Subject: Resource Conflict ASCQ

1 Resource Conflict ASCQ

There are times, especially with dual port, when an active task has ownership of drive resources but is not responding or is responding very slowly. We would like to be able to abort the task we are working on for this initiator and start another one for the other port or another initiator on the same port.

We would like a RESOURCE CONFLICT ASCQ. We would use it with the ABORTED COMMAND key and the recovery action would be to retry the command.

I suggest this new ASCQ be placed under the SYSTEM RESOURCES FAILURE (55h 00h) ASC.
