Subject: T10/03-334r1 ALIGN insertion clarifications

Revision History
Revision 0 (25 September 2003) first revision
Revision 1 (9 October 2003) keep the ALIGN(n) existing rotation rule rather than weaken it.
    Updated the ALIGN and NOTIFY sections.

sas1r01 - Serial Attached SCSI 1.1 revision 1

Overview
This addresses a few issues with ALIGN and NOTIFY insertion for clock skew management and rate matching.

1. No need for consecutive ALIGNs in STP
SAS-1.0 requires that STP initiator phys send out 2 consecutive ALIGNs or NOTIFYs within each 256 dwords (like SATA). However, the STP target phy is not guaranteed to receive them consecutively, because one could be deleted for clock skew management (there is no difference between the 1/2048 and the 2/256 ALIGNs to a receiver).

The STP initiator phy should be required to insert them at the same rate (2/256 dwords), but not be required to send them consecutively, since it doesn't help the receiver.

2. Rate matching interaction
There has been some confusion about how rate matching and clock skew management ALIGNs interact.

- SAS 1/2048 clock skew management ALIGNs are not rate matched.
- SAS 2/256 STP initiator ALIGNs are rate matched. The requirement is to throttle the 1.5 Gbps stream. If these ALIGNs are not rate matched, the dword stream is too fast for the STP/SATA bridge to insert 2/256 on the SATA physical link. Of each set of 512 dwords (ignoring the 1/2048 clock skew management ALIGN)
  - 256 of them are rate match ALIGNs
  - 2 of them are STP initiator ALIGNs
  - 254 are SATA dwords (data dwords or SATA primitives).
- SAS 1/2 rate matching ALIGNs do not fulfill the role of either the 1/2048 or 2/256 ALIGNs.

This proposal restricts the clock skew management section (7.3) to discussing the 1/2048 rule and moves the 2/256 rule to a new section, after connections (7.12) and rate matching (7.13). It calls the 2/256 ALIGNs "STP initiator phy throttling" ALIGNs to avoid confusing them with the SAS clock skew management ALIGNs. They are related to clock skew management when they reach the SATA physical link, but that's outside the scope of this standard.

3. ALIGN before connection starts or ends
Before a connection, an expander phy A is sourcing 1/2048 ALIGNs per clock skew management rules. It might have sent 2047 dwords since the last ALIGN when it forwards an OPEN_ACCEPT; it then starts forwarding dwords received from the remote expander phy B. Phy B might just have received an ALIGN before the OPEN_ACCEPT, so might receive 2047 dwords until it receives another ALIGN. This results in phy A transmitting 2047+2047=4094 dwords between ALIGNs, violating the 1/2048 clock skew management rule on that physical link.

An expander phy needs to output an ALIGN before forwarding an OPEN_ACCEPT or the clock skew management ALIGN frequency might drop below 1/2048.

Similarly, at the end of a connection, the expander phy is changing from forwarding ALIGNs to sourcing them itself. It might have forwarded 2047 non-ALIGN dwords before the CLOSE. Before sending a CLOSE, it needs to send an ALIGN/NOTIFY to meeting the 1/2048 rule on behalf of the forwarded dword stream. (it also must start its 1/2048 counter then, not after the 3 CLOSE dwords, or it would 2050 dwords through next).

Similarly, if the expander chooses to send a BREAK over an open connection, it needs to send an ALIGN/NOTIFY first and start its 1/2048 counter.

Overall, the expander must guarantee ALIGN rules while originating dwords and while changing between originating and forwarding.

4. Rolling windows
Some have questioned whether the 1/2048 requirement allows two back-to-back 2048 dword windows, where the first window has the ALIGN as the first dword and the last window has the ALIGN as the last dword (allowing 2047+2047=5094 dwords in between). This is incorrect; a note is proposed to try to make it clear.

Suggested Changes
7.2.5.2 ALIGN
ALIGNs are used for:

      a) OOB signals;
      b) character and dword alignment during the speed negotiation sequence;
      c) clock skew management after the phy reset sequence (see 7.3); and
      d) rate matching during connections (see 7.13).; and
      e) STP initiator throttling during STP connections (see 7.17.x).

Table 56 defines the different versions of ALIGN primitives.

Phys shall use ALIGN (0) to construct OOB signals as described in 6.5. Phys shall use ALIGN (0) and ALIGN (1) during the speed negotiation sequence as described in 6.6.4.2. Phys shall rotate through ALIGN (0), ALIGN (1), ALIGN (2), and ALIGN (3) for all ALIGNs sent after the phy reset sequence for clock skew management (see 7.3) and rate matching (see 7.13).

Phys receiving ALIGNs after the phy reset sequence shall not verify the rotation and shall accept any of the ALIGNs at any time.

Phys shall only detect an ALIGN after decoding all four characters in the primitive.

> NOTE 14 - SATA devices are allowed to decode every dword starting with a K28.5 as an ALIGN, since ALIGN is the only primitive defined starting with K28.5.

For clock skew management and, rate matching, and STP initiator throttling, ALIGNs may be replaced by NOTIFYs (see 7.2.5.9).

7.2.5.9 NOTIFY
NOTIFY may be transmitted in place of any ALIGN (see 7.2.5.2) being transmitted for clock skew management (see 7.3) or, rate matching (see 7.13), or STP initiator throttling (see 7.17.x). Substitution of a NOTIFY may or may not affect the ALIGN sequencing rotation (i.e., the NOTIFY may take the place of one of the ALIGNs in the rotation through ALIGN (0), ALIGN (1), ALIGN (2), or ALIGN (3) or it may delay the rotation). A specific NOTIFY shall not be transmitted a second time until at least three ALIGNs or different NOTIFYs have been transmitted.

NOTIFY shall not be forwarded through expander devices. Expander devices shall substitute an ALIGN for a NOTIFY if necessary.

SAS target devices are not required to detect every transmitted NOTIFY.

...

7.3 Clock skew management

[Editor's note: some have been confused by this name. It's not really skew between two clocks. Should this be renamed? e.g. "Clock frequency tolerance handling" or "clock frequency tolerance compensation" or "Physical link rate tolerance compensation." The term is used about 15 times.]

The internal clock for a device is typically based on a PLL with its own clock generator and is used when transmitting dwords on the physical link. When receiving, however, dwords need to be latched based on a clock derived from the input bit stream itself. Although the input clock is nominally a fixed frequency, it may differ slightly from the internal clock frequency ~~due to accepted manufacturing tolerance and, for SATA physical links, due to spread spectrum clocking~~. up to the physical link rate tolerance defined in table 24 (see 5.3.2). Over time, if the input clock is faster than the internal clock, the device may receive a dword and not be able to forward it to an internal buffer; this is called an overrun. If the input clock is slower than the internal clock, the device may not have a dword when needed in an internal buffer; this is called an underrun.

To solve this problem, transmitting devices insert ALIGNs or NOTIFYs in the dword stream. Receivers may pass ALIGNs and NOTIFYs through to their internal buffers, or may strip them out when an overrun occurs. Receivers add ALIGNs or NOTIFYs when an underrun occurs. The internal logic shall ignore all ALIGNs and NOTIFYs that arrive in the internal buffers.

Elasticity buffer circuitry, as shown in figure 74, is required to absorb the slight differences in frequencies between the SAS initiator phy, SAS target phy, and expander phys. The frequency tolerance for a phy is specified in 5.3.2.

[**Figure 74 — Elasticity buffers**]

A phy that is the original source for the dword stream (i.e., a phy that is not an expander phy forwarding dwords from another expander phy) shall periodically insert ~~ALIGNs or NOTIFYs into the dword stream as shown in table 65~~one ALIGN or NOTIFY for clock skew management within every 2 048 dwords.

NOTE: This requirement applies to every overlapping window of 2 048 dwords.

NOTE: ALIGNs and NOTIFYs inserted for rate matching (see 7.13) and STP connections (see 7.17.x) are in addition to clock skew management ALIGNs and NOTIFYs.

~~Table 65 — Clock skew management ALIGN or NOTIFY insertion requirements~~

~~Original source of dword stream~~	~~Clock skew management ALIGN or NOTIFY requirements~~
~~Either:~~ ~~a) SSP initiator phy or SSP target phy in SSP connection;~~ ~~b) SMP initiator phy or SMP target phy in SMP connection;~~ ~~c) STP target phy in an STP connection; or~~ ~~d) any phy outside connections.~~	~~One ALIGN or NOTIFY within every 2 048 dwords~~
~~STP initiator phy in an STP connection~~	~~Two consecutive ALIGNs or NOTIFYs within each 256 dwords plus one ALIGN or NOTIFY within each 2 048 dwords~~

7.13 Rate matching

Each successful connection request contains the connection rate (see 4.1.10) of the pathway.

~~Every~~ Each phy in the ~~physical link~~ pathway shall insert ALIGNs or NOTIFYs between dwords ~~to match the connection rate~~if its physical link rate is faster than the connection rate as described in table xx~~.~~

Table xx — Rate matching ALIGN or NOTIFY insertion requirements

Physical link rate	Connection rate	Rate matching ALIGN or NOTIFY insertion requirements
1.5 Gbps	1.5 Gbps	none
3.0 Gbps	1.5 Gbps	One ALIGN or NOTIFY every other dword
3.0 Gbps	3.0 Gbps	none

~~Phys receiving ALIGNs and NOTIFYs delete them regardless of whether the ALIGNs and NOTIFYs were inserted for clock skew management (see 7.3) or for rate matching.~~

~~The faster phy~~A phy inserting ALIGNs~~ ~~ shall rotate between ALIGN (0), ALIGN (1), ALIGN (2), and ALIGN (3) to reduce long strings of repeated patterns appearing on the physical link. NOTIFYs may be used to replace ALIGNs (see 7.2.5.9).

Figure 85 shows an example of rate matching between a 3,0 Gbps source phy and a 3,0 Gbps destination phy, with an intermediate 1,5 Gbps physical link in between.

A phy shall start inserting ALIGNs and NOTIFYs for rate matching at the selected connection rate with the first dword that is not an ALIGN or NOTIFY inserted for clock skew management following:

a) transmitting the EOAF for an OPEN address frame; or
b) transmitting an OPEN_ACCEPT.

The source phy transmits idle dwords including ALIGNs and NOTIFYs at the selected connection rate while waiting for the connection response. This enables each expander device to start forwarding dwords from the source phy to the destination phy after forwarding an OPEN_ACCEPT.

A phy shall stop inserting ALIGNs and NOTIFYs for rate matching after:

a) transmitting the first dword in a CLOSE;
b) transmitting the first dword in a BREAK;
c) receiving an OPEN_REJECT for a connection request; or
d) losing arbitration to a received OPEN address frame.

If an STP initiator port discovers a SATA device behind an STP/SATA bridge with a physical link rate greater than the maximum connection rate supported by the pathway from the STP initiator port, the STP initiator port should use the SMP PHY CONTROL function (see 10.4.3.10) to set the MAXIMUM PHYSICAL LINK RATE field of the expander phy attached to the SATA device to the maximum connection rate supported by the pathway.

7.15 XL (link layer for expander phys) state machine

...
7.15.2 XL transmitter and receiver
The XL transmitter receives the following messages from the XL state machine indicating primitive sequences, frames, and dwords to transmit:

a) Transmit Idle Dword;
b) Transmit AIP with an argument indicating the specific type (e.g., Transmit AIP (Normal));
c) Transmit BREAK;
d) Transmit BROADCAST with an argument indicating the specific type (e.g., Transmit BROADCAST (Change));
e) Transmit CLOSE with an argument indicating the specific type (e.g., Transmit CLOSE (Normal));
f) Transmit OPEN_ACCEPT;

g) Transmit OPEN_REJECT, with an argument indicating the specific type (e.g., Transmit OPEN_REJECT (No Destination));
h) Transmit OPEN Address Frame; and
i) Transmit Dword.

The XL transmitter sends the following messages to the XL state machine:
a) OPEN Address Frame Transmitted.

The XL transmitter shall ensure clock skew management requirements are met (see 7.3) while originating dwords.

The XL transmitter shall ensure clock skew management requirements are met (see 7.3) during and after switching from forwarding dwords to originating dwords, including when:

a) transmitting BREAK;
b) transmitting CLOSE;
c) transmitting an idle dword after closing a connection (i.e., after receiving BREAK or CLOSE);
d) while transmitting a SATA frame to a SAS physical link, transmitting the first SATA HOLDA in response to detection of SATA_HOLD; and
e) while receiving dwords of a SATA frame from a SAS physical link, transmitting SATA_HOLD.
   NOTE: The XL transmitter may always insert an ALIGN or NOTIFY before transmitting a BREAK, CLOSE, or SATA_HOLDA to meet clock skew management requirements.

The XL transmitter shall insert an ALIGN or NOTIFY before switching from originating dwords to forwarding dwords, including when:

a) transmitting OPEN_ACCEPT;
b) transmitting the last idle dword before a connection is established (i.e., after receiving OPEN_ACCEPT);
c) while transmitting a SATA frame to a SAS physical link, transmitting the last dword from the SATA flow control buffer in response to release of SATA_HOLD;
d) while transmitting a SATA frame to a SAS physical link, transmitting the last SATA_HOLDA in response to release of SATA_HOLD (e.g., if the SATA flow control buffer is empty); and
e) while receiving dwords of a SATA frame from a SAS physical link, transmitting the last SATA_HOLD.
   NOTE: This ensures that clock skew management requirements are met, even if the forwarded dword stream does not include an ALIGN or NOTIFY until the last possible dword.

The XL transmitter shall insert ALIGNs and NOTIFYs needed for rate matching during a connection (see 7.13).

The XL transmitter shall ensure STP initiator port throttling requirements are met (see 7.3) when transmitting dwords in the direction of an STP target port while originating dwords (e.g., while transmitting HOLD and unloading the SATA flow control buffer), while switching from forwarding dwords to originating dwords, and while switching from originating dwords to forwarding dwords.

...

7.17 STP link layer

7.17.x STP initiator phy throttling

On a SATA physical link, phys are required to transmit two consecutive ALIGN (0)s within every 256 dwords. To ensure an STP/SATA bridge is able to meet this requirement, an STP initiator phy has to reduce the rate at which it is sourcing dwords by the same amount.

During an STP connection, an STP initiator phy shall insert two ALIGNs or NOTIFYs within every 256 dwords.

NOTE: Unlike SATA phys, STP initiator phys are not required to transmit them consecutively. A phy in the pathway may delete one of them for clock skew management since throttling ALIGNs are indistinguishable from clock skew management ALIGNs.

NOTE: This requirement applies to every overlapping window of 256 dwords.

NOTE: STP target phys are not required to insert extra ALIGNs or NOTIFYs, because SATA hosts are not supported by SAS domains. STP initiator phys, the only recipients of data from STP target phys, do not require extra ALIGNs.

NOTE: ALIGNs and NOTIFYs inserted for clock skew management (see 7.3) and rate matching (see 7.13) are in addition to STP initiator phy throttling ALIGNs and NOTIFYs.

ALIGN insertion summary

[Not currently proposed for insertion into SAS.]

Table xx shows all the possible combinations of ALIGN and NOTIFY insertion rates. "STP" assumes connection data heading to the target; STP connection data heading to the initiator follows SSP/SMP rules.

Table xx. ALIGN and NOTIFY insertion rate examples

Physical link rate	Connection rate	Type of dword stream	ALIGN or NOTIFY insertion rules	Required minimum number of ALIGNs or NOTIFYs within any 2 048 dword window
3.0 Gbps	3.0 Gbps	all others	1 per 2 048	1
3.0 Gbps	3.0 Gbps	to STP target	1 per 2 048 + 2 per 256	17
3.0 Gbps	1.5 Gbps	all others	1 per 2 048 + 1 per 2	1024 or 1025 (a)
3.0 Gbps	1.5 Gbps	to STP target	1 per 2 048 + 1 per 2 + 2 per 256	1032 or 1033 (b)
1.5 Gbps	1.5 Gbps	all others	1 per 2 048	1
1.5 Gbps	1.5 Gbps	to STP target	1 per 2 048 + 2 per 256	17

(a) There are 2 047 dwords left after the clock skew management ALIGN. These alternate between rate matching ALIGNs and other dwords. These requirements alternate every 2048 running windows.

(b) There are 2 047 dwords left after the clock skew management ALIGN. These alternate between ALIGNs and other dwords, leaving 1 024 or 1 025 dwords that are not clock skew management or rate matching ALIGNs. Of these, 2 per 256 (i.e., 8 per 1024) is an STP initiator phy throttling ALIGN. These requirements alternate every 2048 running windows.
