Project Proposal
For a New
NCITS Standard

SCSI Parallel Interface - 4
(SPI-4)
Physical & Protocol Layers

May 6, 1999
1. **Source of the Proposed Project**

1.1. **Title:** SCSI Parallel Interconnect - 4 (SPI-4)

1.2. **Date Submitted:** May 6, 1999

1.3. **Proposer:** T10, 8 members of T10 are also members of NCITS.

2. **Process Description for the Proposed Project**

2.1. **Project Type:**
D - Development

2.2. **Type of Document:**
Standard

2.3. **Definitions of Concepts and Special Terms:**
None

2.4. **Expected Relationship with Approved Reference Models, Frameworks, Architectures, etc.:**

This standard is expected to be used in closed systems.

2.5. **Recommended NCITS Development Technical Committee:**
T10

2.6. **Anticipated Frequency and Duration of Meetings**

Technical Committee T10 meets on a regularly scheduled basis (see www.t10.org for the current meeting schedule). Specific task ad hoc groups are called as required between the regular meetings but their results are not binding.

2.7. **Target Date for Initial Public Review (Milestone 4):**
November, 2000

2.8. **Estimated Useful Life of Standard or Technical Report:**
5 Years

3. **Business Case for Developing the Proposed Standard or Technical Report**

3.1. **Description:**
The SCSI Parallel Interface - 4 (SPI-4), is based on low-voltage differential (LVD) technology and is designed to provide a 320 MB/sec data rate and lay the groundwork for the next data rate, 640 MB/sec.

In addition to doubling the existing data rate of SPI-3, the following items should be considered for inclusion in SPI-4:

1) extended addressing for multi-segment busses;
2) options for easier expander design;
3) options for improving operation with new serial interconnects;
4) extensions to domain validation;
5) skew management schemes to improve physical layer;
6) improvements for physical layer signal integrity;
7) power management and voltage reduction options;
8) other capabilities that may fit within the general application scope of the this project.

3.2. **Existing Practice and the Need for a Standard:**
The proposed project involves a compatible evolution of the present SCSI physical and protocol layers.
3.3. Implementation Impacts of the Proposed Standard:

3.3.1. Development Costs
Resources are provided by the members of T10. The members host the required meetings for development, provide for the necessary lab experiments and silicon technology development, and provide the Technical Editor for the project.

3.3.2. Impact on Existing or Potential Markets
The nature of the proposed project is to insure that SCSI has an upward, highly compatible growth path. This insure that current investments in parallel SCSI are provided with a stable managed migration path in the face of technological developments.

3.3.3. Costs and Methods for Conformity Assessment
The committee will consider the results of testing as may be available to the committee through the voluntary efforts of the various participants in T10. With this method all costs are borne by the organizations of the various participants and have for the most part been mainly an adjunct of their normal development costs.

3.3.4. Return on Investment
ROI information is considered proprietary data by the member organizations.

3.4. Legal Considerations

3.4.1. Patent Assertions
Calls will be made to identify assertions of patent rights in accordance with the relevant NCITS, ANSI, and ISO/IEC policies and procedures.

3.4.2. Dissemination of the Standard or Technical Report
Drafts of this document will be disseminated electronically. Dissemination of the final standard will be restricted as the document becomes property of NCITS, ANSI, or ISO/IEC.

4. Related Standards Activities:

4.1. Existing Standards:
