCSI to ATA protocol bridge, where the ATA device is being accessed by an ATA host port, and the SATL is being accessed with a SCSI target port using a SCSI transport protocol (e.g, FCP-3 or iSCSI):

- a) a logical unit name based on ATA IDENTIFY DEVICE data (see table 91 or table 93 in 10.3.4.2);
- any target port identifiers specified by the SCSI transport protocol standard (e.g., for FCP-3, the SATL includes an identifier with identifier type 3h (i.e., NAA) containing the Port_Name, and may include an identifier with identifier type 4h (i.e., relative target port identifier); and
- c) any other identification descriptors supported by the protocol bridge (e.g., a target device name).

Comments from page 136 continued on next page

10.3.5 Mode Page Policy VPD page

The SATL should implement the Mode Page Policy VPD page for each logical unit emulated (see SPC-3). Table 96 defines the Mode Page Policy VPD page (see SPC-3) returned by the SATL.

Byte\Bit	7	6	5	4	3	2	1	0		
0	PERIF	PHERAL QUAL	IFIER		PERIPHERAL DEVICE TYPE					
1				PAGE CO	de (87h)					
2					otu (n. 2)					
3				PAGE LEN	GTH (II-3)					
		Mode page policy descriptor list								
4			Mod		, descriptor	(firot)				
7			wode page policy descriptor (first)							
•		•								
•		•								
•		•								
n-3										
n		Mode page policy descriptor (last)								

The PERIPHERAL QUALIFIER FIELD and the peripheral device type field shall be set as described in 8.1.2.

The PAGE CODE field shall be set to 87h.

The PAGE LENGTH FIELD is unspecified (see 3.4.2).

If the SATL implements the Mode Page Policy VPD page, then the SATL shall include at least one mode page policy descriptor (see table 97).

Table 97 — Mode policy descriptor for SAT

Byte\Bit	7	6	5	4	3	2	1	0
0	Rese	erved	POLICY PAGE CODE					
1		POLICY SUBPAGE CODE						
2	MLUS	MLUS Reserved MODE PAGE POLICY						GE POLICY
3	Reserved							

The POLICY PAGE CODE field, the POLICY SUBPAGE CODE field, the multiple logical units share (i.e., MLUS) bit, and MODE PAGE POLICY field are unspecified (see 3.4.2 and SPC-3).

10.3.6 Block Device Characteristics VPD Page

Table 98 shows the translation of fields in the $\frac{11}{10}$ lock device characteristics VPD page.

11 Error and sense reporting

³1.1 Error translation – ATA device error to SCSI error map

ATA device errors are translated to the appropriate SCSI errors. The ATA Status register and Error register bit settings provide the information to be translated into SCSI sense key, additional sense code, and additional sense code qualifier for error reporting. Unless otherwise specified in the subclause describing the translation of a particular SCSI command, log page, mode page or VPD page, the SATL shall translate ATA device errors to SCSI errors as shown in table 99.

ATA Error Register			0001 5			
Status Error ^a		Sense key	Additional sense code			
DF ^b	n/a	HARDWARE ERROR	INTERNAL TARGET FAILURE			
ERR	NM	NOT READY	MEDIUM NOT PRESENT			
ERR	UNC	MEDIUM ERROR	UNRECOVERED READ ERROR			
ERR	WP	DATA PROTECT	WRITE PROTECTED			
ERR IDNF		ILLEGAL REQUEST ^d	LOGICAL BLOCK ADDRESS OUT OF RANGE ^d			
ERR ABRT ^c		ABORTED COMMAND	NO ADDITIONAL SENSE INFORMATION			
ERR MC		UNIT ATTENTION	NOT READY TO READY CHANGE, MEDIUM MAY HAVE CHANGED			
ERR	MCR	UNIT ATTENTION	OPERATOR MEDIUM REMOVAL REQUEST			
ERR	ICRC	ABORTED COMMAND	INFORMATION UNIT iuCRC ERROR DETECTED			
CORR	n/a	This condition is not cons	sidered an error.			
 ^a If the Error register has an obsolete bit set to one, the SATL may return a vendor-specific additional sense code (e.g., if the AMNF bit is set to one, return MEDIUM ERROR - ADDRESS MARK NOT FOUND FOR DATA FIELD). ^b After an ATA device returns a DF bit set to one, the SATL processes any subsequent commands received for the emulated logical unit corresponding to the ATA device by terminating the command with CHECK CONDITION status with the sense key set to HARDWARE ERROR and the additional sense code set to INTERNAL TARGET FAILURE. ^c The ABRT bit is ignored if any other ATA error bit is set. ^d SATLs compliant with previous versions of this standard return a sense key of MEDIUM ERROR and an additional sense code of RECORD NOT FOUND

12 SAT-specific SCSI extensions

12.1 SAT-specific SCSI extensions overview

^같his subclause defines additional SCSI commands,<mark>孙ode pages and VPD pages</mark> that may be supported by a SATL to provide capabilities beyond those defined in the other SCSI command sets.

SCSI commands defined for SATL implementations include:

- a) ATA PASS-THROUGH (12) command (see 12.2.2); and
- b) ATA PASS-THROUGH (16) command (see 12.2.3).

Mode pages defined for SATL implementations Hclude:

a) PATA Control mode page (see 12.3.2).

^bital Product Data pages defined for SATL implementations include:

a) ATA Information VPD page (see 12.4.2).

12.2 ATA PASS-THROUGH commands

12.2.1 ATA PASS-THROUGH commands overview

ATA PASS-THROUGH commands provide a method for:

- a) an application client to transmit an ATA command to an ATA device;
- b) optionally, transferring data between an application client and an ATA device; and
- c) an ATA device to transfer completion status through the SATL.

This is accomplished by defining:

- a) CDBs containing ATA command information (see 12.2.2 and 12.2.3); and
- b) specific SCSI status and sense data usage for returning the results of an ATA command (see 12.2.5).

	APT does define s	such a protocol.	. I would not ma	ark obsolete yet.
T	Number: 9 Author: HPQ-	RElliott Subje	ect: Highlight	Date: 9/3/2008 9:42:24 AM -07'00'
	FPDMA			

ata8-acs defines no such protocol; it lumps the FPDMA commands into the "DMA Queued" protocol. Mark as obsolete?

Status moverby Rejected 9/9/2008 2:57:30 PM -07'00' Subject: Sticky Note Date: 9/9/2008 2:57:26 PM -07'00' Rejected: Was discussed and it was decided to leave this in place to give the SATL the ability to configure the host for the correct protocol without having to examine the opcode of the ATA command within ATA pass through.

The PROTOCOL field specifies the protocol to use when the ATA evice executes the command, 대TA8-AAM defines the meaning of protocol values ranging from 양 to 11.

the PROTOCOL field specified is in the range from to 12, the SATL shall send an ATA command to the ATA device.

다. The PROTOCOL field contains 85 (i.e., Return Response Information), then the SATL shall:

- a) if the transport is SATA, read the current Shadow Command Block registers; or
- b) if the transport is PATA, read the current Command Block registers;

and return the contents in the ITA Status Return Descriptor as defined in 12.2.6. The SATL shall ignore all other fields in the CDB.

If the value in the PROTOCOL field is inappropriate for the command specified in the COMMAND field (see ATA8-ACS), then the SATL may lose communication with the ATA device. This standard does not specify the SATL behavior if this occurs.

If the the protocol field is set to to to the protocol field is set to to the protocol field is set to the protocol field is set to zero (i.e., ATA Hardware Reset) and the device is a PATA device, then the SATL shall assert RST- (see ATA8-APT). If the value in the protocol field is set to zero (i.e., ATA Hardware Reset) and the device is a SATA device, then the SATL shall send a COMRESET to the SATA device. When this protocol is selected, only the protocol field and the OFF_LINE field are valid. The SATL shall ignore all other fields in the CDB.

If the PROTOCOL field is set to one, then the SATL shall send a software reset to the ATA device (see ATA8-AAM). When this protocol is selected, only the PROTOCOL field and the OFF_LINE field are valid. The SATL shall ignore all other fields in the CDB.

If the value in the PROTOCOL field requests the SATL to send a command to the ATA device, then the SATL shall set the fields in the ATA command using fields in the ATA PASS-THROUGH CDB as shown in table 105.

The SATL shall determine if a data transfer is necessary and how to perform the data transfer by examining values in the MULTIPLE_COUNT field, PROTOCOL field, OFF_LINE field, T_DIR bit, BYTE_BLOCK bit, and T_LENGTH field. The SATL shall ignore the COMMAND field in the CDB except to copy the COMMAND field in the CDB to the Command field in the Register – Host to Device FIS or to the ATA Command register. If the ATA command completes with an error, then the SATL shall return the Error Output fields (see ATA8-ACS) in the ATA Return descriptor (see 12.2.6).

The SATL shall configure the ATA host and the ATA device for the PIO, DMA, and UDMA transfer rates that both the SATL and ATA device support. The SATL should set the transfer rates to the maximum supported by both the SATL and the ATA device. The COMMAND field of the CDB may specify the ATA SET FEATURES command. The ATA PASS-THROUGH (12) command should not be used to send an ATA SET FEATURES command that changes the PIO/DMA/UDMA or other transfer modes of the ATA device. The result of a SET FEATURES command that changes the PIO/DMA/UDMA or other transfer modes of the ATA device is outside the scope of this standard and may cause communication to be lost with the ATA device; preventing the SATL from performing any action based on the contents of the CDB.

The BYTE_BLOCK (Byte/Block) bit specifies whether the transfer length in the location specified by the T_LENGTH field specifies the number of bytes to transfer or the number of blocks to transfer. If the value in the BYTE_BLOCK bit is set to zero, then the SATL shall transfer the number of bytes specified in the location specified by the T_LENGTH field. If the value in the BYTE_BLOCK bit is set to one the SATL shall transfer the number of blocks specified in the location specified by the T_LENGTH field. If the value in the BYTE_BLOCK bit is set to one the SATL shall transfer the number of blocks specified in the location specified by the T_LENGTH field. The SATL shall ignore the BYTE_BLOCK bit when the T_LENGTH field is set to zero.

The CK_COND (Check Condition) bit may be used to request the SATL to return a copy of ATA register information in the sense data upon command completion. If the CK_COND bit is set to one the SATL shall return a status of CHECK CONDITION when the ATA command completes, even if the command completes successfully, and return the ATA Normal Output fields (see ATA8-ACS) in the sense data using the ATA Return descriptor (see 12.2.6). If the CK_COND bit is set to zero, then the SATL shall terminate the command with CHECK CONDITION status only if an error occurs in processing the command. See clause 11 for a description of ATA error conditions.

Т	nber: 1 Author: moverby Subject: Highlight Date: 9/8/2008 11:12:21 PM -07'00'
_	s is not entirely correct. AAM does not define an SRST protocol. It defines a device management protocol under which SRST falls.

Comments from page 141 continued on next page

The PROTOCOL field specifies the protocol to use when the ATA device executes the command. ATA8-AAM defines the meaning of protocol values ranging from 0 to 11.

If the PROTOCOL field specified is in the range from 3 to 12, the SATL shall send an ATA command to the ATA device.

If the PROTOCOL field contains 15 (i.e., Return Response Information), then the SATL shall:

- a) if the transport is SATA, read the current Shadow Command Block registers; or
- b) if the transport is PATA, read the current Command Block registers;

and return the contents in the ATA Status Return Descriptor as defined in 12.2.6. The SATL shall ignore all other fields in the CDB.

If the value in the PROTOCOL field is inappropriate for the command specified in the COMMAND field (see ATA8-ACS), then the SATL may lose communication with the ATA device. This standard does not specify the SATL behavior if this occurs.

If the value in the PROTOCOL field is set to zero (i.e., ATA Hardware Reset) and the device is a PATA device, then the SATL shall assert RST- (see ATA8-APT). If the value in the PROTOCOL field is set to zero (i.e., ATA Hardware Reset) and the device is a SATA device, then the SATL shall send a COMRESET to the SATA device. When this protocol is selected, only the PROTOCOL field and the OFF_LINE field are valid. The SATL shall ignore all other fields in the CDB.

If the PROTOCOL field is set to one, then the SATL shall send a software reset to the ATA device (see ATA8-AAM). When this protocol is selected, only the PROTOCOL field and the OFF_LINE field are valid. The SATL shall ignore all other fields in the CDB.

If the value in the PROTOCOL field requests the SATL to send a command to the ATA device, then the SATL shall set the fields in the ATA command using fields in the ATA PASS-THROUGH CDB as shown in table 105.

The SATL shall determine if a data transfer is necessary and how to perform the data transfer by examining values in the MULTIPLE_COUNT field, PROTOCOL field, OFF_LINE field, T_DIR bit, BYTE_BLOCK bit, and T_LENGTH field. The SATL shall ignore the COMMAND field in the CDB except to copy the COMMAND field in the CDB to the Command field in the Register – Host to Device FIS or to the ATA Command register. If the ATA command completes with an error, then the SATL shall return the Error Output fields (see ATA8-ACS) in the ATA Return descriptor (see 12.2.6).

The SATL shall configure the ATA host and the ATA device for the PIO, DMA, and UDMA transfer rates that both the SATL and ATA device support. The SATL should set the transfer rates to the maximum supported by both the SATL and the ATA device. ¹³ COMMAND field of the CDB may specify the ATA SET FEATURES command. The ATA PASS-THROUGH (12) command should not be used to send an ATA SET FEATURES command that changes the PIO/DMA/UDMA or other transfer modes of the ATA device. The result of ¹⁴ SET FEATURES command that changes the PIO/DMA/UDMA or other transfer modes of the ATA device is outside the scope of this standard and may cause communication to be lost with the ATA device; preventing the SATL from performing any action based on the contents of the CDB.

The BYTE_BLOCK (Byte/Block) bit specifies whether the transfer length in the location specified by the T_LENGTH field specifies the number of bytes to transfer or the number of blocks to transfer. If the value in the BYTE_BLOCK bit is set to zero, then the SATL shall transfer the number of bytes specified in the location specified by the T_LENGTH field. If the value in the BYTE_BLOCK bit is set to one the SATL shall transfer the number of blocks specified in the location specified by the T_LENGTH field. If the value in the BYTE_BLOCK bit is set to one the SATL shall transfer the number of blocks specified in the location specified by the T_LENGTH field. The SATL shall ignore the BYTE_BLOCK bit when the T_LENGTH field is set to zero.

The CK_COND (Check Condition) bit may be used to request the SATL to return a copy of ATA register information in the sense data upon command completion. If the CK_COND bit is set to one the SATL shall return a status of CHECK CONDITION when the ATA command completes, even if the command completes successfully, and return the ATA Normal Output fields (see ATA8-ACS) in the sense data using the ATA Return descriptor (see 12.2.6). If the CK_COND bit is set to zero, then the SATL shall terminate the command with CHECK CONDITION status only if an error occurs in processing the command. See clause 11 for a description of ATA error conditions.

The DEVICE field specifies a value for the SATL to load into the ATA Device field. Table 102 shows the bits in the DEVICE field.

	Bit						
7	6	5	4	3	2	1	0
Obsolete	Command Specific	Obsolete	DEV		Comman	d Specific	

Table 102 — ATA PASS-THROUGH (12) command and ATA PASS-THROUGH (16) command DEVICE field

The SATL shall ignore the DEV bit in the DEVICE field of the CDB.

The SATL shall set the value of the DEV bit in the ATA device register based upon the SATL mapping of ATA devices to I_T_L nexuses.

If the PROTOCOL field specifies a PIO data transfer, the SATL shall perform a PIO type transfer. The MULTIPLE_COUNT field specifies the logarithm base 2 of the number of logical sectors an ATA host shall transfer per DRQ Data Block (e.g, if the field is set to 4, the SATL shall transfer 2⁴ (i.e., 16) logical sectors of data in each DRQ Data Block). If the MULTIPLE_COUNT field is nonzero and the COMMAND field is not¹ READ MULTIPLE command, a READ MULTIPLE EXT command, a WRITE MULTIPLE command, a WRITE MULTIPLE EXT command, or a WRITE MULTIPLE FUA EXT command, then the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.

The OFF_LINE field specifies the time period during which the ATA Status register and the ATA Alternate Status register may be invalid after command acceptance. In a SATL with a PATA device attached, some commands may cause the PATA device to place the ATA bus in an indeterminate state. This may cause the ATA host to see command completion before the command is completed. When the application client sends a command that is capable of placing the bus in an indeterminate state, it shall set the OFF_LINE field to a value that specifies the maximum number of seconds from the time a command is sent until the ATA Status register is valid. The SATL shall not use the ATA Status register or ATA Alternate Status register to determine ATA command completion status until this time has elapsed. The valid status is available (2^{off_line+1} - 2) seconds (i.e., 0, 2, 6, and 14 seconds) after the command register is stored.

NOTE 13 - If the application client specifies an off_line value that is too small, the results are indeterminate and may compromise the integrity of the data.

If the Transfer Direction (T_DIR) bit and the direction of the data transfer specified in the PROTOCOL field do not match, the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.

If the T_{DIR} bit is set to zero, then the SATL shall transfer data from the application client to the ATA device. If the T_{DIR} bit is set to one, then the SATL shall transfer data from the ATA device to the application client. The SATL shall ignore the T_{DIR} bit if the T_{LENGTH} field is set to zero.

The Transfer Length (T_LENGTH) field specifies where in the CDB the SATL shall locate the transfer length for the command (see table 103).

Code	Description
00b	No data is transferred
01b	The transfer length is an unsigned integer specified in the FEATURES (7:0) field.
10b	The transfer length is an unsigned integer specified in the SECTOR_COUNT (7:0) field.
11b	The transfer length is an unsigned integer specified in the PPSIU (see 3.1.93).

12.2.4 Mapping of ATA PASS-THROUGH CDB field translations

Table 105 shows the mapping between the fields in the ATA PASS-THROUGH (12) CDB and the the ATA PASS-THROUGH (16) CDB to corresponding ATA command fields (see ATA8-ACS).

CDB field	48-bit ATA command field ^a	28-bit ATA command field ^b			
FEATURES (15:8)	Features (15:8)	n/a			
FEATURES (7:0)	Features (7:0)	Features (7:0)			
SECTOR_COUNT (15:8)	Count (15:8)	n/a			
SECTOR_COUNT (7:0)	Count (7:0)	Count (7:0)			
lba_low (15:8)	LBA (31:24)	n/a			
lba_low (7:0)	LBA (7:0)	LBA (7:0)			
LBA_MID (15:8)	LBA (39:32)	n/a			
LBA_MID (7:0)	LBA (15:8)	LBA (15:8)			
LBA_HIGH (15:8)	LBA (47:40)	n/a			
lba_high (7:0)	LBA (23:16)	LBA (23:16)			
DEVICE (7:4)	Device (7:4)	Device (7:4)			
DEVICE (3:0)	Device (3:0)	LBA (27:24)			
COMMAND	Command	Command			
 ^a The 48-bit ATA command translation applies only to the ATA PASS-THROUGH (16) command, and not to the ATA PASS-THROUGH (12) command. ^b The 28-bit ATA command translation may apply to either the ATA PASS-THROUGH (12) command or the ATA PASS-THROUGH (16) command. 					

Table 105 — Mapping of ATA PASS-THROUGH (16) CDB fields to ATA command fields

Dee 12.2.2 for a description of the MULTIPLE_COUNT field, the PROTOCOL field, the OFF_LINE field, the CK_COND bit, the T_DIR bit, and the BYTE_BLOCK bit.

The SATL shall determine the transfer length by the method specified in the T_LENGTH field (see table 106).

EXTEND	T_LENGTH	Description
	00b	No data is transferred.
0	01b	The transfer length is an unsigned integer specified in the FEATURES (7:0) field.
	10b	The transfer length is an unsigned integer specified in the SECTOR_COUNT (7:0) field.
	11b	The transfer length is an unsigned integer specified in the TPSIU (see 3.1.93).
1	00b	No data is transferred.
	01b	The transfer length is an unsigned integer specified in the FEATURES (7:0) field and the FEATURES (15:8) field.
	10b	The transfer length is an unsigned integer specified in the SECTOR_COUNT (7:0) field and the SECTOR_COUNT (15:8) field.
	11b	The transfer length is an unsigned integer specified in the TPSIU (see 3.1.93) STPSIU field.

Table 106 — EXTEND bit and T_LENGTH field

Number: 1 Author: Kevin_Marks Subject: Highlight Date: 8/27/2008 4:30:09 PM -07'00' See 12.2.2 for a description of the MULTIPLE_COUNT field, the PROTOCOL field, the OFF_LINE field, the CK_COND bit, the T_DIR bit, and the BYTE_BLOCK bit.

The SATL shall determine the transfer length by the method specified in the T_LENGTH field (see table 106).

This should be in the previous section 12.2.3, since it defines fields for pass thru (16)

12.2.5 ATA PASS-THROUGH status return

Table 107 shows the possible results of ATA PASS-THROUGH (12) command or ATA PASS-THROUGH (16) command processing depending on the value of the CK_COND bit in the CDB, as reflected in the ERR bit and the DF bit in the ATA Status field.

	Status	field	Conce date returned
CK_COND	ERR	DF	Sense data returned
0			No error, successful completion or command in progress. The SATL shall respond to a REQUEST SENSE command and shall return sense data with the sense key set to NO SENSE with the additional sense code set to NO ADDITIONAL SENSE INFORMATION.
1	0	0	No error, successful completion or command in progress. The SATL shall terminate the command with CHECK CONDITION status with the sense key set to RECOVERED ERROR with the additional sense code set to ATA PASS-THROUGH INFORMATION AVAILABLE (see SPC-4). The sense data shall include the ATA Status Return Descriptor ^[2] / _{[5ee 12.2.5)} ^a .
	n/a	1	The ATA command completed with an error. The SATL shall terminate the
n/a	1	0	command with CHECK CONDITION status with the sense key and additional sense code set as described in clause 11 and the sense data shall include the ATA Status Return Descriptor (see 12.2.6).
^a This ca comple	apability a etion by re	allows th eturning	he host to retrieve the ATA register or field information with successful command data in the ATA registers or fields.

ATA commands may return information in the ATA registers or the Shadow Command Block. The current ATA register information may be retrieved by requesting the ATA Status Return Descriptor issuing the ATA PASS-THROUGH (12) command or ATA PASS-THROUGH (16) command with the PROTOCOL field set to 15 (i.e., Return Response Information).

12.2.6 ATA Return descriptor

Table 108 shows the format of the ATA Return descriptor returned in the sense data (see SPC-3 and SAM-4). The SATL shall return the ATA Return descriptor if the PROTOCOL field in the ATA PASS-THROUGH (12) command or ATA PASS-THROUGH (16) command is set to 15 (i.e., Return Response Information).

The SATL shall support the ATA Return descriptor if the SATL supports the ATA ASSTHROUGH (12) command or the ATA PASS-THROUGH (16) command. Each time the ATA Return descriptor is requested, the SATL shall read the ATA registers and return those values in the sense data as shown in table 108. If the sense data is for an ATA PASS-THROUGH (12) command or for the ATA PASS-THROUGH (16) command with the EXTEND bit set to zero the SATL shall return the 28-bit extended status and shall set the EXTEND bit to zero.

If the sense data is for an ATA PASS-THROUGH (16) command with the EXTEND bit set to one the SATL shall return the 48-bit extended status and shall set the EXTEND bit to one.

12.3 SAT-specific mode pages

12.3.1 SAT-specific mode pages overview

This subclause describes mode pages that the SATL may implement that are unique to the SCSI / ATA Translation standard. These mode pages are for use by the SATL, are shown in table 109, and are described in this subclause.

3upport for these mode pages is optional. A SATL shall support the appropriate mode page for the attached ATA environment (e.g., PATA).

PAGE CODE	SUB PAGE 5 ODE	Mode page name
0Ah	F1h	PATA Control Hode Page
7 <mark>7Ah</mark>	F2h	Reserved
1Ah	F1h	ATA Power Condition Hode Page

12.3.2 PATA Control mode page

The PATA Control mode page provides PATA specific controls for a SATL to configure the underlying PATA host and to understand what parameters are communicated to the PATA device to ensure proper communication for specific transfer rates. This standard specifies the mode parameters that are provided for this mode page.

SATL implementations that support the attachment of PATA devices shall support this mode page. The SATL should allow application clients to configure alternate PATA timings using the MODE SELECT command.

Table 110 shows the PATA Control mode page.

Byte\Bit	7	6	5	4	3	2	1	0

22 June 2008

The PAGE CODE field shall be set to 2Ah.

The PAGE LENGTH field shall be set to 3004h.

The SUBPAGE CODE field shall be set to 41h.

SATL implementations may save the state of the timing parameters defined in this mode page.

Application clients may use the MODE SENSE command for changeable values to determine the underlying ATA host support for a given ATA timing mode. The SATL shall support changeable mode parameters for this mode page.

When processing a MODE SENSE command, the SATL shall set the PIO3 bit and PIO4 bit as the bit as to identify the configured PIO mode.

PIO4	PIO3	PIO mode
0	0	Reserved
0	1	The ATA host shall use PIO mode 3 transfers.
1	0	The ATA host shall use PIO mode 4 transfers.
1	1	Reserved

Table 111 — PIO modes

When changeable values are requested, the PIO3 bit and the PIO4 bit indicate if the underlying ATA host supports those transfer modes. The PIO3 bit shall be set to one if the ATA host supports PIO mode 3. The PIO3 bit and the PIO4 bit shall be set to one if the ATA host supports PIO mode 4.

If the SATL receives a MODE SELECT command and the PIO bits specify a change from the current setting, the SATL shall configure the ATA host to use the new PIO transfer rate, if supported. If the application client requests a PIO setting that the ATA device does not support, then the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN PARAMETER LIST.

The MWD0 bit, the MWD1 bit, and the MWD2 bit are collectively referred to as the MWDMA bits. If the ATA host in the SATL is currently configured to use multiword DMA (MWDMA), then the MWDMA bits are used to determine what mode is currently being used, what modes are supported by the ATA host, and control of the MWDMA mode.

If the SATL receives a MODE SENSE command requesting the current values of the PATA Control mode page, the MWD0 bit shall be set to one by the SATL when the host and device are configured to use MWDMA mode 0. The MWD1 bit shall be set to one by the SATL when the host and device are configured to use MWDMA mode1. The MWD2 bit shall be set to one by the SATL when the host and device are configured to use MWDMA mode1. The MWD2 bit shall be set to one by the SATL when the host and device are configured to use MWDMA mode1.

If the SATL receives a MODE SENSE command requesting the changeable values of the PATA Control mode page, the MWD0 bit shall be set to one if the ATA host supports MWDMA mode 0. The MWD1 bit and MWD0 bit shall each be set to one if the ATA host supports MWDMA mode 1. The MWD2 bit, the MWD1 bit, and the MWD0 bit shall be each be set to one if the ATA host supports MWDMA mode 2.

	Status

Table 112 specifies values set by the SATL in the MWD0 bit, the MWD1 bit, and the MWD2 bit for current and changeable MWDMA settings.

MWDMA ^a bits		bits	ATA host and device shared configuration	ATA host support returned		
MWD2	MWD1	MWD 0	settings returned as current values	as changeable values		
0	0	0	Configured not to use multiword DMA			
1 0 0 0 1 0		0	Configured to use MWDMA mode 1			
		0	Configured to use MWDMA mode 2	megar combination		
1	1	0	Configured to use MWDMA modes 1 and 2			
0	0 0 1		Configured to use MWDMA mode 0	MWDMA mode 0 supported		
1 0 1		1	Configured to use MWDMA modes 0 and 2	Illegal combination		
0	1	1	Configured to use MWDMA modes 0 and 1	MWDMA mode 1 supported		
1 1 1 C		1	Configured to use MWDMA modes 0, 1 and 2	MWDMA mode 2 supported		
^a If the application client attempts to set a MWDMA mode that is not supported by the ATA host environment, the SATL shall return a CHECK CONDITION status with the sense key set to ILLEGAL REQUEST with the additional sense code set to INVALID FIELD IN PARAMETER LIST.						

Table 112 —	MWDMA	modes	reported	bv	MODE	SENSE
		mouco	reported	Ny		

If the SATL receives a MODE SELECT command and the MWDMA bits specify a change from the current settings, then the SATL shall send an ATA SET FEATURES - Set Prnasfer [4] ode (i.e., Features register set to 03h) command to the ATA device to set the MWDMA mode on the ATA device to the state, and then:

- a) if the ATA SET FEATURES command completes with an error, then the SATL shall:
- 1) not change any host transfer thodes;
- 2) complete the MODE SELECT command with a CHECK CONDITION status with the sense key set to ABOR ABOR OMMAND with the additional sense code set to ATA DEVICE FAILED SET FEATURES;
- take no further action regarding this request to change the MWDMA transfer rate; or
- b) if the the SATL shall:

configure the ATA host to communicate with the device at the requested MWDMA transfer rate; and complete the MODE SELECT command with GOOD status.

The MWDMA bits values used to configure ATA hosts and ATA devices using the MODE SELECT command have the same meaning as the MWDMA bits values returned by the MODE SENSE command when current values are requested as shown in table 112.

If the SATL receives a request to set a MWDMA mode that is not supported by the ATA host or the attached PATA device, the SATL shall return a CHECK CONDITION status with the sense key set to ILLEGAL REQUEST with the additional sense code set to INVALID FIELD IN PARAMETER LIST.

The UDMA0 bit, the UDMA1 bit, the UDMA2 bit, the UDMA3 bit, the UDMA4 bit, the UDMA5 bit, and the UDMA6 bit are collectively referred to as the UDMA bits, and are used to determine support for, current use of, and control of Ultra DMA (UDMA) transfer rates on the ATA host and device. The SATL shall determine the highest UDMA mode supported as being the lower of the ATA host maximum transfer mode and the device maximum transfer mode.

NOTE 14 - The ATA device returns the UDMA transfer mode specified in ATA IDENTIFY DEVICE data, word 88 bits 6:0 (see ATA8-ACS).

If the SATL receives a MODE SENSE command requesting the changeable values of the PATA Control mode page, the UDMA bits shall be set according to table 113.

UDMA6	UDMA5	UDMA4	UDMA3	UDMA2	UDMA1	UDMA O	Highest UDMA mode supported
0	0	0	0	0	0	0	UDMA Unsupported
0	0	0	0	0	0	1	0
0	0	0	0	0	1	1	1
0	0	0	0	1	1	1	2
0	0	0	1	1	1	1	3
0	0	1	1	1	1	1	4
0	1	1	1	1	1	1	5
1	1	1	1	1	1	1	6

If the SATL receives a MODE SENSE command requesting the current values of the PATA Control mode page, then the SATL shall set the UDMA bits as defined in table 114. Only one of the UDMA bits shall be set to one at any time for such a request. If UDMA is not the current DMA transfer mode, then all the UDMA bits shall be set to zero. If a UDMA transfer mode is being used, then all of the MWDMA bits shall be set to zero.

	Value	Description
udma0	0	ATA host and device are not communicating using UDMA Mode 0
uamao	1	ATA host and device are communicating using UDMA Mode 0
udra a 1	0	ATA host and device are not communicating using UDMA Mode 1
uama i	1	ATA host and device are communicating using UDMA Mode 1
udmaQ	0	ATA host and device are not communicating using UDMA Mode 2
uumaz	1	ATA host and device are communicating using UDMA Mode 2
udma2	0	ATA host and device are not communicating using UDMA Mode 3
uumas	1	ATA host and device are communicating using UDMA Mode 3
udra o 1	0	ATA host and device are not communicating using UDMA Mode 4
uuma4	1	ATA host and device are communicating using UDMA Mode 4
udmoE	0	ATA host and device are not communicating using UDMA Mode 5
uumas	1	ATA host and device are communicating using UDMA Mode 5
udmaß	0	ATA host and device are not communicating using UDMA Mode 6
uumao	1	ATA host and device are communicating using UDMA Mode 6

Table 114 — UDMA for current MODE SENSE settings

The SAT VENDOR IDENTIFICATION field shall contain an 8-byte ASCII string identifying the vendor of the SATL. The data shall be left aligned within the field. The vendor identification string shall be one assigned by INCITS for use in the Standard INQUIRY data VENDOR IDENTIFICATION field. A list of assigned vendor identification strings is in UPC-3 and on the T10 web site (http://www.t10.org).

The SAT PRODUCT IDENTIFICATION field shall contain sixteen bytes of ASCII data as defined by the vendor of the SATL. The data shall be left-aligned within the field.

The SAT PRODUCT REVISION LEVEL field shall contain four bytes of ASCII data as defined by the vendor of the SATL. The data shall be left-aligned within the field.

The ATA device signature is described in 12.4.2.2.

The COMMAND CODE field contains the of the ATA command used to retrieve the data in the IDENTIFY DEVICE. or IDENTIFY PACKET DEVICE DATA field. The possible command codes are:

- a) ECh for an DENTIFY DEVICE command (i.e., for an ATA device);
 b) A1h for an DENTIFY PACKET DEVICE command (i.e., for an ATAPI device); or
- c) 00h for other device types.

The ATA IDENTIFY DEVICE data or ATA IDENTIFY PACKET DEVICE data is described in 12.4.2.3.

12.4.2.2 ATA device signature

The ATA device signature shall contain the contents of the task file registers after the last power-on reset, hardware reset, software reset, or **LXECUTE** DEVICE DIAGNOSTIC command. The ATA device signature shall follow the format of the initial SATA Device-to-Host Register FIS (see SATA-2.6). Table 117 shows the ATA device signature.

Otherwise the INTERRUPT field and the PM PORT field are reserved. ^b These fields are fields with the same names defined in ATA8-ACS. 									

The TRANSPORT IDENTIFIER field may contain the values shown in table 118.

Table 118 — TRANSPORT IDENTIFIER field

Code	Transport
00h	PATA (see ATA8-APT)
34h	SATA (see SATA-2.6)
All others	Reserved

The INTERRUPT bit corresponds to the "I" bit (i.e., bit 14 of dword 0) of the Register Device-to-Host FIS (see SATA-2.6).

All the remaining fields within the ATA device signature are defined in ATA8-APT and SATA-2.6.

12.4.2.3 ATA IDENTIFY DEVICE data or ATA IDENTIFY PACKET DEVICE data

If the command is an ATA IDENTIFY DEVICE command, and the command completes without error, then the DENTIFY DEVICE OR IDENTIFY PACKET DEVICE DATA field shall contain the ATA IDENTIFY DEVICE data (ATA8-ACS).

If the command is an ATA IDENTIFY PACKET DEVICE command, and the command completes without error, then the BENTIFY DEVICE OR IDENTIFY PACKET DEVICE DATA field shall contain the IDENTIFY PACKET DEVICE data (see ATA8-ACS).

The BENTIFY DEVICE OR IDENTIFY PACKET DEVICE DATA field shall contains 512 bytes of 00h if:

- a) the command is an IDENTIFY DEVICE command or an IDENTIFY PACKET DEVICE command and the command completes with an error; or
- b) the command code is 00h (i.e., some other device type).

The data shall be presented with byte preservation (i.e., ATA byte n maps to SCSI byte n), as shown in table 119.

Table 119 — ATA IDENTIFY DEVICE data or ATA IDENTIFY PACKET DEVICE data

Byte	Contents
0	ATA IDENTIFY DEVICE data or ATA IDENTIFY PACKET DEVICE data word 0 bits 7:0 (i.e., byte 0)
1	ATA IDENTIFY DEVICE data or ATA IDENTIFY PACKET DEVICE data word 0 bits 15:8 (i.e., byte 1)
2	ATA IDENTIFY DEVICE data or ATA IDENTIFY PACKET DEVICE data word 1 bits 7:0 (i.e., byte 2)
3	ATA IDENTIFY DEVICE data or ATA IDENTIFY PACKET DEVICE data word 1 bits 15:8 (i.e., byte 3)
510	ATA IDENTIFY DEVICE data or ATA IDENTIFY PACKET DEVICE data word 255 bits 7:0 (i.e., the signature byte of the Integrity word, see ATA8-ACS)
511	ATA IDENTIFY DEVICE data or ATA IDENTIFY PACKET DEVICE data word 255 bits 15:8 (i.e., the checksum byte of the Integrity word, see ATA8-ACS)

NOTE 15 - Although the Serial number field (i.e., words 19:10), Firmware revision field (i.e., words 26:23), and Model number field (i.e., words 46:27) contain ASCII characters, every other byte is swapped within them (see ATA8-ACS) (e.g., the Serial number field is interpreted as: {word 10 bits 15:8, word 10 bits 7:0, word 11 bits 15:8, word 11 bits 7:0, ...}, which corresponds to these bytes in the IDENTIFY DEVICE OR IDENTIFY PACKET DEVICE DATA field: {byte 21, byte 20, byte 23, byte 22, etc.}).

Since some of the fields within the ATA IDENTIFY DEVICE data or ATA IDENTIFY PACKET DEVICE data may change depending on the state of the ATA device, the SATL shall resend the ATA IDENTIFY DEVICE command or ATA IDENTIFY PACKET DEVICE command to retrieve updated data whenever the ATA Information VPD page is requested.

12.5 SAT-specific

12.5.1 ATA Device Server Password Gecurity Protocol

12.5.1.1 SECURITY PROTOCOL IN command

12.5.1.1.1 SECURITY PROTOCOL IN command overview

The SECURITY PROTOCOL IN command is used by the application client to cause the SATL to return ATA Security feature set data extracted from the BDENTIFY DEVICE data from the ATA device. See ATA8-ACS for a description of the ATA Security feature set and all of the functions the security feature.

the SECURITY PROTOCOL field is set to EFh in a SECURITY PROTOCOL IN the SECURITY PROTOCOL SPECIFIC field shall be set to zero. All other values of the SECURITY PROTOCOL SPECIFIC field are reserved.

12.4.2.3 ATA IDENTIFY DEVICE data or ATA IDENTIFY PACKET DEVICE data

If the command is an ATA IDENTIFY DEVICE command, and the command completes without error, then the **IDENTIFY DEVICE OR IDENTIFY PACKET DEVICE DATA field** shall contain the ATA IDENTIFY DEVICE data (ATA8-ACS).

If the command is an ATA IDENTIFY PACKET DEVICE command, and the command completes without error, then the IDENTIFY DEVICE OR IDENTIFY PACKET DEVICE DATA field shall contain the IDENTIFY PACKET DEVICE data (see ATA8-ACS).

The IDENTIFY DEVICE OR IDENTIFY PACKET DEVICE DATA field shall contains 512 bytes of 00h if:

- a) the command is an IDENTIFY DEVICE command or an IDENTIFY PACKET DEVICE command and the command completes with an error; or
- b) the command code is 00h (i.e., some other device type).

The data shall be presented with byte preservation (i.e., ATA byte n maps to SCSI byte n), as shown in table 119.

Table 119 — ATA IDENTIFY DEVICE data or ATA IDENTIFY PACKET DEVICE data

Byte	Contents
0	ATA IDENTIFY DEVICE data or ATA IDENTIFY PACKET DEVICE data word 0 bits 7:0 (i.e., byte 0)
1	ATA IDENTIFY DEVICE data or ATA IDENTIFY PACKET DEVICE data word 0 bits 15:8 (i.e., byte 1)
2	ATA IDENTIFY DEVICE data or ATA IDENTIFY PACKET DEVICE data word 1 bits 7:0 (i.e., byte 2)
3	ATA IDENTIFY DEVICE data or ATA IDENTIFY PACKET DEVICE data word 1 bits 15:8 (i.e., byte 3)
510	ATA IDENTIFY DEVICE data or ATA IDENTIFY PACKET DEVICE data word 255 bits 7:0 (i.e., the signature byte of the Integrity word, see ATA8-ACS)
511	ATA IDENTIFY DEVICE data or ATA IDENTIFY PACKET DEVICE data word 255 bits 15:8 (i.e., the checksum byte of the Integrity word, see ATA8-ACS)

NOTE 15 - Although the Serial number field (i.e., words 19:10), Firmware revision field (i.e., words 26:23), and Model number field (i.e., words 46:27) contain ASCII characters, every other byte is swapped within them (see ATA8-ACS) (e.g., the Serial number field is interpreted as: {word 10 bits 15:8, word 10 bits 7:0, word 11 bits 15:8, word 11 bits 7:0, ...}, which corresponds to these bytes in the IDENTIFY DEVICE OR IDENTIFY PACKET DEVICE DATA field: {byte 21, byte 20, byte 23, byte 22, etc.}).

Since some of the fields within the ATA IDENTIFY DEVICE data or ATA IDENTIFY PACKET DEVICE data may change depending on the state of the ATA device, the SATL shall resend the ATA IDENTIFY DEVICE command or ATA IDENTIFY PACKET DEVICE command to retrieve updated data whenever the ATA Information VPD page is requested.

22 June 2008

The value in the ENHANCED SECURITY ERASE TIME field indicates the time required by the ATA device to complete its security erase procedure in enhanced mode. Table 121 defines the values in the ENHANCED SECURITY ERASE TIME field.

² able 121 —	SECURITY ERASE TIME and	ENHANCED SECURITY	ERASE TIME	field definition
-------------------------	-------------------------	-------------------	------------	------------------

Value	Time required for erase process
0000h	The time is not specified or the ATA Security feature set is not supported
0001h - 00FEh	(Value in the field) x 2 minutes
00FFh	Greater than 508 minutes
0100h - FFFFh	Reserved

The ATA device does not support the ATA Security feature set (i.e., the s_SUPRT bit is set to zero) or the master password identifier, then the MASTER PASSWORD IDENTIFIER field shall be set to 0000h or FFFFh. If the ATA device supports the ATA Security feature set and the master password identifier, then the MASTER PASSWORD IDENTIFIER field shall be set to the master password identifier set when the master password was last changed.

the master password capability setting (MAXSET) bit is set to zero, and the ATA Security feature set is enabled (i.e., the S_ENABLD bit is set to one), then the security level is set to high. If the MAXSET bit is set to one, then the security level is set to maximum.

the enhanced erase mode supported (EN_ER_SUP) bit is set to zero, then the ATA device does not support the enhanced erase mode. If the EN_ER_SUP bit is set to one, then the ATA device supports the enhanced erase mode.

the password attempt counter exceeded (PWCNTEX) bit is set to zero, then the password attempt counter has not decremented to zero. If the PWCNTEX bit is set to one, then the password attempt counter has decremented to zero.

the frozen state (FROZEN) bit is set to zero, then the ATA device is not in the security frozen state. If the FROZEN bit is set to one, then the ATA device is in the security frozen state.

H the locked state (LOCKED) bit is set to zero, then the ATA device is not in the security locked state. If the LOCKED bit is set to one, then the ATA device is in the security locked state.

12.5.1.1.3 SCSI commands allowed in the presence of various security modes

6		`
	_	L

Certain commands may be allowed or conflict depending on the security mode setting that is in effect for an ATA device.

There are three possible modes:

- a) security locked;
- b) security unlocked or security disabled; and
- c) security frozen.

If a SATL receives a command that is allowed for the current security mode setting of the ATA device, then the SATL translates the command and sends it to the ATA device. If a SATL receives a command that conflicts with the current security mode setting of the , then the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to ATA SECURITY CONFLICT.

Table 122 shows the commands defined in SPC-4 and whether each command is allowed or conflicts depending on the security setting that is in effect for an ATA device. If a command in table 122 is not implemented by the SATL, then processing of the command is vendor specific.

If the ATA IDENTIFY DEVICE data word 128 bit 2 is set to one, then the SATL shall set the locked state (LOCKED) bit to zero.

Comments from page 158 continued on next page

The value in the ENHANCED SECURITY ERASE TIME field indicates the time required by the ATA device to complete its security erase procedure in enhanced mode. Table 121 defines the values in the ENHANCED SECURITY ERASE TIME field.

Value	Time required for erase process
0000h	The time is not specified or the ATA Security feature set is not supported
0001h - 00FEh	(Value in the field) x 2 minutes
00FFh	Greater than 508 minutes
0100h - FFFFh	Reserved

Table 121 —	SECURITY ERASE TIME and	ENHANCED SECURITY ERAS	E TIME field definition
-------------	-------------------------	------------------------	-------------------------

If the ATA device does not support the ATA Security feature set (i.e., the s_SUPRT bit is set to zero) or the master password identifier, then the MASTER PASSWORD IDENTIFIER field shall be set to 0000h or FFFFh. If the ATA device supports the ATA Security feature set and the master password identifier, then the MASTER PASSWORD IDENTIFIER field shall be set to the master password identifier set when the master password was last changed.

If the master password capability setting (MAXSET) bit is set to zero, and the ATA Security feature set is enabled (i.e., the S_ENABLD bit is set to one), then the security level is set to high. If the MAXSET bit is set to one, then the security level is set to maximum.

If the enhanced erase mode supported (EN_ER_SUP) bit is set to zero, then the ATA device does not support the enhanced erase mode. If the EN_ER_SUP bit is set to one, then the ATA device supports the enhanced erase mode.

If the password attempt counter exceeded (PWCNTEX) bit is set to zero, then the password attempt counter has not decremented to zero. If the PWCNTEX bit is set to one, then the password attempt counter has decremented to zero.

If the frozen state (FROZEN) bit is set to zero, then the ATA device is not in the security frozen state. If the FROZEN bit is set to one, then the ATA device is in the security frozen state.

If the locked state (LOCKED) bit is set to zero, then the ATA device is not in the security locked state. If the LOCKED bit is set to one, then the ATA device is in the security locked state.

12.5.1.1.3 SCSI commands allowed in the presence of various security modes

Certain commands may be allowed or conflict depending on the security mode setting that is in effect for an ATA device.

There are three possible modes:

- a) security locked;
- b) security unlocked or security disabled; and
- c) security frozen.

If a SATL receives a command that is allowed for the current security mode setting of the ATA device, then the SATL translates the command and sends it to the ATA device. If a SATL receives a command that conflicts with the current security ¹¹/₁₁ de setting ¹³/₁₃ the , then the SATL shall terminate the command with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to ATA SECURITY CONFLICT.

Table 122 shows the commands defined in SPC-4 and whether each command is allowed or conflicts depending on the security setting that is in effect for an ATA device. $\frac{14}{14}$ command in table 122 is not implemented by the SATL, then processing of the command is vendor specific.

Table 123 — SBC commands allowed in the presence of Parious security modes (part 2 of 2)

12.5.1.2 SECURITY PROTOCOL OUT command

12.5.1.2.1 SECURITY PROTOCOL OUT command overview

The SECURITY PROTOCOL OUT command is used by an application client to send ATA Security feature set commands and data to the ATA device. See ATA8-ACS for a description of the ATA Security feature set and all of the functions defined therein.

When the SECURITY PROTOCOL field is set to EFh in a SECURITY PROTOCOL OUT command, the SECURITY PROTOCOL SPECIFIC field Thall contain a single numeric value as described in table 124.

SECURITY PROTOCOL SPECIFIC field	Description	ATA command processing reference ^a	Parameter data reference	
0000h	Reserved	_		
0001h	Set password		12.5.1.2.2	
0002h	Unlock		12.5.1.2.3	
0003h	Erase prepare		No data is transferred	
0004h	Erase unit		12.5.1.2.4	
0005h	Freeze lock		No data is transferred	
0006h	Disable password	SECURITY DISABLE PASSWORD	12.5.1.2.5	
0007h - FFFFh	Reserved			
^a See ATA8-ACS for a description of how this security protocol specific field value shall be processed.				

Table 124 — SECURITY PROTOCOL SPECIFIC field

The INC_512 bit shall be set to zero. If a SECURITY PROTOCOL OUT command is received with the INC_512 bit is set to one, then the SECURITY PROTOCOL OUT command shall be terminated with CHECK CONDITION status, with the sense key set to ILLEGAL REQUEST, and the additional sense code set to INVALID FIELD IN CDB.

Table 123 — SBC commands allowed in the presence of various security modes (part 2 of 2)

12.5.1.2 SECURITY PROTOCOL OUT command

12.5.1.2.1 SECURITY PROTOCOL OUT command overview

The SECURITY PROTOCOL OUT command is used by an application client to send ATA Security feature set commands and data to the ATA device. See ATA8-ACS for a description of the ATA Security feature set and all of the functions defined therein.

When the SECURITY PROTOCOL field is set to EFh in a SECURITY PROTOCOL OUT command, the SECURITY PROTOCOL SPECIFIC field shall contain a single numeric value as described in table 124.

SECURITY PROTOCOL SPECIFIC field	Description	scription ATA command processing reference ^a			
0000h	Reserved				
0001h	Set password	SECURITY SET PASSWORD	12.5.1.2.2		
0002h	Unlock	SECURITY UNLOCK	12.5.1.2.3		
0003h	Erase prepare	SECURITY ERASE PREPARE	No data is transferred		
0004h	Erase unit	SECURITY ERASE UNIT	12.5.1.2.4		
0005h	Freeze lock	SECURITY FREEZE LOCK	No data is transferred		
0006h	Disable password	¹³ ECURITY DISABLE PASSWORD	12.5.1.2.5		
0007h - FFFFh	Reserved				
¹¹⁴ See ATA8-ACS for a description of how this security protocol specific field value shall be processed.					

Table 124 —	SECURITY	PROTOCOL	SPECIFIC	field
-------------	----------	----------	----------	-------

Internet Inc_512 bit shall be set to zero. If a SECURITY PROTOCOL OUT command is received with the INC_512 bit is set to one, then the SECURITY PROTOCOL OUT command shall be terminated with CHECK CONDITION status, with the sense key set to ILLEGAL REQUEST, and the additional sense code set to INVALID FIELD IN CDB.

a See ATA8-ACS for a description of how this security prot	ocol specific field value shall be processed.
This table note sounds strange, in that it sounds like the se	curity protocol specific values are defined in ATA8-ACS.

I would remove the table note.

Status

,	Number: 15 Author: HPQ-RF	Filiott S	Subject: Cross-Out	Date: 9/3/2008 9:42:24 AM -07'00'	
	moverby Accepted	11/3/200	8 11:07:23 PM		

Ŧ Delete:

The INC_512 bit shall be set to zero. If a SECURITY PROTOCOL OUT command is received with the INC_512 bit is set to one, then the SECURITY PROTOCOL OUT command shall be terminated with CHECK CONDITION status, with the sense key set to ILLEGAL REQUEST, and the additional sense code set to INVALID FIELD IN CDB

This is unnecessary. A SATL should be allowed to accept 512 byte chunks of data with padding. Ease of mapping into ATA was touted as the reason the INC_512 bit was proposed.

Status

moverby Rejected	11/4/2008 1:04:48 PM Subject: Sticky Note	Date: 11/3/2008 11:07:46 PM
Agreed.		
Author: moverby	Subject: Sticky Note	Date: 11/4/2008 1:04:43 PM

After discussion in WG, it was decided that this was the desired behavior. Rejecting change.

All other CDB fields for the SECURITY PROTOCOL OUT command shall meet the requirements stated in SPC-4.

12.5.1.2.2 Set password parameter data

If the SECURITY PROTOCOL SPECIFIC field is set to 0001h in the SECURITY PROTOCOL OUT CDB, then the TRANSFER LENGTH field in the CDB²¹ shall be set to 24h. ¹¹ able 125 defines the parameter data for the set password function.

Bit Byte	7	6	5	4	3	2	1	0	
0				Reserved				MAXLVL	
1			Reserved						
2	(MSB)			DASS					
33				FASS	VORD			(LSB)	
34			Recented I						
35				TC3C	" <mark>(</mark> ¹				

³able 125 — Set password ⁴arameter data

the maximum security level bit (MAXLVL) is set to zero, then the ATA device shall set the security level to high. If the MAXLVL bit is set to one, then the ATA device shall set the security level to maximum.

the master password bit (MSTRPW) is set to zero, then the ATA device shall set the user password to the value in the PASSWORD field. If the MSTRPW bit is set to one, then the ATA device shall set the master password to the value in the PASSWORD field.

The PASSWORD field contains a 32-byte binary value.

12.5.1.2.3 Unlock parameter data

If the SECURITY PROTOCOL SPECIFIC field is set to 0002h in the SECURITY PROTOCOL OUT CDB, then the TRANSFER LENGTH field in the CDB shall be set to 24h. Table 126 defines the parameter data for the unlock function.

Bit Byte	7	6	5	4	3	2	1	0
0				Rese	erved			
1			Reserved					
2	(MSB)			DASS				
33				FAGO	VORD			(LSB)
34			Peserved					
35				TC3C				

Table 126 — Unlock parameter data

If the master password bit (MSTRPW) is set to zero, then the ATA device shall compare the value in the PASSWORD field to the user password. If the MSTRPW bit is set to one, then the ATA device shall compare the value in the PASSWORD field to the master password.

The PASSWORD field contains a 32-byte binary value.

Table 125 defines the parameter data for the set password function.	
s/b	
Table 125 defines the parameter data for the SECURITY PROTOCOL OUT command when the SECURITY PROTOCOL SPECIFIC field is set to 0001h (set password).	
Status moverby Accepted 11/3/2008 11:08:08 PM Number: 2 Author: HPQ-RElliott Subject: Highlight Date: 9/3/2008 9:42:24 AM -07'00'	
shall be set to 24h	
Weaken this rule to allow INC_512 to be used, and also to allow padding even if the extra bytes are not used. If ATA adds some more fields in that area, SATL shoul them through.	d just pass
Status moverby Rejected 11/4/2008 1:05:55 PM Author: moverby Subject: Sticky Note Date: 11/4/2008 1:05:42 PM	
Rejection as this is the expected and desired behavior.

(global)

"The PASSWORD field contains a 32-byte binary value." and the (MSB) and (LSB) labels.

That's an awful large number. This means the SATL converts: SCSI byte 2 (with the MSB) to ATA word 16 bits 15:8 (the MSB in little-endian) SCSI byte 3 to ATA word 16 bits 7:0 SCSI byte 32 to ATA word 1 bits 15:8 SCSI byte 33 (with the LSB) to ATA word 1 bits 7:0 (the LSB in little-endian)

I suspect the intend was that the PASSWORD field to be passed along preserving the byte order. SCSI byte 2 to ATA word 1 bits 7:0 (i.e. ATA byte 2) SCSI byte 3 to ATA word 1 bits 15:8 (i.e., ATA byte 3)

SCSI byte 32 to ATA word 16 bits 7:0 (i.e. ATA byte 32) SCSI byte 33 to ATA word 16 bits 15:8 (i.e. ATA byte 33)

The fix is to simply remove the (MSB) and (LSB) labels. A table showing the desired mapping is highly advisable as well.

Check the other PASSWORD fields as well.

Annex A

(normative)

SCSI to ATAP

A.1 Introduction

This annex specifies the method of transmission of SCSI commands to an **ATAPI device**.

A.2 ATAPI

An ATAPI device perates by using an ATA command, the PACKET command, in order to transmit a SCSI CDB to the device. In addition to the SCSI command set supported by the device, the ATAPI device also supports a limited subset of the ATA command set to facilitate the identification and control of the device. The device supports its primary function through to SCSI command set that the device supports to the device, read or write operations). The device device may implement any command set reportable through the SCSI through the set of the set of

ATAPI devices may be identified through the issuance of the IDENTIFY DEVICE command. If the device is an ATAPI device, the device aborts the IDENTIFY DEVICE command and returns a specific signature in the ATA register set. The SATL can then obtain the correct identification information about the ATA specific configuration of the ATAPI device by issuing an IDENTIFY PACKET DEVICE command.

A.3 SCSI CDB Transmission

A SCSI CDB is transmitted by a SATL to an ATAPI device by the following sequence:

- 1) Issuing the PACKET command to the device;
- 2) Transmitting the SCSI CDB to the device (the command packet phase); and
- 3) Transmitting or receiving any data, if appropriate, necessary for the completion of the SCSI CDB

Some ATAPI devices do not permit the Byte Count Limit parameter of the PACKET command to be zero, even if the CDB requires no data transmission. This restriction, or the lack of such a restriction, is specified for each device in IDENTIFY PACKET DEVICE data, word 125 (see ATA8-ACS). If the device places a restriction, the SATL should place a value of 512 in the Byte Count Limit parameter of the PACKET command when transmitted if the CDB being processed requires no data transfer to or from the device.

Within the **IDENTIFY** PACKET DEVICE data returned by the device is a command size requirement for any SCSI CDB transmitted to the device through the packet command. This restriction is located in word 0 of the **IDENTIFY** PACKET DEVICE data, bits 1:0. This field specifies either a 12 byte or 16 byte CDB restriction. CDBs of a smaller size may be transmitted by the SATL to the device, however any additional bytes beyond the length of the CDB shall be transmitted as zero.

For example, if an ATAPI device reports that 12 byte command packets are required and the SATL sends an **INQURY** command to the device, the SATL would transmit the six bytes of the INQUIRY command, followed by six bytes set to zero.

If an application client sends a CDB to the SATL, where the size is greater than the maximum command packet size supported by the ATAPI device, then the SATL shall complete the command with error and a sense key of ILLEGAL REQUEST and an additional sense code of INVALID COMMAND OPERATION CODE.

During data transfers, ATAPI devices transmit or receive data on word boundaries. If a SATL transmits a data buffer whose length is not a multiple of a word, the SATL shall pad the transmitted data with an additional byte set to zero.

Annex A

(normative)

SCSI to ATAPI Command Transmission

A.1 Introduction

This annex specifies the method of transmission of SCSI commands to an **ATAPI device**.

A.2 ATAPI Device Model

An ATAPI device operates by using an ATA command, the PACKET command, in order to transmit a SCSI CDB to the device. In addition to the SCSI command set supported by the device, the ATAPI device also supports a limited subset of the ATA command set to facilitate the identification and control of the device. The device supports its primary function through the SCSI command set that the device supports (e.g., read or write operations). A packet device may implement any command set reportable through the SCSI INQUIRY command <u>peripheral device type</u> field.

ATAPI devices may be identified through the issuance of the BENTIFY DEVICE command. If the device is an ATAPI device, the device aborts the BENTIFY DEVICE command and returns a specific signature in the ATA register set. The SATL can then obtain the correct identification information about the ATA specific configuration of the ATAPI device by issuing an BENTIFY PACKET DEVICE command.

A.3 SCSI CDB Transmission

A SCSI CDB is transmitted by a SATL to an ATAPI device by the following sequence:

- 1) Issuing the PACKET command to the device;
- Transmitting the SCSI CDB to the device (the command packet phase); and
- 3) Transmitting or receiving any data, if appropriate, necessary for the completion of the SCSI

Some ATAPI devices do not permit the Byte Count Limit parameter of the ²¹ACKET command to be zero, even if the CDB requires no data transmission. This restriction, or the lack of such a restriction, is specified for each device in ²³ENTIFY PACKET DEVICE data²², word 125 (see ATA8-ACS). If the device places a restriction, the SATL should place a value of 512 in the Byte Count Limit parameter of the ²⁴ACKET command when transmitted if the CDB being processed requires no data transfer to or from the device.

Within the DENTIFY PACKET DEVICE data returned by the device is a command size requirement for any SCSI CDB transmitted to the device through the packet command. This restriction is located in word 0 of the IDENTIFY PACKET DEVICE data, bits 1:0. This field specifies either a 12 byte or 16 byte CDB restriction. CDBs of a smaller size may be transmitted by the SATL to the device, however any additional bytes beyond the length of the CDB shall be transmitted as zero.

For example, if an ATAPI device reports that 12 byte command packets are required and the SATL sends an INQURY command to the device, the SATL would transmit the six bytes of the INQUIRY command, followed by six bytes set to zero.

If an application client sends a CDB to the SATL, where the size is greater than the maximum command packet size supported by the ATAPI device, then the SATL shall complete the command with error and a sense key of ILLEGAL REQUEST and an additional sense code of INVALID COMMAND OPERATION CODE.

During data transfers, ATAPI devices transmit or receive data on word boundaries. If a SATL transmits a data buffer whose length is not a multiple of a word, the SATL shall pad the transmitted data with an additional byte set to zero.

Annex A

(normative)

SCSI to ATAPI Command Transmission

A.1 Introduction

This annex specifies the method of transmission of SCSI commands to an **ATAPI device**.

A.2 ATAPI Device Model

An ATAPI device operates by using an ATA command, the PACKET command, in order to transmit a SCSI CDB to the device. In addition to the SCSI command set supported by the device, the ATAPI device also supports a limited subset of the ATA command set to facilitate the identification and control of the device. The device supports its primary function through the SCSI command set that the device supports (e.g., read or write operations). A packet device may implement any command set reportable through the SCSI INQUIRY command peripheral device type field.

ATAPI devices may be identified through the issuance of the IDENTIFY DEVICE command. If the device is an ATAPI device, the device aborts the IDENTIFY DEVICE command and returns a specific signature in the ATA register set. The SATL can then obtain the correct identification information about the ATA specific configuration of the ATAPI device by issuing an IDENTIFY PACKET DEVICE command.

A.3 SCSI CDB Transmission

A SCSI CDB is transmitted by a SATL to an ATAPI device by the following sequence:

- 1) Issuing the PACKET command to the device;
- 2) Transmitting the SCSI CDB to the device (the command packet phase); and
- 3) Transmitting or receiving any data, if appropriate, necessary for the completion of the SCSI CDB

Some ATAPI devices do not permit the Byte Count Limit parameter of the PACKET command to be zero, even if the CDB requires no data transmission. This restriction, or the lack of such a restriction, is specified for each device in IDENTIFY PACKET DEVICE data, word 125 (see ATA8-ACS). If the device places a restriction, the SATL should place a value of 512 in the Byte Count Limit parameter of the PACKET command when transmitted if the CDB being processed requires no data transfer to or from the device.

Within the **IDENTIFY** PACKET DEVICE data returned by the device is a command size requirement for any SCSI CDB transmitted to the device through the packet command. This restriction is located in word 0 of the **PACKET** DEVICE data, bits 1:0. This field specifies either a 12 byte or 16 byte CDB restriction. CDBs of a smaller size may be transmitted by the SATL to the device, however any additional bytes beyond the length of the CDB shall be transmitted as zero.

For example, if an ATAPI device reports that 12 byte command packets are required and the SATL sends an ²⁷QURY command to the device, the SATL would transmit the six bytes of the INQUIRY command, followed by six bytes set to zero.

If an application client sends a CDB to the SATL, where the size is greater than the maximum command packet size supported by the ATAPI device, then the SATL shall complete the command with ²⁸/_C and a sense key of ILLEGAL REQUEST and an additional sense code of INVALID COMMAND OPERATION CODE.

During data transfers, ATAPI devices transmit or receive data on word boundaries. If a SATL transmits a data buffer whose length is not a multiple of a word, the SATL shall pad the transmitted data with an additional byte set to zero.

10/20/2008 1:14:42 PM -07'00'

Status moverby Accepted During data reception, the SATL shall allocate its receive buffers to accommodate an additional byte if the data length is not a multiple of a word.

In addition to the word alignment requirements, ATAPI devices may have additional requirements imposed on them for padding based on the underlying transport (e.g., SATA ATAPI devices are required to transmit all data aligned to a 32-bit dword. Therefore, a SATL in that environment allocates sufficient receive or transmit buffers to transmit or receive data that has been padded with zeros to a dword boundary).

If the ATAPI device completes a packet command with an error, the SATL shall gend a CSI REQUEST SENSE command to the device through the command transmission mechanism described in this subclause to obtain sense data before completing the CDB to the application client as ATAPI devices do not support any form of autosense. In addition SATL error handling does not use the error danslation specified lewhere in this standard,

ATAPI devices do not support any form of queued command transmission and SATL implementations shall either maintain an internal queue of received commands for the device or return TASK SET FULL status to the application client if there is already a ACKET command sequence in process or pending for the ATAPI device.

A.4 ATAPI Command Management

The **ATAPI** protocol does not have a mechanism for transmission of task management functions to an ATAPI device. Translation of task management functions by a SATL is unspecified.

A.5 SATL ATAP

If a SATL supports attachment of ATAPI devices, the SATL shall not use the translations described elsewhere in this standard for the generation of INQUIRY data and instead shall return the INQUIRY data directly from the ATAPI device. In addition, the SATL shall transmit all SCSI CDBs that are permissible within the command packet data length restrictions (see A.3).

A.6 ATAPI

In order to comply with ATA8-ACS, ATAPI devices only support a single logical unit. ATAPI devices often do not implement the REPORT LUNS¹¹ bmmand. A SATL may need to implement the REPORT LUNS command to ensure compatibility of the ATAPI device with application clients.

Comments from page 166 continued on next page

During data reception, the SATL shall allocate its receive buffers to accommodate an additional byte if the data length is not a multiple of a word.

In addition to the word alignment requirements, ATAPI devices may have additional requirements imposed on them for padding based on the underlying transport (e.g., SATA ATAPI devices are required to transmit all data aligned to a 32-bit dword. Therefore, a SATL in that environment allocates sufficient receive or transmit buffers to transmit or receive data that has been padded with zeros to a dword boundary).

If the ATAPI device completes a packet command with an error, the SATL shall send a SCSI REQUEST SENSE command to the device through the command transmission mechanism described in this subclause to obtain sense data before completing the CDB to the application client as ATAPI devices do not support any form of autosense. In addition SATL error handling does not use the error translation specified elsewhere in this standard.

ATAPI devices do not support any form of queued command transmission and SATL implementations shall either maintain an internal queue of received commands for the device or return TASK SET FULL status to the application client if there is already a PACKET command sequence in process or pending for the ATAPI device.

A.4 ATAPI Command Management

The ATAPI protocol does not have a mechanism for transmission of task management functions to an ATAPI device. Translation of task management functions by a SATL is unspecified.

A.5 SATL ATAP<mark> Implementations</mark>

If a SATL supports attachment of ATAPI devices, the SATL shall not use the translations described elsewhere in this standard for the generation of INQUIRY data and instead shall return the INQUIRY data directly from the ATAPI device. In addition, the SATL shall transmit all SCSI CDBs that are permissible within the command packet data length restrictions (see A.3).

A.6 ATAPI Logical Unit Numbers

In order to comply with ATA8-ACS, ATAPI devices only support a single logical unit. ATAPI devices often do not implement the REPORT LUNS command. A SATL may need to implement the REPORT LUNS command to ensure compatibility of the ATAPI device with application clients.
