Very long CDB definition for FCP-2 and SPI-3

Revision 3 of this document corrects the relationship among the task management flags and the presence of a CDB. In FCP, either task management functions or SCSI commands may be transmitted, but not both. The text is corrected to reflect this consistently with FCP.

After discussion with George Penokie, he believes that SPI-3 should have the same properties, since it simplifies the relationship between task management and SCSI command execution. The same correction is provided for SPI-3 and additional areas of SPI-3 where similar changes should be made are noted.

Revision 4 of this document reflects the desire expressed in the April, 1999 meeting of the FCP-2 working group to maintain a fixed position for the FCP_DL field, desirable for hardware and firmware assisted parsing of the FCP_CMND payload.

</table>

The ADDITIONAL FCP_CDB LENGTH field contains the length in 4-byte words of the ADDITIONAL FCP_CDB field.
The ADDITIONAL FCP CDB field contains any CDB bytes beyond those contained within the 16 byte CDB field. The ADDITIONAL FCP CDB field is not valid and is ignored if any task management flag is set to 1. The contents of the CDB shall be as defined in the SCSI command standards.

The ADDITIONAL CDB LENGTH field contains the length in 4-byte words of the ADDITIONAL CDB field.

The ADDITIONAL CDB field contains any CDB bytes beyond those contained within the standard 16 byte CDB field. The ADDITIONAL CDB field is not valid and is ignored if any task management flag is set to 1. The contents of the CDB shall be as defined in the SCSI command standards.

3 Additional changes to SPI-3 to separate task management and CDB delivery

The corresponding description for the CDB field (SPI-3 section 12.2) should be updated as follows:

The CDB field contains the actual CDB to be interpreted by the addressed logical unit. The maximum CDB length is 16 bytes. The CDB field is not valid and is ignored if any task management flag except the clear ACA flag (40h) is selected, is set to 1. The contents of the CDB shall be as defined in the SCSI command standards. Any bytes between the end of a 6 byte CDB, 10 byte CDB, or 12 byte CDB and the end of the CDB field shall be reserved.
