

Information technology - SCSI Primary Commands - 3 (SPC-3)

This is an internal working document of T10, a Technical Committee of Accredited Standards Committee INCITS (InterNational Committee for Information Technology Standards). As such this is not a completed standard and has not been approved. The contents may be modified by the T10 Technical Committee. The contents are actively being modified by T10. This document is made available for review and comment only.

Permission is granted to members of INCITS, its technical committees, and their associated task groups to reproduce this document for the purposes of INCITS standardization activities without further permission, provided this notice is included. All other rights are reserved. Any duplication of this document for commercial or for-profit use is strictly prohibited.

Revision Information

Changes in the SCSI standards family list, clause 1, are never marked with change bars. Changes in the ASC/ASCQ, Operation Code, Log Page Code, Mode Page Code and Vendor ID tables are never marked with change bars.

1 Approved Documents Included

The following T10 approved proposals have been incorporated SPC-3 up to and including this revision:

99-148r7	Proposed Addition of Read and Write Attribute Commands to SPC-2
00-232r9	Asymmetric SCSI behavior
00-257r3	Expander Communication Protocol
00-344r0	Identifying a 3rd Party Copy Management Device/Lun
00-359r8	Unit Attention Issue
00-396r2	Mode pages equivalents for ECP commands
00-398r3	EXTENDED COPY: IPv4 Target Descriptor
00-425r4	Long Identifiers in SPC-3, SAM-2, SBC-2 and other XOR issues
01-004r2	SPC-3 Logical unit groups
01-025r0	SPC-2 FIRST BURST SIZE definition
01-027r2	Numeric Media Serial Number
01-065r2	SPC-3 VPD Page 83 Device Identifier rewrite
01-068r6	Definition of Well Known Logical Units
01-099r6	SPC-3 Letting persistent reservations ignore target ports
01-100r4	Specify initiator ports for persistent reservation registrations
01-104r0	SRP Protocol Identifiers [Annex C table for T10 IEEE OUI Binary Identifiers]
01-134r1	SAM-2, SPC-3, SPI-4, SBC-2 WAKEUP and reset cleanup
01-174r2	Public comment on target descriptors in SPC-2 (SBP-2/3 EXTENDED COPY target descriptor)
01-182r1	SAM-2 device and port names
01-185r1	SAM-2 layering terminology proposal
01-192r2	SPC-3 Extended Copy target descriptor for SRP
01-193r1	SRP Alias entry designation formats
01-199r3	SPC-3 SBC-2 SSC-2 sense data changes
01-204r2	Proposal for an additional persistent Reservations type in SPC-3
01-247r1	SPC-3 Informational exceptions log page
01-253r3	Report Supported Operation Codes Command
01-267r3	Interlocking for exceptions - BUSY, RESERVATION CONFLICT and TASK SET FULL
01-268r3	Access Controls for SPC-3 (the rewrite)
01-269r0	Sense Codes for delivery subsystem errors that have to be reported with SCSI status
01-305r0	Proposed change to UA requirement on SET DEVICE IDENTIFIER command
01-316r1	Proposed change to SSC-2 Progress Indication [ASC/ASCQ definitions only]
01-318r1	SAM-2 SPC-3 Eliminate SCSI-2 references and describe CA
02-016r1	SPC-3 TST field description
02-017r0	SPC-3 sense data size limit
02-025r0	SPC-3 Unit Attention interlock and Asynchronous Event Reporting
02-026r1	SPC-3 REQUEST SENSE during pending-enrolled state
02-029	Minutes of T10 Meeting #47 — Assign ASC/ASCQ 14h/07h to LOCATE OPERATION FAILURE
02-035r3	MD5 Logical Unit Identifier
02-065r2	SPC-3 Persistent reservations corrections
02-075r1	EUI-48 software interface ID VPD page
02-102	Minutes of T10 Meeting #48 — Assign a new device type code to the ADI command set
02-108r0	Obsolete Reserve/Release in SPC-3
02-115r0	SPC-3 table 230 incorrect

02-134r2 Clearing effects of I_T nexus loss {w/ no mode page changes}
 02-144r0 SPC-3 Informational exceptions, linked commands, and CONDITION MET
 02-145r0 SPC-3 AERC clarification
 02-149r1 SPC-3 Port-specific mode page clarifications
 02-189r1 SES-2 SPC-3 vendor-specific diagnostic pages
 02-190r0 SES-2 Enclosure busy indication
 02-194r1 SES-2 Protocol-specific device element information
 02-160 Minutes of CAP WG — Remove proposed DEVICE LOCKS operation code assignment
 02-232r2 SAM-3 SPC-3 SBC-2 SSC-2 Clearing effects of I_T nexus loss
 02-246r1 SPC-3 protocol-specific changes for SAS SSP
 02-254r5 WWNs for WLUNs
 02-260r1 Mandatory REPORT LUNS Support
 02-286r1 Extended Copy Write filemarks operation Segment Descriptor Immediate Bit
 02-303r1 Inquiry Command Parameter Length Increase
 02-304r1 Allowing TUR Through Persistent Reservations
 02-308r1 Change ASC for truncated parameter in SPC-3 for LOG SELECT command
 02-346r1 Report Supported Task Management Functions
 02-403r2 Maximum and first burst size and protocol services
 02-404r2 Sense Data Length for Execute Command
 02-449r3 SAS Simple Relative Offset
 02-454r0 SPC-3 Add NAA=2 format to VPD 83
 02-464r3 SAM-3, SPC-3, and SBC power conditions proposal
 02-466r0 SAM-3 definitions for SCSI initiator device and SCSI target device
 02-485r1 READ MEDIA SERIAL NUMBER command
 02-488r1 SAM-3 Logical Unit Names
 03-001r1 Remove TARGET RESET from SAM-3 and SPC-3
 03-002r3 Remove SPI from SAM-3 and SPC-3
 03-005r1 What is architectural about SAM-3 CDB definitions?
 03-028r2 Block Limits VPD page
 03-031r0 Obsolete Medium Partition mode pages 2-4
 03-051r0 Remove AEN from SPC-3
 03-060r1 Vendor Identification Assignment
 03-088r0 Rename some SAS additional sense codes
 03-092r1 Other SPC-3 Fixes
 03-094r3 Yet More Persistent Reservation Fixes
 03-127r1 SPC-3 MSB and LSB labels
 03-164r3 SAS: Initiator Response Timeout timer (ASC/ASCQ definition only)
 03-169r1 SPC-3: Un-hiding S.M.A.R.T.
 03-172r1 QErr=01b & CHECK CONDITION Initiator

To the best of the technical editor's knowledge, all T10 approved proposals have been included in this revision.

The following proposals have been approved for SPC-3 but are not included in either of the lists above because they are covered by approved proposal 01-268r3 — Access Controls for SPC-3 (the rewrite):

99-245r9 A Detailed Proposal For Access Controls
 00-261r0 Discussion of editorial changes to Access Controls in 99-245r9
 00-287r1 TransportIDs for Access Controls
 00-381r0 Three minor modifications to Access Controls in SPC-3
 01-026r1 SPC-3 Access Controls LUN conflicts due to transport IDs
 01-181r0 Access Controls TransportIDs for SBP, SRP and iSCSI

The following was approved for inclusion in SPC-3 but withdrawn due to discovered bugs before it could be incorporated:

02-035r2 MD5 Logical Unit Identifier

2 Revision History

2.1 Revision 0 (3 June 2001)

Revision 0 of SPC-3 is equal to revision 19 of SPC-2. The only differences relate to things where a dpANS must have different material than a working draft. For SPC-3 revision 0 this material has been changed back to the working draft format.

2.2 Revision 1 (22 September 2001)

Revision 1 incorporates the following T10 approved proposals:

00-257r3	Expander Communication Protocol
00-344r0	Identifying a 3rd Party Copy Management Device/Lun
01-025r0	SPC-2 FIRST BURST SIZE definition
01-065r2	SPC-3 VPD Page 83 Device Identifier rewrite
01-068r6	Definition of Well Known Logical Units
01-182r1	SAM-2 device and port names
01-185r1	SAM-2 layering terminology proposal
01-247r1	SPC-3 Informational exceptions log page
01-269r0	Sense Codes for delivery subsystem errors that have to be reported with SCSI status

As part of incorporating 00-257r3, all code values for the READ BUFFER and WRITE BUFFER MODE fields were changed from binary to hexadecimal because the fields have grown to big for binary bit values to be readable.

Incorporation of 01-068r6 (Definition of Well Known Logical Units) necessitated some changes in SAM-2 that are not present in SAM-2 revision 20 (the revision where well known logical units were first incorporated). The needed changes appear in SAM-2 revision 21, to be published in November.

As part of incorporating 01-182r1, all definitions related to initiator and target were made to match SAM-2 revision 20.

The description of the READ BUFFER command in echo buffer mode was modified clarify that the number of bytes returned cannot exceed the allocation length.

Mode page code 05h was specified as the Write parameters mode page for CD/DVD devices. The version descriptor code values were updated to include new working drafts as well as letter ballot and public review versions of working drafts. Vendor IDs were updated from a 20 September list provided by the T10 chair.

Editorial nits were addressed. 'Savable' was changed to 'saveable' throughout.

2.3 Revision 2 (23 November 2001)

Revision 2 incorporates the following T10 approved proposals:

00-359r8	Unit Attention Issue
01-104r0	SRP Protocol Identifiers [Annex C table for T10 IEEE OUI Binary Identifiers]
01-267r3	Interlocking for exceptions - BUSY, RESERVATION CONFLICT and TASK SET FULL
01-305r0	Proposed change to UA requirement on SET DEVICE IDENTIFIER command
01-316r1	Proposed change to SSC-2 Progress Indication [ASC/ASCQ definitions only]
01-318r1	SAM-2 SPC-3 Eliminate SCSI-2 references and describe CA

The annex describing reservations for SBC-2 and SMC-2 was removed because the text has been incorporated in those working drafts.

Revision 02 contains changes discussed at the 7 November CAP working group meeting (minutes in 01-323) under the topic of data transfer ordering requirements (01-309r0). The change was from 'current task' and 'enabled task' at four sites in the reservations model, specifically identified in 01-309r0. A request was made to search for 'current task' in all of SPC-3. The only other instances found were in the SBC-2 and SMC-2 reservations annex, which has been removed in SPC-3 r02.

Changes were made in the ASC/ASCQ definitions for SSC-2 based on a request from the SSC-2 editor.

A command name in Table 10 (SPC commands that are allowed in the presence of various reservations) was corrected from RECIEVE DIAGNOSTICS to RECEIVE DIAGNOSTIC RESULTS. Instances of FFFFFFFFh were changed to the newly set T10 style of FFFF FFFFh.

2.4 Revision 3 (10 January 2002)

Revision 3 incorporates the following T10 approved proposals:

99-148r7	Proposed Addition of Read and Write Attribute Commands to SPC-2
00-232r9	Asymmetric SCSI behavior
00-398r3	EXTENDED COPY: IPv4 Target Descriptor
00-425r4	Long Identifiers in SPC-3, SAM-2, SBC-2 and other XOR issues
01-004r2	SPC-3 Logical unit groups
01-027r2	Numeric Media Serial Number
01-174r2	Public comment on target descriptors in SPC-2 (SBP-2/3 EXTENDED COPY target descriptor)
01-192r2	SPC-3 Extended Copy target descriptor for SRP
01-193r1	SRP Alias entry designation formats

Numerous editorial changes were applied during the incorporation of 99-148r7.

While incorporating 00-323r9 it was necessary to change the text for additional sense code 04h/0Ah from LOGICAL UNIT NOT ACCESSIBLE, TRANSITIONING BETWEEN ASYMMETRIC ACCESS STATES to LOGICAL UNIT NOT ACCESSIBLE, ASYMMETRIC ACCESS STATE TRANSITION.

While incorporating 01-004r2 the required value in the ASSOCIATION field was changed from 1h (i.e., target port) to 0h (i.e., logical unit) because the descriptor in question concerns logical unit groups and is a property of the logical unit not a property of the target port.

While incorporating the various alias proposals (e.g., 00-425r4), some rewriting was required to fulfill the T10 decision to place all protocol specific command and parameter data in SPC-3.

Edited the description of the ILLEGAL REQUEST sense key to modernize it. Eliminated hanging paragraphs in A.5.

2.5 Revision 4 (12 February 2002)

Revision 4 incorporates the following T10 approved proposals:

00-396r2	Mode pages equivalents for ECP commands
01-099r6	SPC-3 Letting persistent reservations ignore target ports
01-199r3	SPC-3 SBC-2 SSC-2 sense data changes
01-204r2	Proposal for an additional persistent Reservations type in SPC-3
01-253r3	Report Supported Operation Codes Command
02-016r1	SPC-3 TST field description
02-017r0	SPC-3 sense data size limit
02-025r0	SPC-3 Unit Attention interlock and Asynchronous Event Reporting
02-029	Minutes of T10 Meeting #47 — Assign ASC/ASCQ 14h/07h to LOCATE OPERATION FAILURE

During incorporation of 00-396r2, all computed page length value in the 'long' mode page formats were changed from 'n-1' to 'n-3'. The names of the mode page formats also were changed.

During incorporation of 01-199r3, numerous editing changes and the following substantive changes were made:

- a) The behavior description of the one value of the LONG bit in the REQUEST SENSE CDB was changed from 'shall' to '...if implemented...shall...' return the long format sense data; and
- b) The SENSE DATA DESCRIPTOR LENGTH field was changed to the ADDITIONAL LENGTH field and the content was change from the total descriptor length to the number of bytes following the length field. This change brings the field definition in conformance with long standing SCSI parameter data formatting practice.

During the incorporation of 01-253r3 several names of fields and data formats were changed, the CDB usage example was changed to a command and includes a service action, and other editorial changes were made to improve readability.

The wording in 02-025r0 was extensively edited during incorporation.

A long standing problem with EUI-64 references was solved by adding a bibliography annex and placing in that annex a reference to the only existing EUI-64 information, a tutorial on the IEEE web site. If a standard that can be referenced for EUI-64 information is found, the bibliography entry can be removed and a normative reference added in its place.

All instances of "registration key" have been changed to "reservation key" or to "registration" depending on the context. As agreed with the ANSI editor in the SPC-2 review, all instances of "reservation key" have been examined to see if "registration" would be clearer and needed clarifications have been made.

Yet another instance of "other initiator" in 5.5.3.6.3.4 (Removing registrations) was clarified to any initiator other than the one that requested removal of the registrations.

Blue line row separators were introduced for multi-byte two-row fields in numerous data format tables.

In all of the persistent reservations discussion "service action of XYZ" has been changed to "XYZ service action". Many persistent reservations instances of "initiator" and "target" have been changed to "initiator port" and "target port" as well as other similar editorial changes.

Statements in the first two paragraphs of the VPD Device Identifier page overview that imply that the page might be empty have been expunged. Historically, the page and its content were all optional. That is no longer true.

Minor editorial changes were made such as correcting hard coded cross references and changing "with in" to "within". Because these changes are so minor, they have not been marked with change bars.

2.6 Revision 5 (9 March 2002)

Revision 5 incorporates the following T10 approved proposals:

- 01-134r1 SAM-2, SPC-3, SPI-4, SBC-2 WAKEUP and reset cleanup
- 01-268r3 Access Controls for SPC-3 (the rewrite)
- 02-026r1 SPC-3 REQUEST SENSE during pending-enrolled state

During the incorporation of 01-134r1, the flowchart diagrams were converted to state transition figures and the appropriate conventions subclause was added.

During the incorporation of 01-268r3, instances of 'generation' used by persistent reservations were changed to 'PRgeneration' to differentiate them from the 'DLgeneration' used by access controls. Also, wording changes were made to allow (but not require) implementation of access controls support with LUN 0 support. It is unlikely that this possibility will be realized anytime soon.

Because the access controls proposal has had a longer claim on Standard INQUIRY data bit 6 in byte 5, the 3PC bit was moved to bit 3 in byte 5.

In response to the patent claim regarding access controls made 02-033r0, the SPC-3 patent statement was changed to indicate that a call for patents has resulted in a patent claim regarding SPC-3.

In the EXTENDED COPY subclause describing the embedded data to stream device segment descriptor, the descriptor length in the table was corrected from '(n-4)' to '(n-3)'.

In conformance with previous agreements, lingering uses of 'additional sense data' (an undefined term) have been changed to 'additional sense code' as per the glossary.

In the description of the RESERVE(10) command, the LOGICAL UNIT RESET task management function was added to the list of actions that cause a logical unit reservation to be released. Also, the list of causes was made into an unordered list for clarity.

All mode page format tables have been updated to include the SubPage Format (SPF) bit.

The names of log, mode, ACL data, ACE, and VPD pages have been consistently capitalized as proper names. The work 'page' is preceded by the type of page (e.g., log, mode, ...) whenever a particular type of page is being discussed, without resorting to assumptions from the context. This is not true for discussion of field values, such as "page code value".

Consistent with the SSC-2 letter ballot comments resolution (02-081r1), the REPORT LUNS command has been marked as mandatory for tape devices in the numeric order codes annex.

2.7 Revision 6 (5 April 2002)

Revision 6 incorporates the following T10 approved proposals:

- 01-100r4 Specify initiator ports for persistent reservation registrations
- 02-065r2 SPC-3 Persistent reservations corrections
- 02-075r1 EUI-48 software interface ID VPD page
- 02-102 Minutes of T10 Meeting #48 — Assign a new device type code to the ADI command set
- 02-115r0 SPC-3 table 230 incorrect

During incorporation of 01-100r4, the length computation for the TRANSPORTID PARAMETER DATA LENGTH field was corrected.

As part of incorporating 02-075r1, the usage of 'IEEE company identifier' and OUI were modified to match the usage preferred by the IEEE. Glossary entries, bibliography entries, and acronyms were added to assist readers in following the name trail.

Incorrect references to the Read-Write Error Recovery mode page were changed in the definition of the MRIE field in the Informational Exceptions Control mode page.

The service action code assignments for the READ ATTRIBUTE command were made consistent with 99-148r7.

The Execute Command procedure call prototype in clause 4 was updated to match SAM-2.

For the processor device type, the supported log supported were updated. In Annex C, processor device support for any mode pages was removed since the processor device type does not support the MODE SELECT/SENSE commands.

Two additional sense codes, INSUFFICIENT RESOURCES and INSUFFICIENT REGISTRATION RESOURCES, were marked as allowed for use by optical card reader/writer devices.

2.8 Revision 7 (3 May 2002)

Revision 7 incorporates the following T10 approved proposals:

- 02-108r0 Obsolete Reserve/Release in SPC-3
- 02-134r2 Clearing effects of I_T nexus loss {w/ no mode page changes}
- 02-144r0 SPC-3 Informational exceptions, linked commands, and CONDITION MET
- 02-145r0 SPC-3 AERC clarification
- 02-160 Minutes of CAP WG — Remove proposed DEVICE LOCKS operation code assignment

Incorporation of 02-108r0 required removal of the reserve/release description in clause 5, changes in the processor device model (clause 6); removal of discussion of mode parameter handling for third-party reservations in the MODE SELECT(6) clause; removal of reserve/release discussion in the PERSISTENT RESERVE OUT command; and the discussion of the relationship between access controls and reservations.

The operation codes table in Annex B was updated to match SBC-2.

2.9 Revision 8 (25 July 2002)

Revision 8 incorporates the following T10 approved proposals:

02-035r3	MD5 Logical Unit Identifier
02-149r1	SPC-3 Port-specific mode page clarifications
02-190r0	SES-2 Enclosure busy indication
02-194r1	SES-2 Protocol-specific device element information
02-246r1	SPC-3 protocol-specific changes for SAS SSP
02-260r1	Mandatory REPORT LUNS Support

An “asynchronous event notification” that should be “asynchronous event reporting” in the Last n Error Events log page description was changed.

In the definition of the APTPL (Activate Persist Through Power Loss) bit, the wording was changed so that both the zero value and the one value affect only the addressed logical unit.

Discussion of Reserve/Release in the model that was overlooked during the incorporation of 02-108r0 was removed.

In the RECEIVE COPY RESULTS command COPY STATUS TRANSFER COUNT UNITS values table, “giagbinary” was corrected to “gigabinary” and the column lines were fixed to connect with row lines.

In the Informational Exceptions Control mode page, the description of MRIE code vale 1h was clarified to explain that reporting of the exceptions is affected by the UAAERP bit in the Control mode page.

SMC-2 is SCSI Media Changer Commands, i.e., Media not Medium. Changes were made to correct the usage.

While incorporating the 02-190 and 02-194 changes, minor spelling changes were made in the diagnostic parameters clause.

A missing 'be' was added in the MAM Attribute format subclause. Later in the same subclause 'that' was changed to 'the'. In the READ ATTRIBUTE and WRITE ATTRIBUTE command descriptions, 'AUXILIARY MEMORY NOT ACCESSIBLE' was changed to 'LOGICAL UNIT NOT READY, AUXILIARY MEMORY NOT ACCESSIBLE' to match the entry in the ASC/ASCQ tables.

The operation codes table in Annex B was updated to match SBC-2, again, and SES-2.

2.10 Revision 9 (17 September 2002)

Revision 9 incorporates the following T10 approved proposals:

02-189r1	SES-2 SPC-3 vendor-specific diagnostic pages
02-232r2	SAM-3 SPC-3 SBC-2 SSC-2 Clearing effects of I_T nexus loss
02-286r1	Extended Copy Write filemarks operation Segment Descriptor Immediate Bit
02-303r1	Inquiry Command Parameter Length Increase
02-308r1	Change ASC for truncated parameter in SPC-3 for LOG SELECT command
02-346r1	Report Supported Task Management Functions

The gratuitously changes (changes not related to I_T nexus loss issues) in 02-232r2 were edited substantially.

The iSCSI reference was updated to revision 16. In keeping with the changes made in SAM-2 and SAM-3 by 02-348r0, the lengths of iSCSI names were modified in the protocol specific parameters clause.

To better reflect the intention of the ILLEGAL REQUEST sense key, the text describing it was change from:

Indicates that the command was sent to an incorrect logical unit number (see SAM-2), or there was an illegal parameter in the CDB or in the additional parameters supplied as data for some commands (e.g., PERSISTENT RESERVE OUT).

to:

Indicates that the command was sent to an incorrect logical unit number (see SAM-2), [that the command was sent to a logical unit whose current configuration prohibits processing the command](#), [that there was an illegal parameter in the CDB](#), or [that there was an illegal parameter](#) in the additional parameters supplied as data for some commands (e.g., PERSISTENT RESERVE OUT).

Wording in the reservations model was revised to use 'initiator port' instead of 'initiator'. The description of reservation owner was modified to clarify that the all registrants reservations return a reservation key of zero in the PERSISTENT RESERVE IN parameter data.

A reference was added pointing to the T10 web site mechanism for requesting T10 vendor identifiers.

A glossary entry was added for 'protocol identifier' so that other command set standards can reference SPC-3 for protocol identifier values and people reading those standards will have something to lookup in SPC-3.

Errors in incorporating 02-149r1 (revision 08) were corrected.

The operation codes table was updated to match what is specified in SMC-2. The operation codes annex was revised to more correctly reflect the operation usage requirements for media changer and enclosure services devices that are embedded in other device types.

2.11 Revision 10 (10 November 2002)

Revision 10 incorporates the following T10 approved proposals:

02-254r5	WWNs for WLUNs
02-304r1	Allowing TUR Through Persistent Reservations
02-394r2	SAS SPC-3 Protocol Specific log page
02-449r3	SAS Simple Relative Offset
02-454r0	SPC-3 Add NAA=2 format to VPD 83
02-466r0	SAM-3 definitions for SCSI initiator device and SCSI target device

Since the SAM-2 letter ballot comment resolution (02-155r6) removes the Common Access Method (CAM) from the roadmap (figure 1), the same change has been applied in this working draft.

The Enclosure Services Management mode page was added to the codes annex with applicability for all device types except tapes and those that have been obsolete for several years.

For consistency with the rest of the Medium auxiliary memory attributes clause, 'NUMERIC MEDIA SERIAL NUMBER' was changed to NUMERIC MEDIUM SERIAL NUMBER'.

Several mode page format tables were modified to include MSB/LSB indications for multi-byte page length values.

In anticipation of the 12 byte READ MEDIA SERIAL NUMBER command, the codes annex has been updated to include a 12 byte SERVICE ACTION IN and OUT operation code.

2.12 Revision 11 (12 February 2003)

Revision 11 incorporates the following T10 approved proposals:

02-403r2	Maximum and first burst size and protocol services
02-485r1	READ MEDIA SERIAL NUMBER command
02-488r1	SAM-3 Logical Unit Names
03-002r3	Remove SPI from SAM-3 and SPC-3
03-028r2	Block Limits VPD page
03-031r0	Obsolete Medium Partition mode pages 2-4
03-051r0	Remove AEN from SPC-3
03-060r1	Vendor Identification Assignment

While incorporating 02-485r1 it was noticed that the proposal included no discussion of reservation conflicts. The editor made the READ MEDIA SERIAL NUMBER command not conflict with any types of reservation and so notified the proposal author.

Since 02-488r1 appeared to leave the editor some discretion with respect to how much of the Well Known Logical Units model would be removed from SPC-3, material that depends on SPC-3 definitions was left in. The result will be that about four paragraphs will be duplicated between SAM-3 and SPC-3, with the SPC-3 paragraphs containing exact subclause cross references and SAM-3 containing vague references to SPC-3.

The header at the beginning of the standard, before clause 1, was modified to match the latest ANSI format.

The description in table 11 (SPC commands that are allowed in the presence of various reservations) for the PERSISTENT RESERVE OUT command that was lost when the RESERVE/RELEASE commands were removed was restored.

The description of the INQUIRY command was modified to clarify that a change to any Inquiry data (not just standard Inquiry data) shall result in an unit attention condition, e.g. a change in VPD data results in an unit attention condition.

The definition of SELF-TEST CODE field in table 155 was modified to more clearly explain when code value 000b is used.

In Table 189 (Protocol specific port log parameter format), a cut and paste error was corrected by placing the PROTOCOL TYPE field in the location specified by 02-394r2 (SAS SPC-3 Protocol Specific log page).

The unintended requirement that device servers support the WRITE ATTRIBUTE command in the Attribute identifier values overview subclause was modified according to the understanding that the sentence in question was originally intended to explain that only MAM attributes related to the host are writable.

Table formatting problems were corrected the column headings for table 206 (MEDIUM USAGE HISTORY attribute format) and table 207 (PARTITION USAGE HISTORY attribute format).

Several corrections were applied to the incorporation of 02-254r5 (WWNs for WLUNs). The naming of the PROTOCOL TYPE field was modified to be consistent with the protocol identifier usage elsewhere in this standard. The changes in the definition of association type 0h were propagated to other parts of the Subclause. The subclause was restructured to follow traditional methods for describing the contents of fields.

A missing '(LSB)' was added in Table 278 (NAA IEEE Extended IDENTIFIER field format).

An incorrect conversion of the letter 'T' to hex ASCII in Table 287 — Example MD5 input for computation of a logical unit identifier)

A reference to SPC-2 in Annex B was changed to 'this standard'.

'NCITS' was changed to 'INCITS' in annex B (Numeric order codes) and annex C (Vendor identification).

Several grammatical errors were corrected.

2.13 Revision 12 (18 March 2003)

Revision 12 incorporates the following T10 approved proposals:

- 02-404r2 Sense Data Length for Execute Command
- 03-001r1 Remove TARGET RESET from SAM-3 and SPC-3
- 03-005r1 What is architectural about SAM-3 CDB definitions?
- 03-088r0 Rename some SAS additional sense codes
- 03-092r1 Other SPC-3 Fixes

An error made during the incorporation of 02-035r3 was corrected by placing 15 in the last byte number cell of the table describing the MD5 identifier in the Device Identification VPD page.

The definition of the Control mode page UA_INTLCK_CTRL field was clarified to include the fact that any unit attention condition established as a result of code value 11b applies only to the SCSI initiator port that is the source of the task being terminated with BUSY, TASK SET FULL, or RESERVATION CONFLICT status. This should have been obvious owing to the lack of any statement about a broader application of the unit attention, however, so many unit attention conditions apply to a large set of initiators that readers stuck with a habitual reading of the standard might have assumed there was a typo in this definition and implemented the wrong thing.

Glossary entries were added for the Control and Disconnect-Reconnect mode pages as well as for the Device Identification VPD page to give other standards that reference these pages (e.g., SAM-3) a point of entry in SPC-3.

Several incorrect uses of the W-LUN acronym were changed to 'well known logical unit'.

Two spelling errors in additional sense code definitions were corrected, and an vertical alignment problem with name of one field in the Standard INQUIRY data table was fixed.

The results of the March 13-14 SPC-3 editing review session also are incorporated in revision 12. Two major changes resulted:

- a) The description of the sense data was moved from the REQUEST SENSE command definition to a new subclause in the General Concepts clause (clause 4 in this revision); and
- b) A definition for I_T_L_Q nexus transaction was added to clarify the 'delivery of sense data concurrently with a CHECK CONDITION status'.

Where possible, changes resulting from the editing review session are identified with blue text and strike through markings. These marking will be removed in the next revision. A notable exception to the use of blue text is the move sense data subclause in clause 4, where traditional black text is used unless editing changes have been applied to the moved text.

2.14 Revision 13 (16 May 2003)

Revision 13 incorporates the following T10 approved proposals:

02-464r3	SAM-3, SPC-3, and SBC power conditions proposal
03-094r3	Yet More Persistent Reservation Fixes
03-127r1	SPC-3 MSB and LSB labels
03-164r3	SAS: Initiator Response Timeout timer (ASC/ASCQ definition only)
03-169r1	SPC-3: Un-hiding S.M.A.R.T.
03-172r1	QErr=01b & CHECK CONDITION Initiator

Since 03-127r1 was not consistent about the application of MSB and LSB labels to the IPV4 and N_PORT address fields, MSB and LSB labels were left on all such fields. No changes were made in the SUPPORTED LUN-MASK FORMAT field format table since there are no substructures referenced by that table, only bit masks. In the Logical Unit descriptor format table, only the DEFAULT LUN field was changed since none of the other fields reference substructures.

Several instances where discussion of the Processor device command set lingered in SPC-3 were removed.

The description of the RECEIVE COPY RESULTS command was modified to clarify the fact that the OPERATING PARAMETERS service action is processed even if no EXTENDED COPY operations are in progress.

In the Standard INQUIRY data description, the description of the MChngr bit was modified to include a cross reference to the "Removable medium devices with an attached medium changer" model clause. This should eliminate confusion regarding when the MChngr bit should be set.

The description of the 'persistent reservation holder' was clarified (again) to separate the requirements defining which initiator port or initiator ports are the persistent reservation holdler(s) and how this is indicated in the parameter data returned by the PERSISTENT RESERVE IN command.

To save typing and eye strain, 'initiator port' was added to the glossary as an equivalent for 'SCSI initiator port' and 'target port' was added as an equivalent for 'SCSI target port'.

The Terminology Mapping annex was updated to refer to SPC-3 and SPC-2 instead of SAM and SAM-2.

Summaries of the annexes were added to the Introduction.

The results of the May 6 and May 8 SPC-3 editing review sessions also are incorporated in revision 13. Where possible, changes resulting from the editing review session are identified with blue text and strike through markings. These marking will be removed in the next revision.

**American National Standards
for Information Systems -**

SCSI Primary Commands - 3 (SPC-3)

Secretariat
InterNational Committee for Information Technology Standards

Approved mm dd yy

American National Standards Institute, Inc.

Abstract

This standard defines the device model for all SCSI devices. This standard defines the SCSI commands that are basic to every device model and the SCSI commands that may apply to any device model.

Draft

American National Standard

Approval of an American National Standard requires verification by ANSI that the requirements for due process, consensus, and other criteria for approval have been met by the standards developer. Consensus is established when, in the judgment of the ANSI Board of Standards Review, substantial agreement has been reached by directly and materially affected interests. Substantial agreement means much more than a simple majority, but not necessarily unanimity. Consensus requires that all views and objections be considered and that effort be made toward their resolution.

The use of American National Standards is completely voluntary; their existence does not in any respect preclude anyone, whether he or she has approved the standards or not, from manufacturing, marketing, purchasing, or using products, processes, or procedures not confirming to the standards.

The American National Standards Institute does not develop standards and will in no circumstances give interpretation on any American National Standard in the name of the American National Standards Institute. Requests for interpretations should be addressed to the secretariat or sponsor whose name appears on the title page of this standard.

CAUTION NOTICE: This American National Standard may be revised or withdrawn at any time. The procedures of the American National Standards Institute require that action be taken periodically to reaffirm, revise, or withdraw this standard. Purchasers of American National Standards may receive current information on all standards by calling or writing the American National Standards Institute.

CAUTION: The developers of this standard have requested that holders of patents that may be required for the implementation of the standard, disclose such patents to the publisher. However, neither the developers nor the publisher have undertaken a patent search in order to identify which, if any, patents may apply to this standard.

As of the date of publication of this standard, following calls for the identification of patents that may be required for the implementation of the standard, notice of one or more claims has been received.

By publication of this standard, no position is taken with respect to the validity of this claim or of any rights in connection therewith. The known patent holder(s) has (have), however, filed a statement of willingness to grant a license under these rights on reasonable and nondiscriminatory terms and conditions to applicants desiring to obtain such a license. Details may be obtained from the publisher.

No further patent search is conducted by the developer or the publisher in respect to any standard it processes. No representation is made or implied that licenses are not required to avoid infringement in the use of this standard.

Foreword

This foreword is not part of American National Standard INCITS.***:200x.

The SCSI command set is designed to provide efficient peer-to-peer operation of SCSI devices (disks, tapes, printers, etc.) by an operating system. The SCSI command set assumes an underlying command-response protocol.

The SCSI command set provides multiple operating systems concurrent control over one or more SCSI devices. However, proper coordination of activities between the multiple operating systems is critical to avoid data corruption. Commands that assist with coordination between multiple operating systems are described in this standard. However, details of the coordination are beyond the scope of the SCSI command set.

This standard defines the device model for all SCSI devices. This standard defines the SCSI commands that are basic to every device model and the SCSI commands that may apply to any device model.

With any technical document there may arise questions of interpretation as new products are implemented. INCITS has established procedures to issue technical opinions concerning the standards developed by INCITS. These procedures may result in SCSI Technical Information Bulletins being published by INCITS.

These Bulletins, while reflecting the opinion of the Technical Committee that developed the standard, are intended solely as supplementary information to other users of the standard. This standard, ANSI INCITS.***:200x, as approved through the publication and voting procedures of the American National Standards Institute, is not altered by these bulletins. Any subsequent revision to this standard may or may not reflect the contents of these Technical Information Bulletins.

Current INCITS practice is to make Technical Information Bulletins available through:

INCITS Online Store	http://www.techstreet.com/incits.html
managed by Techstreet	Telephone: 1-734-302-7801 or
1327 Jones Drive	1-800-699-9277
Ann Arbor, MI 48105	Facsimile: 1-734-302-7811

or

Global Engineering	http://global.ihs.com/
15 Inverness Way East	Telephone: 1-303-792-2181 or
Englewood, CO 80112-5704	1-800-854-7179
	Facsimile: 1-303-792-2192

Requests for interpretation, suggestions for improvement and addenda, or defect reports are welcome. They should be sent to the INCITS Secretariat, National Committee for Information Technology Standards, Information Technology Institute, 1250 Eye Street, NW, Suite 200, Washington, DC 20005-3922.

This standard was processed and approved for submittal to ANSI by the InterNational Committee for Information Technology Standards (INCITS). Committee approval of the standard does not necessarily imply that all committee members voted for approval. At the time of it approved this standard, INCITS had the following members:

<<Insert INCITS member list>>

Technical Committee T10 on Lower Level Interfaces, which developed and reviewed this standard, had the following members:

John B. Lohmeyer, Chair
George O. Penokie, Vice-Chair
Ralph O. Weber, Secretary

<<Insert T10 member list>>

Introduction

The SCSI Primary Commands - 3 (SPC-3) standard is divided into eleven clauses:

- Clause 1 is the scope.
- Clause 2 enumerates the normative references that apply to this standard.
- Clause 3 describes the definitions, symbols, and abbreviations used in this standard.
- Clause 4 describes the conceptual relationship between this document and the SCSI-3 Architecture Model.
- Clause 5 describes the command model for all SCSI devices.
- Clause 6 defines the commands that may be implemented by any SCSI device.
- Clause 7 defines the parameter data formats that may be implemented by any SCSI device.
- Clause 8 defines the well known logical units that may be implemented by any SCSI device.
- Annex A identifies differences between the terminology used in this standard and previous versions of this standard.
- Annex B elaborates on the procedures for logging operations
- Annex C lists code values in numeric order
- Annex D lists assigned vendor identifiers
- Annex E is a bibliography of references to documents and web pages that are not standards

The annexes provide information to assist with implementation of this standard. The information in the annexes applies to all the SCSI command standards. See 3.1.11 for more information about other SCSI command standards.

AMERICAN NATIONAL STANDARD**INCITS.***:200x****American National Standard
for Information Technology -****SCSI Primary Commands - 3 (SPC-3)****1 Scope**

The SCSI family of standards provides for many different types of SCSI devices (disks, tapes, printers, scanners, and many more). This standard defines a device model that is applicable to all SCSI devices. Other SCSI command standards (see 3.1.17) expand on the general SCSI device model in ways appropriate to specific types of SCSI devices.

The set of SCSI standards specifies the interfaces, functions, and operations necessary to ensure interoperability between conforming SCSI implementations. This standard is a functional description. Conforming implementations may employ any design technique that does not violate interoperability.

This standard defines the SCSI commands that are mandatory and optional for all SCSI devices. This standard also defines the SCSI commands that may apply to any device model.

Figure 1 shows the relationship of this standard to the other standards and related projects in the SCSI family of standards as of the publication of this standard.

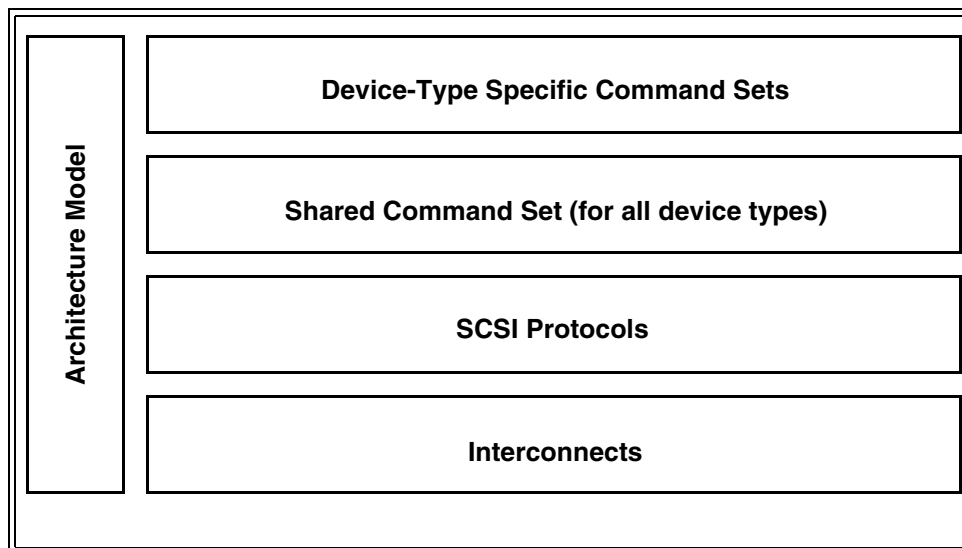

Figure 1 — SCSI document relationships

Figure 1 is intended to show the general relationship of the documents to one another. Figure 1 is not intended to imply a relationship such as a hierarchy, protocol stack, or system architecture. It indicates the applicability of a standard to the implementation of a given transport.

At the time this standard was generated, examples of the SCSI general structure included:

Interconnects:

Fibre Channel Arbitrated Loop - 2	FC-AL-2	[ISO/IEC 14165-122] [ANSI NCITS.332-1999] [ANSI NCITS.332-1999/AM1]
Fibre Channel Physical Interfaces	FC-PI	[ANSI INCITS.352-2002]
Fibre Channel Physical Interfaces - 2	FC-PI-2	[T11/1506-D]
Fibre Channel Framing and Signaling Interface	FC-FS	[T11/1331-D]
High Performance Serial Bus		[ANSI IEEE 1394-1995]
High Performance Serial Bus (supplement to ANSI/IEEE 1394-1995)		[ANSI IEEE 1394a-2000]
SCSI Parallel Interface - 2	SPI-2	[ISO/IEC 14776-112] [ANSI X3.302-1999]
SCSI Parallel Interface - 3	SPI-3	[ISO/IEC 14776-113] [ANSI NCITS.336-2000]
SCSI Parallel Interface - 4	SPI-4	[ISO/IEC 14776-114] [ANSI INCITS.362-2002]
SCSI Parallel Interface - 5	SPI-5	[ISO/IEC 14776-115] [ANSI INCITS.367:2003]
Serial Storage Architecture Physical Layer 1	SSA-PH	[ANSI X3.293-1996]
Serial Storage Architecture Physical Layer 2	SSA-PH-2	[ANSI NCITS.307-1998]
Serial Attached SCSI	SAS	[ISO/IEC 14776-150] [T10/1562-D]
Serial Attached SCSI - 1.1	SAS-1.1	[ISO/IEC 14776-151] [T10/1601-D]

SCSI Transport Protocols:

Automation/Drive Interface - Transport Protocol	ADT	[ISO/IEC 14776-191] [T10/1557-D]
Serial Storage Architecture Transport Layer 1	SSA-TL-1	[ANSI X3.295-1996]
Serial Storage Architecture Transport Layer 2	SSA-TL-2	[ANSI NCITS.308-1998]
SCSI-3 Fibre Channel Protocol	FCP	[ISO/IEC 14776-221] [ANSI X3.269-1996]
SCSI Fibre Channel Protocol - 2	FCP-2	[ISO/IEC 14776-222] [ANSI NCITS.350-2003]
SCSI Fibre Channel Protocol - 3	FCP-3	[ISO/IEC 14776-223] [T10/1560-D]
Serial Bus Protocol - 2	SBP-2	[ISO/IEC 14776-232] [ANSI NCITS.325-1999]
Serial Bus Protocol - 3	SBP-3	[ISO/IEC 14776-233] [T10/1467-D]
Serial Storage Architecture SCSI-3 Protocol	SSA-S3P	[ANSI NCITS.309-1998]
SCSI RDMA Protocol	SRP	[ISO/IEC 14776-241] [T10/1415-D]
SCSI RDMA Protocol - 2	SRP-2	[ISO/IEC 14776-242] [T10/1524-D]

Shared Command Sets:

SCSI-3 Primary Commands	SPC	[ANSI X3.301-1997]
SCSI Primary Commands - 2	SPC-2	[ISO/IEC 14776-452] [ANSI NCITS.351-2001]
SCSI Primary Commands - 3	SPC-3	[ISO/IEC 14776-453] [T10/1416-D]

Device-Type Specific Command Sets:

SCSI-3 Block Commands	SBC	[ISO/IEC 14776-321] [ANSI NCITS.306-1998]
SCSI Block Commands - 2	SBC-2	[ISO/IEC 14776-322] [T10/1417-D]
SCSI-3 Stream Commands	SSC	[ISO/IEC 14776-331] [ANSI NCITS.335-2000]
SCSI Stream Commands - 2	SSC-2	[ISO/IEC 14776-332] [T10/1434-D]
SCSI Stream Commands - 3	SSC-3	[ISO/IEC 14776-333] [T10/1611-D]
SCSI-3 Medium Changer Commands	SMC	[ISO/IEC 14776-351] [ANSI NCITS.314-1998]
SCSI Media Changer Commands - 2	SMC-2	[ISO/IEC 14776-352] [T10/1383-D]
SCSI-3 Multimedia Command Set	MMC	[ANSI X3.304-1997]
SCSI Multimedia Command Set - 2	MMC-2	[ISO/IEC 14776-362] [ANSI NCITS.333-2000]
SCSI Multimedia Command Set - 3	MMC-3	[ISO/IEC 14776-363] [ANSI INCITS.360-2002]
SCSI Multimedia Command Set - 4	MMC-4	[ISO/IEC 14776-364] [T10/1545-D]
SCSI Controller Commands - 2	SCC-2	[ISO/IEC 14776-342] [ANSI NCITS.318-1998]
SCSI Reduced Block Commands	RBC	[ISO/IEC 14776-326] [ANSI NCITS.330-2000]
SCSI-3 Enclosure Services Commands	SES	[ISO/IEC 14776-371] [ANSI NCITS.305-1998]
SCSI Enclosure Services Commands - 2	SES-2	[ISO/IEC 14776-372] [T10/1559-D]
SCSI Specification for Optical Card Reader/Writer	OCRW	[ISO/IEC 14776-381]
Object-based Storage Devices Commands	OSD	[ISO/IEC 14776-391] [T10/1355-D]
SCSI Management Server Commands	MSC	[ISO/IEC 14776-511] [T10/1528-D]
Automation/Drive Interface - Commands	ADC	[ISO/IEC 14776-356] [T10/1558-D]

Architecture Model:

SCSI-3 Architecture Model	SAM	[ISO/IEC 14776-411] [ANSI X3.270-1996]
SCSI Architecture Model - 2	SAM-2	[ISO/IEC 14776-412] [ANSI INCITS.366-2003]
SCSI Architecture Model - 3	SAM-3	[ISO/IEC 14776-413] [T10/1561-D]

The term SCSI is used to refer to the family of standards described in this clause.

2 Normative references

2.1 Normative references

The following standards contain provisions that, by reference in the text, constitute provisions of this standard. At the time of publication, the editions indicated were valid. All standards are subject to revision, and parties to agreements based on this standard are encouraged to investigate the possibility of applying the most recent editions of the standards listed below.

Copies of the following documents may be obtained from ANSI: approved ANSI standards, approved and draft international and regional standards (ISO, IEC, CEN/CENELEC, ITUT), and approved and draft foreign standards (including BSI, JIS, and DIN). For further information, contact ANSI Customer Service Department at 212-642-4900 (phone), 212-302-1286 (fax) or via the World Wide Web at <http://www.ansi.org>.

2.4 IETF References

Copies of the following approved IETF standards may be obtained through the Internet Engineering Task Force (IETF) at www.ietf.org.

RFC 790, Assigned Numbers

RFC 791, Internet Protocol - DARPA Internet Program - Protocol Specification

RFC 1035, Domain Names - Implementation and Specification

RFC 1321, The MD5 Message-Digest Algorithm

RFC 2373, IP Version 6 Addressing Architecture

Copies of the following IETF standards under development may be obtained through the Internet Engineering Task Force (IETF) at www.ietf.org.

draft-ietf-ips-iscsi-16.txt, Internet SCSI (iSCSI)

NOTE 1 - Information about the activities of the Internet Engineering Task Force (IETF) Internet Protocol Storage (IPS) working group is available on the <http://www.ietf.org/html.charters/ips-charter.html> web site. The information includes the current status of the iSCSI draft. As the iSCSI draft progresses, it will become a Request For Comment, at which time it will be assigned a permanent RFC number.

3 Definitions, symbols, abbreviations, and conventions

3.1 Definitions

3.1.1 access control list (ACL): The data used by a SCSI target device to configure access rights for initiators according to the access controls state of the SCSI target device (see 8.3.1.3).

3.1.2 access control list entry (ACE): One entry in the access control list (see 3.1.1).

3.1.3 access controls: An optional SCSI target device feature that restricts initiator access to specific logical units and modifies the information about logical units in the parameter data of the INQUIRY and REPORT LUNS commands (see 8.3.1).

3.1.4 access controls coordinator: The entity within a SCSI target device that coordinates the management and enforcement of access controls (see 8.3.1) for all logical units within the SCSI target device. The access controls coordinator is always addressable through the ACCESS CONTROLS well known logical unit (see 8.3) and LUN 0.

3.1.5 active condition: When a logical unit is capable of responding immediately to media access requests, and operations complete in the shortest practical time.

3.1.6 additional sense code: A combination of the ADDITIONAL SENSE CODE and ADDITIONAL SENSE CODE QUALIFIER fields (see 4.5) in the sense data.

3.1.7 alias list: A list of alias values (see 3.1.8) and their associated designations (see 3.1.23) maintained by the device server and managed by the CHANGE ALIASES command (see 6.2) and REPORT ALIASES command (see 6.19).

3.1.8 alias value: A numeric value associated to a designation (see 3.1.23) in the alias list (see 3.1.7) and used in command or parameter data to reference a SCSI target device or SCSI target port. See 6.2.2.

3.1.9 application client: An object that is the source of SCSI commands. Further definition of an application client may be found in SAM-2.

3.1.10 attached medium changer: A medium changer that is attached to and accessed through some other type of SCSI device. See 5.9.

3.1.11 attribute: A single unit of MAM (see 3.1.58) information.

3.1.12 auto contingent allegiance (ACA): The task set condition established following the return of a CHECK CONDITION status when the NACA bit is set to one in the CONTROL byte. A detailed definition of ACA may be found in SAM-3.

3.1.13 blocked task: A blocked task that is in the blocked state as defined in SAM-2. Tasks become blocked when an ACA condition occurs. The blocked state ends when the ACA condition is cleared. A detailed definition of the blocked task state may be found in SAM-2.

3.1.14 byte: Indicates an 8-bit construct.

3.1.15 command: A request describing a unit of work to be performed by a device server. A detailed definition of a command may be found in SAM-2.

3.1.16 command descriptor block (CDB): The structure used to communicate commands from an application client to a device server. A CDB may have a fixed length of up to 16 bytes or a variable length of between 12 and 260 bytes.

3.1.17 command standard: A SCSI standard that defines the model, commands, and parameter data for a device type (e.g., SBC, SCC, SGC, SMC, SSC, MMC, or SES). See clause 1.

3.1.18 company_id: Synonym for OUI (see 3.1.66).

3.1.19 Control mode page: A mode page that provides controls over several SCSI features (e.g., tagged queuing and error logging) that are applicable to all device types. See 7.4.6.

3.1.20 copy manager: The device server that receives an EXTENDED COPY command and performs the operation requested.

3.1.21 data-in buffer: The buffer identified by the application client to receive data from the device server during the execution of a command (see 4.2 and SAM-2).

3.1.22 data-out buffer: The buffer identified by the application client to supply data that is sent from the application client to the device server during the execution of a command (see 4.2 and SAM-2).

3.1.23 designation: A name and optional identifier information that specifies a SCSI target device or SCSI target port for association with an alias value (see 3.1.8) in the alias list (see 3.1.7). See 6.2.2.

3.1.24 Device Identification VPD page: A VPD page that provides the means to retrieve identification information about the SCSI device, logical unit, and SCSI port. See 7.6.4.

3.1.25 device server: An object within a logical unit that executes SCSI tasks according to the rules of task management. A detailed definition of a device server may be found in SAM-2.

3.1.26 device service request: A request, submitted by an application client, conveying a SCSI command to a device server. A detailed definition of a device service request may be found in SAM-2.

3.1.27 device service response: The response returned to an application client by a device server on completion of a SCSI command. A detailed definition of a device service response may be found in SAM-2.

3.1.28 device type: The type of device (or device model) implemented by the device server.

3.1.29 Disconnect-Reconnect mode page: A mode page that provides the application client the means to tune the performance of the service delivery subsystem. See 7.4.7.

3.1.30 element: An addressable physical component of a medium changer SCSI device that may serve as the location of a removable unit of data storage medium. A detailed definition of an element may be found in SMC.

3.1.31 enabled task state: The only task state in which a task may make progress towards completion. A detailed definition of the enabled task state may be found in SAM-2.

3.1.32 field: A group of one or more contiguous bits, a part of a larger structure such as a CDB (see 3.1.16) or sense data (see 3.1.94).

3.1.33 hard reset: A response to a power on or reset condition in which the SCSI device performs the operations described in SAM-3.

3.1.34 host: A SCSI device with the characteristics of a primary computing device, typically a personal computer, workstation, minicomputer, mainframe computer, or auxiliary computing device or server. A host typically functions as an initiator.

3.1.35 IEEE company_id: Synonym for OUI (see 3.1.66).

3.1.36 I_T_L nexus: The relationship between two SCSI devices and an initiator port, target port, and logical unit in them (see SAM-2).

3.1.37 I_T nexus loss: A condition resulting from the events defined by SAM-3 in which the SCSI device performs the operations described in SAM-3 and this standard.

3.1.38 I_T nexus loss event: A SCSI transport protocol specific event that triggers I_T nexus loss as described in SAM-3.

3.1.39 I_T_L_Q nexus transaction: The information transferred between SCSI ports in a single data structure with defined boundaries (e.g., an information unit).

3.1.40 idle condition: When a logical unit is capable of responding quickly to media access requests. However, a logical unit in the idle condition may take longer to complete a command than when in the active condition because it may have to activate some circuitry.

3.1.41 initiator: A term used by previous versions of this standard and by this standard where the detail provided by newer terms is not critical (see Annex A).

3.1.42 initiator device name: A SCSI device name (see 3.1.84) of a SCSI initiator device or of a SCSI target/initiator device when operating as a SCSI initiator device (see SAM-2).

3.1.43 initiator identifier: A term used by previous versions of this standard and by this standard where the detail provided by newer terms is not critical (see Annex A).

3.1.44 initiator port: Synonymous with SCSI initiator port (see 3.1.88).

3.1.45 initiator port identifier: A value by which a SCSI initiator port (see 3.1.88) is referenced within a SCSI domain (see SAM-2).

3.1.46 initiator port name: A SCSI port name (see 3.1.91) of a SCSI initiator port (see 3.1.88) or of a SCSI target/initiator port when operating as a SCSI initiator port (see SAM-2).

3.1.47 linked command: One in a series of SCSI commands processed by a single task that collectively make up a discrete I/O operation. A detailed definition of a linked command may be found in SAM-2.

3.1.48 least significant bit (LSB): In a binary code, the bit or bit position with the smallest numerical weighting in a group of bits that, when taken as a whole, represent a numerical value (e.g., in the number 0001b, the bit that is set to one).

3.1.49 left-aligned: A type of field containing ASCII data in which unused bytes are placed at the end of the field (highest offset) and are filled with ASCII space (20h) characters. See 4.4.1.

3.1.50 logical unit: An externally addressable entity within a target that implements a SCSI device model and contains a device server. A detailed definition of a logical unit may be found in SAM-2.

3.1.51 logical unit access control descriptor (LUACD): The structure within an ACE (see 3.1.2) that identifies a logical unit to which access is allowed and specifies the LUN by which the logical unit is to be accessed (see 8.3.1.3.3).

3.1.52 logical unit identifier: An object that is part of the SAM-2 definition of a logical unit. A logical unit identifier uniquely identifies a logical unit in a SCSI domain. Detailed definitions of SCSI domain and logical unit identifier may be found in SAM-2.

3.1.53 logical unit inventory: The list of the logical unit numbers reported by a REPORT LUNS command (see 6.21). The list includes the logical unit numbers of all logical units with a PERIPHERAL QUALIFIER value of 000b (see 6.4.2) and may include in a vendor specific manner the logical unit numbers for those logical units with a PERIPHERAL QUALIFIER value of 100b, 101b, 110b, or 111b.

3.1.54 logical unit number (LUN): An encoded 64-bit identifier for a logical unit. A detailed definition of a logical unit number may be found in SAM-2.

3.1.55 logical unit reset: A logical unit response to a logical unit reset event notification in which the logical unit performs the operations described in SAM-3.

3.1.56 logical unit reset event: An event that triggers logical unit reset as described in SAM-3.

3.1.57 medium: A physical entity that stores data in a nonvolatile manner (retained through a power cycle) in accordance with commands processed by the device server.

3.1.58 medium auxiliary memory (MAM): An auxiliary memory residing on a medium that is accessible to the device server (e.g., a tape cartridge). Medium auxiliary memory may be nonvolatile and independent of the main function of the device server.

3.1.59 medium changer: A device that mechanizes the movement of media to and from the SCSI device that records on or reads from the media. A detailed definition of a medium changer may be found in SMC.

3.1.60 most significant bit (MSB): In a binary code, the bit or bit position with the largest numerical weighting in a group of bits that, when taken as a whole, represent a numerical value (e.g., in the number 1000b, the bit that is set to one).

3.1.61 name: A label of an object that is unique within a specified context and should never change (e.g., the term name and world wide identification (WWID) may be interchangeable).

3.1.62 network address authority (NAA): An organization that administers network addresses such as the identifiers that may be used in the Device Identification VPD page (see 7.6.4).

3.1.63 null-padded: A type of field in which unused bytes are placed at the end of the field (highest offset) and are filled with ASCII null (00h) characters. See 4.4.2.

3.1.64 null-terminated: A type of field in which the last byte (highest offset) is required to contain an ASCII null (00h) character. See 4.4.2.

3.1.65 one: The logical true condition of a variable.

3.1.66 organizationally unique identifier (OUI): A numeric identifier that is assigned by the IEEE such that no assigned identifiers are identical (see E.3). OUI is equivalent to company_id or IEEE company_id. The IEEE prefers OUI for EUI-48 identifiers (see E.1) and company_id for EUI-64 identifiers (see E.2). However, the numeric identifier is called an OUI when it is assigned by the IEEE.

3.1.67 page: A regular parameter structure (or format) used by several commands. These pages are identified with a value known as a page code.

3.1.68 persist through power loss: An optional capability associated with some features that allows an application client to request that a device server maintain information regarding that feature across power failures.

3.1.69 persistent reservation holder: The initiator port or ports that are allowed to release or change a persistent reservation without preempting it. See 5.5.2.6..

3.1.70 power cycle: Power being removed from and later applied to a SCSI device.

3.1.71 power on: A condition resulting from a power on event (see 3.1.72).

3.1.72 power on event: Power being applied to a SCSI device, triggering a power on condition (see 3.1.71) in the SCSI device.

3.1.73 protocol identifier: A coded value used in various fields to identify the protocol to which other fields apply. See 7.5.1.

3.1.74 protocol specific: A requirement that is defined by a SCSI protocol standard (see clause 1). A detailed definition of protocol specific may be found in SAM-2.

3.1.75 protocol standard: A SCSI standard that defines SCSI protocol (e.g., SPI-3, SBP-2, or FCP-2). See clause 1.

3.1.76 proxy token: An identifier for a logical unit that may be used to gain temporary access to that logical unit in the presence of access controls (see 8.3.1.6.2).

3.1.77 request for comment (RFC): The name given to standards developed by the Internet engineering task force (see 2.4).

3.1.78 registered: The condition that exists for an initiator port (or application client) from successful completion of a PERSISTENT RESERVE OUT command with a REGISTER or REGISTER AND IGNORE EXISTING KEY service action (see 5.5.2.4) until the initiator registration is removed (see 5.5.2.7).

3.1.79 registrant: An initiator port (or application client) that is registered (see 3.1.78).

3.1.80 reset event: A SCSI transport protocol specific event that triggers a hard reset as described in SAM-3.

3.1.81 right-aligned: A type of field containing ASCII data in which unused bytes are placed at the start of the field (lowest offset) and are filled with ASCII space (20h) characters. See 4.4.1.

3.1.82 SCSI device: A device that contains one or more SCSI ports that are connected to a service delivery subsystem and supports a SCSI application protocol (see SAM-2).

3.1.83 SCSI device identifier: A term used by previous versions of this standard and by this standard where the detail provided by newer terms is not critical (see Annex A).

3.1.84 SCSI device name: A name (see 3.1.61) of a SCSI device that is world wide unique within the protocol of a SCSI domain (see 3.1.85) in which the SCSI device has SCSI ports. The SCSI device name may be made available to other SCSI devices or SCSI ports in that SCSI domain in protocol specific ways.

3.1.85 SCSI domain: The interconnection of two or more SCSI devices and a service delivery subsystem. A detailed definition of a SCSI Domain may be found in SAM-2.

3.1.86 SCSI identifier: A term used by previous versions of this standard and by this standard where the detail provided by newer terms is not critical (see Annex A).

3.1.87 SCSI initiator device: A SCSI device (see 3.1.82) containing application clients (see 3.1.9) and SCSI initiator ports (see 3.1.88) that originate device service and task management requests (see SAM-2) to be processed by a SCSI target device (see 3.1.92) and receives device service and task management responses from SCSI target devices.

3.1.88 SCSI initiator port: A SCSI initiator device (see SAM-2) object acts as the connection between application clients and the service delivery subsystem through which requests and responses are routed.

3.1.89 SCSI port: An element of a SCSI device that connects the application client, device server or task manager to the service delivery subsystem (see SAM-2).

3.1.90 SCSI port identifier: A value by which a SCSI port is referenced within a domain. The SCSI port identifier is either an initiator port identifier (see 3.1.45) or a target port identifier (see 3.1.108).

3.1.91 SCSI port name: A name (see 3.1.61) of a SCSI port that is world wide unique within the protocol of the SCSI domain of that SCSI port (see 3.1.89). The name may be made available to other SCSI devices or SCSI ports in that SCSI domain in protocol specific ways.

3.1.92 SCSI target device: A SCSI device (see 3.1.82) containing logical units (see 3.1.50) and SCSI target ports (see 3.1.93) that receives device service and task management requests (see SAM-2) for processing and sends device service and task management responses to SCSI initiator devices.

3.1.93 SCSI target port: A SCSI target device (see SAM-2) object that acts as the connection between device servers and task managers and the service delivery subsystem through which requests and responses are routed.

3.1.94 sense data: Data describing an error or exceptional condition that a device server delivers to an application client in the same I_T_L_Q nexus transaction (see 3.1.39) as a CHECK CONDITION status or in response to a REQUEST SENSE command (see 6.25). The format of sense data is defined in 4.5.

3.1.95 sense key: The contents of the SENSE KEY field (see 4.5) in the sense data.

3.1.96 service action: A request describing a unit of work to be performed by a device server. A service action is an extension of a command. See SAM-2 for a detailed definition of a command.

3.1.97 service delivery subsystem: That part of a SCSI I/O system that transmits service requests to a logical unit and returns logical unit responses to an initiator. A detailed definition of a service delivery subsystem may be found in SAM-2.

3.1.98 standby condition: When a logical unit is capable of accepting commands, but media is not immediately accessible (e.g., spindle is stopped).

3.1.99 status: One byte of response information sent from a device server to an application client upon completion of each command. A detailed definition of status may be found in SAM-2.

3.1.100 system: One or more SCSI domains operating as a single configuration.

3.1.101 target: A term used by previous versions of this standard and by this standard where the detail provided by newer terms is not critical (see Annex A).

3.1.102 target device name: A SCSI device name (see 3.1.84) of a SCSI target device or of a SCSI target/initiator device when operating as a SCSI target device (see SAM-2).

3.1.103 target identifier: A term used by previous versions of this standard and by this standard where the detail provided by newer terms is not critical (see Annex A).

3.1.104 target port: Synonymous with SCSI target port (see 3.1.93).

3.1.105 target port asymmetric access state: The characteristic that defines the properties of a target port and the allowable command set for a logical unit when commands and task management functions are routed through the target port maintaining that state (see 5.7.1).

3.1.106 target port group: A set of target ports that are in the same target port asymmetric access state (see 3.1.105) at all times (see 5.7.1).

3.1.107 target port group asymmetric access state: The target port asymmetric access state (see 3.1.105) common to the set of target ports in a target port group (see 3.1.106).

3.1.108 target port identifier: A value by which a SCSI target port (see 3.1.93) is referenced within a SCSI domain (see SAM-2).

3.1.109 target port name: A SCSI port name (see 3.1.91) of a SCSI target port or of a SCSI target/initiator port when operating as a SCSI target port (see SAM-2).

3.1.110 task: An object within a logical unit that represents the work associated with a command or a group of linked commands. A detailed definition of a task may be found in SAM-2.

3.1.111 task set: A group of tasks within a logical unit, whose interaction is dependent on the task management (queuing) and ACA rules. See SAM-2 and the Control mode page (see 7.4.6).

3.1.112 third-party: An EXTENDED COPY command issued to one SCSI device to perform a copy operation between two other SCSI devices.

3.1.113 unit attention condition: A state that a logical unit maintains while it has asynchronous status information to report to one or more initiators. A detailed definition of the unit attention condition may be found in SAM-2.

3.1.114 vendor specific (VS): Something (e.g., a bit, field, code value, etc.) that is not defined by this standard and may be vendor defined.

3.1.115 well known logical unit: A logical unit that only does specific functions (see clause 8). Well known logical units allow an application client to issue requests to receive and manage specific information usually relating to a SCSI target.

3.1.116 well known logical unit number (W-LUN): The logical unit number that identifies a well known logical unit.

3.1.117 zero: The logical false condition of a variable.

3.1.118 zero-padded: A type of field in which unused bytes are placed at the end of the field (highest offset) and are filled with zeros. See 4.4.2.

3.2 Acronyms

<	less than
>	greater than
ACE	Access Control list Entry (see 3.1.2)
ACL	Access Control List (see 3.1.1)
ACA	Auto Contingent Allegiance (see 3.1.12)
ADC	Automation/Drive Interface - Commands (see clause 1)
ASC	Additional Sense Code (see 4.5)
ASCII	American Standard Code for Information Interchange (see clause 1)
ASCQ	Additional Sense Code Qualifier (see 4.5)
CDB	Command Descriptor Block (see 3.1.16)
CRC	Cyclic Redundancy Check
D_ID	Destination Identifier (defined in FC-FS, see clause 1)
EUI-48	Extended Unique Identifier, a 48-bit globally unique identifier (see E.1)
EUI-64	Extended Unique Identifier, a 64-bit globally unique identifier (see E.2)
FC-FS	Fibre Channel Framing and Signaling Interface (see clause 1)
FCP-2	SCSI-3 Fibre Channel Protocol - 2 (see clause 1)
ID	Identifier
IEC	International Electrotechnical Commission
IEEE	Institute of Electrical and Electronics Engineers
IETF	Internet Engineering Task Force
iSCSI	Internet SCSI (see 2.4)
ISO	Organization for International Standards
LBA	Logical Block Address
LSB	Least Significant Bit (see 3.1.48)
LUACD	Logical Unit Access Control Descriptor (see 3.1.51)
LUN	Logical Unit Number (see 3.1.54)
MAM	Medium Auxiliary Memory (see 3.1.58)
MMC-2	SCSI Multi-Media Commands -2 (see clause 1)
MMC-3	SCSI Multi-Media Commands -3 (see clause 1)
MSB	Most Significant Bit (see 3.1.60)
NAA	Network Address Authority (see 3.1.62)
INCITS	InterNational Committee for Information Technology Standards
OCRW	SCSI Specification for Optical Card Reader/Writer (see clause 1)
OSD	Object-based Storage Devices Commands (see clause 1)
OUI	Organizationally Unique Identifier (see 3.1.66)
RAID	Redundant Array of Independent Disks
RBC	SCSI Reduced Block Commands (see clause 1)
RDMA	Remote Direct Memory Access (see SRP)
RFC	Request For Comments (see 3.1.77)
RMC	SCSI Reduced Multi-Media Commands (see clause 1)
SAM	SCSI-3 Architecture Model (see clause 1)
SAM-2	SCSI Architecture Model -2 (see clause 1)
SAM-3	SCSI Architecture Model -3 (see clause 1)
SBC	SCSI-3 Block Commands (see clause 1)
SBC-2	SCSI Block Commands -2 (see clause 1)
SBP-2	Serial Bus Protocol -2 (see clause 1)
SCC-2	SCSI Controller Commands -2 (see clause 1)
SCSI	The architecture defined by the family of standards described in clause 1
SES	SCSI-3 Enclosure Services (see clause 1)
SES-2	SCSI Enclosure Services -2 (see clause 1)
SMC	SCSI-3 Medium Changer Commands (see clause 1)

SMC-2	SCSI Media Changer Commands -2 (see clause 1)
SPC	SCSI-3 Primary Commands (ANSI X3.301:1997, see clause 1)
SPC-2	SCSI Primary Commands -2 (see clause 1)
SPC-3	SCSI Primary Commands -2 (this standard, see clause 1)
SPI-3	SCSI Parallel Interface -3 (see clause 1)
SPI-4	SCSI Parallel Interface -4 (see clause 1)
SRP	SCSI RDMA Protocol (see clause 1)
SSC	SCSI-3 Stream Commands (see clause 1)
SSC-2	SCSI Stream Commands -2 (see clause 1)
VPD	Vital Product Data (see 7.6)
VS	Vendor Specific (see 3.1.114)
W-LUN	Well known logical unit number (see 3.1.116)

3.3 Keywords

3.3.1 expected: A keyword used to describe the behavior of the hardware or software in the design models assumed by this standard. Other hardware and software design models may also be implemented.

3.3.2 ignored: A keyword used to describe an unused bit, byte, word, field or code value. The contents or value of an ignored bit, byte, word, field or code value shall not be examined by the receiving SCSI device and may be set to any value by the transmitting SCSI device.

3.3.3 invalid: A keyword used to describe an illegal or unsupported bit, byte, word, field or code value. Receipt of an invalid bit, byte, word, field or code value shall be reported as an error.

3.3.4 mandatory: A keyword indicating an item that is required to be implemented as defined in this standard.

3.3.5 may: A keyword that indicates flexibility of choice with no implied preference (equivalent to "may or may not").

3.3.6 may not: A keyword that indicates flexibility of choice with no implied preference (equivalent to "may or may not").

3.3.7 obsolete: A keyword indicating that an item was defined in prior SCSI standards but has been removed from this standard.

3.3.8 optional: A keyword that describes features that are not required to be implemented by this standard. However, if any optional feature defined by this standards is implemented, then it shall be implemented as defined in this standard.

3.3.9 reserved: A keyword referring to bits, bytes, words, fields and code values that are set aside for future standardization. A reserved bit, byte, word or field shall be set to zero, or in accordance with a future extension to this standard. Recipients are not required to check reserved bits, bytes, words or fields for zero values. Receipt of reserved code values in defined fields shall be reported as error.

3.3.10 restricted: A keyword referring to bits, bytes, words, and fields that are set aside for use in other SCSI standards. A restricted bit, byte, word, or field shall be treated as a reserved bit, byte, word or field for the purposes of the requirements defined in this standard.

3.3.11 shall: A keyword indicating a mandatory requirement. Designers are required to implement all such mandatory requirements to ensure interoperability with other products that conform to this standard.

3.3.12 should: A keyword indicating flexibility of choice with a strongly preferred alternative; equivalent to the phrase "it is strongly recommended".

3.3.13 x or xx: The value of the bit or field is not relevant.

3.4 Conventions

Certain words and terms used in this standard have a specific meaning beyond the normal English meaning. These words and terms are defined either in 3.1 or in the text where they first appear. Names of commands, statuses, sense keys, and additional sense codes are in all uppercase (e.g., REQUEST SENSE). Lowercase is used for words having the normal English meaning.

If there is more than one CDB length for a particular command (e.g., MODE SENSE(6) and MODE SENSE(10)) and the name of the command is used in a sentence without any CDB length descriptor (e.g., MODE SENSE), then the condition specified in the sentence applies to all CDB lengths for that command.

The names of fields are in small uppercase (e.g., ALLOCATION LENGTH). When a field name is a concatenation of acronyms, uppercase letter may be used for readability (e.g., NORMACA). Normal case is used when the contents of a field are being discussed. Fields containing only one bit are usually referred to as the name bit instead of the name field.

Numbers that are not immediately followed by lower-case b or h are decimal values.

Numbers immediately followed by lower-case b (xxb) are binary values. Binary values longer than 4 bits are represented as hexadecimal values.

Numbers or upper case letters immediately followed by lower-case h (xxh) are hexadecimal values. Hexadecimal values longer than two bytes (i.e., four hexadecimal digits) include spaces as separators between every two bytes (i.e., FFFF FFFFh not FFFFFFFFh).

When the value of the bit or field is not relevant, x or xx appears in place of a specific value.

Lists sequenced by letters (e.g., a-red, b-blue, c-green) show no priority relationship between the listed items. Numbered lists (e.g., 1-red, 2-blue, 3-green) show a priority ordering between the listed items.

If a conflict arises between text, tables, or figures, the order of precedence to resolve the conflicts is text; then tables; and finally figures. Not all tables or figures are fully described in the text. Tables show data format and values. Notes do not constitute any requirements for implementors.

3.5 Bit and byte ordering

This subclause describes the representation of fields in a table that defines the format of a SCSI structure (e.g., the format of a CDB).

If a field consists of more than one bit and contains a single value (e.g., a number), the least significant bit (LSB) is shown on the right and the most significant bit (MSB) is shown on the left (e.g., in a byte, bit 7 is the MSB and is shown on the left; and bit 0 is the LSB and is shown on the right). The MSB and LSB are not labeled if the field consists of 8 or fewer bits.

If a field consists of more than one byte and contains a single value, the byte containing the MSB is stored at the lowest address and the byte containing the LSB is stored at the highest address (i.e., big-endian byte ordering). The MSB and LSB are labeled.

If a field consists of more than one byte and contains multiple fields each with their own values (e.g., a descriptor), there is no MSB and LSB of the field itself and thus there are no MSB and LSB labels. Each individual field has an MSB and LSB that are labeled as appropriate in the table (if any) that describes the format of the sub-structure having multiple fields.

If a field contains a text string (e.g., ASCII or UTF-8), the MSB label is the MSB of the first character and the LSB label is the LSB of the last character.

When required for clarity, multiple byte fields may be represented with only two rows in a table. This condition is represented by values in the byte number column not increasing by one in each subsequent table row, thus indicating the presence of additional bytes.

3.6 Notation conventions

3.6.1 Notation for procedure calls

In this standard, the model for functional interfaces between objects is a procedure call. Such interfaces are specified using the following notation:

[Result =] Procedure Name (IN ([input-1] [,input-2] ...), OUT ([output-1] [,output-2] ...))

Where:

Result: A single value representing the outcome of the procedure call.

Procedure Name: A descriptive name for the function modeled by the procedure call. When the procedure call model is used to describe a SCSI transport protocol service, the procedure name is the same as the service name.

Input-1, Input-2, ...: A comma-separated list of names identifying caller-supplied input arguments.

Output-1, Output-2, ...: A comma-separated list of names identifying output arguments to be returned by the procedure call.

"[...]": Brackets enclosing optional or conditional arguments.

This notation allows arguments to be specified as inputs and outputs. The following is an example of a procedure call specification:

Found = Search (IN (Pattern, Item List), OUT ([Item Found]))

Where:

Found = Flag

Flag: if set to one, indicates that a matching item was located.

Input Arguments:

Pattern = ... /* Definition of Pattern argument */
Argument containing the search pattern.

Item List = Item<NN> /* Definition of Item List as an array of NN Item arguments*/
Contains the items to be searched for a match.

Output Arguments:

Item Found = Item ... /* Item located by the search procedure call */
This argument is only returned if the search succeeds.

3.6.2 Notation for state diagrams

All state diagrams use the notation shown in figure 2.

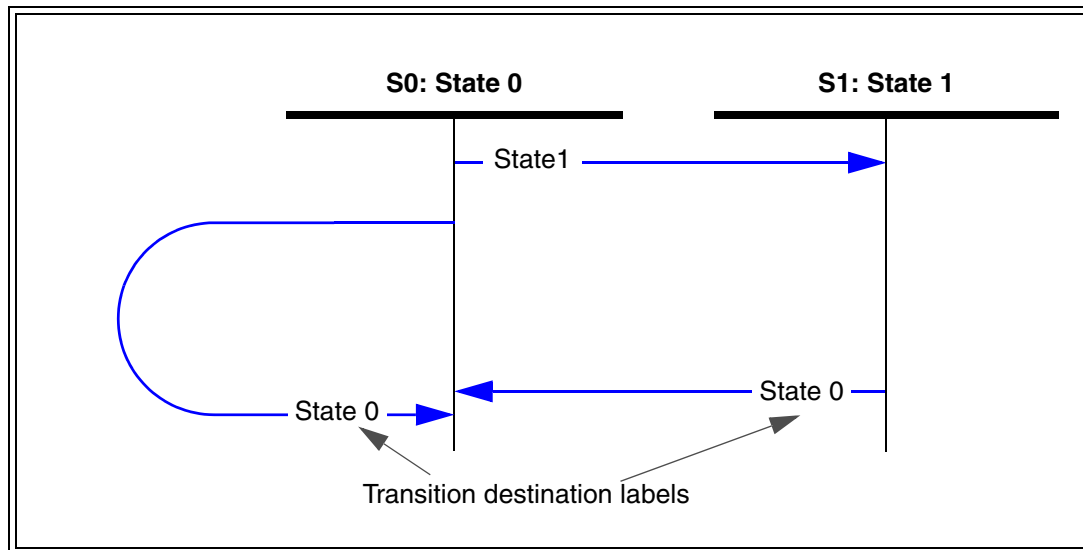

Figure 2 — Example state diagram

The state diagram is followed by subclauses describing the states and state transitions.

Each state and state transition is described in the list with particular attention to the conditions that cause the transition to occur and special conditions related to the transition.

A system specified in this manner has the following properties:

- a) Time elapses only within discrete states; and
- b) State transitions are logically instantaneous.

4 General Concepts

4.1 Introduction

This standard defines behaviors that are common to all SCSI device models (see clause 5). This standard defines the SCSI commands that are basic to more than one device model and the SCSI commands that may apply to any device model (see clause 6). This standard defines the parameters that are basic to more than one device model (see clause 7).

4.2 The request-response model

The SCSI command set assumes an underlying request-response protocol. The fundamental properties of the request-response protocol are defined in SAM-2. Action on SCSI commands shall not be deemed completed until a response is received. The response shall include a status that indicates the final disposition of the command. As per SAM-2, the request-response protocol may be modeled as a procedure call, specifically:

Service response = Execute Command (IN (I_T_L_x Nexus, CDB, [Task Attribute], [Data-In Buffer Size], [Data-Out Buffer], [Data-Out Buffer Size], [Command Reference Number]), OUT ([Data-In Buffer], [Sense Data], [Sense Data Length], Status))

SAM-3 defines all of the inputs and outputs in the procedure call above. As they may apply to any SCSI device, this standard defines the contents of the following procedure inputs and outputs; CDB, Data-Out Buffer, Data-In Buffer, and Sense Data. This standard does not define all possible instances of these procedure inputs and outputs. This standard defines only those instances that may apply to any SCSI device. Instances of the procedure inputs and outputs that apply to specific SCSI device models are defined in the applicable SCSI command standards (see 3.1.17).

This standard references values returned via the Status output parameter. Examples of such status values are CHECK CONDITION and RESERVATION CONFLICT. Status values are not defined by this standard. SAM-2 defines all Status values.

The entity that makes the procedure call from an initiator is an application client, as defined in SAM-2. The procedure call's representation arrives at the target in the form of a device service request. The entity that performs the work of the procedure call in a target is a device server, which is an object within a logical unit and is defined in SAM-2.

4.3 The Command Descriptor Block (CDB)

4.3.1 CDB usage and structure

A command is communicated by sending a command descriptor block (CDB) to the device server. For several commands, the CDB is accompanied by a list of parameters in the Data-Out Buffer. See the specific commands for detailed information.

If a logical unit validates reserved CDB fields and receives a reserved field within the CDB that is not zero or receives a reserved CDB code value, the logical unit shall terminate the command with CHECK CONDITION status; the sense key shall be set to ILLEGAL REQUEST with an additional sense code of INVALID FIELD IN CDB.

The fixed length CDB formats are described in 4.3.2. The variable length CDB formats are described in 4.3.3. The CDB fields that are common to most commands are described in 4.3.4. The fields shown in 4.3.2 and 4.3.3 and

described in 4.3.4 are used consistently by most commands. However, the actual usage of any field (except OPERATION CODE and CONTROL) is described in the subclause defining that command. If a device server receives a CDB containing an operation code that is invalid or not supported, it shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and an additional sense code of INVALID COMMAND OPERATION CODE.

For all commands, if there is an invalid parameter in the CDB, then the device server shall terminate the command without altering the medium.

4.3.2 The fixed length CDB formats

All fixed length CDBs shall have an OPERATION CODE field as their first byte and a CONTROL byte as their last byte. Table 1 shows the typical format of a 6-byte CDB. Table 2 shows the typical format of a 10-byte CDB. Table 3 shows the typical format of a 12-byte CDB. Table 4 shows the typical format of a 16-byte CDB. Table 5 shows the format of a 16-byte CDB for commands that provide for a long LBA.

Table 1 — Typical CDB for 6-byte commands

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE							
1	Reserved			(MSB)				
2	LOGICAL BLOCK ADDRESS (if required)							
3								
4	TRANSFER LENGTH (if required) PARAMETER LIST LENGTH (if required) ALLOCATION LENGTH (if required)							
5	CONTROL							

Table 2 — Typical CDB for 10-byte commands

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE							
1	Reserved			SERVICE ACTION (if required)				
2	(MSB)							
3								
4	LOGICAL BLOCK ADDRESS (if required)							
5	(LSB)							
6	Reserved							
7	(MSB)							
8	TRANSFER LENGTH (if required) PARAMETER LIST LENGTH (if required) ALLOCATION LENGTH (if required)							
9	(LSB)							
	CONTROL							

Table 3 — Typical CDB for 12-byte commands

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE							
1	Reserved			SERVICE ACTION (if required)				
2	(MSB)							
3								
4	LOGICAL BLOCK ADDRESS (if required)							
5	(LSB)							
6	(MSB)							
7	TRANSFER LENGTH (if required)							
8	PARAMETER LIST LENGTH (if required)							
9	ALLOCATION LENGTH (if required)							
10	Reserved							
11	CONTROL							

Table 4 — Typical CDB for 16-byte commands

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE							
1	Reserved			SERVICE ACTION (if required)				
2	(MSB)							
3								
4	LOGICAL BLOCK ADDRESS (if required)							
5	(LSB)							
6								
7								
8	Additional CDB data (if required)							
9								
10	(MSB)							
11	TRANSFER LENGTH (if required)							
12	PARAMETER LIST LENGTH (if required)							
13	ALLOCATION LENGTH (if required)							
14	(LSB)							
15	Reserved							
15	CONTROL							

Table 5 — Typical CDB for long LBA 16-byte commands

Bit Byte	7	6	5	4	3	2	1	0	
0	OPERATION CODE								
1	Reserved			miscellaneous CDB information					
2	LOGICAL BLOCK ADDRESS								
3

14	Reserved								
15	CONTROL								

4.3.3 The variable length CDB formats

Operation code 7Fh heads a variable length CDB. The CONTROL byte is the second byte in the variable length CDB (see table 6).

Table 6 — Typical variable length CDB

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE (7Fh)							
1	CONTROL							
2	Reserved							
3	Reserved							
4	Reserved							
5	Reserved							
6	Reserved							
7	ADDITIONAL CDB LENGTH (n-7)							
8	(MSB)							
9	SERVICE ACTION							
10	(LSB)							
n	Service action specific fields							

The ADDITIONAL CDB LENGTH field indicates the number of additional CDB bytes. This value in the ADDITIONAL CDB LENGTH field shall be a multiple of 4. If the number of CDB bytes delivered by the service delivery subsystem is not sufficient to contain the number of bytes specified by the ADDITIONAL CDB LENGTH field, the command shall be terminated with a CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to INVALID FIELD IN CDB.

The SERVICE ACTION field indicates the action being requested by the application client. The SERVICE ACTION field is required in the variable length CDB format and is described in 4.3.4.2. Each service action code description defines a number of service action specific fields that are needed for that service action.

A 32-byte variable length CDB format is defined for long LBA operations (see table 7).

Table 7 — Typical variable length CDB for long LBA 32-byte commands

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE (7Fh)							
1	CONTROL							
2	Reserved

11	Reserved							
12	(MSB)	LOGICAL BLOCK ADDRESS						
19								(LSB)
20	Additional CDB data							
27								
28	(MSB)	TRANSFER LENGTH (if required) PARAMETER LIST LENGTH (if required) ALLOCATION LENGTH (if required)						
31								(LSB)

4.3.4 Common CDB fields

4.3.4.1 Operation code

The first byte of a SCSI CDB shall contain an operation code identifying the operation being requested by the CDB. Some operation codes provide for modification of their operation based on a service action (see 4.3.4.2). In such cases, the combination of operation code value and service action code value may be modeled as a single, unique command determinate. The location of the SERVICE ACTION field in the CDB varies depending on the operation code value.

The OPERATION CODE (see table 8) of the CDB has a GROUP CODE field and a COMMAND CODE field. The three-bit GROUP CODE field provides for eight groups of command codes. The five-bit COMMAND CODE field provides for thirty-two command codes in each group. A total of 256 possible operation codes exist. Operation codes are defined in this standard and other command standards (see 3.1.17). The group code value shall determine the length of the CDB (see table 9).

Table 8 — OPERATION CODE byte

Bit	7	6	5	4	3	2	1	0
	GROUP CODE			COMMAND CODE				

The value in the GROUP CODE field specifies one of the groups shown in table 9.

Table 9 — Group Code values

Group Code	Meaning
000b	6 byte commands
001b	10 byte commands
010b	10 byte commands
011b	reserved ^a
100b	16 byte commands
101b	12 byte commands
110b	vendor specific
111b	vendor specific
^a The format the commands using the group code 011b and operation code 7Fh is described in 4.3.3. With the exception of operation code 7Fh, all group code 011b operation codes are reserved.	

The OPERATION CODE field has a consistently defined meaning across all commands. This standard specifies the operation code values used by the commands defined herein.

4.3.4.2 Service action

All CDB formats except the 6-byte format provide for a SERVICE ACTION field containing a coded value identifying a function to be performed under the more general command function specified in the OPERATION CODE field. While the SERVICE ACTION field is defined for CDB formats, it is used as described in this subclause only in those CDB formats that contain a SERVICE ACTION field. When the specific field SERVICE ACTION is not defined in a CDB format, the bits identified as the SERVICE ACTION field in a CDB shall be used or reserved as specified by the particular CDB format.

4.3.4.3 Logical block address

The logical block addresses on a logical unit or within a volume partition shall begin with block zero and be contiguous up to the last logical block of that logical unit or within that partition.

A six-byte CDB contains a 21-bit LOGICAL BLOCK ADDRESS field. The ten-byte and the twelve-byte CDBs contain 32-bit LOGICAL BLOCK ADDRESS fields. The sixteen-byte CDB has two formats one with a 32-bit LOGICAL BLOCK ADDRESS field (see table 4) and one with a 64-bit LOGICAL BLOCK ADDRESS field (see table 5). LOGICAL BLOCK ADDRESS fields in additional parameter data have their length specified for each occurrence. See the specific command descriptions.

4.3.4.4 Transfer length

The TRANSFER LENGTH field specifies the amount of data to be transferred, usually the number of blocks. Some commands use transfer length to specify the requested number of bytes to be sent as defined in the command description. See the following descriptions and the individual command descriptions for further information.

Commands that use one byte for the TRANSFER LENGTH field allow up to 256 blocks of data to be transferred by one command. A TRANSFER LENGTH value of 1 to 255 indicates the number of blocks that shall be transferred. A value of zero specifies that 256 blocks shall be transferred.

In commands that use multiple bytes for the TRANSFER LENGTH field, a transfer length of zero indicates that no data transfer shall take place. A value of one or greater indicates the number of blocks that shall be transferred.

Refer to the specific command description for further information.

4.3.4.5 Parameter list length

The PARAMETER LIST LENGTH field is used to specify the number of bytes sent from the Data-Out Buffer. This field is typically used in CDBs for parameters that are sent to a device server (e.g., mode parameters, diagnostic parameters, log parameters). A parameter length of zero indicates that no data shall be transferred. This condition shall not be considered as an error.

4.3.4.6 Allocation length

The ALLOCATION LENGTH field specifies the maximum number of bytes that an application client has allocated for returned data. An allocation length of zero indicates that no data shall be transferred. This condition shall not be considered as an error. The device server shall terminate transfers to the Data-In Buffer when allocation length bytes have been transferred or when all available data have been transferred, whichever is less. The allocation length is used to limit the maximum amount of data (e.g., sense data, mode data, log data, diagnostic data) returned to an application client. If the information being transferred to the Data-In Buffer includes fields containing counts of the number of bytes in some or all of the data, the contents of these fields shall not be altered to reflect the truncation, if any, that results from an insufficient ALLOCATION LENGTH value, unless the standard that describes the Data-In Buffer format specifically states otherwise.

If the amount of information to be transferred exceeds the maximum value that may be specified in the ALLOCATION LENGTH field the device server shall transfer no data and return a CHECK CONDITION status; the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to INVALID FIELD IN CDB.

4.3.4.7 Control

The contents of the CONTROL field are defined in SAM-3. The CONTROL field has a consistently defined meaning across all commands.

4.4 Data field requirements

4.4.1 ASCII data field requirements

ASCII data fields shall contain only ASCII graphic codes (i.e., code values 20h through 7Eh).

ASCII data fields described as being left-aligned shall have any unused bytes at the end of the field (i.e., highest offset) and the unused bytes shall be filled with ASCII space characters (20h).

ASCII data fields described as being right-aligned shall have any unused bytes at the start of the field (i.e., lowest offset) and the unused bytes shall be filled with ASCII space characters (20h).

4.4.2 Null data field termination and zero padding requirements

A data field that is described as being null-terminated shall have one byte containing an ASCII null (00h) character in the last byte (i.e., highest offset) of the field and all other bytes in the field shall not contain the ASCII null character.

A data field may be specified to be a fixed length that may be larger than the contents need or a data field may be specified to have a length that is a multiple of a given value (e.g., a multiple of four bytes). When such fields are described as being null-padded, the bytes at the end of the field that are not needed to contain the field data shall contain ASCII null (00h) characters. When such fields are described as being zero-padded, the bytes at the end of the field that are not needed to contain the field data shall contain zeros.

NOTE 2 - There is no difference between the pad byte contents in null-padded and zero-padded fields. The difference is in the format of the other bytes in the field.

A data field that is described as being both null-terminated and null-padded shall have at least one byte containing an ASCII null (00h) character in the end of the field (i.e., highest offset) and may have more than one byte containing ASCII null characters if needed to met the specified field length requirements. If more than one byte in a null-terminated, null-padded field contains the ASCII null characters, all the bytes containing the ASCII null character shall be at the end of the field (i.e., only the highest offsets).

4.5 Sense data

4.5.1 Sense data introduction

Sense data shall be returned in the same I_T_L_Q nexus transaction (see 3.1.39) as a CHECK CONDITION status and in response to the REQUEST SENSE command. Sense data returned in the same I_T_L_Q nexus transaction as a CHECK CONDITION status shall be either fixed or descriptor format sense data based on the value of the D_SENSE bit in the Control mode page (see 7.4.6). The REQUEST SENSE command may be used to request either the fixed format sense data or the descriptor format sense data.

The first byte of all sense data contains the RESPONSE CODE field that indicates the error type and format of the sense data (see table 10).

Table 10 — Sense data response codes

Response Code	Error type		Sense data format		Implementation Requirements
	Description	Reference	Description	Reference	
00h - 6Fh	Reserved				
70h	Current	4.5.4	Fixed	4.5.3	Mandatory
71h	Deferred	4.5.5	Fixed	4.5.3	Optional
72h	Current	4.5.4	Descriptor	4.5.2	Device specific ^a
73h	Deferred	4.5.5	Descriptor	4.5.2	Optional
74h - 7Eh	Reserved				
7Fh	Vendor specific				
^a Implementation is mandatory for SBC-2 and SSC-2 devices and optional for all others.					

4.5.2 Descriptor format sense data

4.5.2.1 Descriptor format sense data overview

The descriptor sense data format for response codes 72h (current errors) and 73h (deferred errors) is defined in table 11.

Table 11 — Descriptor sense data format

Bit Byte	7	6	5	4	3	2	1	0
0	Reserved	RESPONSE CODE (72h or 73h)						
1	Reserved				SENSE KEY			
2	ADDITIONAL SENSE CODE							
3	ADDITIONAL SENSE CODE QUALIFIER							
4	Reserved							
5								
6								
7	ADDITIONAL SENSE LENGTH (n-7)							
	Sense data descriptor(s)							
8	Sense data descriptor 0 (see table 12)							
	⋮							
n	Sense data descriptor x (see table 12)							

The contents of the RESPONSE CODE field indicate the error type and format of the sense data (see 4.5.1). For the descriptor sense data format, the response code field shall be set to 72h or 73h.

The SENSE KEY, ADDITIONAL SENSE CODE and ADDITIONAL SENSE CODE QUALIFIER fields provide a hierarchy of information. The hierarchy provides a top-down approach for an application client to determine information relating to the error and exception conditions.

The SENSE KEY field indicates generic information describing an error or exception condition. The sense keys are defined in 4.5.6.

The ADDITIONAL SENSE CODE (ASC) field indicates further information related to the error or exception condition reported in the SENSE KEY field. Support of the additional sense codes not required by this standard is optional. A list of additional sense codes is in 4.5.6. If the device server does not have further information related to the error or exception condition, the additional sense code shall be set to NO ADDITIONAL SENSE INFORMATION.

The ADDITIONAL SENSE CODE QUALIFIER (ASCQ) field indicates detailed information related to the additional sense code. If the error or exception condition is reported by the device server, the value returned shall be as specified in 4.5.6. If the device server does not have detailed information related to the error or exception condition, the additional sense code qualifier shall be set to zero.

The ADDITIONAL SENSE LENGTH field indicates the number of additional sense bytes that follow. The additional sense length shall be less than or equal to 244 (i.e., limiting the total length of the sense data to 252 bytes). If the sense data is being returned via a REQUEST SENSE command and the allocation length in the REQUEST SENSE CDB is too small to transfer all of the additional sense bytes, the additional sense length shall not be adjusted to reflect the truncation.

Sense data descriptors (see table 12) provide specific sense information. A given type of sense data descriptor shall be included in the sense data only when the information it contains is valid.

Table 12 — Sense data descriptor format

Bit Byte	7	6	5	4	3	2	1	0
0	DESCRIPTOR TYPE							
1	ADDITIONAL LENGTH (n-1)							
2	Sense data descriptor specific							
n								

The DESCRIPTOR TYPE field contains a type code (see table 13) that identifies the type of sense data descriptor. No more than one sense data descriptor of each type shall be included in the descriptor format sense data.

Table 13 — Sense data descriptor types

Type	Description	Reference
00h	Information	4.5.2.2
01h	Command-specific information	4.5.2.3
02h	Sense key specific	4.5.2.4
03h	Field replaceable unit	4.5.2.5
04h	Stream commands	4.5.2.6
05h	Block commands	4.5.2.7
06h - 7Fh	Reserved	
80h - FFh	Vendor-specific	4.5.2.8

The ADDITIONAL LENGTH field indicates the number of sense data descriptor specific bytes that follow in the sense data descriptor.

4.5.2.2 Information sense data descriptor

The information sense data descriptor (see table 14) provides information that is device-type or command specific and is defined in a command standard (see 3.1.17).

Table 14 — Information sense data descriptor format

Bit Byte	7	6	5	4	3	2	1	0
0	DESCRIPTOR TYPE (00h)							
1	ADDITIONAL LENGTH (0Ah)							
2	VALID	Reserved						
3	Reserved							
4	INFORMATION							
11								

The DESCRIPTOR TYPE and ADDITIONAL LENGTH fields are described in 4.5.2.1. For the information sense data descriptor, the DESCRIPTOR TYPE field shall be set to 00h and the ADDITIONAL LENGTH field shall be set to 0Ah.

The VALID bit shall be set to one.

NOTE 3 - In previous versions of this standard and in the fixed format sense data, the VALID bit indicates whether the contents of the INFORMATION field is valid as defined by a command set standard. Since the contents of the INFORMATION field are valid whenever an information sense data descriptor is included in the sense data, the only legal value for the VALID bit is one.

The contents of the INFORMATION field are device-type or command specific and are defined in a command standard (see 3.1.17). When a four byte quantity is stored in the INFORMATION field, the first four bytes shall be zero.

4.5.2.3 Command-specific information sense data descriptor

The command-specific information sense data descriptor (see table 15) provides information that depends on the command on which the exception condition occurred.

Table 15 — Command-specific information sense data descriptor format

Bit Byte	7	6	5	4	3	2	1	0
0	DESCRIPTOR TYPE (01h)							
1	ADDITIONAL LENGTH (0Ah)							
2	Reserved							
3	Reserved							
4	COMMAND-SPECIFIC INFORMATION							
11								

The DESCRIPTOR TYPE and ADDITIONAL LENGTH fields are described in 4.5.2.1. For the command-specific information sense data descriptor, the DESCRIPTOR TYPE field shall be set to 01h and the ADDITIONAL LENGTH field shall be set to 0Ah.

The COMMAND-SPECIFIC INFORMATION field contains information that depends on the command on which the exception condition occurred. When a four byte quantity is stored in the COMMAND-SPECIFIC INFORMATION field, the first four bytes shall be zero.

Further meaning for the COMMAND-SPECIFIC INFORMATION field is defined within the command description in the appropriate command set standard (e.g., see SBC-2 for the MEDIUM SCAN, REASSIGN BLOCKS, REBUILD, REGENERATE, and XPWRITE EXTENDED commands, or see 6.3 for the EXTENDED COPY command).

4.5.2.4 Sense key specific sense data descriptor

4.5.2.4.1 Sense key specific sense data descriptor introduction

The sense key specific sense data descriptor (see table 16) provides additional information about the exception condition. The format and content of the sense-key specific data depends the value in the SENSE KEY field (see 4.5.2.1).

Table 16 — Sense key specific sense data descriptor format

Bit Byte	7	6	5	4	3	2	1	0
0	DESCRIPTOR TYPE (02h)							
1	ADDITIONAL LENGTH (06h)							
2	Reserved							
3	Reserved							
4	SKSV							
5								
6								
7	Reserved							

The DESCRIPTOR TYPE and ADDITIONAL LENGTH fields are described in 4.5.2.1. For the sense-key specific sense data descriptor, the DESCRIPTOR TYPE field shall be set to 01h and the ADDITIONAL LENGTH field shall be set to 06h.

The sense-key specific valid (SKSV) bit shall be set to one.

NOTE 4 - In previous versions of this standard and in the fixed format sense data, the sksv bit indicates whether the contents of the SENSE KEY SPECIFIC field are valid as defined by a command set standard. Since the contents of the SENSE KEY SPECIFIC field are valid whenever a sense key specific sense data descriptor is included in the sense data, the only legal value for the SKSV bit is one.

The definition of the SENSE KEY SPECIFIC field (see table 17) is determined by the value of the SENSE KEY field (see 4.5.2.1).

Table 17 — Sense key specific field definitions

Sense Key	Sense Key Specific Field Definition	Reference
ILLEGAL REQUEST	Field pointer	4.5.2.4.2
HARDWARE ERROR, MEDIUM ERROR, or RECOVERED ERROR	Actual retry count	4.5.2.4.3
NO SENSE or NOT READY	Progress indication	4.5.2.4.4
COPY ABORTED	Segment pointer	4.5.2.4.5
All other sense keys	The sense key specific sense data descriptor shall not appear in the descriptor format sense data and the SKSV bit (see 4.5.3) shall be set to zero in the fixed format sense data.	

4.5.2.4.2 Field pointer sense key specific data

If the sense key is ILLEGAL REQUEST, then the SENSE KEY SPECIFIC field shall be as shown in table 18.

Table 18 — Field pointer sense key specific data

Bit Byte	7	6	5	4	3	2	1	0
0	SKSV	C/D	Reserved		BPV	BIT POINTER		
1	(MSB) FIELD POINTER (LSB)							
2								

The SKSV bit is described in 4.5.2.4.1 for descriptor format sense data and in 4.5.3 for fixed format sense data.

A command data (C/D) bit of one indicates that the illegal parameter is in the CDB. A C/D bit of zero indicates that the illegal parameter is in the data parameters sent by the application client in the Data-Out Buffer.

A bit pointer valid (BPV) bit of zero indicates that the value in the BIT POINTER field is not valid. A BPV bit of one indicates that the BIT POINTER field specifies which bit of the byte designated by the FIELD POINTER field is in error. When a multiple-bit field is in error, the BIT POINTER field shall point to the first bit (i.e., the left-most bit) of the field.

The FIELD POINTER field indicates which byte of the CDB or of the parameter data was in error. Bytes are numbered starting from zero, as shown in the tables describing the commands and parameters. When a multiple-byte field is in error, the field pointer shall point to the first byte (i.e., the left-most byte) of the field. If several consecutive bytes are reserved, each shall be treated as a single-byte field.

NOTE 5 - The bytes identified as being in error are not necessarily the bytes that need to be changed to correct the problem.

4.5.2.4.3 Actual retry count sense key specific data

If the sense key is **HARDWARE ERROR**, **MEDIUM ERROR**, or **RECOVERED ERROR** the **SENSE KEY SPECIFIC** field shall be as shown in table 19.

Table 19 — Actual retry count sense key specific data

Bit Byte	7	6	5	4	3	2	1	0
0	SKSV	Reserved						
1	(MSB)							
2		ACTUAL RETRY COUNT						(LSB)

The SKSV bit is described in 4.5.2.4.1 for descriptor format sense data and in 4.5.3 for fixed format sense data.

The ACTUAL RETRY COUNT field returns vendor specific information on the number of retries of the recovery algorithm used in attempting to recover an error or exception condition.

NOTE 6 - This field should be computed in the same way as the retry count fields within the Read-Write Error Recovery mode page.

4.5.2.4.4 Progress indication sense key specific data

If the sense key is **NO SENSE** or **NOT READY**, the **SENSE KEY SPECIFIC** field shall be as shown in table 20.

Table 20 — Progress indication sense key specific data

Bit Byte	7	6	5	4	3	2	1	0
0	SKSV	Reserved						
1	(MSB)	PROGRESS INDICATION						
2								
								(LSB)

The SKSV bit is described in 4.5.2.4.1 for descriptor format sense data and in 4.5.3 for fixed format sense data.

The PROGRESS INDICATION field is a percent complete indication in which the returned value is a numerator that has 65 536 (10000h) as its denominator. The progress indication shall be based upon the total operation.

NOTE 7 - The progress indication should be time related, however this is not an absolute requirement. For example, since format time varies with the number of defects encountered, etc., it is reasonable for the device server to assign values to various steps within the process. The granularity of these steps should be small enough to provide reasonable assurances to the application client that progress is being made.

4.5.2.4.5 Segment pointer sense key specific data

If the sense key is COPY ABORTED, the SENSE KEY SPECIFIC field shall be as shown in table 21.

Table 21 — Segment pointer sense key specific data

Bit Byte	7	6	5	4	3	2	1	0
0	SKSV	Reserved	SD	Reserved	BPV	BIT POINTER		
1	(MSB) FIELD POINTER							
2	(LSB)							

The SKSV bit is described in 4.5.2.4.1 for descriptor format sense data and in 4.5.3 for fixed format sense data.

The segment descriptor (SD) bit indicates whether the field pointer is relative to the start of the parameter list or to the start of a segment descriptor. An SD value of zero indicates that the field pointer is relative to the start of the parameter list. An SD value of one indicates that the field pointer is relative to the start of the segment descriptor indicated by the third and fourth bytes of the COMMAND-SPECIFIC INFORMATION field (see 6.3.3).

A bit pointer valid (BPV) bit of zero indicates that the value in the BIT POINTER field is not valid. A BPV bit of one indicates that the BIT POINTER field specifies which bit of the byte designated by the FIELD POINTER field is in error. When a multiple-bit field is in error, the BIT POINTER field shall point to the most-significant (i.e., left-most) bit of the field.

The FIELD POINTER field indicates which byte of the parameter list or segment descriptor was in error.

If the parameter list is in excess of 65 528 bytes in length and SD is set to zero, the FIELD POINTER value may not fit in two bytes provided by the sense key specific sense data descriptor.

4.5.2.5 Field replaceable unit sense data descriptor

The field replaceable unit sense data descriptor (see table 22) provides information about a component that has failed.

Table 22 — Field replaceable unit sense data descriptor format

Bit Byte	7	6	5	4	3	2	1	0
0	DESCRIPTOR TYPE (03h)							
1	ADDITIONAL LENGTH (02h)							
2	Reserved							
3	FIELD REPLACEABLE UNIT CODE							

The DESCRIPTOR TYPE and ADDITIONAL LENGTH fields are described in 4.5.2.1. For the field replaceable unit sense data descriptor, the DESCRIPTOR TYPE field shall be set to 03h and the ADDITIONAL LENGTH field shall be set to 02h.

Non-zero values in the FIELD REPLACEABLE UNIT CODE field are used to identify a component that has failed. A value of zero in this field shall indicate that no specific component has been identified to have failed or that the data is not available. The format of this information is not specified by this standard. Additional information about the field replaceable unit may be available in the ASCII Information VPD page (see 7.6.3), if supported by the device server.

4.5.2.6 Stream commands sense data descriptor

The stream commands sense data descriptor (see table 23) contains fields defined for sequential devices (see SSC-2).

Table 23 — Stream commands sense data descriptor format

Bit Byte	7	6	5	4	3	2	1	0
0	DESCRIPTOR TYPE (04h)							
1	ADDITIONAL LENGTH (02h)							
2	Reserved							
3	FILEMARK	EOM	ILI	Reserved				

The DESCRIPTOR TYPE and ADDITIONAL LENGTH fields are described in 4.5.2.1. For the stream commands sense data descriptor, the DESCRIPTOR TYPE field shall be set to 04h and the ADDITIONAL LENGTH field shall be set to 02h.

See the SSC-2 READ and SPACE commands for examples of FILEMARK bit usage.

See the SSC-2 READ, SPACE, and WRITE commands for examples of end-of-medium (EOM) bit usage.

See the SSC-2 READ command for examples of incorrect length indicator (ILI) bit usage.

4.5.2.7 Block commands sense data descriptor

The block commands sense data descriptor (see table 24) contains fields defined for block devices (see SBC-2).

Table 24 — Block commands sense data descriptor format

Bit Byte	7	6	5	4	3	2	1	0
0	DESCRIPTOR TYPE (05h)							
1	ADDITIONAL LENGTH (02h)							
2	Reserved							
3	Reserved		ILI	Reserved				

The DESCRIPTOR TYPE and ADDITIONAL LENGTH fields are described in 4.5.2.1. For the block commands sense data descriptor, the DESCRIPTOR TYPE field shall be set to 05h and the ADDITIONAL LENGTH field shall be set to 02h.

See the SBC-2 READ LONG and WRITE LONG commands for examples of incorrect length indicator (ILI) bit usage.

4.5.2.8 Vendor specific sense data descriptors

Vendor specific sense data descriptors (see table 25) contain vendor specific data that further defines the nature of the exception condition.

Table 25 — Vendor specific sense data descriptor format

Bit Byte	7	6	5	4	3	2	1	0
0	DESCRIPTOR TYPE (80h - FFh)							
1	ADDITIONAL LENGTH (n-1)							
2	Vendor specific							
n								

The DESCRIPTOR TYPE and ADDITIONAL LENGTH fields are described in 4.5.2.1. For the vendor specific sense data descriptor, the DESCRIPTOR TYPE field shall be set to a value between 80h and FFh, inclusive,

4.5.3 Fixed format sense data

The fixed sense data format for response codes 70h (current errors) and 71h (deferred errors) is defined in table 26.

Table 26 — Fixed sense data format

Bit Byte	7	6	5	4	3	2	1	0
0	VALID	RESPONSE CODE (70h or 71h)						
1	Obsolete							
2	FILEMARK	EOM	ILI	Reserved	SENSE KEY			
3	INFORMATION							
6								
7	ADDITIONAL SENSE LENGTH (n-7)							
8	COMMAND-SPECIFIC INFORMATION							
11								
12	ADDITIONAL SENSE CODE							
13	ADDITIONAL SENSE CODE QUALIFIER							
14	FIELD REPLACEABLE UNIT CODE							
15	SKSV	SENSE KEY SPECIFIC						
17								
18	Additional sense bytes							
n								

A VALID bit of zero indicates that the INFORMATION field is not as defined in this standard or any other command standard (see 3.1.17). A VALID bit of one indicates the INFORMATION field contains valid information as defined in this standard or a command set standard.

The contents of the RESPONSE CODE field indicate the error type and format of the sense data (see 4.5.1). For the fixed sense data format, the RESPONSE CODE field shall be set to 70h or 71h.

The obsolete byte 1 contained information used by the COPY command.

The FILEMARK and EOM bits are described in 4.5.2.6.

The ILI bit is described in 4.5.2.6 and 4.5.2.7.

The SENSE KEY, ADDITIONAL SENSE CODE, and ADDITIONAL SENSE CODE QUALIFIER fields are described in 4.5.2.1.

The INFORMATION field is described in 4.5.2.2.

The ADDITIONAL SENSE LENGTH field indicates the number of additional sense bytes that follow. The additional sense length shall be less than or equal to 244 (i.e., limiting the total length of the sense data to 252 bytes). If the sense data is being returned via a REQUEST SENSE command and the allocation length in the REQUEST SENSE CDB is too small to transfer all of the additional sense bytes, the additional sense length shall not be adjusted to reflect the truncation.

The COMMAND-SPECIFIC INFORMATION field is described in 4.5.2.3.

The FIELD REPLACEABLE UNIT CODE field is described in 4.5.2.5.

A sense-key specific valid (SKSV) bit of one indicates the SENSE KEY SPECIFIC field contains valid information as defined in this standard. An SKSV bit of zero indicates that the SENSE KEY SPECIFIC field is not as defined by this standard.

The SENSE KEY SPECIFIC field is described in 4.5.2.4.

The additional sense bytes may contain vendor specific data that further defines the nature of the exception condition.

4.5.4 Current errors

Response codes 70h and 72h (current error) indicate that the sense data returned is the result of an error or exception condition on the task that returned the CHECK CONDITION status or a protocol specific failure condition. This includes errors generated during processing of the command. It also includes errors not related to any command that are detected during processing of a command (e.g., disk servo-mechanism failure, off-track errors, or power-up test errors).

4.5.5 Deferred errors

Response codes 71h and 73h (deferred error) indicate that the sense data returned is the result of an error or exception condition that occurred during processing of a previous command for which GOOD, CONDITION MET, INTERMEDIATE, and INTERMEDIATE-CONDITION MET status has already been returned. Such commands are associated with the use of the immediate bit and with some forms of caching. Device servers that implement these features shall implement deferred error reporting.

The deferred error may be indicated by returning CHECK CONDITION status to an application client accessed through the initiator port as described in this subclause.

If the task terminates with CHECK CONDITION status and the sense data describes a deferred error the command for the terminated task shall not have been processed. After the device server detects a deferred error condition, it shall return a deferred error according to the following rules:

- a) If no external intervention is necessary to recover a deferred error, a deferred error indication shall not be returned unless required by the error handling parameters of a MODE SELECT command. The occurrence of the error may be logged if statistical or error logging is supported;
- b) If it is possible to associate a deferred error with a initiator port and with a particular function or a particular subset of data, and the error is either unrecovered or required to be reported by the mode parameters, a deferred error indication shall be returned to an application client accessed through the initiator port associated with the error. If an application client accessed through a initiator port other than the initiator port associated with the error attempts access to the particular function or subset of data associated with the deferred error and the TST field equals 000b (see 7.4.6), the device server shall respond to the command with a BUSY or ACA ACTIVE status according to the requirements in SAM-3. If an application client accessed through a initiator port other than the initiator port associated with the error attempts access to the particular function or subset of data associated with the deferred error and the TST field equals 001b, the command attempting the access shall not be blocked by the deferred error and the cause of the deferred error may result in an error being reported for the command attempting the access;
- c) If the device server is unable to associate a deferred error with a initiator port or with a particular subset of data, the device server shall return a deferred error indication to an application client accessed through each initiator port. If multiple deferred errors have accumulated for a initiator port, only the last error shall be returned;
- d) If the SCSI target device is unable to associate a deferred error with a particular logical unit, it shall return a deferred error indication to an application client associated with every logical unit and shall return the deferred error through an appropriate initiator port; or
- e) If a task has never entered the enabled task state, and a deferred error occurs, the task shall be terminated with a CHECK CONDITION status and deferred error information returned in the sense data. If a deferred error occurs after a task has entered the enabled task state and the task is affected by the error, the task shall be terminated with a CHECK CONDITION status and the current error information shall be returned in the sense data. In this case, if the current error information does not adequately define the deferred error condition, a deferred error may be returned after the current error information has been returned. If a deferred error occurs after a task has entered the enabled task state and the task completes successfully, the device server may choose to return the deferred error information after the completion of the current command in conjunction with a subsequent command that has not begun processing.

NOTE 8 - A deferred error may indicate that an operation was unsuccessful long after GOOD status was returned. If the application client is unable to replicate or recover from other sources the data that is being written using cached or buffered write operations, synchronization commands should be performed before the critical data is destroyed. This is necessary for actions taken when deferred errors occur in the storing of the data. The synchronizing process should provide the necessary commands to allow returning CHECK CONDITION status and subsequent returning of deferred error sense information after all cached or buffered operations are completed.

4.5.6 Sense key and sense code definitions

The sense keys are defined in table 27.

Table 27 — Sense key descriptions (part 1 of 2)

Sense Key	Description
0h	NO SENSE: Indicates that there is no specific sense key information to be reported. This may occur for a successful command or for a command that receives CHECK CONDITION status because one of the FILEMARK, EOM, or ILI bits is set to one.
1h	RECOVERED ERROR: Indicates that the last command completed successfully, with some recovery action performed by the device server. Details may be determined by examining the additional sense bytes and the INFORMATION field. When multiple recovered errors occur during one command, the choice of which error to report (e.g., first, last, most severe) is vendor specific.
2h	NOT READY: Indicates that the logical unit addressed cannot be accessed. Operator intervention may be required to correct this condition.
3h	MEDIUM ERROR: Indicates that the command terminated with a non-recovered error condition that may have been caused by a flaw in the medium or an error in the recorded data. This sense key may also be returned if the device server is unable to distinguish between a flaw in the medium and a specific hardware failure (i.e., sense key 4h).
4h	HARDWARE ERROR: Indicates that the device server detected a non-recoverable hardware failure (e.g., controller failure, device failure, or parity error) while performing the command or during a self test.
5h	<p>ILLEGAL REQUEST: Indicates that:</p> <ul style="list-style-type: none"> a) The command was addressed to an incorrect logical unit number (see SAM-3); b) The command was addressed to a logical unit whose current configuration prohibits processing the command; c) There was an illegal parameter in the CDB; or d) There was an illegal parameter in the additional parameters supplied as data for some commands (e.g., PERSISTENT RESERVE OUT). <p>If the device server detects an invalid parameter in the CDB, then it shall terminate the command without altering the medium. If the device server detects an invalid parameter in the additional parameters supplied as data, then the device server may have already altered the medium.</p>
6h	UNIT ATTENTION: Indicates that the removable medium may have been changed, a logical unit reset occurred, or an I_T nexus loss occurred involving the initiator port. For more information see SAM-3.
7h	DATA PROTECT: Indicates that a command that reads or writes the medium was attempted on a block that is protected. The read or write operation is not performed.
8h	BLANK CHECK: Indicates that a write-once device or a sequential-access device encountered blank medium or format-defined end-of-data indication while reading or that a write-once device encountered a non-blank medium while writing.
9h	VENDOR SPECIFIC: This sense key is available for reporting vendor specific conditions.
Ah	COPY ABORTED: Indicates an EXTENDED COPY command was aborted due to an error condition on the source device, the destination device, or both (see 6.3.3).
Bh	ABORTED COMMAND: Indicates that the device server aborted the command. The application client may be able to recover by trying the command again.
Ch	Obsolete

Table 27 — Sense key descriptions (part 2 of 2)

Sense Key	Description
Dh	VOLUME OVERFLOW: Indicates that a buffered SCSI device has reached the end-of-partition and data may remain in the buffer that has not been written to the medium. One or more RECOVER BUFFERED DATA command(s) may be issued to read the unwritten data from the buffer. (See SSC-2.)
Eh	MISCOMPARE: Indicates that the source data did not match the data read from the medium.
Fh	Reserved

The additional sense codes and additional sense code qualifiers are defined in table 28.

5 Model common to all device types

5.1 Introduction to the model common to all device types

This model describes some of the general characteristics expected of most SCSI devices. It is not intended to alter any requirements defined elsewhere in SCSI. Devices conforming to this standard also shall conform to SAM-2.

5.2 Commands implemented by all SCSI device servers

5.2.1 Summary of commands implemented by all SCSI device servers

This standard defines three commands that all SCSI device servers shall implement - INQUIRY, REQUEST SENSE, and TEST UNIT READY. These commands are used to configure the system, to test devices, and to return important information concerning errors and exception conditions.

5.2.2 Using the INQUIRY command

The INQUIRY command may be used by an application client to determine the configuration of the logical unit. Device servers respond with information that includes their type and standard version and may include the vendor's identification, model number and other information. It is recommended that device servers be capable of returning this information (or whatever part of it that is available) upon completing power-on initialization. A device server may take longer to get certain portions of this information, especially if it retrieves the information from the medium.

5.2.3 Using the REQUEST SENSE command

The REQUEST SENSE command may be used by an application client to poll the status of some background operations and to clear interlocked unit attention conditions (see 7.4.6).

5.2.4 Using the TEST UNIT READY command

The TEST UNIT READY command allows an application client to poll a logical unit until it is ready without the need to allocate space for returned data. The TEST UNIT READY command may be used to check the media status of logical units with removable media. Device servers should respond promptly to indicate the current status of the SCSI device, delays to achieve GOOD status may adversely affect initiator performance.

5.3 Parameter rounding

Certain parameters sent to a device server with various commands contain a range of values. Device servers may choose to implement only selected values from this range. When the device server receives a value that it does not support, it either rejects the command (CHECK CONDITION status with ILLEGAL REQUEST sense key) or it rounds the value received to a supported value.

When parameter rounding is implemented, a device server that receives a parameter value that is not an exact supported value shall adjust the value to one that it supports and shall return CHECK CONDITION status with a sense key of RECOVERED ERROR. The additional sense code shall be set to ROUNDED PARAMETER. The application client should issue an appropriate command to learn what value the device server has selected.

The device server shall reject unsupported values unless rounding is permitted in the description of the parameter. When the description of a parameter states that rounding is permitted, the device server should adjust maximum-value fields down to the next lower supported value than the one specified by the application client.

Minimum-value fields should be rounded up to the next higher supported value than the one specified by the application client. In some cases, the type of rounding (up or down) is explicitly specified in the description of the parameter.

5.4 Self-test Operations

5.4.1 Default self-test

The SEND DIAGNOSTIC command provides a means to request that a SCSI device perform a self test. While the test is vendor specific, the means of requesting the test is standardized.

The default self-test is mandatory for all device types that support the SEND DIAGNOSTICS command. The response is GOOD status if the test detects no exceptions or a CHECK CONDITION status if the test detects exceptions.

5.4.2 The short and extended self-tests

There are two optional types of self-test aside from the mandatory default self-test that may be invoked using the SELF-TEST CODE field in the SEND DIAGNOSTICS command: a short self-test and an extended self-test. The goal of the short self-test is to quickly identify if the logical unit determines that it is faulty. A goal of the extended self-test routine is to simplify factory testing during integration by having logical units perform more comprehensive testing without application client intervention. A second goal of the extended self-test is to provide a more comprehensive test to validate the results of a short self-test, if its results are judged by the application client to be inconclusive.

The criteria for the short self-test are that it has one or more segments and completes in two minutes or less. The criteria for the extended self-test are that it has one or more segments and that the completion time is vendor specific. Any tests performed in the segments are vendor specific.

The following are examples of segments:

- a) An electrical segment wherein the logical unit tests its own electronics. The tests in this segment are vendor specific, but some examples of tests that may be included are: a buffer RAM test, a read/write circuitry test, and/or a test of the read/write head elements;
- b) A seek/servo segment wherein a device tests its capability to find and servo on data tracks; and
- c) A read/verify scan segment wherein a device performs read scanning of some or all of the medium surface.

The tests performed in the segments may be the same for the short and extended self-tests. The time required by a logical unit to complete its extended self-test is reported in the EXTENDED SELF-TEST COMPLETION TIME field in the Control mode page (see 7.4.6).

5.4.3 Self-test modes

There are two modes for short and extended self-tests: a foreground mode and a background mode. These modes are described in 5.4.3.1 and 5.4.3.2.

5.4.3.1 Foreground mode

When a device server receives a SEND DIAGNOSTICS command specifying a self-test to be performed in the foreground mode, the device server shall return status for that command after the self-test has been completed.

While performing a self-test in the foreground mode, the device server shall respond to all commands except INQUIRY, REPORT LUNS, and REQUEST SENSE with a CHECK CONDITION status, a sense key of NOT READY and an additional sense code of LOGICAL UNIT NOT READY, SELF-TEST IN PROGRESS.

If a device server is performing a self-test in the foreground mode and a test segment error occurs during the test, the device server shall update the Self-Test Results log page (see 7.2.10) and report CHECK CONDITION status with a sense key of HARDWARE ERROR and an additional sense code of LOGICAL UNIT FAILED SELF-TEST. The application client may obtain additional information about the failure by reading the Self-Test Results log page. If the device server is unable to update the Self-Test Results log page it shall return a CHECK CONDITION status with a sense key of HARDWARE ERROR and an additional sense code of LOGICAL UNIT UNABLE TO UPDATE SELF-TEST LOG.

An application client should reserve the logical unit before initiating a self-test in the foreground mode. An application client may terminate a self-test that is being performed in the foreground mode using an ABORT TASK, ABORT TASK SET, or CLEAR TASK SET task management function. If a task manager receives an ABORT TASK, ABORT TASK SET, or CLEAR TASK SET task management function while performing a self-test in the foreground mode, then it shall abort the self-test and update the Self-Test Results log page (see 7.2.10).

5.4.3.2 Background mode

When a device server receives a SEND DIAGNOSTICS command specifying a self-test to be performed in the background mode, the device server shall return status for that command as soon as the CDB has been validated.

After returning status for the SEND DIAGNOSTICS command specifying a self-test to be performed in the background mode, the device server shall initialize the Self-Test Results log page (see 7.2.10) as follows. The self-test code from the SEND DIAGNOSTICS command shall be placed in the SELF-TEST CODE field in the log page. The SELF-TEST RESULTS field shall be set to Fh. After the Self-Test Results log page is initialized, the device server shall begin the first self-test segment.

While the device server is performing a self-test in the background mode, it shall terminate with a CHECK CONDITION status any SEND DIAGNOSTICS command it receives that meets one of the following criteria:

- a) The SELFTEST bit is one; or
- b) The SELF-TEST CODE field contains a value other than 000b or 100b.

When terminating the SEND DIAGNOSTICS command, the sense key shall be set to NOT READY and the additional sense code shall be set to LOGICAL UNIT NOT READY, SELF-TEST IN PROGRESS.

While performing a self-test in the background mode, the device server shall suspend the self-test to service any other commands received with the exceptions listed in table 29. Suspension of the self-test to service the command shall occur as soon as practical and shall not take longer than two seconds.

Table 29 — Exception commands for background self-tests

Device type	Command	Reference
All device types	SEND DIAGNOSTICS (with SELF-TEST CODE field set to 100b) WRITE BUFFER (with the mode set to any download microcode option)	6.26 6.31
Direct access	FORMAT UNIT START/STOP UNIT	SBC
Sequential access	ERASE FORMAT MEDIUM REWIND LOAD UNLOAD SPACE LOCATE VERIFY READ WRITE READ POSITION WRITE BUFFER READ REVERSE WRITE FILEMARKS	SSC
Medium changer	EXCHANGE MEDIUM INITIALIZE ELEMENT STATUS MOVE MEDIUM POSITION TO ELEMENT READ ELEMENT STATUS (if CURDATA=0 and device motion is required) WRITE BUFFER	SMC
NOTE 1 Device types not listed in this table do not have commands that are exceptions for background self-tests, other than those listed above for all device types.		

If one of the exception commands listed in table 29 is received, the device server shall abort the self-test, update the self-test log, and service the command as soon as practical but not longer than two seconds after the CDB has been validated.

An application client may terminate a self-test that is being performed in the background mode by issuing a SEND DIAGNOSTICS command with the SELF-TEST CODE field set to 100b (Abort background self-test function).

5.4.3.3 Elements common to foreground and background self-test modes

The PROGRESS INDICATION field returned in response to a REQUEST SENSE command (see 6.25) may be used by the application client at any time during a self-test operation to poll the logical unit's progress. While a self-test operation is in progress unless an error has occurred, a device server shall respond to a REQUEST SENSE command by returning a sense key of NOT READY and an additional sense code of LOGICAL UNIT NOT READY, SELF-TEST IN PROGRESS with the sense key specific bytes set for progress indication.

The application client may obtain information about the twenty most recently completed self-tests by reading the Self-Test Results log page (see 7.2.10). This is the only method for an application client to obtain information about self-tests performed in the background mode.

Table 30 summarizes when a logical unit returns status after receipt of a self-test command, how an application client may abort a self-test, how a logical unit handles new commands that are received while a self-test is in progress, and how a logical unit reports a self-test failure.

Table 30 — Self-test mode summary

Mode	When Status is Returned	How to abort the self-test	Processing of subsequent commands while self-test is executing	Self-test failure reporting
Fore-ground	After the self-test is complete	ABORT TASK task management function	If the command is INQUIRY, REPORT LUNS or REQUEST SENSE, process normally. Otherwise, terminate with CHECK CONDITION status, NOT READY sense key, and LOGICAL UNIT NOT READY, SELF-TEST IN PROGRESS additional sense code.	Terminate with CHECK CONDITION status, HARDWARE ERROR sense key, and LOGICAL UNIT FAILED SELF-TEST or LOGICAL UNIT UNABLE TO UPDATE SELF-TEST LOG additional sense code.
Back-ground	After the CDB is validated	SEND DIAGNOSTICS command with SELF-TEST CODE field set to 100b	Process the command, except as described in 5.4.3.2.	Application client checks Self-Test Results log page (see 7.2.10) after the PROGRESS INDICATION field returned from REQUEST SENSE indicates the self-test is complete.

5.5 Reservations

5.5.1 Reservations overview

Reservations may be used to allow a device server to execute commands from a selected set of I_T nexuses (i.e., combinations of initiator ports accessing target ports) and reject commands from I_T nexuses outside the selected set. The device server uniquely identifies I_T nexuses using protocol specific mechanisms.

Application clients may add or remove I_T nexuses from the selected set using reservation commands. If the application clients do not cooperate in the reservation protocol, data may be unexpectedly modified and deadlock conditions may occur.

The scope of a reservation shall be one of the following:

- a) **Logical unit reservations** - a logical unit reservation restricts access to the entire logical unit; and
- b) **Element reservations** - an element reservation restricts access to a specified element within a medium changer.

Reservations may be further qualified by restrictions on types of access (e.g., read, write). However, any restrictions based on the type of reservation are independent of the scope of the reservation.

Reservation restrictions are placed on commands as a result of access qualifiers associated with the type of reservation. The details of which commands are allowed under what types of reservations are described in table 31. If any element is reserved within a logical unit, that logical unit shall be considered reserved for the commands listed in table 31 and the allowed/conflict information in table 31 shall apply.

In table 31 and table 32 the following key words are used:

allowed: Commands received from I_T nexuses not holding the reservation or from I_T nexuses not registered when a registrants only or all registrants type persistent reservation is present should complete normally.

conflict: Commands received from I_T nexuses not holding the reservation or from I_T nexuses not registered when a registrants only or all registrants type persistent reservation is present shall not be performed and the device server shall terminate the command with a RESERVATION CONFLICT status.

Commands from I_T nexuses holding a reservation should complete normally. The behavior of commands from registered I_T nexuses when a registrants only or all registrants persistent reservation is present is specified in table 31 and table 32.

An unlinked command shall be checked for reservation conflicts before the task containing that command enters the enabled task state. The reservation state as it exists when the first command in a group of linked commands enters the enabled task state shall be used in checking for reservation conflicts for all the commands in the task. Once a task has entered the enabled task state, the command or commands comprising that task shall not be terminated with a RESERVATION CONFLICT due to a subsequent reservation. Any command in a group of linked commands that changes the reservation state shall be the last command in the group.

For each command, this standard or a related command standard (see 3.1.17) defines the conditions that result in RESERVATION CONFLICT. Command standards define the conditions either in the device model (preferred) or in the descriptions each specific command.

Table 31 — SPC commands that are allowed in the presence of various reservations (part 1 of 2)

Command	Addressed LU has this type of persistent reservation held by another I_T nexus

REGISTER AND IGNORE EXISTING KEY	Allowed	Allowed
RELEASE	Allowed ^a	Conflict
RESERVE	Conflict	Conflict
Key: LU =Logical Unit		
^a The reservation is not released (see 5.5.2.7.2).		

The time at which a reservation is established with respect to other tasks being managed by the device server is vendor specific. Successful completion of a reservation command indicates that the new reservation is established. A reservation may apply to some or all of the tasks in the task set before the completion of the reservation command. The reservation shall apply to all tasks received by the device server after successful completion of the reservation command. Any persistent reserve service action shall be performed as a single indivisible event.

Multiple persistent reserve service actions may be present in the task set at the same time. The order of execution of such service actions is defined by the tagged queuing restrictions, if any, but each is executed as a single indivisible command without any interleaving of actions that may be required by other reservation commands.

5.5.2 The Persistent Reservations management method

5.5.2.1 Overview of the Persistent Reservations management method

The persistent reservations management method is the mechanism specified by this standard for use by multiple initiator ports communicating through multiple I_T nexuses that require operations to be protected across SCSI initiator device failures, which usually involve logical unit resets and involve I_T nexus losses. Persistent reservations persist across recovery actions, to provide application clients with more detailed control over reservations recovery. Persistent reservations are not reset by hard reset, logical unit reset, or I_T nexus loss.

The persistent reservation held by a failing I_T nexus may be preempted by another I_T nexus as part of the recovery process. Persistent reservations shall be retained by the device server until released, preempted, or cleared by mechanisms specified in this standard. Optionally, persistent reservations may be retained when power to the target is removed.

The PERSISTENT RESERVE OUT and PERSISTENT RESERVE IN commands provide the basic mechanism for dynamic contention resolution in systems with multiple initiator ports using logical units with SCSI multiple target

ports. Before a persistent reservation may be established, an application client shall register each I_T Nexus with a device server using a reservation key. Reservation keys are necessary to allow:

- a) Authentication of subsequent PERSISTENT RESERVE OUT commands;
- b) Identification of other I_T nexuses that are registered;
- c) Identification of the reservation key(s) that have an associated persistent reservation;
- d) Preemption of a persistent reservation from a failing or uncooperative I_T nexus; and
- e) Multiple I_T nexuses to participate in a persistent reservation.

The reservation key provides a method for the application client to associate a protocol-independent identifier with a registered I_T nexus. The reservation key is used in the PERSISTENT RESERVE IN command to identify which I_T nexuses are registered and which I_T nexus, if any, holds the persistent reservation. The reservation key is used in the PERSISTENT RESERVE OUT command to register an I_T nexus, to verify the I_T nexus issuing the PERSISTENT RESERVATION OUT command is registered, and to specify which registrations or persistent reservation to preempt.

Reservation key values may be used by application clients to identify registered I_T nexuses, using application specific methods that are outside the scope of this standard. This standard provides the ability to register no more than one key per I_T_L nexus. Multiple I_T nexuses may use the same key for a logical unit accessed through the same target port. Multiple initiator ports may use the same key value for a logical unit accessed through the same target ports. An initiator port may use the same key value for a logical unit accessed through different target ports. A separate key shall be maintained for each I_T nexus, regardless of the key's value.

An I_T nexus may establish registrations for multiple logical units in a SCSI target device using any combination of unique or duplicate keys. These rules provide the ability for an application client to preempt multiple I_T nexuses with a single PERSISTENT RESERVE OUT command, but they do not provide the ability for the application client to uniquely identify the I_T nexuses using the PERSISTENT RESERVE commands.

5.5.2.2 Preserving persistent reservations and registrations

The application client may request activation of the persist through power loss device server capability to preserve the persistent reservation and registrations across power cycles by setting the APTPL bit to one in the PERSISTENT RESERVE OUT parameter data sent with a REGISTER, or REGISTER AND IGNORE EXISTING KEY service action.

After the application client enables the persist through power loss capability the device server shall preserve all current and future registrations and persistent reservations associated with the logical unit to which the REGISTER or the REGISTER AND IGNORE EXISTING KEY service action was addressed until an application client disables the persist through power loss capability. The APTPL value from the most recent successfully completed REGISTER or REGISTER AND IGNORE EXISTING KEY service action from any application client shall determine the logical unit's behavior in the event of a power loss.

The device server shall preserve the following information for each existing registration across any hard reset, logical unit reset, or I_T nexus loss, and if the persist through power loss capability is enabled, across any power cycle:

- a) On SCSI protocols where initiator port names (see 3.1.46) are required, the initiator port name; otherwise, the initiator port identifier (see 3.1.45);
- b) Reservation key; and
- c) Indication of the target port to which the registration was applied.

The device server shall preserve the following information about the existing persistent reservation across any hard reset, logical unit reset, or I_T nexus loss, and if the persist through power loss capability is enabled, across any power cycle:

- a) On SCSI protocols where initiator port names are required, the initiator port name; otherwise, the initiator port identifier;
- b) Reservation key;
- c) Scope;
- d) Type; and
- e) Indication of the target port through which the reservation was established.

NOTE 9 - For an all registrants type persistent reservation, only the scope and type need to be preserved.

The capability of preserving persistent reservations and registrations across power cycles requires the use of a nonvolatile memory within the SCSI device. Any SCSI device that supports the persist through power loss capability of persistent reservation and has nonvolatile memory that is not ready shall allow the following commands into the task set:

- a) INQUIRY;
- b) LOG SENSE;
- c) READ BUFFER;
- d) REPORT LUNS;
- e) REQUEST SENSE;
- f) START/STOP UNIT (with the START bit set to one and POWER CONDITIONS field value of 0h); and
- g) WRITE BUFFER.

When nonvolatile memory has not become ready since a power cycle, commands other than those listed above shall return CHECK CONDITION status. The sense key shall be set to NOT READY and the additional sense code shall be set as described in table 164 (see 6.29).

5.5.2.3 Finding persistent reservations and reservation keys

5.5.2.3.1 Summary of commands for finding persistent reservations and reservation keys

The application client may obtain information about the persistent reservation and the reservation keys (i.e., registrations) that are present within a device server by issuing PERSISTENT RESERVE IN commands with READ RESERVATION or READ KEYS service action.

5.5.2.3.2 Reporting reservation keys

An application client may issue a PERSISTENT RESERVE IN command with READ KEYS service action to determine if any I_T nexuses have been registered with a logical unit through any target port.

In response to a PERSISTENT RESERVE IN with READ KEYS service action the device server shall report the following:

- a) The current PRgeneration value (see 6.11.3); and
- b) The reservation key for every I_T nexus that is currently registered regardless of the target port through which the registration occurred.

The PRgeneration value allows the application client to verify that the configuration of the I_T nexuses registered with a logical unit has not been modified.

The application client may examine the reservation keys to identify relationships between I_T nexuses based on mechanisms that are outside the scope of this standard. Duplicate keys shall be reported if multiple I_T nexuses are registered using the same reservation key.

5.5.2.3.3 Reporting persistent reservations

An application client may issue a PERSISTENT RESERVE IN command with READ RESERVATION service action to receive the persistent reservation information.

In response to a PERSISTENT RESERVE IN command with READ RESERVATION service action the device server shall report the following as an uninterrupted series of actions:

- a) The current PRgeneration value (see 6.11.3);
- b) The registered reservation key, if any, associated with the I_T nexus that holds the persistent reservation;
- c) The scope and type of each persistent reservation, if any; and
- d) The scope-specific address, if any (see 6.11.4.1).

If an application client uses a different reservation key for each I_T_L nexus the application client may use the reservation key to associate the persistent reservation with the initiator port that holds the persistent reservation. This association is done using techniques that are outside the scope of this standard.

5.5.2.4 Registering

To establish a persistent reservation the application client shall first register an I_T nexus with a logical unit. An application client registers with a logical unit by issuing a PERSISTENT RESERVE OUT command with REGISTER or REGISTER AND IGNORE EXISTING KEY service action.

If the I_T nexus has not yet established a reservation key or the reservation key and registration have been removed, the registration is accomplished by issuing a PERSISTENT RESERVE OUT command with REGISTER service action with the following parameters:

- a) APTPL bit optionally set to one;
- b) RESERVATION KEY field set to zero; and
- c) SERVICE ACTION RESERVATION KEY field set to a non-zero value.

If the I_T nexus has an established registration it may change its reservation key. This is accomplished by issuing a PERSISTENT RESERVE OUT command with REGISTER service action with the following parameters:

- a) APTPL bit optionally set to one;
- b) RESERVATION KEY field set to the value of the reservation key that is registered for the I_T_L nexus; and
- c) SERVICE ACTION RESERVATION KEY field set to a non-zero value.

If the SERVICE ACTION RESERVATION KEY field is set to zero, the registration shall be removed (see 5.5.2.7.1).

Alternatively, an application client may establish a reservation key for an I_T nexus without regard for whether one has previously been established by issuing a PERSISTENT RESERVE OUT command with REGISTER AND IGNORE EXISTING KEY service action and the following parameters:

- a) APTPL bit optionally set to one; and
- b) SERVICE ACTION RESERVATION KEY field set to a non-zero value.

If the SERVICE ACTION RESERVATION KEY field is set to zero and the I_T_L nexus is registered, the registration shall be removed (see 5.5.2.7.1).

If a PERSISTENT RESERVE OUT command with REGISTER AND IGNORE EXISTING KEY service action is sent when an established registration exists, that registration shall be superseded with the specified service action reservation key. If a PERSISTENT RESERVE OUT command with REGISTER AND IGNORE EXISTING KEY service action is sent when there is no established registration, a new registration shall be established.

If a PERSISTENT RESERVE OUT command with REGISTER or a REGISTER AND IGNORE EXISTING KEY service action is attempted, but there are insufficient device server resources to complete the operation, the device server shall return a CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to INSUFFICIENT REGISTRATION RESOURCES.

In response to a PERSISTENT RESERVE OUT command with REGISTER or a REGISTER AND IGNORE EXISTING KEY service action the device server shall perform a registration by doing the following as an uninterrupted series of actions:

- a) Process the registration request regardless of any persistent reservations;
- b) Process the APTPL bit;
- c) Ignore the contents of the SCOPE and TYPE fields;
- d) Map the reservation key to the registering I_T nexus using the indication of the target port associated with the registration and either the initiator port name (see 3.1.46) on SCSI protocols where port names are required or the initiator port identifier (see 3.1.45) on SCSI protocols where port names are not required;
- e) Register the reservation key without changing any persistent reservation that may exist; and
- f) Retain the reservation key and associated information.

After the registration request has been processed, the device server shall then allow other PERSISTENT RESERVE OUT commands from the registered I_T nexus to execute. For each I_T nexus that is the source a PERSISTENT RESERVE OUT command with REGISTER or a REGISTER AND IGNORE EXISTING KEY service action, the device server shall retain the reservation key until the key is changed by a new PERSISTENT RESERVE OUT command with the REGISTER or the REGISTER AND IGNORE EXISTING KEY service action from the same I_T nexus or until the registration is removed (see 5.5.2.7).

Any PERSISTENT RESERVE OUT command service action received from an unregistered I_T nexus, other than the REGISTER or the REGISTER AND IGNORE EXISTING KEY service action, shall be rejected with a RESERVATION CONFLICT status.

It is not an error for an I_T nexus that is registered to register again with the same reservation key or a new reservation key. A registration shall have no effect on any other registrations (e.g., when more than one I_T nexus is registered with the same reservation key and one of those I_T nexuses registers again it has no effect on the other I_T nexus' registrations). A registration that contains a non-zero value in the SERVICE ACTION RESERVATION KEY field shall have no effect on any persistent reservations (i.e., the reservation key for an I_T nexus may be changed without affecting any previously created persistent reservation).

Multiple I_T nexuses may be register with the same reservation key. An application client may use the same reservation key for other I_T nexuses and logical units.

5.5.2.5 Reserving

An application client creates a persistent reservation by issuing a PERSISTENT RESERVE OUT command with RESERVE service action through a registered I_T nexus with the following parameters:

- a) RESERVATION KEY set to the value of the reservation key that is registered for the I_T_L nexus; and
- b) TYPE and SCOPE fields set to the persistent reservation being created.

Only one persistent reservation with a scope of logical unit is allowed at a time per logical unit. Multiple persistent reservations with a scope of element may be created in a logical unit that contains multiple elements. However, there shall only be one persistent reservation per element.

If the device server receives a PERSISTENT RESERVE OUT command from an I_T nexus other than a persistent reservation holder (see 5.5.2.6) that attempts to create a persistent reservation when a persistent reservation already exists for the logical unit, then the command shall be rejected with a RESERVATION CONFLICT status.

If a persistent reservation holder attempts to modify the TYPE or SCOPE of an existing persistent reservation, then the command shall be rejected with a RESERVATION CONFLICT status.

If the device server receives a PERSISTENT RESERVE OUT command with RESERVE service action where the TYPE and SCOPE are the same as the existing TYPE and SCOPE from a persistent reservation holder, it shall not make any change to the existing persistent reservation and shall return a GOOD status.

See 5.5.1 for information on when a persistent reservation takes effect.

5.5.2.6 Persistent reservation holder

The persistent reservation holder is determined by the type of persistent reservation as follows:

- a) For a persistent reservation of the type Write Exclusive – All Registrants or Exclusive Access – All Registrants, the persistent reservation holder is any registered I_T nexus; or
- b) For all other persistent reservation types, the persistent reservation holder is the I_T nexus from which the PERSISTENT RESERVE OUT command with RESERVE, PREEMPT, or PREEMPT AND ABORT service action was received.

A persistent reservation holder has its reservation key returned in the parameter data from a PERSISTENT RESERVE IN command with READ RESERVATIONS service action as follows:

- a) For a persistent reservation of the type Write Exclusive – All Registrants or Exclusive Access – All Registrants, the reservation key shall be set to zero; or
- b) For all other persistent reservation types, the reservation key shall be set to the registered reservation key for the I_T nexus that holds the persistent reservation.

It is not an error for a persistent reservation holder to send a PERSISTENT RESERVE OUT command with RESERVE service action to the reserved logical unit with TYPE and SCOPE fields that match those of the persistent reservation (see 5.5.2.5).

A persistent reservation holder is allowed to release the persistent reservation using the PERSISTENT RESERVE OUT command with RELEASE service action.

If the registration of the persistent reservation holder is removed (see 5.5.2.7.1), the reservation is automatically released. When the persistent reservation holder is more than one I_T nexus, the reservation is not automatically released until the registrations for all persistent reservation holder I_T nexuses are removed.

5.5.2.7 Releasing persistent reservations and removing registrations

5.5.2.7.1 Overview of releasing persistent reservations and removing registrations

An application client may release or preempt persistent reservations by issuing one of the following commands through a registered I_T nexus with the RESERVATION KEY field set to the reservation key value that is registered for the I_T_L nexus:

- a) A PERSISTENT RESERVE OUT command with RELEASE service action from a persistent reservation holder (see 5.5.2.7.2);
- b) A PERSISTENT RESERVE OUT command with PREEMPT service action specifying the reservation key of the persistent reservation holder or holders (see 5.5.2.7.4);
- c) A PERSISTENT RESERVE OUT command with PREEMPT AND ABORT service action specifying the reservation key of the persistent reservation holder or holders (see 5.5.2.7.5);
- d) A PERSISTENT RESERVE OUT command with CLEAR service action (see 5.5.2.7.6); or
- e) If the I_T nexus is the persistent reservation holder and the persistent reservation is not an all registrants type, a PERSISTENT RESERVE OUT command with REGISTER service action or REGISTER AND IGNORE EXISTING KEY service action with the SERVICE ACTION RESERVATION KEY field set to zero (see 5.5.2.7.3).

An application client may remove registrations by issuing one of the following commands through a registered I_T nexus with the RESERVATION KEY field set to the reservation key value that is registered for the I_T_L nexus:

- a) A PERSISTENT RESERVE OUT command with PREEMPT service action with the RESERVATION KEY field set to the reservation key (see 5.5.2.7.4) to be removed;
- b) A PERSISTENT RESERVE OUT command with PREEMPT AND ABORT service action with the RESERVATION KEY field set to the reservation key (see 5.5.2.7.5) to be removed;
- c) A PERSISTENT RESERVE OUT command with CLEAR service action (see 5.5.2.7.6); or
- d) A PERSISTENT RESERVE OUT command with REGISTER service action or REGISTER AND IGNORE EXISTING KEY service action with the service action RESERVATION KEY field set to zero (see 5.5.2.7.3).

When a reservation key (i.e, registration) has been removed, no information shall be reported for that unregistered I_T nexus in subsequent READ KEYS service action(s) until the I_T nexus is registered again (see 5.5.2.4). As shown in table 33, the handling of any persistent reservation whose persistent reservation holder or holders become unregistered depends on the reservation type.

Table 33 — Handling for released persistent reservations

Reservation Type	Reference
Write Exclusive – Registrants Only or Exclusive Access – Registrants Only	5.5.2.7.1.1
Write Exclusive – All Registrants or Exclusive Access – All Registrants	5.5.2.7.1.2
Write Exclusive or Exclusive Access	5.5.2.7.1.3

Registrations and persistent reservations may also be released by a loss of power, if the persist through power loss capability is not enabled. When the most recent APTPL value received by the device server is zero (see 6.12.3), a power cycle:

- a) Releases all persistent reservations; and
- b) Removes all registered reservation keys (see 5.5.2.4).

5.5.2.7.1.1 Handling for released registrants only persistent reservations

When the persistent reservation holder (see 5.5.2.6) of a Write Exclusive – Registrants Only or Exclusive Access – Registrants Only type reservation becomes unregistered the persistent reservation shall be released. The device server shall establish a unit attention condition for every initiator port associated with a registered I_T nexus other than the initiator port associated with the I_T nexus that unregistered. The sense key shall be set to UNIT ATTENTION and the additional sense code shall be set to RESERVATIONS RELEASED.

The device server shall establish a unit attention for every initiator port associated with a registered I_T nexus whose reservation key was removed. The additional sense code shall be set as follows:

- a) If the service action was CLEAR, the additional sense code shall be set to RESERVATIONS PREEMPTED; or
- b) If the service action was PREEMPT or PREEMPT AND ABORT, the additional sense code shall be set to REGISTRATIONS PREEMPTED.

If the TYPE or SCOPE changed or the reservation was released, the device server shall establish a unit attention for every initiator port associated with a registered I_T nexus whose reservation key was not removed except for the initiator port through which the command was issued. The additional sense code shall be set as follows:

- a) If the service action was PREEMPT or PREEMPT AND ABORT, the additional sense code shall be set to RESERVATIONS RELEASED;
- b) If the service action was REGISTER or REGISTER AND IGNORE with the SERVICE ACTION KEY field set to zero, the additional sense code shall be set to RESERVATIONS RELEASED; or
- c) If the service action was RELEASE, the additional sense code shall be set to RESERVATIONS RELEASED.

5.5.2.7.1.2 Handling for released all registrants persistent reservations

A Write Exclusive – All Registrants or Exclusive Access – All Registrants type persistent reservation shall be released when the registration for the last registered I_T nexus is removed or when the TYPE or SCOPE is changed.

The device server shall establish a unit attention for every initiator port associated with a registered I_T nexus whose reservation key was removed. The additional sense code shall be set as follows:

- a) If the service action was CLEAR, the additional sense code shall be set to RESERVATIONS PREEMPTED; or
- b) If the service action was PREEMPT or PREEMPT AND ABORT, the additional sense code shall be set to REGISTRATIONS PREEMPTED.

If a persistent reservation was removed or changed, the device server shall establish a unit attention for every initiator port associated with a registered I_T nexus whose reservation key was not removed except for the initiator port through which the command was issued. The additional sense code shall be set as follows:

- a) If the service action was PREEMPT or PREEMPT AND ABORT with a SERVICE ACTION RESERVATION KEY set to zero, the additional sense code shall be set to RESERVATIONS RELEASED.
- b) If the service action was RELEASE, the additional sense code shall be set to RESERVATIONS RELEASED.

5.5.2.7.1.3 Handling for other released persistent reservations

When the persistent reservation holder (see 5.5.2.6) of a Write Exclusive or Exclusive Access type reservation becomes unregistered the persistent reservation shall be released.

5.5.2.7.2 Releasing

Only a persistent reservation holder (see 5.5.2.6) is allowed to release a persistent reservation.

An application client releases a persistent reservation by issuing a PERSISTENT RESERVE OUT command with RELEASE service action through an I_T nexus that is a persistent reservation holder with the following parameters:

- a) RESERVATION KEY field set to the value of the reservation key that is registered for the I_T_L nexus; and
- b) TYPE and SCOPE fields set to match the persistent reservation being released.

In response to a persistent reservation release request from a persistent reservation holder the device server shall perform a release by doing the following as an uninterrupted series of actions:

- a) Release the persistent reservation;
- b) Not remove any registration(s);
- c) If the released persistent reservation is a registrants only or all registrants type persistent reservation, the device server shall establish a unit attention condition for every initiator port associated with a registered I_T nexus other than the initiator port that issued the PERSISTENT RESERVE OUT command with RELEASE service action. The sense key shall be set to UNIT ATTENTION and the additional sense code shall be set to RESERVATIONS RELEASED; and
- d) If the persistent reservation is of any other type the device server shall not establish a unit attention condition.

The established persistent reservation shall not be altered and the device server shall return a CHECK CONDITION status for a PERSISTENT RESERVE OUT command that specifies the release of a persistent reservation when:

- a) The requesting I_T nexus is a persistent reservation holder (see 5.5.2.6); and
- b) The SCOPE and TYPE fields do not match the scope and type of the established persistent reservation.

The sense key shall be set to ILLEGAL REQUEST and additional sense code shall be set to INVALID RELEASE OF PERSISTENT RESERVATION.

If there is no persistent reservation or in response to a persistent reservation release request from a registered I_T nexus that is not a persistent reservation holder (see 5.5.2.6), the device server shall do the following:

- a) Not release the persistent reservation (if any); and
- b) Not remove any registrations.

5.5.2.7.3 Unregistering

An application client may remove a registration for an I_T nexus by issuing a PERSISTENT RESERVE OUT command with REGISTER service action or a REGISTER AND IGNORE EXISTING KEY service action with the SERVICE ACTION RESERVATION KEY field set to zero through that I_T nexus.

If the I_T nexus is a reservation holder, the persistent reservation is of an all registrants type, and the I_T nexus was the last registered initiator, the device server shall also release the persistent reservation.

If the I_T nexus is the reservation holder and the persistent reservation is of a type other than all registrants, the device server shall also release the persistent reservation. If the persistent reservation is a registrants only type, the device server shall generate a unit attention condition for every initiator port associated with a registered I_T nexus. The additional sense code shall be set to RESERVATIONS RELEASED.

5.5.2.7.4 Preempting

5.5.2.7.4.1 Overview of preempting

A PERSISTENT RESERVE OUT command with PREEMPT service action or PREEMPT AND ABORT service action is used to:

- a) Preempt (i.e., replace) a persistent reservation and remove registrations; or
- b) Remove registrations.

Table 34 lists the actions taken based on the current persistent reservation type and the SERVICE ACTION RESERVATION KEY field in the PERSISTENT RESERVE OUT command.

Table 34 — Preempting actions

Reservation Type	Service Action Reservation Key	Action	Reference
All Registrants	Zero	Preempt persistent reservations and remove registrations.	5.5.2.7.4.3
	Any reservation key	Remove registrations.	5.5.2.7.4.4
All other types	Zero	Return CHECK CONDITION status, setting the sense key to ILLEGAL REQUEST and the additional sense code to INVALID FIELD IN PARAMETER LIST.	
	Reservation holder's reservation key	Preempt persistent reservations and remove registrations.	5.5.2.7.4.3
	Any other reservation key	Remove registrations.	5.5.2.7.4.4

See figure 3 for a description of how a device server interprets a PREEMPT service action to determine its actions (e.g., preempt persistent reservation, remove registration, or both preempt persistent reservation and remove registration).

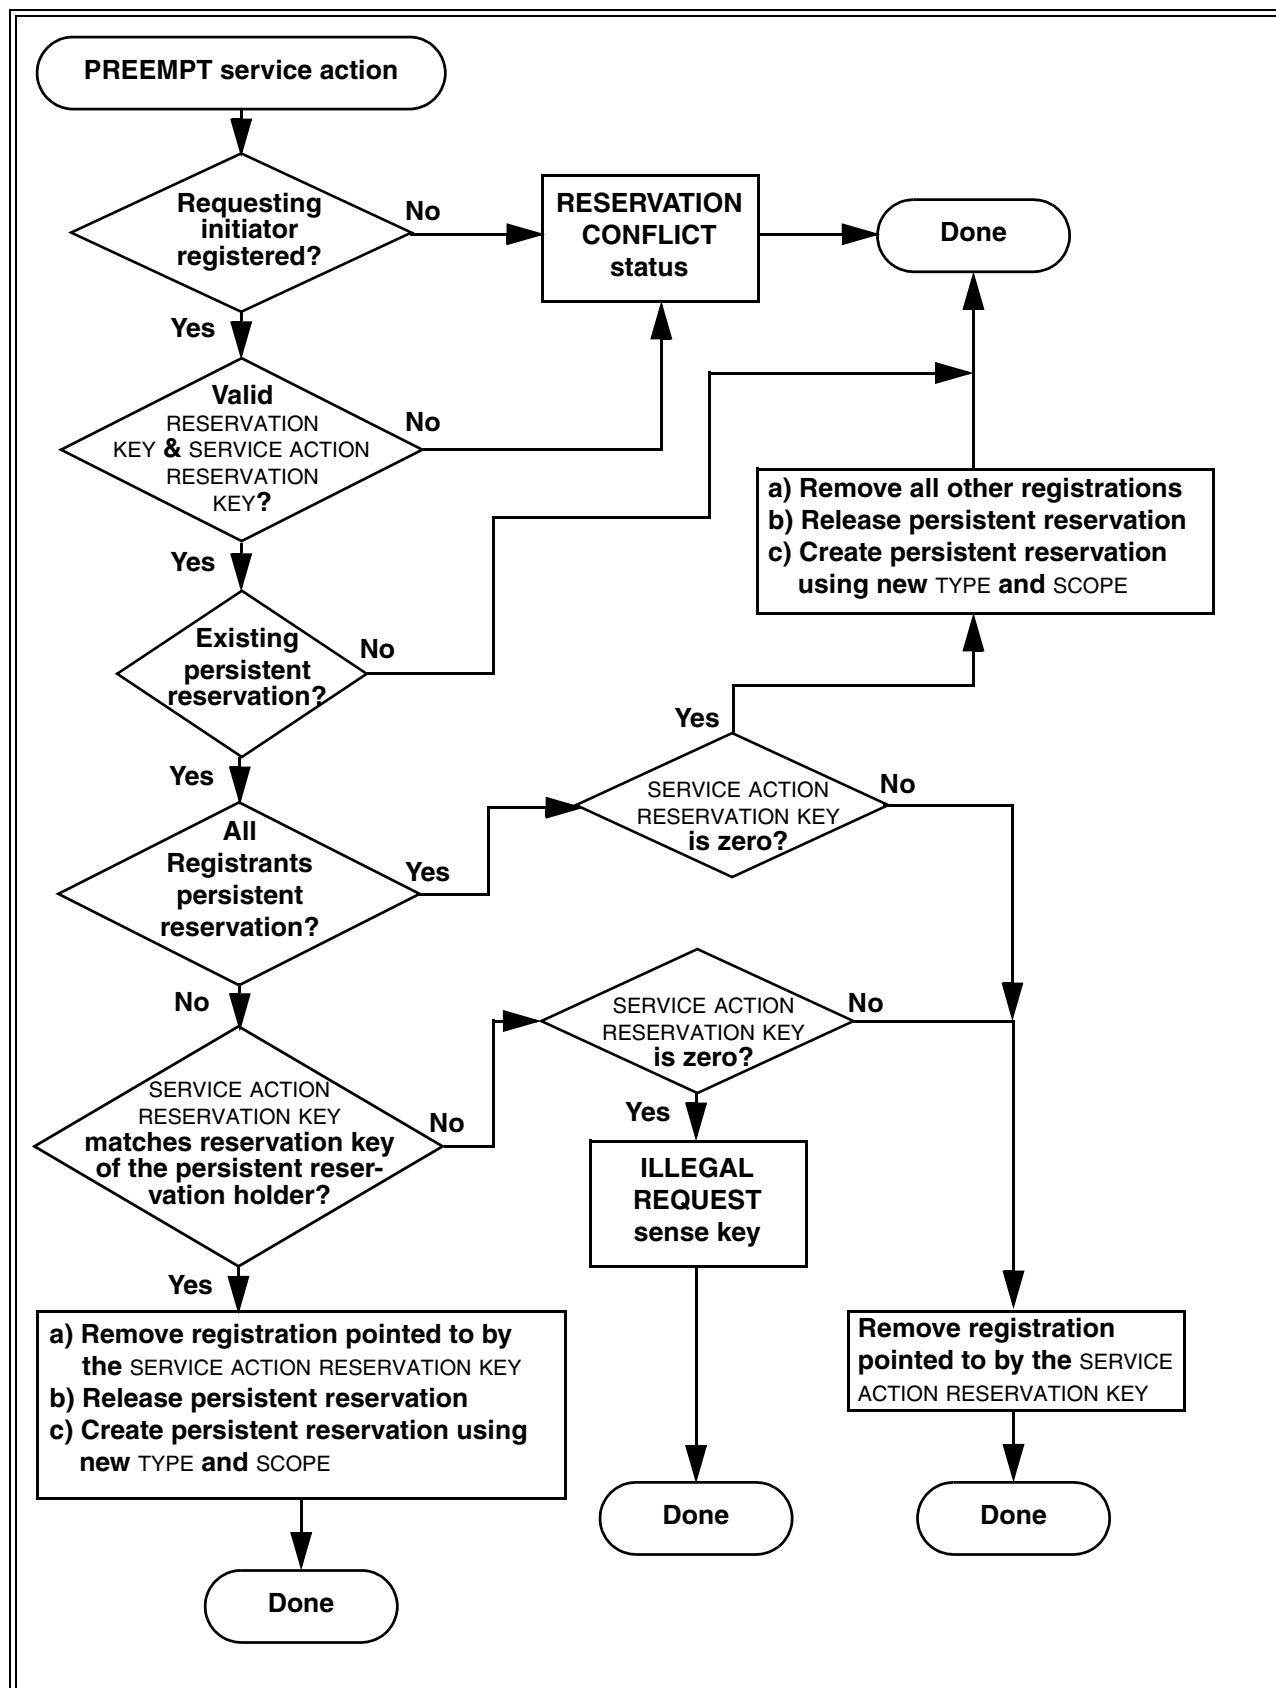

Figure 3 — Device server interpretation of PREEMPT service action

5.5.2.7.4.2 Failed persistent reservation preempt

If the preempting I_T nexus' PREEMPT service action or PREEMPT AND ABORT service action fails (e.g., repeated TASK SET FULL status, repeated BUSY status, SCSI protocol time-out, or time-out due to the queue being blocked due to failed initiator port or failed SCSI initiator device), the application client may issue a LOGICAL UNIT RESET task management function to the failing logical unit to remove blocking tasks and then reissue the preempting service action.

5.5.2.7.4.3 Preempting persistent reservations and registration handling

An application client may preempt any persistent reservation with another persistent reservation by issuing a PERSISTENT RESERVE OUT command with PREEMPT service action or PREEMPT AND ABORT service action through a registered I_T nexus with the following parameters:

- a) RESERVATION KEY field set to the value of the reservation key that is registered for the I_T_L nexus;
- b) SERVICE ACTION RESERVATION KEY set to the value of the reservation key of the persistent reservation to be preempted; and
- c) TYPE and SCOPE fields set to define a new persistent reservation. The SCOPE and TYPE of the persistent reservation created by the preempting I_T nexus may be different than those of the persistent reservation being preempted.

If the SERVICE ACTION RESERVATION KEY identifies a persistent reservation holder (see 5.5.2.6), the device server shall perform a preempt by doing the following as an uninterrupted series of actions:

- a) Release the persistent reservation for the holder identified by the SERVICE ACTION RESERVATION KEY;
- b) Remove the registrations for all I_T nexuses identified by the SERVICE ACTION RESERVATION KEY, except the I_T nexus that issued the PERSISTENT RESERVE OUT command. If an all registrants persistent reservation is present and the SERVICE ACTION RESERVATION KEY is set to zero then all registrations shall be removed except for the initiator port that issued the PERSISTENT RESERVE OUT command;
- c) Establish a persistent reservation for the preempting I_T nexus using the contents of the SCOPE and TYPE fields;
- d) Process tasks as defined in 5.5.1; and
- e) Establish a unit attention condition for every initiator port associated with an I_T nexus that lost its persistent reservation and/or registration. The sense key shall be set to UNIT ATTENTION and the additional sense code shall be set to REGISTRATIONS PREEMPTED.

After GOOD status has been returned for the PERSISTENT RESERVE OUT command, new tasks are subject to the persistent reservation restrictions established by the preempting I_T nexus.

The following tasks shall be subjected in a vendor specific manner either to the restrictions established by the persistent reservation being preempted or to the restrictions established by the preempting I_T nexus:

- a) A task received after the arrival, but before the completion of the PERSISTENT RESERVE OUT command with the PREEMPT service action or the PREEMPT AND ABORT service action; or
- b) A task in the dormant, blocked, or enable state at the time the PERSISTENT RESERVE OUT command with the PREEMPT service action or the PREEMPT AND ABORT service action is received.

Completion status shall be returned for each task.

A PERSISTENT RESERVE OUT with a PREEMPT service action or a PREEMPT AND ABORT service action with the SERVICE ACTION RESERVATION KEY value equal to the persistent reservation holder's reservation key is not an error. In that case the device server shall establish the new persistent reservation and maintain the registration.

5.5.2.7.4.4 Removing registrations

When a registered reservation key does not identify a persistent reservation holder (see 5.5.2.6), an application client may remove the registration(s) without affecting any persistent reservations by issuing a PERSISTENT RESERVE OUT command with PREEMPT service action through a registered I_T nexus with the following parameters:

- a) RESERVATION KEY field set to the value of the reservation key that is registered for the I_T_L nexus; and
- b) SERVICE ACTION RESERVATION KEY field set to match the reservation key of the registration being removed.

If there is a persistent reservation and if the SERVICE ACTION RESERVATION KEY field does not identify a persistent reservation holder the device server shall perform a preempt by doing the following in an uninterrupted series of actions:

- a) Remove the registration for the I_T nexus or I_T nexuses identified by the SERVICE ACTION RESERVATION KEY field;
- b) Ignore the contents of the SCOPE and TYPE fields;
- c) Process tasks as defined in 5.5.1; and
- d) Establish a unit attention condition for any initiator port associated with an I_T nexus that lost its registration other than the initiator port that sent the PERSISTENT RESERVE OUT command. The sense key shall be set to UNIT ATTENTION and the additional sense code shall be set to REGISTRATIONS PREEMPTED.

If a PERSISTENT RESERVE OUT with a PREEMPT service action or a PREEMPT AND ABORT service action sets the SERVICE ACTION RESERVATION KEY field to a value that does not match any registered reservation key the device server shall return a RESERVATION CONFLICT status.

It is not an error for a PERSISTENT RESERVE OUT with a PREEMPT service action or a PREEMPT AND ABORT service action to set the RESERVATION KEY and the SERVICE ACTION RESERVATION KEY to the same value, however, no unit attention condition is established for the initiator port that sent the PERSISTENT RESERVE OUT command.

5.5.2.7.5 Preempting and aborting

The application client's request for and the device server's responses to a PERSISTENT RESERVE OUT command PREEMPT AND ABORT service action are identical to the responses to a PREEMPT service action (see 5.5.2.7.4) except for the following additions. If no reservation conflict occurred, the device server shall perform the following uninterrupted series of actions:

- a) If the TST field is 000b (see 7.4.6) and ACA condition exists for initiator ports other than the initiator port associated with the I_T nexus that is being preempted, the PERSISTENT RESERVE OUT command shall be terminated prior to processing with a status of ACA ACTIVE if the NACA bit equals one in the CDB CONTROL byte (see SAM-2) or BUSY if the NACA equals zero. If the TST field contains 001b, then ACA condition for initiator ports other than the initiator port associated with the I_T nexuses that are being preempted shall not prevent the processing of the PERSISTENT RESERVE OUT command;
- b) Perform the uninterrupted series of actions described for the PREEMPT service action (see 5.5.2.7.4);
- c) All tasks from the initiator ports associated with the preempted I_T nexuses (called preempted tasks) except the task containing the PERSISTENT RESERVE OUT command itself shall be terminated. Application client notification shall be provided, as specified by the TAS bit in the Control mode page (see 7.4.6) that applies to the initiator port associated with the preempted I_T nexus (called the preempted initiator port), as follows:
 - A) If the TAS bit is set to zero then all preempted tasks shall be terminated as if an ABORT TASK SET task management function had been performed by each preempted initiator port; or

- B) If the TAS bit is set to one then all preempted tasks from initiator ports other than the initiator port that sent the PREEMPT AND ABORT service action shall be terminated with a TASK ABORTED status (see SAM-2). Any preempted tasks from the initiator port that sent the PREEMPT AND ABORT service action shall be terminated as if an ABORT TASK SET task management function had been performed by that initiator port.

If a terminated task is a command that causes the device server to generate additional commands and data transfers (e.g., EXTENDED COPY), all commands and data transfers generated by the command shall be terminated before the ABORT TASK SET task management function is considered completed. After the ABORT TASK SET function has completed, all new tasks are subject to the persistent reservation restrictions established by the preempting initiator port;

- d) The device server shall clear any ACA condition associated with an initiator port being preempted and shall clear any tasks with an ACA attribute from that initiator port; and
- e) For logical units that implement the PREVENT ALLOW MEDIUM REMOVAL command, the device server shall perform an action equivalent to the execution of a PREVENT ALLOW MEDIUM REMOVAL command with the PREVENT field equal to zero for the initiator port or initiator ports associated with the I_T nexus or I_T nexuses being preempted (see 6.13).

The actions described in the preceding list shall be performed for all I_T nexuses that are registered with the SERVICE ACTION RESERVATION KEY value, without regard for whether the preempted I_T nexuses hold the persistent reservation. If an all registrants persistent reservation is present and the SERVICE ACTION RESERVATION KEY value is set to zero the device server shall abort all tasks for all registered I_T nexuses.

5.5.2.7.6 Clearing

Any application client may release a persistent reservation and remove all registrations from a device server by issuing a PERSISTENT RESERVE OUT command with CLEAR service action through a registered I_T nexus with the following parameter:

- a) RESERVATION KEY field set to the value of the reservation key that is registered for the I_T_L nexus.

In response to this request the device server shall perform a clear by doing the following as part of an uninterrupted series of actions:

- a) Release any persistent reservation;
- b) Remove all registration(s) (see 5.5.2.4);
- c) Ignore the contents of the SCOPE and TYPE fields;
- d) Continue normal execution of any tasks from any I_T nexus that have been accepted by the device server as allowed (i.e., nonconflicting); and
- e) Establish a unit attention condition for every initiator port associated with registered I_T nexuses other than the initiator port that sent the PERSISTENT RESERVE OUT command with CLEAR service action, if any, for the cleared logical unit. The sense key shall be set to UNIT ATTENTION and the additional sense code shall be set to RESERVATIONS PREEMPTED.

Application clients should not use the CLEAR service action except during recoveries that are associated with initiator port or system reconfiguration, since the effect of the CLEAR service action is to remove the persistent reservation management conventions that protect data integrity.

5.6 Multiple target port and initiator port behavior

SAM-2 specifies the behavior of logical units being accessed by application clients through more than one initiator port through one or more target ports. Additional initiator ports and target ports provide alternate paths through which the device server may be reached. An alternate path may be used to improve the availability of logical units

in the presence of certain types of failures and to improve the performance between an application client and logical unit when some paths may be busy.

If a SCSI target device has more than one target port, the arbitration and connection management among the target ports is vendor specific. If one target port is being used by an initiator port, accesses attempted through other target port(s) may:

- a) Receive a status of BUSY; or
- b) Be accepted as if the other target port(s) were not in use.

The device server shall indicate the presence of multiple target ports by setting the MULTIP bit to one in its standard INQUIRY data.

Only the following operations allow an initiator port to interact with the tasks of other initiator ports, regardless of the target port:

- a) The PERSISTENT RESERVE OUT with PREEMPT service action preempts persistent reservations (see 5.5.2.7.4);
- b) The PERSISTENT RESERVE OUT with PREEMPT AND ABORT service action preempts persistent reservations and aborts tasks (see 5.5.2.7.5);
- c) The PERSISTENT RESERVE OUT with CLEAR service action releases persistent reservations for all initiator ports (see 5.5.2.7.6);
- d) The LOGICAL UNIT RESET task management function removes all tasks for all initiator ports for the addressed logical unit and any logical units issuing from it in a hierarchical addressing structure (see SAM-2). Persistent reservations remain unmodified; and
- e) The CLEAR TASK SET task management function removes all tasks for all initiator ports for the selected logical unit. Most other logical unit states remain unmodified, including MODE SELECT parameters, reservations, and ACA (see SAM-2).

5.7 Asymmetric logical unit access

5.7.1 Introduction to asymmetric logical unit access

Logical units may be connected to the service delivery subsystem via multiple target ports (see SAM-2). Asymmetric logical unit access occurs when the access characteristics of one port may differ from those of another port. SCSI devices with target ports implemented in separate physical units may need to designate differing levels of access for the target ports associated with each logical unit. While commands and task management functions (see SAM-2) may be routed to a logical unit through any target port, the performance may not be optimal, and the accepted command set may be less complete than when the same commands and task management functions are routed through a different target port. When a failure on the path to one target port is detected, the SCSI target device may perform automatic internal reconfiguration to make a logical unit accessible from a different set of target ports or may be instructed by the initiator to make a logical unit accessible from a different set of target ports.

A target port characteristic called target port asymmetric access state (see 5.7.4) defines properties of a target port and the allowable command set for a logical unit when commands and task management functions are routed through the target port maintaining that state.

A target port group is defined as a set of target ports that are in the same target port asymmetric access state at all times. A target port group asymmetric access state is defined as the target port asymmetric access state common to the set of target ports in a target port group. The grouping of target ports is vendor specific.

A logical unit may have commands and task management functions routed through multiple target port groups. Logical units support asymmetric logical unit access if different target port groups may be in different target port group asymmetric access states.

An example of asymmetric logical unit access is a SCSI controller device with two separated controllers where all target ports on one controller are in the same asymmetric access state with respect to a logical unit and are members of the same target port group. Target ports on the other controller are members of another target port group. The behavior of each target port group may be different with respect to a logical unit, but all members of a single target port group are always in the same target port asymmetric access state with respect to a logical unit.

An example of target port groups is shown in figure 4.

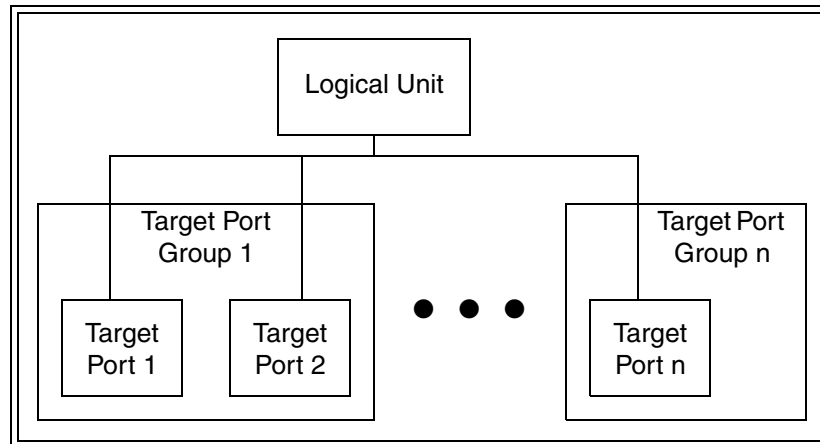

Figure 4 — Target port group example

5.7.2 Explicit and implicit asymmetric logical unit access

Asymmetric logical unit access may be managed explicitly by an application client using the REPORT TARGET PORT GROUPS (see 6.24) and SET TARGET PORT GROUPS (see 6.28) commands.

Alternatively, asymmetric logical unit access may be managed implicitly by the SCSI target device based on the type of transactions being routed through each target port and the internal configuration capabilities of the target port group(s) through which the logical unit may be accessed. In general, the logical units attempt to maintain full performance across the target port groups that are busiest and that show the most reliable performance, allowing other target port groups to select a lower performance target port asymmetric access state.

If both explicit and implicit asymmetric logical unit access are implemented the precedence of one over the other is vendor specific.

5.7.3 Discovery of asymmetric logical unit access behavior

SCSI logical units with asymmetric logical unit access may be identified by inspecting the data returned by the INQUIRY command. The value in the asymmetric logical units access (ALUA) field (see 6.4.2) indicates whether or not the logical unit supports asymmetric logical unit access and if so whether implicit or explicit management is supported.

5.7.4 Target port asymmetric access states

5.7.4.1 Target port asymmetric access states overview

For all SCSI target devices that report in the INQUIRY data that they support asymmetric logical unit access, all of the target ports in a target port group shall be in the same target port asymmetric access state with respect to the ability to route information to a logical unit. The possible target port asymmetric access states are:

- a) Active/optimized;
- b) Active/non-optimized;
- c) Standby; and
- d) Unavailable.

5.7.4.2 Active/Optimized state

When commands and task management functions are being routed through a target port in the active/optimized target port asymmetric access state, the device server shall function as specified in the appropriate command set standards. All target ports within a target port group should be capable of immediately accessing the logical unit.

The SCSI target device shall participate in all task management functions as defined in SAM-2.

5.7.4.3 Active/Non-optimized state

When commands and task management functions are being routed through a target port in the active/non-optimized target port asymmetric access state, the device server shall function as specified in the appropriate command set standards.

The processing of some commands, especially those involving data transfer or caching and task management function, may operate with lower performance than they would if the target port were in the active/optimized target port asymmetric access state.

The SCSI target device shall participate in all task management functions as defined in SAM-2.

5.7.4.4 Standby state

When being accessed through a target port in the standby target port asymmetric access state, the device server shall support those of the following commands that it supports while in the active/optimized target port asymmetric access state:

- a) INQUIRY;
- b) LOG SELECT;
- c) LOG SENSE;
- d) MODE SELECT;
- e) MODE SENSE;
- f) REPORT LUNS (for LUN 0);
- g) RECEIVE DIAGNOSTIC RESULTS;
- h) SEND DIAGNOSTIC;
- i) REPORT TARGET PORT GROUPS;
- j) SET TARGET PORT GROUPS;
- k) REQUEST SENSE;
- l) PERSISTENT RESERVE IN;
- m) PERSISTENT RESERVE OUT;
- n) Echo buffer modes of READ BUFFER; and
- o) Echo buffer modes of WRITE BUFFER.

The device server may support other commands.

For those commands that are not supported, the device server shall return CHECK CONDITION status with the sense key set to NOT READY and an additional sense code of LOGICAL UNIT NOT ACCESSIBLE, TARGET PORT IN STANDBY STATE.

The SCSI target device shall participate in all task management functions as defined in SAM-2.

5.7.4.5 Unavailable state

When being accessed through a target port in the unavailable target port asymmetric access state, the device server shall accept only a limited set of commands. The unavailable target port asymmetric access state is intended for situations when the target port accessibility to a logical unit may be severely restricted due to, for example, a hardware error. Therefore it may not be possible to transition from this state to either the active/optimized, active/non-optimized or standby states. The unavailable target port asymmetric access state is also intended for minimizing any disruption when using the downloading microcode mode of the WRITE BUFFER command.

While in the unavailable target port asymmetric access state, the device server shall support those of the following commands that it supports while in the active/optimized state:

- a) INQUIRY (the peripheral device qualifier (see 6.4.2) shall be set to 001b);
- b) REPORT LUNS (for LUN 0);
- c) REPORT TARGET PORT GROUPS;
- d) SET TARGET PORT GROUPS;
- e) REQUEST SENSE;
- f) Echo buffer modes of READ BUFFER;
- g) Echo buffer modes of WRITE BUFFER; and
- h) Download microcode mode of WRITE BUFFER.

The device server may support other commands.

For those commands that are not supported, the device server shall return CHECK CONDITION status with the sense key set to NOT READY and an additional sense code of LOGICAL UNIT NOT ACCESSIBLE, TARGET PORT IN UNAVAILABLE STATE.

The SCSI target device is not required to participate in all task management operations.

5.7.5 Transitions between target port asymmetric access states

The movement from one target port asymmetric access state to another is called a transition.

During a transition between target port asymmetric access states the device servers shall respond to a command in one of the following ways:

- a) If during the transition the logical unit is inaccessible, then the transition is performed as a single indivisible event and the device server shall respond by either returning BUSY status or returning CHECK CONDITION status with the sense key set to NOT READY and an additional sense code of LOGICAL UNIT NOT ACCESSIBLE, ASYMMETRIC ACCSSS STATE TRANSITION; or
- b) If during the transition the target ports in a target port group are able to access the requested logical unit, then the device server shall support those of the following commands that it supports while in the active/optimized asymmetric access state:
 - A) INQUIRY;

- B) REPORT LUNS (for LUN 0);
- C) REPORT TARGET PORT GROUPS;
- D) SET TARGET PORT GROUPS;
- E) REQUEST SENSE;
- F) Echo Buffer modes of READ BUFFER; and
- G) Echo Buffer modes of WRITE BUFFER.

The device server may support other commands when those commands are routed through a target port that is transitioning between asymmetric access states.

For those commands that are not supported during a transition, the device server shall return CHECK CONDITION status with the sense key set to NOT READY and an additional sense code of LOGICAL UNIT NOT ACCESSIBLE, ASYMMETRIC ACCESS STATE TRANSITION.

The SCSI target device is not required to participate in all task management functions.

If the transition was explicit and it failed, then the device server shall return CHECK CONDITION status with the sense key set to HARDWARE ERROR and an additional sense code of SET TARGET PORT GROUPS COMMAND FAILED. The target port group that encountered the error should complete a transition to the unavailable target port asymmetric access state. If a target port group asymmetric access state change occurred as a result of the failed transition the device server shall establish a unit attention condition for all initiators other than the one that sent the SET TARGET PORT GROUPS command with an additional sense code of ASYMMETRIC ACCESS STATE CHANGED.

If the transition was implicit and it failed, then the device server shall establish a unit attention condition for all initiators with an additional sense code of IMPLICIT ASYMMETRIC ACCESS STATE TRANSITION FAILED.

An implicit CLEAR TASK SET task management function may be performed following a transition failure.

Once a transition is completed, the new target port asymmetric access state may apply to some or all tasks entered into the task set before the completion of the transition. The new target port asymmetric access state shall apply to all tasks received by the device server after completion of a transition.

After an implicit target port asymmetric access state change, a device server shall establish a unit attention condition for all initiators with an additional sense code of ASYMMETRIC ACCESS STATE CHANGED.

After an explicit target port asymmetric access state change, a device server shall establish a unit attention condition with an additional sense code of ASYMMETRIC ACCESS STATE CHANGED for all initiators other than the initiator that issued the SET TARGET GROUPS command.

5.7.6 Implicit asymmetric logical units access management

SCSI target devices with implicit asymmetric logical units access management are capable of setting the target port group asymmetric access state of each target port group using mechanisms other than the SET TARGET PORT GROUPS command.

All logical units that report in the standard INQUIRY data (see 6.4.2) that they support asymmetric logical units access and support implicit asymmetric logical unit access (i.e., the ALUA field contains 01b or 11b) shall:

- a) Implement the INQUIRY command Device Identifier VPD page (see 7.6.4) identifier types 4h and 5h; and
- b) Support the REPORT TARGET PORT GROUPS command as described in 6.24.

5.7.7 Explicit asymmetric logical units access management

All logical units that report in the standard INQUIRY data (see 6.4.2) that they support asymmetric logical units access and support explicit asymmetric logical unit access (i.e., the ALUA field contains 10b or 11b) shall:

- a) Implement the INQUIRY command Device Identifier VPD page (see 7.6.4) identifier types 4h and 5h;
- b) Support the REPORT TARGET PORT GROUPS command as described in 6.24; and
- c) Support the SET TARGET PORT GROUPS command as described in 6.28.

5.7.8 Behavior after power on, hard reset, logical unit reset, and I_T nexus loss

For all SCSI target devices that report in the standard INQUIRY data (see 6.4.2) that they support only explicit asymmetric logical unit access (i.e., the ALUA field contains 10b), the target port shall preserve the target port asymmetric access state during any power cycle, hard reset, logical unit reset, and I_T nexus loss.

5.8 Power conditions

5.8.1 Power conditions overview

The optional Power Condition mode page (see 7.4.11) allows an application client to modify the behavior of a target port and/or logical unit in a manner that may reduce power consumption. This behavior modification is invoked by enabling and setting the idle condition timer and/or the standby condition timer using the mode page.

In addition to the Power Condition mode page, the power condition of a target port and/or logical unit may be controlled by the START STOP UNIT command (see SBC-2 or RBC). If both the Power Condition mode page and the START STOP UNIT command methods are being used to control the power condition of the same target port and/or logical unit, then any START STOP UNIT command's power condition specification shall override the Power Condition mode page's power control and may disable the idle condition and standby condition timers.

There shall be no notification to the application client that a target port and/or logical unit has transitioned from one power condition to another. An application client may determine the current power condition of a logical unit by issuing a REQUEST SENSE command (see 6.25).

No power condition shall affect the supply of any power required for proper operation of the service delivery subsystem.

Logical units that contain cache memory shall write all cached data to the medium for the logical unit (e.g., as a logical unit would do in response to a SYNCHRONIZE CACHE command as described in SBC-2) prior to entering into any power condition that prevents accessing the media (e.g., before a hard drive stops its spindle motor during transition to the standby power condition).

The power conditions are described in table 35.

Table 35 — Power Conditions

Power Condition	Description
active	While in the active power condition: <ul style="list-style-type: none"> a) A device server is capable of responding to all of its supported commands including media access requests; b) A logical unit completes processing of operations in the shortest time when compared to the time required for completion while in the idle or standby power conditions; and c) A logical unit may consume more power than when in the idle or standby power conditions (e.g., a disk drive's spindle motor may be active).
idle	While in the idle power condition: <ul style="list-style-type: none"> a) A device server is capable of responding to all of its supported commands including media access requests; b) A logical unit may take longer to complete processing a command than it would while in the active power condition (e.g., the device may have to activate some circuitry before processing a command); and c) A logical unit may consume less power than when in the active power condition.
standby	While in the standby power condition: <ul style="list-style-type: none"> a) A device server is not capable of processing media access commands; and b) A logical unit may consume less power than when in the idle power condition (e.g., a disk drive's spindle motor is stopped).

5.8.2 Power condition state machine

5.8.2.1 Power condition state machine overview

The PC (power condition) state machine describes the logical unit power states and transitions resulting from Power Condition mode page settings.

The PC states are as follows:

- a) PC0:Powered_on (see 5.8.2.2) (initial state);
- b) PC1:Active (see 5.8.2.3);
- c) PC2:Idle (see 5.8.2.4); and
- d) PC3:Standby (see 5.8.2.5).

The PC state machine shall start in the PC0:Powered_on state after power on.

Figure 5 describes the PC state machine.

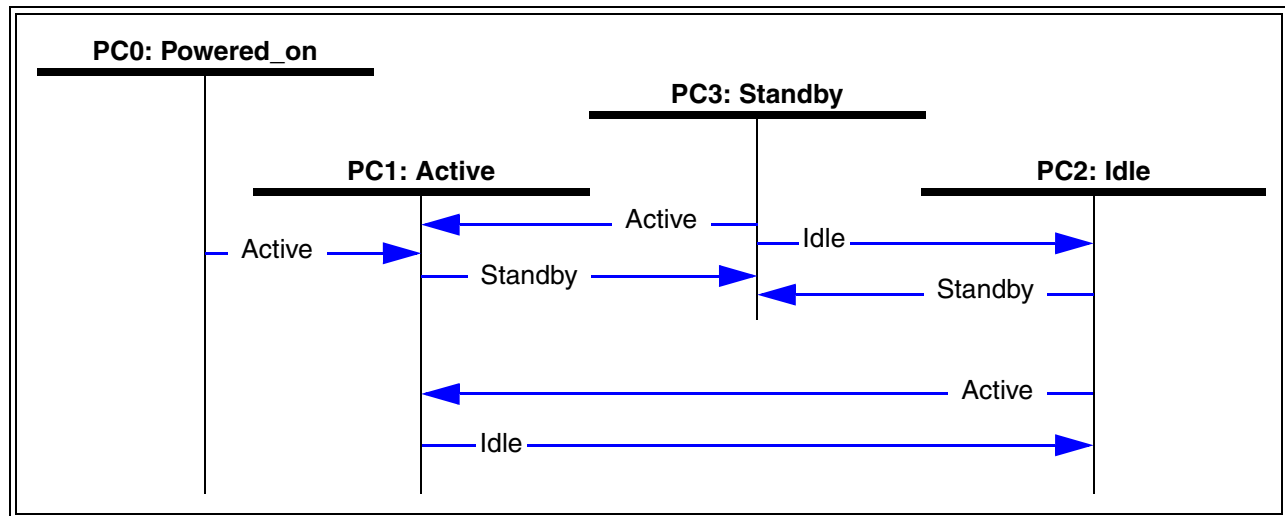

Figure 5 — Power condition state machine

5.8.2.2 PC0:Powered_on state

5.8.2.2.1 PC0:Powered_on state description

The logical unit shall enter this state upon power on. This state consumes zero time.

5.8.2.2.2 Transition PC0:Powered_on to PC1:Active

This transition shall occur after the logical unit is ready to begin its power on initialization.

5.8.2.3 PC1:Active state

5.8.2.3.1 PC1:Active state description

While in this state, if power on initialization is not complete, then the logical unit shall complete its power on initialization.

While in this state, if power on initialization is complete, then:

- A logical unit is in the active power condition (see table 35);
- If the idle condition timer is active, then the idle condition timer is running; and
- If the standby condition timer is active, then the standby condition timer is running.

5.8.2.3.2 Transition PC1:Active to PC2:Idle

This transition shall occur after:

- The idle condition timer is active; and
- The idle condition timer is zero.

5.8.2.3.3 Transition PC1:Active to PC3:Standby

This transition shall occur after:

- a) The standby condition timer is active; and
- b) The standby condition timer is zero.

5.8.2.4 PC2:Idle state

5.8.2.4.1 PC2:Idle state description

While in this state:

- a) A logical unit is in the idle power condition (see table 35); and
- b) If the standby condition timer is active, then the standby condition timer is running.

5.8.2.4.2 Transition PC2:Idle to PC1:Active

This transition shall occur after the device server receives a command that requires the logical unit to be in the PC1:Active state to process the command.

5.8.2.4.3 Transition PC2:Idle to PC3:Standby

This transition shall occur after:

- a) The standby condition timer is active; and
- b) The standby condition timer is zero.

5.8.2.5 PC3:Standby state

5.8.2.5.1 PC3:Standby state description

While in this state, a logical unit is in the standby power condition (see table 35).

5.8.2.5.2 Transition PC3:Standby to PC1:Active

This transition shall occur after the device server receives a command that requires the logical unit to be in the PC1:Active state to process the command.

5.8.2.5.3 PC3:Standby to PC2:Idle

This transition shall occur after the device server receives a command that requires the logical unit to be in the PC2:Idle state to process the command.

5.9 Removable medium devices with an attached medium changer

When a logical unit is served by a medium changer, control over one medium transport element may be effected using medium changer commands sent to the device server within the logical unit. The level of control is not as complete as would be available if a fully functional medium-changer device server were implemented (see SMC). However, the amount of control is sufficient for paired device and medium changer configurations.

The device server shall indicate its ability to support medium changer commands by setting the MCHNGR bit to one in its standard INQUIRY data (see 6.4.2). An MCHNGR bit of one shall indicate that the MOVE MEDIUM ATTACHED and READ ELEMENT STATUS ATTACHED commands are supported by the device server. Definitions of the MOVE MEDIUM ATTACHED and READ ELEMENT STATUS ATTACHED commands may be found in SMC.

Only one medium transport element shall be permitted, element 0. Only one data transfer element shall be permitted. Media exchanges shall not be supported by attached medium changers. The RESERVE ELEMENT and RELEASE ELEMENT commands shall not be supported by attached medium changers.

5.10 Medium auxiliary memory

Some types of media, especially removable media, include a non-volatile memory referred to as MAM (medium auxiliary memory). Medium auxiliary memory is used to store data describing the media and its contents. This standard supports medium auxiliary memory with the READ ATTRIBUTE command (see 6.14) and the WRITE ATTRIBUTE command (see 6.30). These commands are used to retrieve and store information in the medium auxiliary memory in the form of attributes.

A MAM attribute is represented in a format described in 7.3 and is composed of:

- a) An attribute identifier;
- b) An attribute format code;
- c) A bit indicating whether the identified attribute is read only;
- d) An attribute length specifying the number of bytes in the identified attribute value; and
- e) The value of the identified attribute.

There are three types of attributes (see table 36).

Table 36 — Types of MAM attributes

Attribute Type	Attribute Source	Example	Readable with READ ATTRIBUTE	Writable with WRITE ATTRIBUTE
Medium	Permanently stored in the medium auxiliary memory during manufacture.	Media Serial Number	Yes	No
Device	Maintained by the device server.	Load Count	Yes	No
Host	Maintained by the application client.	Backup Date	Yes	Yes

Depending on that attribute type, attributes have the states shown in table 37.

Table 37 — MAM attribute states

Attribute Type	Attribute State	Description
Medium or Device	Read Only	An application server may read the contents of the attribute with the READ ATTRIBUTE command, but an attempt to clear or change the attribute using the WRITE ATTRIBUTE command shall result in the command being terminated with a CHECK CONDITION status. When the READ ONLY bit (see 7.3.1) is one, the attribute is in the read only state.
	Unsupported	The device server does not support the attribute and shall not return it in response to a READ ATTRIBUTE command.
Host	Nonexistent	A host attribute does not exist in the medium auxiliary memory until a WRITE ATTRIBUTE command creates it.
	Read/Write	The attribute has been created using the WRITE ATTRIBUTE command. After the attribute has been created, the contents may be altered using subsequent WRITE ATTRIBUTE commands. A read/write attribute may be returned to the nonexistent state using a WRITE ATTRIBUTE command with the attribute length set to zero. When the READ ONLY bit (see 7.3.1) is zero, the attribute is in the read/write state.

6 Commands for all device types

6.1 Summary of commands for all device types

The operation codes for commands that apply to all device types are listed in table 38.

Table 38 — Commands for all device types (part 1 of 2)

Command name	Operation code	Type	Reference
ACCESS CONTROL IN	86h	O	8.3.2
ACCESS CONTROL OUT	87h	O	8.3.3
CHANGE ALIASES	A4h/0Bh ^b	O	6.2
EXTENDED COPY	83h	O	6.3
INQUIRY	12h	M	6.4
LOG SELECT	4Ch	O	6.5
LOG SENSE	4Dh	O	6.6
MODE SELECT(6)	15h	Z	6.7
MODE SELECT(10)	55h	Z	6.8
MODE SENSE(6)	1Ah	Z	6.9
MODE SENSE(10)	5Ah	Z	6.10
MOVE MEDIUM ATTACHED ^a	A7h	Z	SMC
PERSISTENT RESERVE IN	5Eh	Z	6.11
PERSISTENT RESERVE OUT	5Fh	Z	6.12
PREVENT ALLOW MEDIUM REMOVAL	1Eh	Z	6.13
READ ATTRIBUTE	8Ch	O	6.14
READ BUFFER	3Ch	O	6.15
READ ELEMENT STATUS ATTACHED ^a	B4h	Z	SMC
READ MEDIA SERIAL NUMBER	ABh/01h ^b	Z	6.16
RECEIVE COPY RESULTS	84h	O	6.17
RECEIVE DIAGNOSTIC RESULTS	1Ch	O	6.18
REPORT ALIASES	A3h/0Bh ^b	O	6.19
REPORT DEVICE IDENTIFIER	A3h/05h ^b	O	6.20
REPORT LUNS	A0h	X	6.21
REPORT SUPPORTED OPERATION CODES	A3h/0Ch ^b	O	6.22
REPORT SUPPORTED TASK MANAGEMENT FUNCTIONS	A3h/0Dh ^b	O	6.23
REPORT TARGET PORT GROUPS	A3h/0Ah ^b	O	6.24
Key: M = Command implementation is mandatory. O = Command implementation is optional. OB = Command implementation is defined in a previous standard X = Command implementation requirements given in reference subclause of this standard. Z = Command implementation is device type specific.

6.2 CHANGE ALIASES command

6.2.1 CHANGE ALIASES command introduction

The CHANGE ALIASES command (see table 39) requests that the device server maintain and make changes to a list of associations between eight byte alias values and SCSI device or port designations. A designation contains a name and optional identifier information that specifies a SCSI device or port (see 6.2.2). The alias list may be queried by the initiator via the REPORT ALIASES command (see 6.19). If the REPORT ALIASES command is supported then the CHANGE ALIASES command shall also be supported.

The CHANGE ALIASES command is a service action of the MAINTENANCE OUT command. Additional MAINTENANCE OUT service actions are defined in SCC-2 and in this standard. The MAINTENANCE OUT service actions defined in SCC-2 apply only to logical units that return a device type of 0Ch or the sccs bit equal to one in their standard INQUIRY data (see 6.4.2).

Table 39 — CHANGE ALIASES command

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE (A3h)							
1	Reserved			SERVICE ACTION (0Bh)				
2	Reserved							
3	Reserved							
4	Reserved							
5	Reserved							
6	(MSB)							
7								
8	PARAMETER LIST LENGTH							
9	(LSB)							
10	Reserved							
11	CONTROL							

The PARAMETER LIST LENGTH field specifies the length in bytes of the parameter data that shall be transferred from the application client to the device server. A parameter list length value of zero indicates that no data shall be transferred and no changes shall be made in the alias list.

If the parameter list length results in the truncation of the header or any alias entry, then the device server shall make no changes to the alias list and terminate the command with CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to PARAMETER LIST LENGTH ERROR.

On successful completion of a CHANGE ALIASES command, the device server shall maintain an association of each assigned eight byte alias value to the SCSI device or port designation. These associations shall be cleared by a logical unit reset or I_T nexus loss. The device server shall maintain a separate alias list for each initiator.

A CHANGE ALIASES command may add, change or remove entries from the alias list. Alias list entries not referenced in the CHANGE ALIASES parameter data shall not be changed.

NOTE 10 - An application client may use alias values to reference SCSI devices or ports in third party commands (e.g., EXTENDED COPY). The alias list provides a mechanism for eight byte third party identifier fields to reference a third party device or port whose name or addressing information is longer than eight bytes. For example, an application may use the CHANGE ALIASES command to establish an association between an alias value and a SCSI target device or SCSI target port designation. Then, it may send an EXTENDED COPY command containing in the parameter data an alias target descriptor (see 6.3.6.3) that includes this alias value. At the completion of the EXTENDED COPY command the application should clear this entry from the device server's alias list by sending a CHANGE ALIASES command that requests association of the alias value to a NULL DESIGNATION (see 6.2.4.2) alias format.

If the device server has insufficient resources to make all requested changes to the alias list, the device server shall make no changes to the alias list and shall terminate the command with CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST and additional sense code shall be set to INSUFFICIENT RESOURCES.

The parameter data for a CHANGE ALIASES command (see table 40) contains zero or more alias entries. If the device server processes a CHANGE ALIASES command that contains at least one alias entry while there exists any other enabled task that references an alias entry in the alias list, the device server shall terminate the CHANGE ALIASES command with CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to OPERATION IN PROGRESS.

Table 40 — CHANGE ALIASES parameter list

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB)							
3	PARAMETER DATA LENGTH (n-3)							(LSB)
4	Reserved							
7								
	Alias entry (or entries)							
8	Alias entry 0 (see 6.2.2)							
	⋮							
	⋮							
	⋮							
n	Alias entry x (see 6.2.2)							

The PARAMETER DATA LENGTH field should contain the number of bytes of attribute data and should be ignored by the device server.

The format of an alias entry is described in 6.2.2.

6.2.2 Alias entry format

One alias entry (see table 41) describes one alias reported via the REPORT ALIASES command (see 6.19) or to be changed via the CHANGE ALIASES command.

Table 41 — Alias entry format

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB)							
7	ALIAS VALUE (LSB)							
8	PROTOCOL IDENTIFIER							
9	Reserved							
10								
11	FORMAT CODE							
12	Reserved							
13								
14	(MSB)							
15	DESIGNATION LENGTH (n-15) (LSB)							
16	DESIGNATION							
n								

The ALIAS VALUE field contains the numeric alias value that the device server shall associate with the SCSI target device or SCSI target port specified by the values in the PROTOCOL IDENTIFIER, FORMAT CODE and DESIGNATION fields.

The PROTOCOL IDENTIFIER field (see table 42) specifies that the alias entry designation is independent of SCSI protocol or the SCSI protocol to which the alias entry applies.

Table 42 — Alias entry protocol identifiers

PROTOCOL IDENTIFIER	Description	Subclause
00h - 0Fh	Protocol specific designation	7.5.2
10h - 7Fh	Reserved	
80h	Protocol independent designation	6.2.4
81h - FFh	Reserved	

The FORMAT CODE field contents combined with the PROTOCOL IDENTIFIER field contents defines the format of the DESIGNATION field. The subclauses that describe each PROTOCOL IDENTIFIER field usage (see table 42) define the applicable FORMAT CODE field values.

The DESIGNATION LENGTH field specifies the number of bytes of the DESIGNATION field. The DESIGNATION LENGTH value shall be a multiple of four.

The zero-padded (see 4.4.2) DESIGNATION field should designate a unique SCSI target device or SCSI target port using the following:

- a) A SCSI target device name or a SCSI target port name, and
- b) Optionally, one or more SCSI target port identifiers or SCSI protocol specific identifiers.

6.2.3 Alias designation validation

The device server shall not validate any designation at the time of processing either the REPORT ALIASES or CHANGE ALIASES command. Such validation shall occur only when the device server consults the alias list to resolve an alias to a designation in the context of third-party commands (e.g., EXTENDED COPY) or any other command that requires reference to the alias list.

If a designation identifies a unique SCSI target device or SCSI target port that is within a SCSI domain accessible to the device server, the designation is considered valid.

Based on the SCSI protocol specific requirements for a given designation format, a designation that does not identify a unique SCSI target device or SCSI target port within the SCSI domains accessible to the device server is considered invalid.

NOTE 11 - For example, a designation may be considered invalid if the device server has no ports on the SCSI domain of the designated SCSI target device or SCSI target port.

A designation having both SCSI name and SCSI identifier information may be inconsistent if the device server is not able to access the named SCSI target device or SCSI target port through one or more of the names or identifiers in the designation. In such cases, the designation shall be declared valid or invalid according to the SCSI protocol specific requirements.

Notes

- 12 For example, in FCP-2 both an N_Port and World Wide Name for a SCSI port may be given in a designation. The designation definition may require that the N_Port be that of the named port. In that case, the designation would be invalid. Alternatively, the designation definition may view the N_Port as a hint for the named FC Port accessible to the device server through a different D_ID. In that case, the designation would be valid and designate the named FC Port.
- 13 When only name information is provided in a designation, it is assumed that the device server has access to a mechanism for resolving names to identifiers. Access to such a service is SCSI protocol specific and vendor specific.

6.2.4 Alias entry protocol independent designations

6.2.4.1 Alias entry protocol independent designations overview

The protocol independent alias entry designations have a protocol identifier of 80h and one of the format codes shown in table 43.

Table 43 — Protocol independent alias entry format codes

Format Code	Name	Designation Length (bytes)	Designation Contents	Subclause
00h	NULL DESIGNATION	0	none	6.2.4.2
01h - FFh	Reserved			

6.2.4.2 NULL DESIGNATION alias format

In response to an alias entry with the NULL DESIGNATION format, the device server shall remove the specified alias value from the alias list. Application clients should use the NULL DESIGNATION format in a CHANGE ALIASES command to remove an alias entry from the alias list when that alias entry is no longer needed. The NULL DESIGNATION format shall not appear in REPORT ALIASES parameter data.

6.3 EXTENDED COPY command

6.3.1 EXTENDED COPY command introduction

The EXTENDED COPY command (see table 44) provides a means to copy data from one set of logical units to another set or to the same set of logical units. The entity within a device server that receives and performs the EXTENDED COPY command is called the copy manager. The copy manager is responsible for copying data from the source device(s) to the destination device(s). The copy source and destination devices are logical units that may reside in different SCSI devices or the same SCSI device. It is possible that all the SCSI devices and the copy manager are the same logical unit.

Table 44 — EXTENDED COPY command

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE (83h)							
1	Reserved							
2	Reserved							
3	Reserved							
4	Reserved							
5	Reserved							
6	Reserved							
7	Reserved							
8	Reserved							
9	Reserved							
10	(MSB)							
11								
12	PARAMETER LIST LENGTH							
13								
14	(LSB)							
15	Reserved							
	CONTROL							

Before the copy manager is instructed to move data, the application controlling the data movement shall independently take any necessary actions required to prepare the source and destination devices for the EXTENDED COPY command. These actions may include media changer commands, loading of tapes, MODE SELECT commands reservation commands, positioning of tape, etc. After all preparatory actions have been accomplished, the EXTENDED COPY command should be issued to the copy manager to start the data transfer.

The PARAMETER LIST LENGTH field specifies the length in bytes of the parameter data that shall be contained in the Data-Out Buffer. A parameter list length of zero indicates that copy manager shall not transfer any data or alter any internal state; this shall not be considered an error. If the parameter list length causes truncation of the parameter list in a target descriptor or segment descriptor, no data shall be transferred and the EXTENDED COPY command shall be terminated with a CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to PARAMETER LIST LENGTH ERROR.

The EXTENDED COPY parameter list (see table 45) begins with a sixteen byte header that contains the LIST IDENTIFIER field, the STR, and NRCR bits, the command's priority, the length of the target descriptor list, the length of the segment descriptor list, and the length of the optional inline data. Immediately following the header is one or more target descriptors, followed by one or more segment descriptors, followed by any optional inline data.

Table 45 — EXTENDED COPY parameter list

Bit Byte	7	6	5	4	3	2	1	0
0	LIST IDENTIFIER							
1	Reserved		STR	NRCR	Reserved	PRIORITY		
2	(MSB) _____							
3	TARGET DESCRIPTOR LIST LENGTH (n-15) _____							
4	(LSB)							
7	Reserved _____							
8	(MSB) _____							
11	SEGMENT DESCRIPTOR LIST LENGTH (m-n) _____							
12	(LSB)							
15	(MSB) _____							
	INLINE DATA LENGTH _____							
	(LSB)							
	Target descriptor(s)							
16	_____							
47	Target descriptor 0 _____							
	⋮							
n-31	_____							
n	Target descriptor x _____							
	Segment descriptor(s)							
n+1	_____							
n+1+l	Segment descriptor 0 _____							
	(See specific table for length.)							
	⋮							
	Segment descriptor y _____							
m	(See specific table for length.)							
	Inline data							

NOTE 14 - Unexpected results may occur when an initiator fails to zero the reserved bytes in this parameter list. Copy managers should insure that the reserved bytes 4 through 7 contain zeros.

The LIST IDENTIFIER field is a value selected by the application client to uniquely identify the extended copy operation to the copy manager. The list identifier also may be used in the RECEIVE COPY RESULTS command (see 6.17) to request status for a specific EXTENDED COPY command. The LIST IDENTIFIER value shall be unique for each concurrent EXTENDED COPY command sent by an initiator. If the copy manager detects a duplicate LIST IDENTIFIER value the command shall be terminated with a CHECK CONDITION, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to OPERATION IN PROGRESS.

The **PRIORITY** field establishes the priority of data transfer operations resulting from this **EXTENDED COPY** command relative to data transfer operations resulting from other commands being executed by the same device server. All commands other than copy commands have a priority of 1h. Priority 0h is the highest priority, with increasing **PRIORITY** values indicating lower priorities.

A **Sequential Striped** bit (**STR**) value of one indicates to the copy manager that the majority of the disk references in the parameter list represent sequential access of several striped disks. This may be used by the copy manager to perform read operations from a source disk at any time and in any order during processing of an **EXTENDED COPY** command as described in 6.3.6.4. A **STR** value of zero indicates to the copy manager that disk references are not necessarily sequential.

If the **No Receive Copy Results** (**NRCR**) bit is zero, the copy manager shall hold data for retrieval by the application client using the **RECEIVE COPY RESULTS** command with the **RECEIVE DATA** service action (see 6.17.3) and specified by the segment descriptors. If **NRCR** is one, the copy manager may discard all data accessible to the application client via the **RECEIVE COPY RESULTS** command with the **RECEIVE DATA** service action. If the application client requests delivery of data that has been discarded as a result of **NRCR** being one, the copy manager shall respond as if the **EXTENDED COPY** command has not been processed.

The **TARGET DESCRIPTOR LIST LENGTH** contains the length in bytes of the target descriptor list that immediately follows the parameter list header. The number of target descriptors equals the length in bytes of the target descriptor list divided by 32.

An **EXTENDED COPY** command may reference one or more target devices (the name given by the **EXTENDED COPY** command description to source and/or the destination logical units). Each target device is described by a target descriptor. All target descriptors have their formats specified by an **EXTENDED COPY** descriptor code. A copy manager may not support all target descriptor formats and shall list all target descriptor formats supported in response to the **RECEIVE COPY RESULTS** command with **OPERATING PARAMETERS** service action (see 6.17.4). See 6.3.6 for a detailed description of the target descriptors.

Segment descriptors reference target descriptors by their position, or index, in the target descriptor list. The index for a target descriptor is computed by subtracting 16 from the starting byte number for the target descriptor in the parameter data and dividing the result by 32. The maximum number of target descriptors permitted within a parameter list is indicated by the **MAXIMUM TARGET COUNT** field in the copy manager's operating parameters (see 6.17.4). If the number of target descriptors exceeds the allowed number, the command shall be terminated with **CHECK CONDITION** status. The sense key shall be set to **ILLEGAL REQUEST** and the additional sense code shall be set to **TOO MANY TARGET DESCRIPTORS**.

The **SEGMENT DESCRIPTOR LIST LENGTH** contains the length in bytes of the segment descriptor list that follows the target descriptors. See 6.3.7 for a detailed description of the segment descriptors. The maximum number of segment descriptors permitted within a parameter list is indicated by the **MAXIMUM SEGMENT COUNT** field in the copy manager's operating parameters (see 6.17.4). If the number of segment descriptors exceeds the allowed number, the command shall be terminated with **CHECK CONDITION** status. The sense key shall be set to **ILLEGAL REQUEST** and the additional sense code shall be set to **TOO MANY SEGMENT DESCRIPTORS**.

The maximum length of the target and segment descriptors permitted within a parameter list is indicated by the **MAXIMUM DESCRIPTOR LIST LENGTH** field in the copy manager's operating parameters (see 6.17.4). If the combined length of the target and segment descriptors exceeds the allowed value, the command shall be terminated with **CHECK CONDITION** status. The sense key shall be set to **ILLEGAL REQUEST** and the additional sense code shall be set to **PARAMETER LIST LENGTH ERROR**.

The **INLINE DATA LENGTH** field contains the number of bytes of inline data, after the last segment descriptor. A value of zero indicates that no inline data is present.

The copy manager shall move data from the source devices to the destination devices as prescribed by the segment descriptors. The specific commands issued by the copy manager to the source and destination devices while processing the segment descriptors is vendor specific. Upon completion of an EXTENDED COPY command that returns GOOD status, the source and destination devices, particularly stream devices, shall be positioned at deterministic locations such that the device may be repositioned to the same location by the application client with appropriate commands.

6.3.2 Errors detected before starting processing of the segment descriptors

Errors may occur during processing of an EXTENDED COPY command before the first segment descriptor is processed. These conditions include CRC or parity errors while transferring the EXTENDED COPY command, invalid parameters in the CDB or parameter data, invalid segment descriptors, and inability of the copy manager to continue operating. In the event of such an exception condition, the copy manager shall:

- a) Terminate the EXTENDED COPY command with CHECK CONDITION status; and
- b) Set the VALID bit in the sense data to zero. The sense key shall contain the sense key code describing the exception condition (i.e.: not COPY ABORTED).

6.3.3 Errors detected during processing of segment descriptors

Errors may occur after the copy manager has begun processing segment descriptors. These include invalid parameters in segment descriptors, invalid segment descriptors, unavailable targets referenced by target descriptors, inability of the copy manager to continue operating, and errors reported by source or destination target devices. If the copy manager receives a CHECK CONDITION status from one of the target devices, it shall recover the sense data associated with the exception condition and clear any ACA condition associated with the CHECK CONDITION status.

If processing of a segment cannot complete because the copy manager is unable to establish communications with a target device, or because the target device does not respond to INQUIRY, or because the data returned in response to INQUIRY indicates an unsupported logical unit, then the EXTENDED COPY command shall be terminated with a CHECK CONDITION status. The sense key shall be set to COPY ABORTED and the additional sense code shall be set to COPY TARGET DEVICE NOT REACHABLE.

If processing of a segment cannot complete because the data returned in response to an INQUIRY command indicates a device type that does not match the type in the target descriptor, then the EXTENDED COPY command shall be terminated with a CHECK CONDITION status. The sense key shall be set to COPY ABORTED and the additional sense code shall be set to INCORRECT COPY TARGET DEVICE TYPE.

If the copy manager has issued a command other than INQUIRY to a target device while processing an EXTENDED COPY command and the target device either fails to respond with status or responds with status other than BUSY, TASK SET FULL, ACA ACTIVE, or RESERVATION CONFLICT the condition shall be considered a target device command failure. In response to a target device command failure the EXTENDED COPY command shall be terminated with a CHECK CONDITION status. The sense key shall be set to COPY ABORTED and the additional sense code shall be set to THIRD PARTY DEVICE FAILURE.

If a target device responds to a command from the copy manager with a status of BUSY, TASK SET FULL, ACA ACTIVE, or RESERVATION CONFLICT the copy manager shall either retry the command or terminate the EXTENDED COPY command as a target device command failure.

NOTES

- 15 The copy manager is assumed to employ a vendor specific retry policy that minimizes time consuming and/or fruitless repetition of retries.
- 16 RESERVATION CONFLICT is listed only to give the copy manager leeway in multi-port cases. The copy manager may have multiple ports that are capable of reaching a target device, and there may be a third-party

reservation for one of these ports. The copy manager may need to try access from multiple ports to find one with access.

If a target device responds to an input or output operation with a GOOD status but less data than expected is transferred, then the EXTENDED COPY command shall be terminated with a CHECK CONDITION status. The sense key shall be set to COPY ABORTED and additional sense code shall be set to COPY TARGET DEVICE DATA UNDERRUN. If an overrun is detected, then the EXTENDED COPY command shall be terminated with a CHECK CONDITION status. The sense key shall be set to COPY ABORTED and additional sense code shall be set to COPY TARGET DEVICE DATA OVERRUN.

Following an exception condition detected during segment descriptor processing, the copy manager shall:

- a) Terminate the EXTENDED COPY command with CHECK CONDITION status;
- b) Set the sense key code to COPY ABORTED;
- c) Indicate the segment that was being processed at the time of the exception by writing the segment number to third and fourth bytes of the COMMAND-SPECIFIC INFORMATION field. The segment number is based on the relative position of the segment descriptor in the EXTENDED COPY parameter list. The first segment descriptor in the parameter list is assigned descriptor number zero, the second is assigned one, etc.;
- d) If any data has been written to the destination for the segment being processed at the time the error occurred, the residual for the segment shall be placed in the INFORMATION field, and the VALID bit shall be set to one. The residual count shall be reported in bytes if the peripheral device type in the destination target descriptor is 03h, and in destination device blocks for all other device type codes. The residual count shall be computed by subtracting the number of bytes or blocks successfully written during the processing of the current segment from the number of bytes or blocks which would have been written if all commands had completed with GOOD status and all READ commands had returned the full data length requested. When computing the residual count, the copy manager shall include only the results of commands successfully completed by a destination device, specifically commands completed by a destination device with a GOOD status or with a CHECK CONDITION status and the EOM bit set to one in the sense data. If the copy manager has used out of order transfers the residual count shall be based solely on the contiguous successfully completed transfers starting at relative byte zero of the segment (i.e., any successfully completed transfers farther from relative byte zero than the first incomplete or unsuccessful transfer shall not contribute to the computation of the residual count). If no data has been written to the destination for the segment being processed at the time the error occurred, then the VALID bit shall be set to zero and the contents of the INFORMATION field are not defined. Segment descriptors that do not specify a transfer count shall not have a valid residual count returned;
- e) If the exception condition is reported by the source logical unit, then the first byte of the COMMAND-SPECIFIC INFORMATION field shall specify the starting byte number, relative to the first byte of sense data, of an area that contains the status byte and sense data delivered to the copy manager by the source logical unit. The status byte and sense data shall not be modified by the copy manager or device server. A zero value indicates that no status byte and sense data is being returned for the source logical unit;
- f) If the exception condition is reported by the destination logical unit, then the second byte of the COMMAND-SPECIFIC INFORMATION field shall specify the starting byte number, relative to the first byte of sense data, of an area that contains the status byte and sense data delivered to the copy manager by the destination logical unit. The status byte and sense data shall not be modified by the copy manager or device server. A zero value indicates that no status byte and sense data is being returned for the destination logical unit;
- g) If segment processing is terminated because a target device is unreachable or as the result of a target command failure, then the SENSE-KEY SPECIFIC field shall be set as described in 4.5.2.4.5, with the FIELD POINTER field indicating the first byte of the target descriptor that identifies the target; and
- h) If, during the processing of a segment descriptor, the copy manager detects an error in the segment descriptor, then the SENSE-KEY SPECIFIC field shall be set as described in 4.5.2.4.5, with the FIELD POINTER field indicating the byte in error. The FIELD POINTER field may be used to indicate an offset into either the parameter data or the segment descriptor. The SD bit is used to differentiate between these two cases. The SD bit shall be set to zero to indicate the FIELD POINTER field contains an offset from the start of the

parameter data. The SD bit shall be set to one to indicate the FIELD POINTER field contains an offset from the start of the segment descriptor; and

- i) The copy manager shall preserve information for the FAILED SEGMENT DETAILS service action of the RECEIVE COPY RESULTS command (see 6.17.5). The information shall be discarded as described in 6.17.5.

6.3.4 Abort task management functions

When a device server processes an ABORT TASK, ABORT TASK SET, or CLEAR TASK SET task management function that terminates an EXTENDED COPY command, the copy manager shall ensure that all commands and data transfers generated by the terminated EXTENDED COPY command have been terminated and are no longer transferring data before allowing the task manager to complete the task management function. This requirement shall also apply to the processing the PREEMPT AND ABORT service action on the PERSISTENT RESERVE OUT command as described in 5.5.2.7.5.

6.3.5 Descriptor type codes

Target descriptors and segment descriptors share a single set of code values that identify the type of descriptor (see table 46). Segment descriptors use codes in the range 00h to BFh. The definitions of codes between C0h and DFh are vendor specific. Target descriptors use codes in the range E0h to FFh.

Table 46 — EXTENDED COPY descriptor type codes (part 1 of 2)

Descriptor type code	Reference	Description ^a	Shorthand ^a
00h	6.3.7.3	Copy from block device to stream device	block→stream
01h	6.3.7.4	Copy from stream device to block device	stream→block
02h	6.3.7.5	Copy from block device to block device	block→block
03h	6.3.7.6	Copy from stream device to stream device	stream→stream
04h	6.3.7.7	Copy inline data to stream device	inline→stream
05h	6.3.7.8	Copy embedded data to stream device	embedded→stream
06h	6.3.7.9	Read from stream device and discard	stream→discard
07h	6.3.7.10	Verify block or stream device operation	
08h	6.3.7.11	Copy block device with offset to stream device	block<o>→stream
09h	6.3.7.12	Copy stream device to block device with offset	stream→block<o>
0Ah	6.3.7.13	Copy block device with offset to block device with offset	block<o>→block<o>
0Bh	6.3.7.3	Copy from block device to stream device and hold a copy of processed data for the application client ^b	block→stream +application client
^a Block devices are those with peripheral device type codes 0h, 4h, 5h, 7h, and Eh. Stream devices are those devices with peripheral device type codes 1h and 3h. Sequential-access (indicated by "tape" in the shorthand column) devices are those with peripheral device type code 01h. See 6.4.2 for peripheral device type code definitions.			
^b The application client shall use the RECEIVE COPY RESULTS with a RECEIVE DATA service action to retrieve data held for it by the copy manager (see 6.17.3).			

Table 46 — EXTENDED COPY descriptor type codes (part 2 of 2)

Descriptor type code	Reference	Description ^a	Shorthand ^a
0Ch	6.3.7.4	Copy from stream device to block device and hold a copy of processed data for the application client ^b	stream— block +application client
0Dh	6.3.7.5	Copy from block device to block device and hold a copy of processed data for the application client ^b	block— block +application client
0Eh	6.3.7.6	Copy from stream device to stream device and hold a copy of processed data for the application client ^b	stream— stream +application client
0Fh	6.3.7.9	Read from stream device and hold a copy of processed data for the application client ^b	stream— discard +application client
10h	6.3.7.14	Write filemarks to sequential-access device	filemark— tape
11h	6.3.7.15	Space records or filemarks on sequential-access device	space— tape
12h	6.3.7.16	Locate on sequential-access device	locate— tape
13h	6.3.7.17	Image copy from sequential-access device to sequential-access device	<i>tape— x i>tape
14h	6.3.7.18	Register key	
15h - BFh		Reserved for segment descriptors	
C0h - DFh		Vendor unique descriptors	
E0h	7.5.3.2	Fibre Channel World Wide Name target descriptor	
E1h	7.5.3.3	Fibre Channel N_Port target descriptor	
E2h	7.5.3.4	Fibre Channel N_Port with World Wide Name checking target descriptor	
E3h	7.5.3.5	Parallel Interface T_L target descriptor	
E4h	6.3.6.2	Identification descriptor target descriptor	
E5h	7.5.3.8	IPv4 target descriptor	
E6h	6.3.6.3	Alias target descriptor	
E7h	7.5.3.7	RDMA target descriptor	
E8h	7.5.3.6	IEEE 1394 EUI-64 target descriptor	
E9h	7.5.3.9	SAS Serial SCSI Protocol target descriptor	
EAh - FFh		Reserved for target descriptors	
^a Block devices are those with peripheral device type codes 0h, 4h, 5h, 7h, and Eh. Stream devices are those devices with peripheral device type codes 1h and 3h. Sequential-access (indicated by "tape" in the shorthand column) devices are those with peripheral device type code 01h. See 6.4.2 for peripheral device type code definitions. ^b The application client shall use the RECEIVE COPY RESULTS with a RECEIVE DATA service action to retrieve data held for it by the copy manager (see 6.17.3).			

6.3.6 Target descriptors

6.3.6.1 Target descriptors introduction

All target descriptors are 32 bytes in length and begin with a four-byte header (see table 47) that contains the DESCRIPTOR TYPE CODE field, that identifies the format of the descriptor. The assigned values for target descriptors type codes are shown in table 46. Support for each target descriptor format is optional. If copy manager receives an unsupported descriptor type code in a target descriptor, the command shall be terminated with CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to UNSUPPORTED TARGET DESCRIPTOR TYPE CODE.

Table 47 — Target descriptor format

Bit Byte	7	6	5	4	3	2	1	0
0	DESCRIPTOR TYPE CODE (E0 - FFh)							
1	LU ID TYPE		NUL	PERIPHERAL DEVICE TYPE				
2	Reserved							
3	Reserved							
4	Target descriptor parameters							
27								
28	Device type specific parameters							
31								

The DESCRIPTOR TYPE CODE field is described in 6.3.5.

The LU ID TYPE field (see table 48) specifies the interpretation of the LU IDENTIFIER field in target descriptors that contain a LU IDENTIFIER field.

Table 48 — LU ID type codes

Type Code	LU IDENTIFIER field contents	Reference
00b	Logical Unit Number	SAM-2
01b	Proxy Token	8.3.1.6.2
10b - 11b	Reserved	

Support for LU ID type codes other than 00b is optional. If a copy manager receives an unsupported LU ID type code, the command shall be terminated with a CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to INVALID FIELD IN PARAMETER LIST.

If the LU ID TYPE field specifies that the LU IDENTIFIER field contains a logical unit number, then the LU IDENTIFIER field specifies the logical unit within the SCSI device specified by other fields in the target descriptor that shall be the source or destination for EXTENDED COPY operations.

If the LU ID TYPE field specifies that the LU IDENTIFIER field contains a proxy token (see 8.3.1.6.2), then the copy manager shall use the LU IDENTIFIER field contents to obtain proxy access rights to the logical unit associated with the proxy token. The logical unit number that represents the proxy access rights shall be the source or destination for EXTENDED COPY operations.

The copy manager should obtain a LUN value for addressing this logical unit by sending an ACCESS CONTROL OUT command with ASSIGN PROXY LUN service action (see 8.3.3.11) to the access controls coordinator of the SCSI device that is identified by other fields in the target descriptor. The copy manager shall use a LUN assigned on the basis of a proxy token only for those commands that are necessary for the processing of the EXTENDED COPY command whose parameter data contains the proxy token. When the copy manager has completed EXTENDED COPY commands involving a proxy token, the copy manager should release the LUN value using an ACCESS CONTROL OUT command with RELEASE PROXY LUN service action (see 8.3.3.12).

EXTENDED COPY access to proxy logical units is to be accomplished only via LU ID type 01b. If the copy manager receives a target descriptor containing LU ID type 00b and a logical unit number matching a LUN value that the copy manager has obtained using an ACCESS CONTROL OUT command with ASSIGN PROXY LUN service action, the EXTENDED COPY command shall be terminated with a CHECK CONDITION status, the sense key shall be set to COPY ABORTED and the additional sense code shall be set to COPY TARGET DEVICE NOT REACHABLE.

A null device (NUL) bit of zero indicates that the target descriptor identifies a SCSI device that is expected to respond to an INQUIRY command and to which data movement commands may be sent. A NUL bit of one indicates that the descriptor identifies a null device that is not expected to be the recipient of any SCSI commands. If NUL is one, bytes 4-27 of the target descriptor shall be ignored. If the processing required by a segment descriptor necessitates sending a command to a target device whose target descriptor has the NUL bit set to one, then the EXTENDED COPY command shall be terminated as if an unreachable target had been encountered (see 6.3.3).

NOTE 17 - Target descriptors with the NUL bit set to one are useful for processing the residual data from previous segment descriptors without affecting any media. For example, a segment descriptor of type 06h (stream device to discard) with a byte count of zero, CAT equal to zero, and a null source target descriptor with PAD equal to one may be used to discard all residual data.

The PERIPHERAL DEVICE TYPE field is described in 6.4.2. The value in the DESCRIPTOR TYPE CODE field determines the format of the target descriptor parameters that follow the four-byte header and precede the device type specific parameters. The values in the DESCRIPTOR TYPE CODE field are listed in table 46.

The value in the PERIPHERAL DEVICE TYPE field determines the format of the device type specific parameters that follow the target descriptor parameters. The device type specific parameters convey information specific to the type of device identified by the target descriptor.

Table 49 lists the peripheral device type code values having formats defined for the device type specific parameters in a target descriptor. Peripheral device types with code values not listed in table 49 are reserved in the EXTENDED COPY parameter list.

Table 49 — Device type specific parameters in target descriptors

Peripheral Device Type	Reference	Description	Shorthand
00h, 04h, 05h, 07h, and 0Eh	6.3.6.4	Block devices	Block
01h	6.3.6.5	Sequential-access devices	Stream or Tape
03h	6.3.6.6	Processor devices	Stream

The copy manager may, as part of processing a segment descriptor, verify the information in a target descriptor's device specific fields. However, when verifying the information, the copy manager shall not issue any commands that change the position of read/write media on the target without restoring it. Any errors encountered while verifying the information shall be handled as described in 6.3.3.

6.3.6.2 Identification descriptor target descriptor format

The target descriptor format shown in table 50 instructs the copy manager to locate a target and logical unit that returns a Device Identification VPD page (see 7.6.4) containing an Identification descriptor having the specified CODE SET, ASSOCIATION, IDENTIFIER TYPE, IDENTIFIER LENGTH, and IDENTIFIER field values. The copy manager may use any N_Port, target identifier and logical unit number values that result in matching VPD field values to address the copy device. If multiple N_Port, target identifiers and logical unit number combinations access matching VPD field values, the copy manager may use any combination to address the copy device and shall try other combinations in the event that one combination becomes non-operational during the processing of an EXTENDED COPY command.

Table 50 — Identification descriptor target descriptor format

Bit Byte	7	6	5	4	3	2	1	0
0	DESCRIPTOR TYPE CODE (E4h)							
1	LU ID TYPE		NUL	PERIPHERAL DEVICE TYPE				
2	Reserved							
3	Reserved							
4	Reserved				CODE SET			
5	Reserved		ASSOCIATION		IDENTIFIER TYPE			
6	Reserved							
7	IDENTIFIER LENGTH (n-7)							
8	IDENTIFIER							
n								
n+1	Reserved							
27								
28	Device type specific parameters							
31								

The DESCRIPTOR TYPE CODE, PERIPHERAL DEVICE TYPE and NUL fields and the device type specific parameters are described in 6.3.6.1.

The LU ID TYPE field is reserved for this target descriptor.

The contents of the CODE SET, ASSOCIATION, IDENTIFIER TYPE, IDENTIFIER LENGTH, and IDENTIFIER fields are specified in 7.6.4.

The identifier length shall be 20 or less. If the identifier length is 20 there shall be no reserved bytes between the target descriptor parameters and the device type specific parameters.

Some combinations of code set, association, identifier type, identifier length and identifier do not uniquely identify a logical unit to serve as a copy target device. The application client shall not send such combinations to the copy manager.

6.3.6.3 Alias target descriptor format

The target descriptor format shown in table 51 instructs the copy manager to locate a target and logical unit using the alias list (see 3.1.7) designation associated with the specified alias value. The alias list is maintained using the CHANGE ALIASES command (see 6.2).

Table 51 — Alias target descriptor format

Bit Byte	7	6	5	4	3	2	1	0
0	DESCRIPTOR TYPE CODE (E6h)							
1	LU ID TYPE		NUL	PERIPHERAL DEVICE TYPE				
2	Reserved							
3	Reserved							
4	LU IDENTIFIER							
11								
12	ALIAS VALUE							
19								
20	Reserved							
27								
28	Device type specific parameters							
31								

The DESCRIPTOR TYPE CODE, LU ID TYPE, PERIPHERAL DEVICE TYPE, NUL and LU IDENTIFIER fields and the device type specific parameters are described in 6.3.6.1.

The ALIAS VALUE field specifies an alias value in the alias list as managed by the CHANGE ALIASES command (see 6.2) and maintained by the device server.

When the device server first processes an alias target descriptor, it shall check the value of the ALIAS VALUE field for a corresponding entry in the alias list. If the value is not in the alias list or the device server is unable to validate the designation (see 6.2.3) associated with the alias value, the command shall be terminated because the target is unavailable (see 6.3.3). An application client generating EXTENDED COPY commands that include alias target descriptors in the parameter data is responsible for providing a valid entry in the alias list using the CHANGE ALIASES command (see 6.2) prior to sending the EXTENDED COPY command.

6.3.6.4 Device type specific target descriptor parameters for block device types

The format for the device type specific target descriptor parameters for block device types (device type code values 00h, 04h, 05h, 07h, and 0Eh) is shown in table 52.

Table 52 — Device type specific target descriptor parameters for block device types

Bit Byte	7	6	5	4	3	2	1	0
28	Reserved					PAD	Reserved	
29	(MSB)							
30	DISK BLOCK LENGTH							
31	(LSB)							

The PAD bit is used in conjunction with the CAT bit (see 6.3.7.1) in the segment descriptor to determine what action should be taken when a segment of the copy does not fit exactly into an integer number of destination blocks.

The DISK BLOCK LENGTH field contains the number of bytes in a disk block for the logical device being addressed.

The copy manager may read ahead from sources of block device type. That is, the copy manager may perform read operations from a source disk at any time and in any order during processing of an EXTENDED COPY command, provided that the relative order of writes and reads on the same blocks within the same target descriptor does not differ from their order in the segment descriptor list.

6.3.6.5 Device type specific target descriptor parameters for sequential-access device types

The format for the device type specific target descriptor parameters for the sequential-access device type (device type code value 01h) is shown in table 53.

Table 53 — Device type specific target descriptor parameters for sequential-access device types

Bit Byte	7	6	5	4	3	2	1	0
28	Reserved					PAD	Reserved	FIXED
29	(MSB)							
30	STREAM BLOCK LENGTH							
31	(LSB)							

The contents of the FIXED bit and STREAM BLOCK LENGTH field are combined with the STREAM DEVICE TRANSFER LENGTH FIELD in the segment descriptor to determine the length of the stream read or write operation as specified in table 54.

Table 54 — Stream device transfer lengths

FIXED bit	STREAM BLOCK LENGTH field	Description
0	0	Use variable length reads or writes. The number of bytes for each read or write is specified by the STREAM DEVICE TRANSFER LENGTH field in the segment descriptor.
0	not 0	The command shall be terminated with a CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to INVALID FIELD IN PARAMETER LIST.
1	0	The command shall be terminated with a CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to INVALID FIELD IN PARAMETER LIST.
1	not 0	Use fixed record length reads or writes. The number of bytes for each read or write shall be the product of the STREAM BLOCK LENGTH field and the STREAM DEVICE TRANSFER LENGTH field in the segment descriptor.

The PAD bit is used in conjunction with the CAT bit (see 6.3.7.1) in the segment descriptor to determine what action should be taken when a segment of the copy does not fit exactly into an integer number of destination blocks.

All read commands issued to sequential-access type devices shall have the SILI bit equal to zero.

NOTE 18 - It is anticipated that future versions of this standard may use bit 1 of byte 28 in the device type specific target descriptor parameters for stream device types to indicate the value of the SILI bit for read commands, after T10 establishes how the copy manager is to process tape reads of unknown block length without error.

The copy manager shall not read ahead from sources of stream device type. That is, the read operations required by a segment descriptor for which the source is a stream device shall not be started until all write operations for previous segment descriptors have completed.

6.3.6.6 Device type specific target descriptor parameters for processor device types

The format for the device type specific target descriptor parameters for the processor device type (device type code value 03h) is shown in table 55.

Table 55 — Device type specific target descriptor parameters for processor device types

Bit Byte	7	6	5	4	3	2	1	0
28	Reserved					PAD	Reserved	
29	Reserved							
31								

The PAD bit is used in conjunction with the CAT bit (see 6.3.7.1) in the segment descriptor to determine what action should be taken when a segment of the copy does not fit exactly into an integer number of SEND or RECEIVE commands.

When the processor device is a source, the number of bytes to be transferred by a SEND command shall be specified by STREAM DEVICE TRANSFER LENGTH field in the segment descriptor. When the processor device is a destination, the number of bytes to be transferred by a RECEIVE command shall be specified by STREAM DEVICE TRANSFER LENGTH field in the segment descriptor.

6.3.7 Segment Descriptors

6.3.7.1 Segment descriptors introduction

All segment descriptors begin with the eight byte header shown in table 56.

Table 56 — Segment descriptor header

Bit Byte	7	6	5	4	3	2	1	0
0	DESCRIPTOR TYPE CODE (00h-3Fh)							
1	Reserved						DC	CAT
2	(MSB)	DESCRIPTOR LENGTH						
3								(LSB)
4	(MSB)	SOURCE TARGET DESCRIPTOR INDEX						
5								(LSB)
6	(MSB)	DESTINATION TARGET DESCRIPTOR INDEX						
7								(LSB)

The descriptor type code field is described in 6.3.5. Support for each segment descriptor format is optional. If copy manager receives an unsupported descriptor type code in a segment descriptor, the command shall be terminated with CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to UNSUPPORTED SEGMENT DESCRIPTOR TYPE CODE.

The destination count (DC) bit is only applicable to segment descriptors with descriptor type code values of 02h and 0Dh. The DC bit is reserved for all other segment descriptors. Details of usage for the DC bit appear in the subclauses defining the segment descriptors that use it.

The CAT bit is described in 6.3.7.2.

The DESCRIPTOR LENGTH field contains the length in bytes of the fields that follow the DESCRIPTOR LENGTH field in the segment descriptor. In most cases, the length is constant.

The SOURCE TARGET DESCRIPTOR INDEX field contains an index into the target descriptor list (see 6.3.1) identifying the source target device. The DESTINATION TARGET DESCRIPTOR INDEX field contains an index into the target descriptor list (see 6.3.1) identifying the destination target device. Some segment descriptor formats do not require a SOURCE TARGET DESCRIPTOR INDEX field or a DESTINATION TARGET DESCRIPTOR INDEX field, in which case the field is reserved.

If the target identified by a SOURCE TARGET DESCRIPTOR INDEX field or a DESTINATION TARGET DESCRIPTOR INDEX field is not accessible to the copy manager, then the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to COPY ABORTED and the additional sense code shall be set to UNREACHABLE COPY TARGET.

6.3.7.2 Segment descriptor processing

In processing a segment descriptor, the copy manager may be required:

- a) To read source data by issuing data input commands to the source device;
- b) To process data, an operation that generally designates data as destination data intended for transfer to the destination device; and
- c) To write some or all of the destination data to the destination device.

The number of blocks to read and write, the number of bytes to process, and the nature of processing are determined by the segment descriptor type code, the parameters of the segment descriptor, and the amount of residual source or destination data retained from the previous segment, if any.

Except as otherwise specified by particular segment descriptor type codes:

- a) Just enough whole-block read operations shall be performed to supply, together with residual source data from the previous segment or segments, the number of bytes to be processed;
- b) Processing consists of removing bytes from the source data and designating them as destination data, without change.
- c) As many whole-block write operations as possible shall be performed with the destination data, including any residual destination data from the previous segment or segments.

Any residual source data from the previous segment or segments shall be processed before any data read from the source device during processing of the current segment descriptor. Any residual destination data from the previous segment or segments shall be written before any data processed during processing of the current segment descriptor.

Exceptions and clarifications to these general rules are described in table 57 and the subclauses it references.

Table 57 — Descriptor Type Code Dependent Copy Manager Processing (part 1 of 2)

Segment Descriptor Type Code	Reference	Description
00h (block→stream) or 0Bh (block→stream+application client)	6.3.7.3	The number of bytes processed is determined by the BLOCK DEVICE NUMBER OF BLOCKS field for the source blocks (see applicable type code definition subclauses for details). ^a
02h (block→block) or 0Dh (block→block+application client) with DC=0	6.3.7.5	
02h (block→block) or 0Dh (block→block+application client) with DC=1	6.3.7.5	The number of blocks or byte range specified shall be output to the destination device. If residual destination data is sufficient to perform the output then no data shall be processed. Otherwise, just as much data as needed shall be processed (which may involve reading data from the source device) so that the destination data (which includes any residual destination data from the previous segment) is sufficient. ^a
01h (stream→block) or 0Ch (stream→block+application client)	6.3.7.3	
09h (stream→block<0>)	6.3.7.12	
03h (stream→stream) or 0Eh (stream→stream+application client)	6.3.7.6	The number of bytes specified in the segment descriptor shall be processed. ^a
^a For segment descriptor type codes 0Bh, 0Ch, 0Dh and 0Eh, a copy of the processed data shall also be held for retrieval by the application client.		

Table 57 — Descriptor Type Code Dependent Copy Manager Processing (part 2 of 2)

Segment Descriptor Type Code	Reference	Description
04h (inline →stream)	6.3.7.7	The specified number of bytes of inline or embedded data shall be appended to the destination data, and no source data shall be processed.
05h (embedded →stream)	6.3.7.8	
06h (stream →discard)	6.3.7.9	The specified number of bytes shall be removed from the source data and discarded.
07h (verify device operation)	6.3.7.10	No data shall be processed and no read or write operations shall be performed on target devices. Residual source or destination data, if any, shall be retained or discarded as if the CAT bit were equal to one.
10h (filemark →tape)	6.3.7.14	
11h (space →tape)	6.3.7.15	
12h (locate →tape)	6.3.7.16	
14h (register key)	6.3.7.18	
08h (block<0> →stream)	6.3.7.11	The required blocks shall be read from the source device, the designated byte range shall be extracted as source data, and the designated number of bytes (starting with residual source data, if any) shall be processed.
0Ah (block<0> →block<0>)	6.3.7.13	The source byte range specified shall be read into source data, the number of bytes specified shall be moved from source data to destination data, and the specified destination byte range shall be written using destination data.
0Fh (stream →discard +application client)	6.3.7.9	The specified number of bytes shall be removed from the source data and held for retrieval by the application client.
13h (<i>tape →x >tape)	6.3.7.17	The data movement shall not involve "processing" as described in this subclause. Residual source or destination data, if any, shall not be used and shall be retained or discarded as if the CAT bit were equal to one.
^a For segment descriptor type codes 0Bh, 0Ch, 0Dh and 0Eh, a copy of the processed data shall also be held for retrieval by the application client.		

Reads and writes shall be performed using whole-block transfer lengths determined by the block size, transfer length, or both. Therefore some source data may remain unprocessed and some destination data may not have been transferred at the end of a segment. If so, the residue shall be handled according to the CAT bit in the segment descriptor and the PAD bits of the source and destination target descriptors, as defined in table 58.

Table 58 — PAD and CAT bit definitions

PAD bit in		CAT bit	Copy manager action
Source target descriptor	Destination target descriptor		
0 or 1	0 or 1	1	Any residual source data shall be retained as source data for a subsequent segment descriptor. Any residual destination data shall be retained as destination data for a subsequent segment descriptor. It shall not be an error if either the source or destination target index in the following segment descriptor does not match the corresponding target index with which residual data was originally associated. If the CAT bit is one on the last segment of an EXTENDED COPY command any residual data shall be discarded; this shall not be considered an error.
1	1	0	Any residual source data shall be discarded. Any residual destination data shall be padded with zeroes to make a whole block transfer. ^a
0	1	0	Any residual source data shall be handled as if the CAT bit is equal to one (i.e., discarded on the last segment and retained otherwise). Any residual destination data shall be padded with zeroes to make a whole block transfer. ^a
1	0	0	Any residual source or destination data shall be discarded.
0	0	0	If there is residual source or destination data the EXTENDED COPY command shall be terminated with a CHECK CONDITION status. The sense key shall be set to an COPY ABORTED and the additional sense code shall be set to UNEXPECTED INEXACT SEGMENT.
^a When the CAT bit is set to zero and the destination target descriptor has the PAD bit set to one, the EXTENDED COPY command shall be terminated with a CHECK CONDITION status, the sense key shall be set to COPY ABORTED, and the additional sense code shall be set to UNEXPECTED INEXACT SEGMENT if any of the following conditions are met: <ul style="list-style-type: none"> a) If any residual destination data is present after writing the designated byte range for a segment descriptor of type 09h (stream—block <o>) or 0Ah (block<o>—block<o>); or b) If any residual destination data is present after the designated number of blocks have been written for a segment descriptor of type 02h (block—block) with DC set to one, 0Dh (block—block+application client) with DC set to one, 01h (stream—block) or 0Ch (stream—block+application client). 			

A few segment descriptors have either no source or no target and handling of the PAD bit for those descriptors shall be as follows. For segment descriptor types 04h (inline—~~stream~~, see 6.3.7.7) and 05h (embedded—~~stream~~, see 6.3.7.8), the handling shall be as if the PAD were equal to zero for the source target descriptor. For segment descriptor types 06h and 0Fh (stream—~~discard~~ and stream—~~discard~~+application client, see 6.3.7.9), handling shall be as if the PAD were equal to zero for the destination target descriptor.

6.3.7.3 Block device to stream device operations

The segment descriptor format shown in table 59 is used by the copy operations that move data from a block device to a stream device or vice versa.

Table 59 — Block device to or from stream device segment descriptor

Bit Byte	7	6	5	4	3	2	1	0						
0	DESCRIPTOR TYPE CODE (00h, 01h, 0Bh, or 0Ch)													
1	Reserved							CAT						
2	(MSB)	DESCRIPTOR LENGTH (0014h)												
3									(LSB)					
4	(MSB)	SOURCE TARGET DESCRIPTOR INDEX												
5									(LSB)					
6	(MSB)	DESTINATION TARGET DESCRIPTOR INDEX												
7									(LSB)					
8	Reserved													
9	(MSB)	STREAM DEVICE TRANSFER LENGTH												
10														
11									(LSB)					
12	Reserved													
13	Reserved													
14	(MSB)	BLOCK DEVICE NUMBER OF BLOCKS												
15									(LSB)					
16	(MSB)	BLOCK DEVICE LOGICAL BLOCK ADDRESS												
23									(LSB)					

The DESCRIPTOR TYPE CODE field is described in 6.3.5 and 6.3.7.1. Two DESCRIPTOR TYPE CODE values use the segment descriptor format shown in table 59 and described in this subclause.

For descriptor type code 00h (block→stream) or descriptor type code 0Bh (block→stream+application client), the copy manager shall copy the data from the source block device identified by the SOURCE TARGET DESCRIPTOR INDEX field to the destination stream device identified by the DESTINATION TARGET DESCRIPTOR INDEX field using the logical blocks starting at the location identified by the BLOCK DEVICE LOGICAL BLOCK ADDRESS field. As many blocks shall be read as necessary to process (see 6.3.7.2) a number of bytes equal to the contents of the DISK BLOCK LENGTH field in the target descriptor for the source device times the contents of the BLOCK DEVICE NUMBER OF BLOCKS field. The data shall be written to the stream device starting at the current position of the media.

For descriptor type code 0Bh (block→stream+application client), the copy manager also shall hold a copy of the processed data for delivery to the application client upon completion of the EXTENDED COPY command in response to a RECEIVE COPY RESULTS command with RECEIVE DATA service action as described in 6.17.3. The minimum amount of held data supported by the copy manager is returned in the response data for the RECEIVE COPY RESULTS command with OPERATING PARAMETERS service action (see 6.17.4). If the copy manager supports the 0Bh descriptor type code it also shall support the RECEIVE COPY RESULTS command with RECEIVE DATA service action.

The CAT bit is described in 6.3.7.2.

The DESCRIPTOR LENGTH field shall contain 20 (0014h). The SOURCE TARGET DESCRIPTOR INDEX and DESTINATION TARGET DESCRIPTOR INDEX fields are described in 6.3.7.1.

The STREAM DEVICE TRANSFER LENGTH field specifies the amount of data to be written on each write operation to the stream device. See 6.3.6.5 for a description of how data in the STREAM DEVICE TRANSFER LENGTH field in the segment descriptor interacts with data in the STREAM BLOCK LENGTH field in the device type specific target descriptor parameters for the sequential-access device type.

The BLOCK DEVICE NUMBER OF BLOCKS field specifies the length, in source logical blocks, of data to be processed (see 6.3.7.2) in the segment. A value of zero shall not be considered as an error. No data shall be processed, but any residual destination data retained from a previous segment shall be written if possible to the destination in whole-block transfers. A value of zero shall not modify the handling of residual data.

The BLOCK DEVICE LOGICAL BLOCK ADDRESS field specifies the starting logical block address on the block device for this segment.

6.3.7.4 Stream device to block device operations

The segment descriptor format shown in table 59 (see 6.3.7.3) also is used by the copy operations that move data from a stream device to a block device. Two DESCRIPTOR TYPE CODE values use the segment descriptor format shown in table 59 and described in this subclause.

For descriptor type code 01h (stream→block) or descriptor type code 0Ch (stream→block+application client), the copy manager shall copy the data from the source stream device identified by the SOURCE TARGET DESCRIPTOR INDEX field to the destination block device identified by the DESTINATION TARGET DESCRIPTOR INDEX field using the stream data starting at the current position of the stream device. The data shall be written to logical blocks starting at the location identified by the BLOCK DEVICE LOGICAL BLOCK ADDRESS field and continuing for the number of blocks specified in the BLOCK DEVICE NUMBER OF BLOCKS field.

For descriptor type code 0Ch (stream→block+application client), the copy manager also shall hold a copy of the processed data for delivery to the application client upon completion of the EXTENDED COPY command in response to a RECEIVE COPY RESULTS command with RECEIVE DATA service action as described in 6.17.3. The minimum amount of held data supported by the copy manager is returned in the response data for the RECEIVE COPY RESULTS command with OPERATING PARAMETERS service action (see 6.17.4). If the copy manager supports the 0Ch descriptor type code it also shall support the RECEIVE COPY RESULTS command with RECEIVE DATA service action.

The CAT bit is described in 6.3.7.2.

The DESCRIPTOR LENGTH field shall contain 20 (0014h). The SOURCE TARGET DESCRIPTOR INDEX and DESTINATION TARGET DESCRIPTOR INDEX fields are described in 6.3.7.1.

The STREAM DEVICE TRANSFER LENGTH field specifies the amount of data to be read from the source stream device on each read operation. See 6.3.6.5 for a description of how data in the STREAM DEVICE TRANSFER LENGTH field in the segment descriptor interacts with data in the STREAM BLOCK LENGTH field in the device type specific target descriptor parameters for the sequential-access device type.

The BLOCK DEVICE NUMBER OF BLOCKS field specifies the number blocks to be written by the segment. A value of zero indicates that no blocks shall be written in this segment. This shall not be considered as an error.

The BLOCK DEVICE LOGICAL BLOCK ADDRESS field specifies the starting logical block address on the block device for this segment.

6.3.7.5 Block device to block device operations

The segment descriptor format shown in table 60 is used by the copy operations that move data from a block device to a block device.

Table 60 — Block device to block device segment descriptor

Bit Byte	7	6	5	4	3	2	1	0
0	DESCRIPTOR TYPE CODE (02h or 0Dh)							
1	Reserved						DC	CAT
2	(MSB)	DESCRIPTOR LENGTH (0018h)						
3								
4	(MSB)	SOURCE TARGET DESCRIPTOR INDEX						
5								
6	(MSB)	DESTINATION TARGET DESCRIPTOR INDEX						
7								
8	Reserved							
9	Reserved							
10	(MSB)	BLOCK DEVICE NUMBER OF BLOCKS						
11								
12	(MSB)	SOURCE BLOCK DEVICE LOGICAL BLOCK ADDRESS						
19								
20	(MSB)	DESTINATION BLOCK DEVICE LOGICAL BLOCK ADDRESS						
27								

The DESCRIPTOR TYPE CODE field is described in 6.3.5 and 6.3.7.1. Two DESCRIPTOR TYPE CODE values use the segment descriptor format shown in table 60 and described in this subclause.

For descriptor type code 02h (block–block) or descriptor type code 0Dh (block–block+application client), the copy manager shall copy the data from the source block device identified by the SOURCE TARGET DESCRIPTOR INDEX field to the destination block device identified by the DESTINATION TARGET DESCRIPTOR INDEX field using the logical blocks starting at the location identified by the SOURCE BLOCK DEVICE LOGICAL BLOCK ADDRESS field. The data shall be written to logical blocks starting at the location identified by the DESTINATION BLOCK DEVICE LOGICAL BLOCK ADDRESS field.

If the DC bit equals zero, as many blocks shall be read as necessary to process (see 6.3.7.2) a number of bytes equal to the contents of the DISK BLOCK LENGTH field in the target descriptor for the source device times the contents of the BLOCK DEVICE NUMBER OF BLOCKS field, and as many writes as possible shall be performed using any residual destination data from the previous segment and the data processed in this segment. If the DC bit equals one, the number of blocks specified by the BLOCK DEVICE NUMBER OF BLOCKS field shall be written to the destination block device, as many bytes shall be processed as necessary for these writes to be performed, and as many blocks shall be read as necessary to supply the data to be processed.

For descriptor type code 0Dh (block–block+application client), the copy manager also shall hold a copy of the processed data for delivery to the application client upon completion of the EXTENDED COPY command in response to a RECEIVE COPY RESULTS command with RECEIVE DATA service action as described in 6.17.3.

The minimum amount of held data supported by the copy manager is returned in the response data for the RECEIVE COPY RESULTS command with OPERATING PARAMETERS service action (see 6.17.4). If the copy manager supports the 0Dh descriptor type code it also shall support the RECEIVE COPY RESULTS command with RECEIVE DATA service action.

The CAT bit is described in 6.3.7.2.

The destination count (DC) bit indicates whether the BLOCK DEVICE NUMBER OF BLOCKS field refers to the source or destination device. A DC bit of zero indicates that the BLOCK DEVICE NUMBER OF BLOCKS field refers to the source device. A DC bit of one indicates that the BLOCK DEVICE NUMBER OF BLOCKS field refers to the destination device.

The DESCRIPTOR LENGTH field shall contain 24 (0018h). The SOURCE TARGET DESCRIPTOR INDEX and DESTINATION TARGET DESCRIPTOR INDEX fields are described in 6.3.7.1.

The BLOCK DEVICE NUMBER OF BLOCKS field specifies the number of blocks to be processed (if DC is set to zero) or to be written to the destination device (if DC is set to one). A value of zero shall not be considered as an error. If the DC bit equals one, a value of zero indicates that no destination blocks shall be written and the only processing to be performed is that any residual source or destination data from the previous segment shall be handled as residual data as described in 6.3.7.2. If the DC bit equals zero, a value of zero indicates that no source blocks shall be read and no source data shall be processed, but any residual destination data from a previous segment shall be written if possible to the destination in whole-block transfers, and any residual data shall be handled as described in 6.3.7.2.

The SOURCE BLOCK DEVICE LOGICAL BLOCK ADDRESS field specifies the logical block address from which the reading of data shall start.

The DESTINATION BLOCK DEVICE LOGICAL BLOCK ADDRESS field specifies the logical block address to which the writing of data shall begin.

6.3.7.6 Stream device to stream device operations

The segment descriptor format shown in table 61 is used by the copy operations that move data from a stream device to a stream device.

Table 61 — Stream device to stream device segment descriptor

Bit Byte	7	6	5	4	3	2	1	0
0	DESCRIPTOR TYPE CODE (03h or 0Eh)							
1	Reserved							CAT
2	(MSB)	DESCRIPTOR LENGTH (0010h)						
3								
4	(MSB)	SOURCE TARGET DESCRIPTOR INDEX						
5								
6	(MSB)	DESTINATION TARGET DESCRIPTOR INDEX						
7								
8	Reserved							
9	(MSB)	SOURCE STREAM DEVICE TRANSFER LENGTH						
10								
12	Reserved							
13	(MSB)	DESTINATION STREAM DEVICE TRANSFER LENGTH						
14								
16	(MSB)	BYTE COUNT						
19								

The DESCRIPTOR TYPE CODE field is described in 6.3.5 and 6.3.7.1. Two DESCRIPTOR TYPE CODE values use the segment descriptor format shown in table 61 and described in this subclause.

For descriptor type code 03h (stream→stream) or descriptor type code 0Eh (stream→stream+application client), the copy manager shall copy the data from the source stream device identified by the SOURCE TARGET DESCRIPTOR INDEX field to the destination stream device identified by the DESTINATION TARGET DESCRIPTOR INDEX field. Data shall be read from the source stream device starting at the current position of the source stream device. Data shall be written to the destination stream device starting at the current position of the destination stream device. The BYTE COUNT field defines the number of bytes to be processed (see 6.3.7.2) by the copy manager. The copy manager shall perform read operations as necessary to supply the source data, and as many write operations as possible using the destination data.

For descriptor type code 0Eh (stream→stream+application client), the copy manager also shall hold a copy of the processed data for delivery to the application client upon completion of the EXTENDED COPY command in response to a RECEIVE COPY RESULTS command with RECEIVE DATA service action as described in 6.17.3. The minimum amount of held data supported by the copy manager is returned in the response data for the RECEIVE COPY RESULTS command with OPERATING PARAMETERS service action (see 6.17.4). If the copy

manager supports the 0Eh descriptor type code it also shall support the RECEIVE COPY RESULTS command with RECEIVE DATA service action.

The CAT bit is described in 6.3.7.2.

The DESCRIPTOR LENGTH field shall contain 16 (0010h). The SOURCE TARGET DESCRIPTOR INDEX and DESTINATION TARGET DESCRIPTOR INDEX fields are described in 6.3.7.1.

The SOURCE STREAM DEVICE TRANSFER LENGTH field specifies the amount of data to be read from the source stream device on each read operation. See 6.3.6.5 for a description of how data in the SOURCE STREAM DEVICE TRANSFER LENGTH field in the segment descriptor interacts with data in the STREAM BLOCK LENGTH field in the device type specific target descriptor parameters for the source sequential-access device type.

The DESTINATION STREAM DEVICE TRANSFER LENGTH field specifies the amount of data to be written to the destination stream device on each write operation. See 6.3.6.5 for a description of how data in the DESTINATION STREAM DEVICE TRANSFER LENGTH field in the segment descriptor interacts with data in the STREAM BLOCK LENGTH field in the device type specific target descriptor parameters for the destination sequential-access device type.

The BYTE COUNT field specifies the number of bytes that shall be processed for this segment descriptor. A value of zero shall not be considered as an error, and shall specify that no source blocks shall be read and no source data shall be processed. However, a value of zero shall specify that any residual destination data from a previous segment shall be written if possible to the destination in whole-block transfers, and any residual data shall be handled as described in 6.3.7.2.

6.3.7.7 Inline data to stream device operation

The segment descriptor format shown in table 62 instructs the copy manager to write inline data from the EXTENDED COPY parameter list to a stream device.

Table 62 — Inline data to stream device segment descriptor

Bit Byte	7	6	5	4	3	2	1	0
0	DESCRIPTOR TYPE CODE (04h)							
1	Reserved							CAT
2	(MSB)	DESCRIPTOR LENGTH (0010h)						
3								(LSB)
4	Reserved							
5	Reserved							
6	(MSB)	DESTINATION TARGET DESCRIPTOR INDEX						
7								(LSB)
8	Reserved							
9	(MSB)	STREAM DEVICE TRANSFER LENGTH						
10								
11								(LSB)
12	(MSB)	INLINE DATA OFFSET						
15								(LSB)
16	(MSB)	INLINE DATA NUMBER OF BYTES						
19								(LSB)

The DESCRIPTOR TYPE CODE field is described in 6.3.5 and 6.3.7.1. Descriptor type code 04h (inline-stream) instructs the copy manager to write inline data from the EXTENDED COPY parameter list to a stream device. The inline data shall be read from the optional inline data at the end of the EXTENDED COPY parameter list. The data shall be written to the destination stream device identified by the DESTINATION TARGET DESCRIPTOR INDEX field starting at the current position of the stream device. Any residual destination data from a previous segment descriptor shall be written before the data of the current segment descriptor. Any residual source data from a previous segment descriptor shall not be processed (see 6.3.7.2), and shall be handled as residual source data.

The CAT bit is described in 6.3.7.2.

The DESCRIPTOR LENGTH field shall contain 16 (0010h). The DESTINATION TARGET DESCRIPTOR INDEX field is described in 6.3.7.1.

The STREAM DEVICE TRANSFER LENGTH field specifies the amount of data to be written to the stream device on each write operation. See 6.3.6.5 for a description of how data in the STREAM DEVICE TRANSFER LENGTH field in the segment descriptor interacts with data in the STREAM BLOCK LENGTH field in the device type specific target descriptor parameters for the destination sequential-access device type.

The value in the INLINE DATA OFFSET field is added to the location of the first byte of inline data in the EXTENDED COPY parameter list (see table 45) to locate the first byte of inline data to be written to the stream device. The INLINE DATA OFFSET value shall be a multiple of 4.

The INLINE DATA NUMBER OF BYTES field specifies the number of bytes of inline data that are to be transferred to the stream device. A value of zero shall not be considered an error.

If the sum of the INLINE DATA OFFSET and the INLINE DATA NUMBER OF BYTES values exceeds the value in the INLINE DATA LENGTH field (see table 45), the copy manager shall terminate the command with a CHECK CONDITION status. The sense key shall be set to COPY ABORTED and the additional sense code shall be set to INLINE DATA LENGTH EXCEEDED.

6.3.7.8 Embedded data to stream device operation

The segment descriptor format shown in table 63 instructs the copy manager to write embedded data from the segment descriptor to a stream device.

Table 63 — Embedded data to stream device segment descriptor

Bit Byte	7	6	5	4	3	2	1	0
0	DESCRIPTOR TYPE CODE (05h)							
1	Reserved							CAT
2	(MSB)	DESCRIPTOR LENGTH (n-3)						
3								
4	Reserved							
5	Reserved							
6	(MSB)	DESTINATION TARGET DESCRIPTOR INDEX						
7								
8	Reserved							
9	(MSB)	STREAM DEVICE TRANSFER LENGTH						
10								
11		(LSB)						
12	(MSB)	EMBEDDED DATA NUMBER OF BYTES						
13								
14		Reserved						
15								
16		EMBEDDED DATA						
n								

The DESCRIPTOR TYPE CODE field is described in 6.3.5 and 6.3.7.1. Descriptor type code 05h (embedded-stream) instructs the copy manager to write embedded data from the segment descriptor to a stream device. The embedded data shall be read from the segment descriptor. The data shall be written to the destination stream device identified by the DESTINATION TARGET DESCRIPTOR INDEX field starting at the current position of the stream device. Any residual destination data from a previous segment descriptor shall be written before the data of the current segment descriptor. Any residual source data from a previous segment descriptor shall not be processed (see 6.3.7.2), and shall be handled as residual source data.

The CAT bit is described in 6.3.7.2.

The DESCRIPTOR LENGTH field shall contain the length in bytes of the fields that follow the DESCRIPTOR LENGTH field, including the embedded data. The value in the DESCRIPTOR LENGTH field shall be a multiple of 4.

The DESTINATION TARGET DESCRIPTOR INDEX field is described in 6.3.7.1.

The STREAM DEVICE TRANSFER LENGTH field specifies the amount of data to be written to the stream device on each write operation. See 6.3.6.5 for a description of how data in the STREAM DEVICE TRANSFER LENGTH field in the segment descriptor interacts with data in the STREAM BLOCK LENGTH field in the device type specific target descriptor parameters for the destination sequential-access device type.

The EMBEDDED DATA NUMBER OF BYTES field specifies the number of bytes of embedded data that are to be transferred to the stream device. A value of zero shall not be considered an error. The EMBEDDED DATA NUMBER OF BYTES value shall be less than or equal to the DESCRIPTOR LENGTH value minus 12.

6.3.7.9 Stream device to discard operation

The segment descriptor format shown in table 64 instructs the copy manager to read data from a stream device and not copy it to any destination device.

Table 64 — Stream device to discard segment descriptor

Bit Byte	7	6	5	4	3	2	1	0
0	DESCRIPTOR TYPE CODE (06h or 0Fh)							
1	Reserved							CAT
2	(MSB)	DESCRIPTOR LENGTH (000Ch)						(LSB)
3								
4	(MSB)	SOURCE TARGET DESCRIPTOR INDEX						(LSB)
5								
6	Reserved							
7	Reserved							
8	Reserved							
9	(MSB)	STREAM DEVICE TRANSFER LENGTH						(LSB)
10								
11								
12	(MSB)	NUMBER OF BYTES						(LSB)
15								

The DESCRIPTOR TYPE CODE field is described in 6.3.5 and 6.3.7.1. Two DESCRIPTOR TYPE CODE values use the segment descriptor format shown in table 64 and described in this subclause.

For descriptor type code 06h (stream—discard) or descriptor type code 0Fh (stream—discard+application client), the copy manager shall read data as necessary from the source stream device identified by the SOURCE TARGET DESCRIPTOR INDEX field starting at the current position of the source stream device. The number of bytes indicated by the NUMBER OF BYTES field shall be removed from the source data, starting with any residual source data from the previous segment.

For descriptor type code 06h (stream+discard) the removed data shall be discarded and not written to any destination device. For descriptor type code 0Fh (stream+discard+application client) the removed data shall be held for delivery to the application client upon completion of the EXTENDED COPY command in response to a RECEIVE COPY RESULTS command with RECEIVE DATA service action as described in 6.17.3. The minimum amount of held data supported by the copy manager is returned in the response data for the RECEIVE COPY RESULTS command with OPERATING PARAMETERS service action (see 6.17.4). If the copy manager supports the 0Fh (stream+discard+application client) descriptor type code it also shall support the RECEIVE COPY RESULTS command with RECEIVE DATA service action.

The CAT bit is described in 6.3.7.2.

The DESCRIPTOR LENGTH field shall contain 12 (000Ch). The DESTINATION TARGET DESCRIPTOR INDEX field is described in 6.3.7.1.

The SOURCE STREAM DEVICE TRANSFER LENGTH field specifies the amount of data to be read from the source stream device on each read operation. See 6.3.6.5 for a description of how data in the SOURCE STREAM DEVICE TRANSFER LENGTH field in the segment descriptor interacts with data in the STREAM BLOCK LENGTH field in the device type specific target descriptor parameters for the source sequential-access device type.

The NUMBER OF BYTES field specifies the number of bytes to be removed from the source data.

6.3.7.10 Verify device operation

The segment descriptor format shown in table 65 instructs the copy manager to verify the accessibility of a SCSI device.

Table 65 — Verify device operation segment descriptor

Bit Byte	7	6	5	4	3	2	1	0
0	DESCRIPTOR TYPE CODE (07h)							
1	Reserved							
2	(MSB)	DESCRIPTOR LENGTH (0008h)						
3								(LSB)
4	(MSB)	SOURCE TARGET DESCRIPTOR INDEX						
5								(LSB)
6		Reserved						
7								
8		Reserved						TUR
9	Reserved							
11								

The DESCRIPTOR TYPE CODE field is described in 6.3.5 and 6.3.7.1. Descriptor type code 07h instructs the copy manager to verify the accessibility of the device identified by the SOURCE TARGET DESCRIPTOR INDEX field.

The DESCRIPTOR LENGTH field shall contain 8 (0008h). The SOURCE TARGET DESCRIPTOR INDEX field is described in 6.3.7.1.

Support for a value of one in the TUR (Test Unit Ready) bit is optional. If a TUR value of one is supported and the TUR bit contains one, then a TEST UNIT READY command (see 6.29) shall be used to determine the readiness of the device. If a TUR value of one is not supported and the TUR bit contains one, then the EXTENDED COPY command shall be terminated with a CHECK CONDITION status. The sense key shall be set to COPY ABORTED and the additional sense code shall be set to INVALID FIELD IN PARAMETER LIST. The SENSE-KEY SPECIFIC field shall be set as described in 6.3.3. If the TUR bit contains zero, then the accessibility should be verified without disturbing established unit attention or ACA conditions, for example, using the INQUIRY command (see 6.4).

6.3.7.11 Block device with offset to stream device operation

The segment descriptor format shown in table 66 is used to instruct the copy manager to move data from a block device with a byte offset to a stream device or vice versa.

Table 66 — Block device with offset to or from stream device segment descriptor

Bit Byte	7	6	5	4	3	2	1	0
0	DESCRIPTOR TYPE CODE (08h or 09h)							
1	Reserved							CAT
2	(MSB)	DESCRIPTOR LENGTH (0018h)						(LSB)
3								
4	(MSB)	SOURCE TARGET DESCRIPTOR INDEX						(LSB)
5								
6	(MSB)	DESTINATION TARGET DESCRIPTOR INDEX						(LSB)
7								
8	Reserved							
9	(MSB)	STREAM DEVICE TRANSFER LENGTH						(LSB)
10								
11		NUMBER OF BYTES						(LSB)
12	(MSB)							
15		BLOCK DEVICE LOGICAL BLOCK ADDRESS						(LSB)
16	(MSB)							
23		Reserved						(LSB)
24								
25	Reserved							
26	(MSB)	BLOCK DEVICE BYTE OFFSET						(LSB)
27								

The DESCRIPTOR TYPE CODE field is described in 6.3.5 and 6.3.7.1. Descriptor type code 08h (block<0>-stream) instructs the copy manager to copy the data from the source block device identified by the SOURCE TARGET DESCRIPTOR INDEX field to the destination stream device identified by the DESTINATION TARGET DESCRIPTOR INDEX field using data starting at the location identified by the BLOCK DEVICE BYTE OFFSET field in the logical block identified by the BLOCK DEVICE LOGICAL BLOCK ADDRESS field and continuing for the number of bytes specified in the NUMBER OF BYTES field. The data shall be written to the stream device starting at the current position of the media.

The CAT bit is described in 6.3.7.2.

The DESCRIPTOR LENGTH field shall contain 24 (0018h). The SOURCE TARGET DESCRIPTOR INDEX and DESTINATION TARGET DESCRIPTOR INDEX fields are described in 6.3.7.1.

The STREAM DEVICE TRANSFER LENGTH field specifies the amount of data to be written on each write operation to the stream device. See 6.3.6.5 for a description of how data in the STREAM DEVICE TRANSFER LENGTH field in the segment descriptor interacts with data in the STREAM BLOCK LENGTH field in the device type specific target descriptor parameters for the sequential-access device type.

The NUMBER OF BYTES field specifies the number bytes to be read. A value of zero indicates that no bytes shall be transferred in this segment. This shall not be considered as an error.

The BLOCK DEVICE LOGICAL BLOCK ADDRESS field specifies the starting logical block address on the source block device for this segment.

The BLOCK DEVICE BYTE OFFSET field specifies the offset into the first source block at which to begin reading bytes.

6.3.7.12 Stream device to block device with offset operation

The segment descriptor format shown in table 66 (see 6.3.7.11) also is used to instruct the copy manager to move data from a stream device to a block device with a byte offset.

The DESCRIPTOR TYPE CODE field is described in 6.3.5 and 6.3.7.1. Descriptor type code 09h (stream→block<0>) instructs the copy manager to copy the data from the source stream device identified by the SOURCE TARGET DESCRIPTOR INDEX field to the destination block device identified by the DESTINATION TARGET DESCRIPTOR INDEX field using the stream data starting at the current position of the stream device. The data shall be written starting at the location identified by the BLOCK DEVICE BYTE OFFSET field in the logical block identified by the BLOCK DEVICE LOGICAL BLOCK ADDRESS field and continuing for the number of bytes specified in the NUMBER OF BYTES field.

The content of the starting logical block on the destination device before the starting offset shall be preserved. The content on the ending logical block beyond the end of the transfer shall be preserved. The copy manager may implement this operation by reading the starting and ending logical blocks, modifying a portion of the blocks as required, and writing the full blocks to the destination device.

The CAT bit is described in 6.3.7.2.

The DESCRIPTOR LENGTH field shall contain 24 (0018h). The SOURCE TARGET DESCRIPTOR INDEX and DESTINATION TARGET DESCRIPTOR INDEX fields are described in 6.3.7.1.

The STREAM DEVICE TRANSFER LENGTH field specifies the amount of data to be written on each write operation to the stream device. See 6.3.6.5 for a description of how data in the STREAM DEVICE TRANSFER LENGTH field in the segment descriptor interacts with data in the STREAM BLOCK LENGTH field in the device type specific target descriptor parameters for the sequential-access device type.

The NUMBER OF BYTES field specifies the number bytes to be read. A value of zero indicates that no bytes shall be transferred in this segment. This shall not be considered as an error.

The BLOCK DEVICE LOGICAL BLOCK ADDRESS field specifies the starting logical block address on the destination block device for this segment.

The BLOCK DEVICE BYTE OFFSET field is the offset into the first destination block at which to begin writing data to the destination block device.

6.3.7.13 Block device with offset to block device with offset operation

The segment descriptor format shown in table 67 instructs the copy manager to move data from a block device with a byte offset to a block device with a byte offset.

Table 67 — Block device with offset to block device with offset segment descriptor

Bit Byte	7	6	5	4	3	2	1	0
0	DESCRIPTOR TYPE CODE (0Ah)							
1	Reserved							CAT
2	(MSB)	DESCRIPTOR LENGTH (001Ch)						(LSB)
3								
4	(MSB)	SOURCE TARGET DESCRIPTOR INDEX						(LSB)
5								
6	(MSB)	DESTINATION TARGET DESCRIPTOR INDEX						(LSB)
7								
8	(MSB)	NUMBER OF BYTES						(LSB)
11								
12	(MSB)	SOURCE BLOCK DEVICE LOGICAL BLOCK ADDRESS						(LSB)
19								
20	(MSB)	DESTINATION BLOCK DEVICE LOGICAL BLOCK ADDRESS						(LSB)
27								
28	(MSB)	SOURCE BLOCK DEVICE BYTE OFFSET						(LSB)
29								
30	(MSB)	DESTINATION BLOCK DEVICE BYTE OFFSET						(LSB)
31								

The DESCRIPTOR TYPE CODE field is described in 6.3.5 and 6.3.7.1. Descriptor type code 0Ah (block<o>—block<o>) instructs the copy manager to copy the data from the source block device identified by the SOURCE TARGET DESCRIPTOR INDEX field to the destination block device identified by the DESTINATION TARGET DESCRIPTOR INDEX field using data starting at the location identified by the source BLOCK DEVICE BYTE OFFSET field in the logical block identified by the SOURCE BLOCK DEVICE LOGICAL BLOCK ADDRESS field and continuing for the number of bytes specified in the NUMBER OF BYTES field. The data shall be written starting at the location identified by the DESTINATION BLOCK DEVICE BYTE OFFSET field in the logical block identified by the DESTINATION BLOCK DEVICE LOGICAL BLOCK ADDRESS field.

The content of the starting logical block on the destination device before the starting offset shall be preserved. The content on the ending logical block beyond the end of the transfer shall be preserved. The copy manager may implement this operation by reading the starting and ending logical blocks, modifying a portion of the blocks as required, and writing the full blocks to the destination device.

The CAT bit is described in 6.3.7.2.

The DESCRIPTOR LENGTH field shall contain 28 (001Ch). The SOURCE TARGET DESCRIPTOR INDEX and DESTINATION TARGET DESCRIPTOR INDEX fields are described in 6.3.7.1.

The NUMBER OF BYTES field specifies the number bytes to be read. A value of zero indicates that no bytes shall be transferred in this segment. This shall not be considered as an error.

The SOURCE BLOCK DEVICE LOGICAL BLOCK ADDRESS field specifies the starting address on the source block device for this segment.

The DESTINATION BLOCK DEVICE LOGICAL BLOCK ADDRESS field specifies the starting logical block address on the destination block device for this segment.

The SOURCE BLOCK DEVICE BYTE OFFSET field specifies the offset into the first source block at which to begin reading bytes.

The DESTINATION BLOCK DEVICE BYTE OFFSET field is the offset into the first destination block at which to begin writing data to the destination block device.

6.3.7.14 Write filemarks operation

The segment descriptor format shown in table 68 instructs the copy manager to write filemarks or setmarks on the destination tape device.

Table 68 — Write filemarks operation segment descriptor

Bit Byte	7	6	5	4	3	2	1	0
0	DESCRIPTOR TYPE CODE (10h)							
1	Reserved							
2	(MSB)	DESCRIPTOR LENGTH (0008h)						
3								(LSB)
4	Reserved							
5	Reserved							
6	(MSB)	DESTINATION TARGET DESCRIPTOR INDEX						
7								(LSB)
8	Reserved						WSMK	IMMED
9	(MSB)	TRANSFER LENGTH						
10								
11								(LSB)

The DESCRIPTOR TYPE CODE field is described in 6.3.5 and 6.3.7.1. Descriptor type code 10h (filemark-tape) instructs the copy manager to write filemarks or setmarks to the destination tape device identified by the DESTINATION TARGET DESCRIPTOR INDEX field starting at the current position of the tape device. If the PERIPHERAL DEVICE TYPE field in the target descriptor identified by the DESTINATION TARGET DESCRIPTOR INDEX field does not contain 01h, the copy manager shall terminate the command with a CHECK CONDITION status. The sense key shall be set to COPY ABORTED and the additional sense code shall be set to INVALID OPERATION FOR COPY SOURCE OR DESTINATION.

The DESCRIPTOR LENGTH field shall contain 8 (0008h). The DESTINATION TARGET DESCRIPTOR INDEX field is described in 6.3.7.1.

6.3.7.16 Locate operation

The segment descriptor format shown in table 70 instructs the copy manager to send a LOCATE command (see SSC) to the destination tape device.

Table 70 — Locate operation segment descriptor

Bit Byte	7	6	5	4	3	2	1	0
0	DESCRIPTOR TYPE CODE (12h)							
1	Reserved							
2	(MSB)	DESCRIPTOR LENGTH (0008h)						
3								(LSB)
4	Reserved							
5	Reserved							
6	(MSB)	DESTINATION TARGET DESCRIPTOR INDEX						
7								(LSB)
8	(MSB)	BLOCK ADDRESS						
11								(LSB)

The DESCRIPTOR TYPE CODE field is described in 6.3.5 and 6.3.7.1. Descriptor type code 12h (locate—tape) instructs the copy manager to send a LOCATE command to the destination tape device identified by the DESTINATION TARGET DESCRIPTOR INDEX field. If the PERIPHERAL DEVICE TYPE field in the target descriptor identified by the DESTINATION TARGET DESCRIPTOR INDEX field does not contain 01h, the copy manager shall terminate the command with a CHECK CONDITION status. The sense key shall be set to COPY ABORTED and the additional sense code shall be set to INVALID OPERATION FOR COPY SOURCE OR DESTINATION.

The DESCRIPTOR LENGTH field shall contain 8 (0008h). The DESTINATION TARGET DESCRIPTOR INDEX field is described in 6.3.7.1.

The BLOCK ADDRESS field contents in the LOCATE command sent to the destination tape device shall be copied from the BLOCK ADDRESS field in the segment descriptor. All other fields in the LOCATE command sent to the destination tape device that affect the positioning of the tape shall be set to zero.

NOTE 19 - The restrictions described above for the LOCATE command limit the operation to locating SCSI logical block addresses in the current tape partition.

6.3.7.17 Tape device image copy operation

The segment descriptor format shown in table 71 instructs the copy manager to perform an image copy from the source tape device to the destination tape device.

Table 71 — Tape device image copy segment descriptor

Bit Byte	7	6	5	4	3	2	1	0
0	DESCRIPTOR TYPE CODE (13h)							
1	Reserved							
2	(MSB)	DESCRIPTOR LENGTH (0008h)						
3								(LSB)
4	(MSB)	SOURCE TARGET DESCRIPTOR INDEX						
5								(LSB)
6	(MSB)	DESTINATION TARGET DESCRIPTOR INDEX						
7								(LSB)
8	(MSB)	COUNT						
11								(LSB)

The DESCRIPTOR TYPE CODE field is described in 6.3.5 and 6.3.7.1. Descriptor type code 13h (<i>tape→xi>tape) instructs the copy manager to create a compatible image of the source device medium identified by the SOURCE TARGET DESCRIPTOR INDEX field on the destination device medium identified by the DESTINATION TARGET DESCRIPTOR INDEX field beginning at their current positions. If the PERIPHERAL DEVICE TYPE field in the target descriptor identified by the SOURCE TARGET DESCRIPTOR INDEX field or the DESTINATION TARGET DESCRIPTOR INDEX field does not contain 01h, the copy manager shall terminate the command with a CHECK CONDITION status. The sense key shall be set to COPY ABORTED and the additional sense code shall be set to INVALID OPERATION FOR COPY SOURCE OR DESTINATION.

The DESCRIPTOR LENGTH field shall contain 8 (0008h). The SOURCE TARGET DESCRIPTOR INDEX and DESTINATION TARGET DESCRIPTOR INDEX fields are described in 6.3.7.1.

The tape image copy operation terminates when:

- The source device encounters an end-of-partition as defined by the source device;
- The source device encounters an end-of-data as defined by the source device (i.e., BLANK CHECK sense key);
- The copy manager has copied the number of consecutive filemarks specified in the count field from the source device to the destination device; or
- The copy manager has copied the number of consecutive filemarks and/or setmarks specified in the count field from the source device to the destination device, if the RSMK bit in the Device Configuration mode page (see SSC) of the source device is on.

A COUNT field of zero indicates that the EXTENDED COPY command shall not terminate due to any number of consecutive filemarks or setmarks. Other error or exception conditions (e.g., early-warning, end-of-partition on destination device) may cause the EXTENDED COPY command to terminate prior to completion. In such cases, it is not possible to calculate a residue, so the information field in the sense data shall be set to zero.

6.3.7.18 Register key operation

The segment descriptor format shown in table 72 instructs the copy manager to register a persistent reservations key 5.5.2.4 with the device identified by the DESTINATION TARGET DESCRIPTOR INDEX field.

Table 72 — Register key segment descriptor

Bit Byte	7	6	5	4	3	2	1	0
0	DESCRIPTOR TYPE CODE (14h)							
1	Reserved							
2	(MSB)	DESCRIPTOR LENGTH (0018h)						(LSB)
3								
4	Reserved							
5	Reserved							
6	(MSB)	DESTINATION TARGET DESCRIPTOR INDEX						(LSB)
7								
8	(MSB)	RESERVATION KEY						(LSB)
15								
16	(MSB)	SERVICE ACTION RESERVATION KEY						(LSB)
23								
24	Reserved							
27								

The DESCRIPTOR TYPE CODE field is described in 6.3.5 and 6.3.7.1. Descriptor type code 14h instructs the copy manager to register a persistent reservations key with the device identified by the DESTINATION TARGET DESCRIPTOR INDEX field using a PERSISTENT RESERVE OUT command with a REGISTER service action (see 6.12.2).

The DESCRIPTOR LENGTH field shall contain 24 (0018h). The DESTINATION TARGET DESCRIPTOR INDEX field is described in 6.3.7.1.

The RESERVATION KEY and SERVICE ACTION RESERVATION KEY field contents in the PERSISTENT RESERVE OUT command sent to the destination device shall be copied from the RESERVATION KEY and SERVICE ACTION RESERVATION KEY fields in the segment descriptor.

NOTE 20 - The initiator sending the EXTENDED COPY command may need to remove the reservation key held by the copy manager as described in 5.5.2.7 prior to sending the EXTENDED COPY command.

6.4 INQUIRY command

6.4.1 INQUIRY command introduction

The INQUIRY command (see table 73) requests that information regarding parameters of the target and a component logical unit be sent to the application client. Options allow the application client to request additional information about the target and logical unit (see 6.4.4) or information about SCSI commands supported by the device server (see 6.4.5).

Table 73 — INQUIRY command

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE (12h)							
1	Reserved						CMDDT	EVPD
2	PAGE OR OPERATION CODE							
3	ALLOCATION LENGTH							
4								
5								
	CONTROL							

An enable vital product data (EVPD) bit of one specifies that the device server shall return the vital product data specified by the PAGE OR OPERATION CODE field.

A command support data (CMDDT) bit of one specifies that the device server shall return the optional command support data specified by the PAGE OR OPERATION CODE field. If the device server does not support returning command data and this bit is set to one, the device server shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and an additional sense code of INVALID FIELD IN CDB. Details of the command support data may be found in 6.4.5.

NOTE 21 - An application client may receive a CHECK CONDITION status response with the sense key set to ILLEGAL REQUEST upon sending an INQUIRY command with the CMDDT bit set to one to some device servers, since this bit was reserved in previous versions of the SCSI standards.

If both the EVPD and CMDDT bits are zero, the device server shall return the standard INQUIRY data (see 6.4.2). If the PAGE OR OPERATION CODE field is not zero when both EVPD and CMDDT are zero, the device server shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and an additional sense code of INVALID FIELD IN CDB.

If both the EVPD and CMDDT bits are one, the device server shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and an additional sense code of INVALID FIELD IN CDB.

When the EVPD bit is one, the PAGE OR OPERATION CODE field specifies which page of vital product data information the device server shall return (see 7.6).

When the CMDDT bit is one, the PAGE OR OPERATION CODE field specifies the SCSI operation code for which device server shall return command support data (see 6.4.5).

The INQUIRY command shall return CHECK CONDITION status only when the device server is unable to return the requested INQUIRY data.

If an INQUIRY command is received from an initiator with a pending unit attention condition (i.e., before the device server reports CHECK CONDITION status), the device server shall perform the INQUIRY command and shall not clear the unit attention condition (see SAM-2).

The INQUIRY data should be returned even though the device server is not ready for other commands. The standard INQUIRY data should be available without incurring any media access delays. If the device server does store some of the INQUIRY data on the media, it may return zeros or ASCII spaces (20h) in those fields until the data is available from the media.

The INQUIRY data may change as the target executes its initialization sequence. For example, the target may contain a minimum command set in its nonvolatile memory and may load its final firmware from the media when it becomes ready. After the target has loaded the firmware, it may support more options and therefore return different supported options information in the INQUIRY data.

If the INQUIRY data changes for any reason, the device server shall generate a unit attention condition for all initiators (see SAM-2). The device server shall set the additional sense code to INQUIRY DATA HAS CHANGED.

NOTE 22 - The INQUIRY command may be used by an application client after a hard reset or power on condition to determine the device types for system configuration.

6.4.2 Standard INQUIRY data

The standard INQUIRY data (see table 74) shall contain at least 36 bytes.

Table 74 — Standard INQUIRY data format

Bit Byte	7	6	5	4	3	2	1	0
0	PERIPHERAL QUALIFIER			PERIPHERAL DEVICE TYPE				
1	RMB	Reserved						
2	VERSION							
3	Obsolete	Obsolete	NORMACA	HiSUP	RESPONSE DATA FORMAT			
4	ADDITIONAL LENGTH (n-4)							
5	SCCS	ACC	ALUA		3PC	Reserved		
6	BQUE	ENC SERV	VS	MULTIP	MCHNGR	Obsolete	Obsolete	ADDR16 ^a
7	RELADR	Obsolete	WBUS16 ^a	SYNC ^a	LINKED	Obsolete	CMDQUE	VS
8	(MSB) _____							
15	VENDOR IDENTIFICATION _____ (LSB)							
16	(MSB) _____							
31	PRODUCT IDENTIFICATION _____ (LSB)							
32	(MSB) _____							
35	PRODUCT REVISION LEVEL _____ (LSB)							
36	_____

73	VERSION DESCRIPTOR 8 _____ (LSB)							
74	_____							
95	Reserved _____							
	Vendor specific parameters							
96	_____							
n	Vendor specific _____							
^a The meanings of these fields are specific to SPI-3 (see 6.4.3). For SCSI protocols other than the SCSI Parallel Interface, these fields are reserved.								

The PERIPHERAL QUALIFIER and PERIPHERAL DEVICE TYPE fields identify the device currently connected to the logical unit. If the target is not capable of supporting a device on this logical unit, the device server shall set this field to 7Fh (PERIPHERAL QUALIFIER set to 011b and PERIPHERAL DEVICE TYPE set to 1Fh).

The peripheral qualifier is defined in table 75 and the peripheral device type is defined in table 76.

Table 75 — Peripheral qualifier

Qualifier	Description
000b	The specified peripheral device type is currently connected to this logical unit. If the device server is unable to determine whether or not a physical device is currently connected, it also shall use this peripheral qualifier when returning the INQUIRY data. This peripheral qualifier does not mean that the device is ready for access by the initiator.
001b	The device server is capable of supporting the specified peripheral device type on this logical unit. However, the physical device is not currently connected to this logical unit.
010b	Reserved
011b	The device server is not capable of supporting a physical device on this logical unit. For this peripheral qualifier the peripheral device type shall be set to 1Fh to provide compatibility with previous versions of SCSI. All other peripheral device type values are reserved for this peripheral qualifier.
1xxb	Vendor specific

Table 76 — Peripheral device type (part 1 of 2)

Code	Doc. ^a	Description
00h	SBC	Direct-access device (e.g., magnetic disk)
01h	SSC	Sequential-access device (e.g., magnetic tape)
02h	SSC	Printer device
03h	SPC-2	Processor device
04h	SBC	Write-once device (e.g., some optical disks)
05h	MMC-2	CD-ROM device
06h		Scanner device (obsolete)
07h	SBC	Optical memory device (e.g., some optical disks)
08h	SMC	Medium changer device (e.g., jukeboxes)
09h		Communications device (obsolete)
0Ah - 0Bh		Defined by ASC IT8 (Graphic arts pre-press devices)
0Ch	SCC-2	Storage array controller device (e.g., RAID)
0Dh	SES	Enclosure services device
0Eh	RBC	Simplified direct-access device (e.g., magnetic disk)
0Fh	OCRW	Optical card reader/writer device
10h		Reserved ^b
^a All standards are subject to revision, and parties to agreements based on this standard are encouraged to investigate the possibility of applying the most recent editions of the listed standards. ^b Type code 10h is reserved for use by Bridging Expanders. ^c All well known logical units use the same peripheral device type code.		

Table 76 — Peripheral device type (part 2 of 2)

Code	Doc. ^a	Description
11h	OSD	Object-based Storage Device
12h	ADC	Automation/Drive Interface
13h - 1Dh		Reserved
1Eh		Well known logical unit ^c
1Fh		Unknown or no device type
^a All standards are subject to revision, and parties to agreements based on this standard are encouraged to investigate the possibility of applying the most recent editions of the listed standards. ^b Type code 10h is reserved for use by Bridging Expanders. ^c All well known logical units use the same peripheral device type code.		

A removable medium (RMB) bit of zero indicates that the medium is not removable. A RMB bit of one indicates that the medium is removable.

The VERSION field indicates the implemented version of this standard and is defined in table 77.

Table 77 — Version

Code	Description
00h	The device does not claim conformance to any standard.
02h	Obsolete
03h	The device complies to ANSI X3.301:1997 (SPC).
04h	The device complies to ANSI X3.351:200x (SPC-2).
05h	The device complies to this standard.
Code	Description
1h	Obsolete (SCSI=001b)
08h - 0Ch	Obsolete (ECMA=001b)
40h - 44h	Obsolete (ISO=01b)
48h - 4Ch	Obsolete (ISO=01b & ECMA=001b)
80h - 84h	Obsolete (ISO=10b)
88h - 8Ch	Obsolete (ECMA=001b)

Code	Description	Code	Description
6h - 7h	Reserved	0Dh - 3Fh	Reserved
45h - 47h	Reserved	4Dh - 7Fh	Reserved
85h - 87h	Reserved	8Dh - FFh	Reserved

The Normal ACA Supported bit (NORMACA) of one indicates that the device server supports setting the NACA bit to one in the CONTROL byte of the CDB (see SAM-2). A NORMACA bit of zero indicates that the device server does not support setting the NACA bit to one.

A hierarchical support (HiSUP) bit of zero indicates the target does not use the hierarchical addressing model to assign LUNs to logical units. A HiSUP bit of one indicates the target uses the hierarchical addressing model to assign LUNs to logical units. When the HiSUP bit is one, the device server shall support the REPORT LUNS command (see 6.21). When the HiSUP bit is zero, the device server may support the REPORT LUNS command.

A RESPONSE DATA FORMAT field value of two indicates that the data shall be in the format specified in this standard. Response data format values less than two are obsolete. Response data format values greater than two are reserved.

The ADDITIONAL LENGTH field shall specify the length in bytes of the parameters. If the ALLOCATION LENGTH of the CDB is too small to transfer all of the parameters, the ADDITIONAL LENGTH shall not be adjusted to reflect the truncation.

An SCC Supported (SCCS) bit of one indicates that the device contains an embedded storage array controller component. See SCC-2 for details about storage array controller devices. An SCCS bit of zero indicates that the device does not contain an embedded storage array controller component.

An Access Controls Coordinator (ACC) bit of one indicates that the device contains an access controls coordinator (see 3.1.4) that may be addressed through this logical unit. An ACC bit of zero indicates that no access controls coordinator may be addressed through this logical unit. If the device contains an access controls coordinator that may be addressed through any logical unit other than the ACCESS CONTROLS well known logical unit (see 8.3), the ACC bit shall be set to one for LUN 0.

The contents of the asymmetric logical unit access (ALUA) field (see table 78) indicate the support for asymmetric logical unit access (see 5.7).

Table 78 — ALUA field contents

Value	Description
00b	The SCSI target device does not support asymmetric logical unit access or supports a form of asymmetric access that is vendor specific. Neither the REPORT TARGET GROUPS nor the SET TARGET GROUPS commands is supported.
01b	Only implicit asymmetric logical unit access (see 5.7.6) is supported. The SCSI target device is capable of changing target port asymmetric access states without a SET TARGET PORT GROUPS command. The REPORT TARGET PORT GROUPS command is supported and the SET TARGET PORT GROUPS command is not supported.
10b	Only explicit asymmetric logical unit access (see 5.7.7) is supported. The SCSI target device only changes target port asymmetric access states as requested with the SET TARGET PORT GROUPS command. Both the REPORT TARGET PORT GROUPS command and the SET TARGET PORT GROUPS command are supported.
11b	Both explicit and implicit asymmetric logical unit access are supported. Both the REPORT TARGET PORT GROUPS command and the SET TARGET PORT GROUPS commands are supported.

A Third-Party Copy (3PC) bit of one indicates that the device supports third-party copy commands such as the EXTENDED COPY command (see 6.3). A 3PC bit of zero indicates that the device does not support such commands.

The basic queuing (BQUE) bit shall be zero if the CMDQUE bit is one.

When the CMDQUE bit is zero, the BQUE bit shall have the following meaning. A BQUE bit of zero indicates that the device does not support tagged tasks (command queuing) for this logical unit. A value of one indicates that the device supports, for this logical unit, the basic task management model defined by SAM-2.

An Enclosure Services (ENCSERV) bit of one indicates that the device contains an embedded enclosure services component. See SES for details about enclosure services, including a device model for an embedded enclosure services device. An ENCSERV bit of zero indicates that the device does not contain an embedded enclosure services component.

A Multi Port (MULTIP) bit of one indicates that this is a multi-port (two or more ports) device and conforms to the SCSI multi-port device requirements found in the applicable standards (e.g., SAM-2, a SCSI protocol standard and

possibly provisions of a command set standard). A value of zero indicates that this device has a single port and does not implement the multi-port requirements.

A medium changer (MCHNGR) bit of one indicates that the device is associated with or attached to a medium transport element. See 5.9 and SMC for details about medium changers, including a device model for an attached medium changer device. The MCHNGR bit is valid only when the RMB bit is equal to one. A MCHNGR bit of zero indicates that the device is not embedded within or attached to a medium transport element.

A relative addressing (RELADR) bit of one indicates that the device server supports the relative addressing mode. If this bit is set to one, the linked command (LINKED) bit shall also be set to one; since relative addressing is only allowed with linked commands. A RELADR bit of zero indicates the device server does not support relative addressing.

A linked command (LINKED) bit of one indicates that the device server supports linked commands (see SAM-2). A value of zero indicates the device server does not support linked commands.

A command queuing (CMDQUE) bit of one indicates that the device supports tagged tasks (command queuing) for this logical unit (see SAM-2). A value of zero indicates the device server may support tagged tasks for this logical unit (see the BQUE bit, above). Table 79 summarizes the relationship of the BQUE and CMDQUE bits.

Table 79 — Relationship of BQUE and CMDQUE bits

BQUE	CMDQUE	Description
0	0	No command queuing of any kind supported.
0	1	Command queuing with all types of task tags supported.
1	0	Basic task management model supported (see SAM-2)
1	1	Illegal combination of BQUE and CMDQUE bits.

The VENDOR IDENTIFICATION field contains eight bytes of left-aligned ASCII data (see 4.4.1) identifying the vendor of the product. The vendor identification shall be one assigned by INCITS. A list of assigned vendor identifications is in Annex D and on the T10 web site (www.T10.org).

NOTE 23 - The T10 web site (www.t10.org) provides a convenient means to request an identification code.

The PRODUCT IDENTIFICATION field contains sixteen bytes of left-aligned ASCII data (see 4.4.1) defined by the vendor.

The PRODUCT REVISION LEVEL field contains four bytes of left-aligned ASCII data defined by the vendor.

The VERSION DESCRIPTOR fields provide for identifying up to eight standards to which the device claims conformance. The value in each VERSION DESCRIPTOR field shall be selected from table 80. All version descriptor values not listed in table 80 are reserved. Technical Committee T10 of INCITS maintains an electronic copy of the information in table 80 on its world wide web site (<http://www.t10.org/>). In the event that the T10 world wide web site is no longer active, access may be possible via the INCITS world wide web site (<http://www.incits.org/>), the ANSI world wide web site (<http://www.ansi.org/>), the IEC site (<http://www.iec.ch/>), the ISO site (<http://www.iso.ch/>), or the ISO/IEC JTC 1 web site (<http://www.jtc1.org/>). It is recommended that the first version descriptor be used for the SCSI architecture standard, followed by the physical standard if any, followed by the SCSI protocol, followed by the appropriate SPC version, followed by the device type command set, followed by a secondary command set if any.

6.4.3 SCSI Parallel Interface specific INQUIRY data

Portions of bytes 6 and 7 and all of byte 56 of the standard INQUIRY data shall be used only by the SCSI Parallel Interface. These fields are noted in table 74. For details on how the SPI-specific fields relate to the SCSI Parallel Interface see SPI-n (where n is 2 or greater). Table 81 shows just the SPI-specific standard INQUIRY fields. The definitions of the SCSI Parallel Interface specific fields shall be as follows.

Table 81 — SPI-specific standard INQUIRY bits

Bit Byte	7	6	5	4	3	2	1	0
6	see table 74							ADDR16
7	see table 74		WBUS16	SYNC	see table 74	Obsolete	see table 74	
	⋮							
56	Reserved				CLOCKING		QAS	IUS

A wide SCSI address 16 (ADDR16) bit of one indicates that the target supports 16-bit wide SCSI addresses. A value of zero indicates that the device does not support 16-bit wide SCSI addresses.

A wide bus 16 (WBUS16) bit of one indicates that the target supports 16-bit wide data transfers. A value of zero indicates that the device does not support 16-bit wide data transfers.

A synchronous transfer (SYNC) bit of one indicates that the target supports synchronous data transfer. A value of zero indicates the device does not support synchronous data transfer.

The obsolete bit 2 in byte 7 indicates whether the target supports an obsolete data transfers management mechanism defined in SPI-2.

Table 82 defines the relationships between the ADDR16 and WBUS16 bits.

Table 82 — Maximum logical device configuration table

ADDR16	WBUS16	Description
0	0	8 bit wide data path on a single cable with 8 SCSI IDs supported
0	1	16 bit wide data path on a single cable with 8 SCSI IDs supported
1	1	16 bit wide data path on a single cable with 16 SCSI IDs supported

The CLOCKING field shall not apply to asynchronous transfers and is defined in table 83.

Table 83 — CLOCKING field

Code	Description
00b	Indicates the device server supports only ST
01b	Indicates the device server supports only DT
10b	Reserved
11b	Indicates the device server supports ST and DT

A quick arbitration and selection supported (QAS) bit of one indicates that the device server supports quick arbitration and selection. A value of zero indicates that the device server does not support quick arbitration and selection.

An information units supported (IUS) bit of one indicates that the device server supports information unit transfers. A value of zero indicates that the device server does not support information unit transfers.

NOTE 24 - The acronyms ST and DT and the terms 'quick arbitration and selection' and 'information units' are defined in SPI-3, SPI-4, and possibly later revisions of the SCSI parallel interface standard.

6.4.4 Vital product data

The application client requests the vital product data information by setting the EVPD bit to one and specifying the page code of the desired vital product data. See 7.6 for details about vital product data. The information returned consists of configuration data (e.g., vendor identification, product identification, model, serial number), manufacturing data (e.g., plant and date of manufacture), field replaceable unit data and other vendor specific or device specific data. If the device server does not implement the requested page it shall return CHECK CONDITION status. The a sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to INVALID FIELD IN CDB.

NOTES

- 25 The device server should have the ability to process the INQUIRY command even when an error occurs that prohibits normal command completion. In such a case, CHECK CONDITION status should be returned for commands other than INQUIRY or REQUEST SENSE. The sense data returned may contain the field replaceable unit code. The vital product data may be obtained for the failing device using the INQUIRY command.
- 26 This standard defines a format that allows device-independent application client software to display the vital product data returned by the INQUIRY command. The contents of the data may be vendor specific, and may be unusable without detailed information about the device.
- 27 This standard does not define the location or method of storing the vital product data. The retrieval of the data may require completion of initialization operations within the device, that may induce delays before the data is available to the application client. Time-critical requirements are an implementation consideration and are not addressed in this standard.

6.4.5 Command support data

Implementation of command support data is optional. The application client may request the command support data information by setting the CMDDT bit to one and specifying the SCSI operation code of the desired CDB.

If the device server implements the requested SCSI operation code, it shall return the data defined in table 84. If the device server does not implement the requested SCSI operation code it shall return the peripheral qualifier and type byte and 001b in the SUPPORT field.

Table 84 — Command support data format

Bit Byte	7	6	5	4	3	2	1	0
0	PERIPHERAL QUALIFIER			PERIPHERAL DEVICE TYPE				
1	Reserved				SUPPORT			
2	VERSION							
3	Reserved							
4	Reserved							
5	CDB SIZE (m - 5)							
6	CDB USAGE DATA							
m								

The PERIPHERAL QUALIFIER, the PERIPHERAL DEVICE TYPE, and the VERSION fields are defined in 6.4.2.

Table 85 defines the values and meanings of the SUPPORT field.

Table 85 — SUPPORT values and meanings

Support	Description
000b	Data about the requested SCSI operation code is not currently available.
001b	The device server does not support the tested SCSI operation code. All data after byte 1 is undefined.
010b	Reserved
011b	The device server supports the tested SCSI operation code in conformance with a SCSI standard. The data format conforms to the definition in table 84.
100b	Vendor specific
101b	The device server supports the tested SCSI operation code in a vendor specific manner. The data format conforms to the definition in table 84.
110b	Vendor specific
111b	Reserved

If the SUPPORT field contains 000b, all data after byte 1 is not valid. One possible reason for SUPPORT being 000b is the device server's inability to retrieve information stored on the media. When this is the case, a subsequent request for command support data may be successful.

The CDB SIZE field shall contain the number of bytes in the CDB for the operation code being queried, and the size of the CDB USAGE DATA field in the return data.

NOTE 28 - The CDB SIZE field is provided for the convenience of the application client. In most cases, the size is known from the operation code group.

The CDB USAGE DATA field shall contain information about the CDB for the operation code being queried. The first byte of the CDB usage data shall contain the operation code for the operation being queried. All bytes except the first byte of the CDB usage data shall contain a usage map for bits in the CDB for the operation code being queried.

The bits in the usage map shall have a one-for-one correspondence to the CDB for the operation code being queried. If the device server evaluates a bit in the CDB for the operation code being queried, the usage map shall contain a one in the corresponding bit position. If any bit representing part of a field is returned as one all bits for the field shall be returned as one. If the device server ignores or treats as reserved a bit in the CDB for the operation code being queried, the usage map shall contain a zero in the corresponding bit position. The usage map bits for a given CDB field all shall have the same value.

For example, the CDB usage bit map for the SEND DIAGNOSTIC command of a device server that implements only the default self-test capability is: 1Dh, 04h, 00h, 00h, 00h, 07h. This example assumes that the logical unit only supports the low-order three bits of the CONTROL byte. The first byte contains the operation code and the remaining bytes contain the usage map.

6.5 LOG SELECT command

The LOG SELECT command (see table 86) provides a means for an application client to manage statistical information maintained by the device about the device or its logical units. Device servers that implement the LOG SELECT command shall also implement the LOG SENSE command. Structures in the form of log parameters within log pages are defined as a way to manage the log data. The LOG SELECT command provides for sending zero or more log pages via the Data-Out Buffer. This standard defines the format of the log pages, but does not define the exact conditions and events that are logged.

Table 86 — LOG SELECT command

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE (4Ch)							
1	Reserved						PCR	SP
2	PC		Reserved					
3	Reserved							
4	Reserved							
5	Reserved							
6	Reserved							
7	(MSB) _____							
8	PARAMETER LIST LENGTH						(LSB)	
9	CONTROL							

A parameter code reset (PCR) bit of one and a parameter list length of zero shall cause all implemented parameters to be set to the target-defined default values (e.g., zero). If the PCR bit is one and the parameter list length is greater than zero, the command shall be terminated with CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to INVALID FIELD IN CDB. A PCR bit of zero specifies that the log parameters shall not be reset.

A save parameters (SP) bit of one indicates that after performing the specified LOG SELECT operation the target shall save to nonvolatile memory all parameters identified as saveable by the DS bit in the log page (see 7.2). A SP bit of zero specifies that parameters shall not be saved.

Saving of log parameters is optional and indicated for each log parameter by the DS bit in the log page. Log parameters also may be saved at vendor specific times subject to the TSD bit (see 7.2) in the log parameter or the GLTSD bit in the Control mode page (see 7.4.6). If the target does not implement saved parameters for any log parameter and the SP bit is set to one, the command shall be terminated with CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST, and the additional sense code set to INVALID FIELD IN CDB.

It is not an error to set the SP bit to one and to set the DS bit of a log parameter to one. In this case, the parameter value for that log parameter is not saved.

The page control (PC) field defines the type of parameter values to be selected. The PC field is defined in table 87.

Table 87 — Page control field

PC	LOG SELECT parameter values	LOG SENSE parameter values
00b	Current threshold values	Threshold values
01b	Current cumulative values	Cumulative values
10b	Default threshold values	Default threshold values
11b	Default cumulative values	Default cumulative values

The current cumulative values may be updated by the target or by the application client using the LOG SELECT command to reflect the cumulative number of events experienced by the target. Fields in the parameter control byte (see 7.2) of each log parameter control the updating and saving of the current cumulative parameters.

The device server shall set the current threshold parameters to the default threshold values in response to a LOG SELECT command with the PC field set to 10b and the parameter list length field set to zero.

The device server shall set all cumulative parameters to their default values in response to a LOG SELECT command with the PC field set to 11b and the parameter list length field set to zero.

The current threshold value may only be modified by the application client via the LOG SELECT command. If the application client attempts to change current threshold values that are not available or not implemented for that log parameter, then the device server shall terminate the LOG SELECT command with CHECK CONDITION status, the sense key set to ILLEGAL REQUEST, and the additional sense code set to INVALID FIELD IN PARAMETER LIST. The saving of current threshold parameters and the criteria for the current threshold being met are controlled by bits in the parameter control byte (see 7.2).

NOTE 29 - Log pages or log parameters that are not available may become available at some later time (e.g., after the device has become ready).

The PARAMETER LIST LENGTH field specifies the length in bytes of the parameter list that shall be located in the Data-Out Buffer. A parameter list length of zero indicates that no log pages shall be transferred. This condition shall not be considered an error. If an application client sends page codes or parameter codes within the parameter list that are reserved or not implemented by the target, the device server shall terminate the LOG SELECT command with CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN PARAMETER LIST.

If a parameter list length results in the truncation of any log parameter, the device server shall terminate the command with CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST. The additional sense code should be set to PARAMETER LIST LENGTH ERROR or may be set to INVALID FIELD IN CDB.

The application client should send log pages in ascending order by page code value if the Data-Out Buffer contains multiple log pages. If the Data-Out Buffer contains multiple log parameters within a log page, they should be sent in ascending order by parameter code value. The device server shall return CHECK CONDITION status if the application client sends log pages out of order or parameter codes out of order. The sense key shall be set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN PARAMETER LIST.

NOTE 30 - Initiators should issue LOG SENSE commands prior to issuing LOG SELECT commands to determine supported log pages and page lengths.

The target may provide independent sets of log parameters for each logical unit or for each combination of logical units and initiators. If the target does not support independent sets of log parameters and any log parameters are changed that affect other initiators, then the device server shall generate a unit attention condition for all initiators

except the one that issued the LOG SELECT command (see SAM-2). This unit attention condition shall be returned with an additional sense code of LOG PARAMETERS CHANGED.

If an application client sends a log parameter that is not supported by the target, the device server shall terminate the command with CHECK CONDITION status, set the sense key to ILLEGAL REQUEST, and set the additional sense code to INVALID FIELD IN PARAMETER LIST.

Additional information about the LOG SELECT command may be found in informative Annex B.

6.6 LOG SENSE command

The LOG SENSE command (see table 88) provides a means for the application client to retrieve statistical or other operational information maintained by the device about the device or its logical units. It is a complementary command to the LOG SELECT command.

Table 88 — LOG SENSE command

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE (4Dh)							
1	Reserved						PPC	SP
2	PC		PAGE CODE					
3	Reserved							
4	Reserved							
5	(MSB) _____							
6	PARAMETER POINTER _____ (LSB)							
7	(MSB) _____							
8	ALLOCATION LENGTH _____ (LSB)							
9	CONTROL							

The parameter pointer control (PPC) bit controls the type of parameters requested from the device server:

- a) A PPC bit of one indicates that the device server shall return a log page with parameter code values that have changed since the last LOG SELECT or LOG SENSE command. The device server shall return only those parameter codes following the PARAMETER POINTER field.
- b) A PPC bit of zero indicates that the log parameter requested from the device server shall begin with the parameter code specified in the PARAMETER POINTER field and return the number of bytes specified by the ALLOCATION LENGTH field in ascending order of parameter codes from the specified log page. A PPC bit of zero and a PARAMETER POINTER field of zero shall cause all available log parameters for the specified log page to be returned to the application client subject to the specified allocation length.

Saving parameters is an optional function of the LOG SENSE command. If the target does not implement saving log parameters and if the save parameters (SP) bit is one, then the device server shall return CHECK CONDITION status, set the sense key to ILLEGAL REQUEST, and set the additional sense code to INVALID FIELD IN CDB.

An SP bit of zero indicates the device server shall perform the specified LOG SENSE command and shall not save any log parameters. If saving log parameters is implemented, an SP bit of one indicates that the device server shall

perform the specified LOG SENSE command and shall save all log parameters identified as saveable by the DS bit (see 7.2) to a nonvolatile, vendor specific location.

The page control (PC) field defines the type of parameter values to be selected (see 6.5 for the definition of the page control field). The parameter values returned by a LOG SENSE command are determined as follows:

- a) The specified parameter values at the last update (i.e., in response to a LOG SELECT or LOG SENSE command or done automatically by the target for cumulative values);
- b) The saved values, if saved parameters are implemented and an update has not occurred since the last logical unit reset; or
- c) The default values, if saved values are not available or not implemented and an update has not occurred since the last logical unit reset.

The PAGE CODE field identifies which log page of data is being requested (see 7.2). If the log page code is reserved or not implemented, the device server shall terminate the command with CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST with the additional sense code set to INVALID FIELD IN CDB.

The PARAMETER POINTER field allows the application client to request parameter data beginning from a specific parameter code to the maximum allocation length or the maximum parameter code supported by the target, whichever is less. If the value of the PARAMETER POINTER field is larger than the largest available parameter code known to the device server for the specified log page, the device server shall terminate the command with CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to INVALID FIELD IN CDB.

Log parameters within the specified log page shall be transferred in ascending order according to parameter code.

Additional information about the LOG SENSE command may be found in Annex B.

6.7 MODE SELECT(6) command

The MODE SELECT(6) command (see table 89) provides a means for the application client to specify medium, logical unit, or peripheral device parameters to the device server. Device servers that implement the MODE SELECT(6) command shall also implement the MODE SENSE(6) command. Application clients should issue MODE SENSE(6) prior to each MODE SELECT(6) to determine supported mode pages, page lengths, and other parameters.

Table 89 — MODE SELECT(6) command

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE (15h)							
1	Reserved			PF	Reserved			SP
2	Reserved							
3	Reserved							
4	PARAMETER LIST LENGTH							
5	CONTROL							

Logical units shall share mode parameter header and block descriptor values across all initiator ports and I_T nexuses. I_T nexus loss shall not affect mode parameter header, block descriptor, and mode page values.

Logical units shall maintain current and saved values of each mode page based on any of the policies listed in table 90.

Table 90 — Mode page policies

Mode page policy	Logical unit maintains
Shared	One copy of the mode page
Per initiator port	Separate copies of the mode page for each initiator port
Per I_T nexus	Separate copies of the mode page for each I_T nexus

After a logical unit reset, each mode parameter header, block descriptor, and mode page shall revert to saved values if supported or default values if saved values are not supported.

If an application client sends a MODE SELECT command that changes any parameters applying to other initiators, the device server shall generate a unit attention condition for all initiators except the one that issued the MODE SELECT command (see SAM-2). The device server shall set the additional sense code to MODE PARAMETERS CHANGED.

A page format (PF) bit of zero indicates that all parameters after the block descriptors are vendor specific. A PF bit of one indicates that the MODE SELECT parameters following the header and block descriptor(s) are structured as pages of related parameters and are as specified in this standard.

A save pages (SP) bit of zero indicates the device server shall perform the specified MODE SELECT operation, and shall not save any mode pages. If the logical unit implements no distinction between current and saved mode pages and the SP bit is zero, the command shall be terminated with CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST, and the additional sense code shall be set to INVALID FIELD IN CDB. An SP bit of one indicates that the device server shall perform the specified MODE SELECT operation, and shall save to a nonvolatile vendor specific location all the saveable mode pages including any sent in the Data-Out Buffer. The SP

bit is optional. Mode pages that are saved are identified by the parameter saveable (PS) bit that is returned in the page header by the MODE SENSE command (see 7.4). If the PS bit is set to one in the MODE SENSE data then the mode page shall be saveable by issuing a MODE SELECT command with the SP bit set to one. If the logical unit does not implement saved mode pages and the SP bit is set to one, the command shall be terminated with CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST, and the additional sense code shall be set to INVALID FIELD IN CDB.

The PARAMETER LIST LENGTH field specifies the length in bytes of the mode parameter list that shall be contained in the Data-Out Buffer. A parameter list length of zero indicates that the Data-Out Buffer shall be empty. This condition shall not be considered as an error.

The device server shall terminate the command with CHECK CONDITION status if the parameter list length results in the truncation of any mode parameter header, mode parameter block descriptor(s), or mode page. The sense key shall be set to ILLEGAL REQUEST, and the additional sense code shall be set to PARAMETER LIST LENGTH ERROR.

The mode parameter list for the MODE SELECT and MODE SENSE commands is defined in 7.4. Parts of each mode parameter list are defined in a device-type dependent manner. Definitions for the parts of each mode parameter list that are uniquely for each device-type may be found in the applicable command standards (see 3.1.17).

The device server shall terminate the MODE SELECT command with CHECK CONDITION status, set the sense key to ILLEGAL REQUEST, set the additional sense code to INVALID FIELD IN PARAMETER LIST, and shall not change any mode parameters for the following conditions:

- a) If the application client sets any field that is reported as not changeable by the device server to a value other than its current value;
- b) If the application client sets any field in the mode parameter header or block descriptor(s) to an unsupported value;
- c) If an application client sends a mode page with a page length not equal to the page length returned by the MODE SENSE command for that mode page;
- d) If the application client sends a unsupported value for a mode parameter and rounding is not implemented for that mode parameter; or
- e) If the application client sets any reserved field in the mode parameter list to a non-zero value.

If the application client sends a value for a mode parameter that is outside the range supported by the device server and rounding is implemented for that mode parameter, the device server handles the condition by either:

- a) Rounding the parameter to an acceptable value and terminate the command as described in 5.3; or
- b) Terminating the command with CHECK CONDITION status, the sense key set to ILLEGAL REQUEST, and set the additional sense code to INVALID FIELD IN PARAMETER LIST.

A device server may alter any mode parameter in any mode page, even those reported as non-changeable, as a result of changes to other mode parameters.

The device server validates the non-changeable mode parameters against the current values that existed for those mode parameters prior to the MODE SELECT command.

NOTE 31 - The current values calculated by the device server may affect the application client's operation. The application client may issue a MODE SENSE command after each MODE SELECT command, to determine the current values.

6.8 MODE SELECT(10) command

The MODE SELECT(10) command (see table 91) provides a means for the application client to specify medium, logical unit, or peripheral device parameters to the device server. See the MODE SELECT(6) command (6.7) for a description of the fields and operation of this command. Application clients should issue MODE SENSE(10) prior to each MODE SELECT(10) to determine supported mode pages, page lengths, and other parameters. Device servers that implement the MODE SELECT(10) command shall also implement the MODE SENSE(10) command.

Table 91 — MODE SELECT(10) command

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE (55h)							
1	Reserved			PF	Reserved			SP
2	Reserved							
3	Reserved							
4	Reserved							
5	Reserved							
6	Reserved							
7	(MSB) _____							
8	PARAMETER LIST LENGTH _____ (LSB)							
9	CONTROL							

6.9 MODE SENSE(6) command

6.9.1 MODE SENSE(6) command introduction

The MODE SENSE(6) command (see table 92) provides a means for a device server to report parameters to an application client. It is a complementary command to the MODE SELECT(6) command. Device servers that implement the MODE SENSE(6) command shall also implement the MODE SELECT(6) command.

Table 92 — MODE SENSE(6) command

Bit Byte	7	6	5	4	3	2	1	0
0	Operation code (1Ah)							
1	Reserved				DBD	Reserved		
2	PC		PAGE CODE					
3	SUBPAGE CODE							
4	ALLOCATION LENGTH							
5	CONTROL							

A disable block descriptors (DBD) bit of zero indicates that the device server may return zero or more block descriptors in the returned MODE SENSE data (see 7.4). A DBD bit of one specifies that the device server shall not return any block descriptors in the returned MODE SENSE data.

The page control (PC) field defines the type of mode parameter values to be returned in the mode pages. The PC field is defined in table 93.

Table 93 — Page control field

Code	Type of parameter	Reference
00b	Current values	6.9.2
01b	Changeable values	6.9.3
10b	Default values	6.9.4
11b	Saved values	6.9.5

The PC field only affects the mode parameters within the mode pages, however the PS bit, PAGE CODE and PAGE LENGTH fields should return current values since they have no meaning when used with other types. The mode parameter header and mode parameter block descriptor should return current values.

Some SCSI devices may not distinguish between current and saved mode parameters and report identical values in response to a PC field of either 00b or 11b. See also the description of the save pages (SP) bit in the MODE SELECT command.

The PAGE CODE and SUBPAGE CODE fields specify which mode pages and subpages to return (see table 94).

Table 94 — Mode page code usage for all devices

Page Code	Subpage Code	Description
00h	vendor specific	Vendor specific (does not require page format)
01h - 1Fh	00h	See specific device types (page_0 format)
	01h - DFh	See specific device types (sub_page format)
	E0h - FEh	Vendor specific (sub_page format)
	FFh	Return all subpages for the specified device specific mode page in the page_0 format for subpage 00h and in the sub_page format for subpages 01h - FEh
20h - 3Eh	00h	Vendor specific (page_0 format required)
	01h - FEh	Vendor specific (sub_page format required)
	FFh	Return all subpages for the specified vendor specific mode page in the page_0 format for subpage 00h and in the sub_page format for subpages 01h - FEh
3Fh	00h	Return all subpage 00h mode pages in page_0 format
	01h - FEh	Reserved
	FFh	Return all subpages for all mode pages in the page_0 format for subpage 00h and in the sub_page format for subpages 01h - FEh

An application client may request any one or all of the supported mode pages from the device server. If an application client issues a MODE SENSE command with a page code or subpage code value not implemented by the target, the device server shall return CHECK CONDITION status and shall set the sense key to ILLEGAL REQUEST and the additional sense code to INVALID FIELD IN CDB.

If the mode parameter list exceeds 256 bytes for a MODE SENSE(6) command or 65 536 bytes for a MODE SENSE(10) command, the device server shall return CHECK CONDITION status and the sense key shall be set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.

Mode page 00h, if implemented, shall be returned after all other mode pages.

Mode pages should be returned in ascending page code order except for mode page 00h.

If the PC field and the PAGE CODE field are both set to zero the device server should return a mode parameter header and block descriptor (if applicable).

The mode parameter list for all device types for MODE SELECT and MODE SENSE is defined in 7.4. Parts of the mode parameter list are specifically defined for each device type. Definitions for the parts of each mode parameter list that are unique for each device-type may be found in the applicable command standards (see 3.1.17).

6.9.2 Current values

A PC field value of 00b requests that the device server return the current values of the mode parameters. The current values returned are:

- a) The current values of the mode parameters established by the last successful MODE SELECT command;
- b) The saved values of the mode parameters if a MODE SELECT command has not successfully completed since the mode parameters were restored to their saved values (see 6.7); or
- c) The default values of the mode parameters if a MODE SELECT command has not successfully completed since the mode parameters were restored to their default values (see 6.7).

6.9.3 Changeable values

A PC field value of 01b requests that the device server return a mask denoting those mode parameters that are changeable. In the mask, the fields of the mode parameters that are changeable shall be set to all one bits and the fields of the mode parameters that are non-changeable (i.e., defined by the target) shall be set to all zero bits.

Implementation of changeable mode page parameters is optional. If the target does not implement changeable parameters mode pages and the device server receives a MODE SENSE command with 01b in the PC field, the command shall be terminated with CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST, and the additional sense code set to INVALID FIELD IN CDB.

An attempt to change a non-changeable mode parameter using the MODE SELECT command shall result in an error condition (see 6.7).

The application client should issue a MODE SENSE command with the PC field set to 01b and the PAGE CODE field set to 3Fh to determine which mode pages are supported, which mode parameters within the mode pages are changeable, and the supported length of each mode page prior to issuing any MODE SELECT commands.

6.9.4 Default values

A PC field value of 10b requests that the device server return the default values of the mode parameters. Unsupported parameters shall be set to zero. Default values should be accessible even if the device is not ready.

6.9.5 Saved values

A PC field value of 11b requests that the device server return the saved values of the mode parameters. Implementation of saved mode page parameters is optional. Mode parameters not supported by the target shall be set to zero. If saved values are not implemented, the command shall be terminated with CHECK CONDITION status, the

sense key set to ILLEGAL REQUEST and the additional sense code set to SAVING PARAMETERS NOT SUPPORTED.

The method of saving parameters is vendor specific. The parameters are preserved in such a manner that they are retained when the device is powered down. All saveable mode pages should be considered saved when a MODE SELECT command issued with the SP bit set to one has returned a GOOD status or after the successful completion of a FORMAT UNIT command.

6.9.6 Initial responses

After a logical unit reset, the device server shall respond in the following manner:

- a) If default values are requested, report the default values;
- b) If saved values are requested, report valid restored mode parameters, or restore the mode parameters and report them. If the saved values of the mode parameters are not able to be accessed from the nonvolatile vendor specific location, terminate the command with CHECK CONDITION status and set the sense key set to NOT READY. If saved parameters are not implemented respond as defined in 6.9.5; or
- c) If current values are requested and the current values of the mode parameters have not been sent by the application client (via a MODE SELECT command), the device server may return either the default or saved values, as defined above. If current values have been sent, the current values shall be reported.

6.10 MODE SENSE(10) command

The MODE SENSE(10) command (see table 95) provides a means for a device server to report parameters to an application client. It is a complementary command to the MODE SELECT(10) command. Device servers that implement the MODE SENSE(10) command shall also implement the MODE SELECT(10) command.

Table 95 — MODE SENSE(10) command

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE (5Ah)							
1	Reserved			LLBAA	DBD	Reserved		
2	PC		PAGE CODE					
3	SUBPAGE CODE							
4	Reserved							
5	Reserved							
6	Reserved							
7	(MSB)							
8	ALLOCATION LENGTH							
9	(LSB)							
	CONTROL							

If the Long LBA Accepted (LLBAA) bit is one, the device server is allowed to return parameter data with the LONGLBA bit equal to one (see 7.4.3). If LLBAA is zero, the LONGLBA bit shall be zero in the parameter data returned by the device server.

See the MODE SENSE(6) command (6.9) for a description of the other fields and operation of this command.

6.11 PERSISTENT RESERVE IN command

6.11.1 PERSISTENT RESERVE IN command introduction

The PERSISTENT RESERVE IN command (see table 96) is used to obtain information about persistent reservations and reservation keys (i.e., registrations) that are active within a device server. This command is used in conjunction with the PERSISTENT RESERVE OUT command (see 6.12).

Table 96 — PERSISTENT RESERVE IN command

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE (5Eh)							
1	Reserved			SERVICE ACTION				
2	Reserved							
3	Reserved							
4	Reserved							
5	Reserved							
6	Reserved							
7	(MSB) _____							
8	ALLOCATION LENGTH _____ (LSB)							
9	CONTROL							

The PERSISTENT RESERVE IN parameter data includes a field that indicates the number of parameter data bytes available to be returned. The ALLOCATION LENGTH field in the CDB indicates how much space has been allocated for the returned parameter list. An allocation length that is not sufficient to contain the entire parameter list shall not be considered an error. If the complete list is required, the application client should send a new PERSISTENT RESERVE IN command with allocation length large enough to contain the entire list.

6.11.2 PERSISTENT RESERVE IN service actions

6.11.2.1 Summary of PERSISTENT RESERVE IN service actions

The service action codes for the PERSISTENT RESERVE IN command are defined in table 97.

Table 97 — PERSISTENT RESERVE IN service action codes

Code	Name	Description
00h	READ KEYS	Reads all registered reservation keys (i.e., registrations)
01h	READ RESERVATION	Reads the current persistent reservations
02h	REPORT CAPABILITIES	Returns capability information
03h - 1Fh	Reserved	Reserved

6.11.2.2 READ KEYS

The READ KEYS service action requests that the device server return a parameter list containing a header and a list of each currently registered I_T nexus' reservation key. If multiple I_T nexuses have registered with the same key, then that key value shall be listed multiple times, once for each such registration.

For more information on READ KEYS see 5.5.2.3.2.

6.11.2.3 READ RESERVATIONS

The READ RESERVATIONS service action requests that the device server return a parameter list containing a header and the persistent reservations, if any, that are present in the device server. Multiple persistent reservations may be returned only if element persistent reservations are present.

For more information on READ RESERVATION see 5.5.2.3.3.

6.11.2.4 REPORT CAPABILITIES

The REPORT CAPABILITIES service action requests that the device server return information on persistent reservation features.

6.11.3 PERSISTENT RESERVE IN parameter data for READ KEYS

The format for the parameter data provided in response to a PERSISTENT RESERVE IN command with the READ KEYS service action is shown in table 98.

Table 98 — PERSISTENT RESERVE IN parameter data for READ KEYS

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB)							
3	PRGENERATION (LSB)							
4	(MSB)							
7	ADDITIONAL LENGTH (n-7) (LSB)							
	Reservation key list							
8	(MSB)							
15	First reservation key (LSB)							
	⋮							
n-7	(MSB)							
n	Last reservation key (LSB)							

The Persistent Reservations Generation (PRGENERATION) field shall contain a 32-bit counter maintained by the device server that shall be incremented every time a PERSISTENT RESERVE OUT command requests a REGISTER, a REGISTER AND IGNORE EXISTING KEY, a CLEAR, a PREEMPT, or a PREEMPT AND ABORT service action. The counter shall not be incremented by a PERSISTENT RESERVE IN command, by a PERSISTENT RESERVE OUT command that performs a RESERVE or RELEASE service action, or by a PERSISTENT RESERVE OUT command that is terminated due to an error or reservation conflict. Regardless of the APTPL bit value the PRgeneration value shall be set to zero by a power on.

The ADDITIONAL LENGTH field contains a count of the number of bytes in the Reservation key list. If the allocation length specified by the PERSISTENT RESERVE IN command is not sufficient to contain the entire parameter list, then only the first portion of the list (byte 0 to the allocation length) shall be sent to the application client. The incremental remaining bytes shall be truncated, although the ADDITIONAL LENGTH field shall still contain the actual

number of bytes in the reservation key list without consideration of any truncation resulting from an insufficient allocation length. This shall not be considered an error.

The reservation key list contains the 8-byte reservation keys for all I_T nexuses that have registered with the device server through all combinations of initiator ports and target ports.

6.11.4 PERSISTENT RESERVE IN parameter data for READ RESERVATION

6.11.4.1 Format of PERSISTENT RESERVE IN parameter data for READ RESERVATION

The format for the parameter data provided in response to a PERSISTENT RESERVE IN command with the READ RESERVATION service action is shown in table 99.

Table 99 — PERSISTENT RESERVE IN parameter data for READ RESERVATION

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB) _____							
3	PRGENERATION (LSB) _____							
4	(MSB) _____							
7	ADDITIONAL LENGTH (n-7) (LSB) _____							
8	Reservation descriptor(s) _____							
n	(see table 100) _____							

The PRGENERATION field shall be as defined for the PERSISTENT RESERVE IN READ KEYS parameter data (see 6.11.3).

The ADDITIONAL LENGTH field contains a count of the number of bytes to follow in reservation descriptor(s). If the allocation length specified by the PERSISTENT RESERVE IN command is not sufficient to contain the entire parameter list, then only the first portion of the list (byte 0 to the allocation length) shall be sent to the application client. The incremental remaining bytes shall be truncated, although the ADDITIONAL LENGTH field shall still contain the actual number of bytes of reservation descriptor(s) and shall not be affected by the truncation. This shall not be considered an error.

The format of the reservation descriptors is defined in table 100. There shall be a reservation descriptor for the persistent reservation, if any, present in the logical unit and a reservation descriptor for each element, if any, having a persistent reservation.

If a persistent reservation is present in the logical unit that does not contain elements, there shall be a single reservation descriptor in the list of parameter data returned by the device server in response to the PERSISTENT RESERVE IN command with READ RESERVATION service action. The reservation descriptor for each persistent reservation shall contain the RESERVATION KEY under which the persistent reservation is held (see 5.5.2.6). The TYPE and SCOPE of each persistent reservation as present in the PERSISTENT RESERVE OUT command that created the persistent reservation shall be returned (see 6.11.4.2 and 6.11.4.3).

If a persistent reservation is present in the logical unit that does contain elements, there shall be a reservation descriptor in the list of parameter data returned by the device server in response to the PERSISTENT RESERVE IN command with READ RESERVATION service action for the LU_SCOPE persistent reservation that is held, if any, and each ELEMENT_SCOPE persistent reservation that may be held. The reservation descriptor shall contain the RESERVATION KEY under which the persistent reservation is held. The TYPE and SCOPE of the persistent reser-

Table 100 — PERSISTENT RESERVE IN reservation descriptor

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB) _____ RESERVATION KEY _____ (LSB)							
7								
8	(MSB) _____ SCOPE-SPECIFIC ADDRESS _____ (LSB)							
11								
12	Reserved							
13	SCOPE				TYPE			
14								
15	Obsolete _____							

vation as present in the PERSISTENT RESERVE OUT command that created the persistent reservation shall be returned (see 6.11.4.2 and 6.11.4.3).

If the SCOPE is an ELEMENT_SCOPE persistent reservation, the SCOPE-SPECIFIC ADDRESS field shall contain the element address, zero filled in the most significant bits to fit the field. If the SCOPE is a LU_SCOPE persistent reservation, the SCOPE-SPECIFIC ADDRESS field shall be set to zero. The obsolete field in Bytes 14 and 15 was defined in a previous standard.

6.11.4.2 Persistent reservations Scope

6.11.4.2.1 Summary of persistent reservations Scope

The value in the SCOPE field shall indicate whether a persistent reservation applies to an entire logical unit or to an element. The values in the SCOPE field are defined in table 101.

Table 101 — Persistent reservation scope codes

Code	Name	Description
0h	LU_SCOPE	Persistent reservation applies to the full logical unit
1h		Obsolete
2h	ELEMENT_SCOPE	Persistent reservation applies to the specified element
3h - Fh	Reserved	Reserved

6.11.4.2.2 Logical unit scope

A SCOPE field value of LU_SCOPE shall indicate that the persistent reservation applies to the entire logical unit. The LU_SCOPE scope shall be implemented by all device servers that implement PERSISTENT RESERVE OUT.

6.11.4.2.3 Element scope

A SCOPE field value of ELEMENT_SCOPE shall indicate that the persistent reservation applies to the element of the logical unit defined by the SCOPE-SPECIFIC ADDRESS field in the PERSISTENT RESERVE OUT parameter list. An element is defined by the SMC-2 standard. The ELEMENT_SCOPE scope is optional for all device servers that implement PERSISTENT RESERVE OUT.

6.11.4.3 Persistent Reservations Type

The value in the TYPE field shall specify the characteristics of the persistent reservation being established for all data blocks within the element or within the logical unit. Table 102 defines the characteristics of the different type values. For each persistent reservation type, table 102 lists code value and describes the required device server support. In table 102, the description of required device server support is divided into three paragraphs:

- 1) A definition of the required handling for read operations;
- 2) A definition of the required handling for write operations; and
- 3) A definition of the persistent reservation holder (see 5.5.2.6).

Table 102 — Persistent reservation type codes (part 1 of 2)

Code	Name	Description
0h		Obsolete
1h	Write Exclusive	<p>Reads Shared: Any application client on any I_T nexus may initiate tasks that request transfers from the storage medium or cache of the logical unit to the I_T nexus.</p> <p>Writes Exclusive: Any task from any I_T nexus other than the I_T nexus holding the persistent reservation that requests a transfer from the I_T nexus to the storage medium or cache of the logical unit shall be terminated with RESERVATION CONFLICT status.</p> <p>Persistent Reservation Holder: The I_T nexus that delivered the PERSISTENT RESERVE OUT command with RESERVE, PREEMPT, or PREEMPT AND ABORT service action as identified by its registered reservation key.</p>
2h		Obsolete
3h	Exclusive Access	<p>Reads Exclusive: Any task from any I_T nexus other than the I_T nexus holding the persistent reservation that requests a transfer from the storage medium or cache of the logical unit to the I_T nexus shall be terminated with RESERVATION CONFLICT status.</p> <p>Writes Exclusive: Any task from any I_T nexus other than the I_T nexus holding the persistent reservation that requests a transfer from the I_T nexus to the storage medium or cache of the logical unit shall be terminated with RESERVATION CONFLICT status.</p> <p>Persistent Reservation Holder: The I_T nexus that delivered the PERSISTENT RESERVE OUT command with RESERVE, PREEMPT, or PREEMPT AND ABORT service action as identified by its registered reservation key.</p>
4h		Obsolete
5h	Write Exclusive – Registrants Only	<p>Reads Shared: Any application client on any I_T nexus may initiate tasks that request transfers from the storage medium or cache of the logical unit to the I_T nexus.</p> <p>Writes Exclusive: A task that requests a transfer to the storage medium or cache of the logical unit from a initiator port that is not associated with a registered I_T nexus shall be terminated with RESERVATION CONFLICT status.</p> <p>Persistent Reservation Holder: The I_T nexus that delivered the PERSISTENT RESERVE OUT command with RESERVE, PREEMPT, or PREEMPT AND ABORT service action as identified by its registered reservation key.</p>

Table 102 — Persistent reservation type codes (part 2 of 2)

Code	Name	Description
6h	Exclusive Access – Registrants Only	<p>Reads Exclusive: A task that requests a transfer from the storage medium or cache of the logical unit to a initiator port that is not associated with a registered I_T nexus shall be terminated with RESERVATION CONFLICT status.</p> <p>Writes Exclusive: A task that requests a transfer to the storage medium or cache of the logical unit from an initiator port that is not currently registered with the device server shall be terminated with RESERVATION CONFLICT status.</p> <p>Persistent Reservation Holder: The I_T nexus that delivered the PERSISTENT RESERVE OUT command with RESERVE, PREEMPT, or PREEMPT AND ABORT service action as identified by its registered reservation key.</p>
7h	Write Exclusive – All Registrants	<p>Reads Shared: Any application client on any I_T nexus may initiate tasks that request transfers from the storage medium or cache of the logical unit to the I_T nexus.</p> <p>Writes Exclusive: A task that requests a transfer to the storage medium or cache of the logical unit from a initiator port that is not associated with a registered I_T nexus shall be terminated with RESERVATION CONFLICT status.</p> <p>Persistent Reservation Holder: Any registered I_T nexus as identified by a zero reservation key value.</p>
8h	Exclusive Access – All Registrants	<p>Reads Exclusive: A task that requests a transfer from the storage medium or cache of the logical unit to a initiator port that is not associated with a registered I_T nexus shall be terminated with RESERVATION CONFLICT status.</p> <p>Writes Exclusive: A task that requests a transfer to the storage medium or cache of the logical unit from a initiator port that is not associated with a registered I_T nexus shall be terminated with RESERVATION CONFLICT status.</p> <p>Persistent Reservation Holder: Any registered I_T nexus as identified by a zero reservation key value.</p>
9h - Fh	Reserved	

6.11.5 PERSISTENT RESERVE IN parameter data for REPORT CAPABILITIES

The format for the parameter data provided in response to a PERSISTENT RESERVE IN command with the REPORT CAPABILITIES service action is shown in table 103.

Table 103 — PERSISTENT RESERVE IN parameter data for REPORT CAPABILITIES

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB) _____							
1	LENGTH (0008h) _____ (LSB)							
2	Reserved				SIP_C	ATP_C	ES_C	PTPL_C
3	Reserved							PTPL_A
4	Reserved _____							
7								

The LENGTH field indicates the length in bytes of the parameter data. If the ALLOCATION LENGTH field in the CDB is too small to transfer all of the parameter data, the length shall not be adjusted to reflect the truncation.

An `SIP_C` (Specify Initiator Ports Capable) bit of one indicates that the device server supports the `SPEC_I_PT` bit in the PERSISTENT RESERVE OUT command parameter data (see 6.12.3). An `SIP_C` bit of zero indicates that the device server does not support the `SPEC_I_PT` bit in the PERSISTENT RESERVE OUT command parameter data.

An `ATP_C` (All Target Ports Capable) bit of one indicates that the device server supports the `ALL_TG_PT` bit in the PERSISTENT RESERVE OUT command parameter data. An `ATP_C` bit of zero indicates that the device server does not support the `ALL_TG_PT` bit in the PERSISTENT RESERVE OUT command parameter data.

An `PTPL_C` (Persist Through Power Loss Capable) bit of one indicates that the device server supports the persist through power loss capability (see 5.5.2.2) for persistent reservations and the `APTPL` bit in the PERSISTENT RESERVE OUT command parameter data. An `PTPL_C` bit of zero indicates that the device server does not support the persist through power loss capability.

An `ES_C` (Element Scope Capable) bit of one indicates that the device server supports a `SCOPE` value of `ELEMENT_SCOPE` (see 6.11.4.2) in PERSISTENT RESERVE OUT commands (see 6.12). An `ES_C` bit of zero indicates that the device server does not support a `SCOPE` value of `ELEMENT_SCOPE` in PERSISTENT RESERVE OUT commands.

A `PTPL_A` (Persist Through Power Loss Activated) bit of one indicates that persist through power loss capability (see 5.5.2.2) is activated because the most recent successfully completed PERSISTENT RESERVE OUT command with REGISTER or REGISTER AND IGNORE EXISTING KEY service action had the `APTPL` bit set to one in the parameter data. A `PTPL_A` bit of zero indicates that the persist through power loss capability is not activated.

6.12 PERSISTENT RESERVE OUT command

6.12.1 PERSISTENT RESERVE OUT command introduction

The PERSISTENT RESERVE OUT command (see table 104) is used to request service actions that reserve a logical unit or element for the exclusive or shared use of a particular I_T nexus. The command uses other service actions to manage and remove such persistent reservations.

I_T nexuses performing PERSISTENT RESERVE OUT service actions are identified by a registered reservation key provided by the application client. An application client may use the PERSISTENT RESERVE IN command to obtain the reservation key, if any, for the I_T nexus holding a persistent reservation and may use the PERSISTENT RESERVE OUT command to preempt that persistent reservation.

Table 104 — PERSISTENT RESERVE OUT command

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE (5Fh)							
1	Reserved			SERVICE ACTION				
2	SCOPE				TYPE			
3	Reserved							
4	Reserved							
5	Reserved							
6	Reserved							
7	(MSB) _____							
8	PARAMETER LIST LENGTH _____ (LSB)							
9	CONTROL							

If a PERSISTENT RESERVE OUT command is attempted, but there are insufficient device server resources to complete the operation, the device server shall return a CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to INSUFFICIENT REGISTRATION RESOURCES.

The PERSISTENT RESERVE OUT command contains fields that specify a persistent reservation service action, the intended scope of the persistent reservation, and the restrictions caused by the persistent reservation. The TYPE and SCOPE fields are defined in 6.11.4.2 and 6.11.4.3. If a SCOPE field specifies a scope that is not implemented, the device server shall return a CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST and additional sense code shall be set to INVALID FIELD IN CDB.

Fields contained in the PERSISTENT RESERVE OUT parameter list specify the information required to perform a particular persistent reservation service action.

If the SPEC_I_PT bit (see 6.12.3) is zero, the parameter list shall be 24 bytes in length and the PARAMETER LIST LENGTH field shall contain 24 (18h). If the SPEC_I_PT bit is zero and the parameter list length is not 24, the device server shall return a CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to PARAMETER LIST LENGTH ERROR. If the SPEC_I_PT bit is one, the PARAMETER LIST LENGTH field specifies the number of bytes of parameter data for the PERSISTENT RESERVE OUT command.

6.12.2 PERSISTENT RESERVE OUT Service Actions

When processing the PERSISTENT RESERVE OUT service actions, the device server shall increment the PRgeneration value as specified in 6.11.3.

The PERSISTENT RESERVE OUT command service actions are defined in table 105.

Table 105 — PERSISTENT RESERVE OUT service action codes

Code	Name	Description	PRGENERATION field incremented (see 6.11.3)
00h	REGISTER	Register a reservation key with the device server (see 5.5.2.4) or unregister a reservation key (see 5.5.2.7.3).	Yes
01h	RESERVE	Creates a persistent reservation having a specified SCOPE and TYPE (see 5.5.2.5). The SCOPE and TYPE of a persistent reservation are defined in 6.11.4.2 and 6.11.4.3.	No
02h	RELEASE	Releases the selected persistent reservation (see 5.5.2.7.2).	No
03h	CLEAR	Clears all reservation keys (i.e., registrations) and all persistent reservations (see 5.5.2.7.6).	Yes
04h	PREEMPT	Preempts persistent reservations and/or removes registrations (see 5.5.2.7.4).	Yes
05h	PREEMPT AND ABORT	Preempts persistent reservations and/or removes registrations and aborts all tasks for all preempted I_T nexuses (see 5.5.2.7.4 and 5.5.2.7.5).	Yes
06h	REGISTER AND IGNORE EXISTING KEY	Register a reservation key with the device server (see 5.5.2.4) or unregister a reservation key (see 5.5.2.7.3).	Yes
07h - 1Fh	Reserved		

The parameter list values for each service action are specified in 6.12.3.

6.12.3 PERSISTENT RESERVE OUT parameter list

The parameter list required to perform the PERSISTENT RESERVE OUT command is defined in table 106. All fields shall be sent on all PERSISTENT RESERVE OUT commands, even if the field is not required for the specified service action and scope values.

Table 106 — PERSISTENT RESERVE OUT parameter list

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB) _____							
7	RESERVATION KEY _____ (LSB)							
8	(MSB) _____							
15	SERVICE ACTION RESERVATION KEY _____ (LSB)							
16	(MSB) _____							
19	SCOPE-SPECIFIC ADDRESS _____ (LSB)							
20	Reserved				SPEC_I_PT	ALL_TG_PT	Reserved	APTPL
21	Reserved							
22	Obsolete _____							
23								
24	Additional parameter data _____							
n								

The obsolete field in Bytes 22 and 23 was defined in a previous standard for use with an obsolete scope (see table 101). If the obsolete scope is not supported Bytes 22 and 23 should be zero.

The RESERVATION KEY field contains an 8-byte value provided by the application client to the device server to identify the I_T nexus that is the source of the PERSISTENT RESERVE OUT command. The device server shall verify that the contents of the RESERVATION KEY field in a PERSISTENT RESERVE OUT command parameter data matches the registered reservation key for the I_T nexus from which the task was received, except for:

- a) The REGISTER AND IGNORE EXISTING KEY service action where the RESERVATION KEY field shall be ignored; and
- b) The REGISTER service action for an unregistered I_T nexus where the RESERVATION KEY field shall contain zero.

Except as noted above, when a PERSISTENT RESERVE OUT command specifies a RESERVATION KEY field other than the reservation key registered for the I_T nexus the device server shall return a RESERVATION CONFLICT status. Except as noted above, the reservation key of the I_T nexus shall be verified to be correct regardless of the SERVICE ACTION and SCOPE field values.

The SERVICE ACTION RESERVATION KEY field contains information needed for four service actions: the REGISTER, REGISTER AND IGNORE EXISTING KEY, PREEMPT, and PREEMPT AND ABORT service actions. The SERVICE ACTION RESERVATION KEY field is ignored for all other service actions.

For the REGISTER and REGISTER AND IGNORE EXISTING KEY service action, the SERVICE ACTION RESERVATION KEY field contains:

- a) The new reservation key to be registered in place of the registered reservation key specified in the RESERVATION KEY field; or
- b) Zero to unregister the registered reservation key specified in the RESERVATION KEY field.

For the PREEMPT and PREEMPT AND ABORT service actions, the SERVICE ACTION RESERVATION KEY field contains the reservation key of:

- a) The registrations to be removed; and
- b) If the SERVICE ACTION RESERVATION KEY field identifies a persistent reservation holder (see 5.5.2.6), persistent reservations that are to be preempted.

If the scope is an ELEMENT_SCOPE persistent reservation, the SCOPE-SPECIFIC ADDRESS field shall contain the element address, zero filled in the most significant bits to fit the field. If the service action is REGISTER, REGISTER AND IGNORE EXISTING KEY, or CLEAR or if the scope is a LU_SCOPE persistent reservation, the SCOPE-SPECIFIC ADDRESS field shall be set to zero.

If the SPEC_I_PT (Specify Initiator Ports) bit is set to zero, the device server shall ignore the additional parameter data and shall apply the registration only to the I_T nexus that sent the PERSISTENT RESERVE OUT command. If the SPEC_I_PT bit is set to one for the REGISTER or REGISTER AND IGNORE EXISTING KEY service actions, the additional parameter data shall include a list of transport IDs (see table 107) and the device server shall apply the registration to the I_T nexus for each initiator port specified by a TransportID. If a registration fails for any initiator port (e.g., if the SCSI target device does not have enough resources available to hold the registration information), none of the other registrations shall be made.

Table 107 — PERSISTENT RESERVE OUT specify initiator ports additional parameter data

Bit Byte	7	6	5	4	3	2	1	0
24	TRANSPORTID PARAMETER DATA LENGTH (n - 27)							
27								
	TransportIDs list							
28	First TransportID							
	⋮							
	Last TransportID							
n								

The TRANSPORTID PARAMETER DATA LENGTH field specifies the number of bytes of TransportIDs that follow.

The command shall be terminated with a CHECK CONDITION status and the sense key set to ILLEGAL REQUEST:

- a) If the value in the parameter list length field in the CDB does not include all of the additional parameter list bytes specified by the TRANSPORTID PARAMETER DATA LENGTH field; or
- b) If the value in the TRANSPORTID PARAMETER DATA LENGTH field results in the truncation of a TransportID.

The format of a TransportID is specified in 7.5.4.

The ALL_TG_PT (All Target Ports) bit is valid only for the REGISTER and REGISTER AND IGNORE EXISTING KEY service actions, and shall be ignored for all other service actions. Support for the ALL_TG_PT bit is optional. If the device server receives a REGISTER or REGISTER AND IGNORE EXISTING KEY service action with the ALL_TG_PT bit set to one, it shall create the specified registration on all target ports in the target device (i.e., as if the same registration request had been received individually through each target port). If the device server receives a REGISTER or REGISTER AND IGNORE EXISTING KEY service action with the ALL_TG_PT bit set to zero, it shall apply the registration only to the target port through which the PERSISTENT RESERVE OUT command was received.

The APTPL (Activate Persist Through Power Loss) bit is valid only for the REGISTER and REGISTER AND IGNORE EXISTING KEY service actions, and shall be ignored for all other service actions. Support for an APTPL bit equal to one is optional. If a device server that does not support the APTPL bit value of one receives that value in a REGISTER or a REGISTER AND IGNORE EXISTING KEY service action, the device server shall return a CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST and additional sense code shall be set to INVALID FIELD IN PARAMETER LIST.

If the last valid APTPL bit value received by the device server is zero, the loss of power in the SCSI target device shall release the persistent reservation for the logical unit and remove all registered reservation keys (see 5.5.2.4). If the last valid APTPL bit value received by the device server is one, the logical unit shall retain any persistent reservation(s) that may be present and all reservation keys (i.e., registrations) for all I_T nexuses even if power is lost and later returned (see 5.5.2.2).

Table 108 summarizes which fields are set by the application client and interpreted by the device server for each service action and scope value.

Table 108 — PERSISTENT RESERVE OUT service actions and valid parameters (part 1 of 2)

Service action	Allowed SCOPE	Parameters (part 1 of 2)			
		TYPE	RESERVATION KEY	SERVICE ACTION RESERVATION KEY	SCOPE-SPECIFIC ADDRESS
REGISTER	ignored	ignored	valid	valid	ignored
REGISTER AND IGNORE EXISTING KEY	ignored	ignored	ignored	valid	ignored
RESERVE	LU_SCOPE ELEMENT_SCOPE	valid	valid	ignored	ignored valid (element)
RELEASE	LU_SCOPE ELEMENT_SCOPE	valid	valid	ignored	ignored valid (element)
CLEAR	ignored	ignored	valid	ignored	ignored
PREEMPT	LU_SCOPE ELEMENT_SCOPE	valid	valid	valid	ignored valid (element)
PREEMPT & ABORT	LU_SCOPE ELEMENT_SCOPE	valid	valid	valid	ignored valid (element)

Table 108 — PERSISTENT RESERVE OUT service actions and valid parameters (part 2 of 2)

Service action	Allowed SCOPE	Parameters (part 2 of 2)		
		APTPL	ALL_TG_PT	SPEC_I_PT
REGISTER	ignored	valid	valid	valid
REGISTER AND IGNORE EXISTING KEY	ignored	valid	valid	valid
RESERVE	all	ignored	ignored	ignored
RELEASE	all	ignored	ignored	ignored
CLEAR	ignored	ignored	ignored	ignored
PREEMPT	all	ignored	ignored	ignored
PREEMPT & ABORT	all	ignored	ignored	ignored

6.13 PREVENT ALLOW MEDIUM REMOVAL command

The PREVENT ALLOW MEDIUM REMOVAL command (see table 109) requests that the target enable or disable the removal of the medium in the logical unit. The logical unit shall not allow medium removal if any initiator currently has medium removal prevented.

Table 109 — PREVENT ALLOW MEDIUM REMOVAL command

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE (1Eh)							
1	Reserved							
2	Reserved							
3	Reserved							
4	Reserved						PREVENT	
5	CONTROL							

Table 110 defines the PREVENT field values and their meanings.

Table 110 — PREVENT ALLOW MEDIUM REMOVAL PREVENT field

PREVENT	Description
00b	Medium removal shall be allowed from both the data transport element and the attached medium changer (if any).
01b	Medium removal shall be prohibited from the data transport element but allowed from the attached medium changer (if any).
10b	Medium removal shall be allowed for the data transport element but prohibited for the attached medium changer.
11b	Medium removal shall be prohibited for both the data transport element and the attached medium changer.

PREVENT values 10b and 11b are valid only when the RMB bit and the MCHNGR bit are both equal to one in the standard INQUIRY data.

The prevention of medium removal shall begin when any application client issues a PREVENT ALLOW MEDIUM REMOVAL command with a PREVENT field of 01b or 11b (i.e., medium removal prevented). The prevention of medium removal for the logical unit shall terminate:

- a) After all initiators with application clients that previously prevented medium removal issue PREVENT ALLOW MEDIUM REMOVAL commands with a PREVENT field of 00b or 10b, and the device server has successfully performed a synchronize cache operation; or
- b) Upon a logical unit reset.

For an initiator that has executed a PERSISTENT RESERVE OUT command with a service action of RESERVE, REGISTER AND IGNORE EXISTING KEY, or REGISTER service action, the PREVENT field shall be set to zero as part of the uninterrupted sequence of events performed by a PERSISTENT RESERVE OUT command with a service action of PREEMPT AND ABORT using that initiator's registration value in the SERVICE ACTION RESERVATION KEY field. This allows an initiator to override the prevention of medium removal function for an initiator that is no longer operating correctly.

While a prevention of medium removal condition is in effect, the target shall inhibit mechanisms that normally allow removal of the medium by an operator.

6.14 READ ATTRIBUTE command

6.14.1 READ ATTRIBUTE command introduction

The READ ATTRIBUTE command (see table 111) allows an application client to read attribute values from medium auxiliary memory.

Table 111 — READ ATTRIBUTE command

Bit Byte	7	6	5	4	3	2	1	0						
0	OPERATION CODE (8Ch)													
1	Reserved			SERVICE ACTION										
2														
3	Restricted (see SMC-2)													
4														
5	VOLUME NUMBER													
6	Reserved													
7	PARTITION NUMBER													
8	(MSB)	FIRST ATTRIBUTE IDENTIFIER												
9								(LSB)						
10	(MSB)	ALLOCATION LENGTH												
11														
12														
13								(LSB)						
14	Reserved													
15	CONTROL													

If the medium auxiliary memory is not accessible because there is no medium present, the READ ATTRIBUTE command shall be terminated with a CHECK CONDITION status. The sense key shall be set to NOT READY and the additional sense code shall be set to MEDIUM NOT PRESENT.

If the medium is present but the medium auxiliary memory is not accessible, the READ ATTRIBUTE command shall be terminated with a CHECK CONDITION status. The sense key shall be set to MEDIUM ERROR and the additional sense code shall be set to LOGICAL UNIT NOT READY, AUXILIARY MEMORY NOT ACCESSIBLE.

If the medium auxiliary memory is not operational, the READ ATTRIBUTE command shall be terminated with a CHECK CONDITION status. The sense key shall be set to MEDIUM ERROR and the additional sense code shall be set to AUXILIARY MEMORY READ ERROR.

The service actions defined for the READ ATTRIBUTE command are shown in table 112.

Table 112 — READ ATTRIBUTE service action codes

Code	Name	Description	Subclause
00h	ATTRIBUTE VALUES	Return attribute values.	6.14.2
01h	ATTRIBUTE LIST	Return a list of available attribute identifiers, identifiers that are not in the nonexistent state or unsupported state (see 5.10).	6.14.3
02h	VOLUME LIST	Return a list of known volume numbers.	6.14.4
03h	PARTITION LIST	Return a list of known partition numbers.	6.14.5
04h	Restricted		
05h-1Fh	Reserved		

The VOLUME NUMBER field specifies a volume (see SSC-2) within the medium auxiliary memory. The number of volumes of the medium auxiliary memory shall equal that of the attached medium. If the medium only has a single volume, then its volume number shall be zero.

The PARTITION NUMBER field specifies a partition (see SSC-2) within a volume. The number of partitions of the medium auxiliary memory shall equal that of the attached medium. If the medium only has a single partition, then its partition number shall be zero.

If the combination of volume number and partition number is not valid, the command shall be terminated with a CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST, and the additional sense code shall be set to INVALID FIELD IN CDB.

The FIRST ATTRIBUTE IDENTIFIER field specifies the attribute identifier of the first attribute to be returned. If the specified attribute is in the unsupported state or nonexistent state (see 5.10), the READ ATTRIBUTE command shall be terminated with a CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to INVALID FIELD IN CDB.

The ALLOCATION LENGTH field specifies how many bytes have been allocated for the returned parameter list. If the length is not sufficient to contain the entire parameter list, the first portion of the list shall be returned. This shall not be considered an error. If the remainder of the list is required, the application client should either send a new READ ATTRIBUTE command with an allocation length large enough to contain the entire parameter list or use the FIRST ATTRIBUTE IDENTIFIER field to restrict the attributes returned.

The format of parameter data returned by the READ ATTRIBUTE command depends on the service action specified.

6.14.2 ATTRIBUTE VALUES service action

The READ ATTRIBUTE command with ATTRIBUTE VALUES service action returns parameter data containing the attributes specified by the PARTITION NUMBER, VOLUME NUMBER, and FIRST ATTRIBUTE IDENTIFIER fields in the CDB.

The returned parameter data shall contain the requested attributes in ascending numerical order by attribute identifier value and in the format shown in table 113.

Table 113 — READ ATTRIBUTE with ATTRIBUTE VALUES service action parameter list format

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB)							
3	AVAILABLE DATA (n-3)							(LSB)
	Attribute(s)							
4	Attribute 0 (see 7.3.1)							
	⋮							
n	Attribute x (see 7.3.1)							

The AVAILABLE DATA field shall contain the number of bytes of attribute information in the parameter list. If the parameter list is truncated as a result of insufficient allocation length, the contents of the AVAILABLE DATA field shall not be altered.

The format of the attributes is described in 7.3.1.

6.14.3 ATTRIBUTE LIST service action

The READ ATTRIBUTE command with ATTRIBUTE LIST service action returns parameter data containing the attribute identifiers for the attributes that are not in the unsupported state and not in the nonexistent state (see 5.10) in the specified partition and volume number. The contents of FIRST ATTRIBUTE IDENTIFIER field in the CDB shall be ignored. The returned parameter data shall contain the requested attribute identifiers in ascending numerical order by attribute identifier value and in the format shown in table 114.

Table 114 — READ ATTRIBUTE with ATTRIBUTE LIST service action parameter list format

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB)							
3	AVAILABLE DATA (n-3)							(LSB)
	Attribute identifiers							
4	ATTRIBUTE IDENTIFIER 0							
5	⋮							
n-1	ATTRIBUTE IDENTIFIER x							
n								

The AVAILABLE DATA field shall contain the number of bytes of attribute identifiers in the parameter list. If the parameter list is truncated as a result of insufficient allocation length, the contents of the AVAILABLE DATA field shall not be altered.

An ATTRIBUTE IDENTIFIER field is returned for each attribute that is not in the unsupported state and not in the non-existent state (see 5.10) in the specified partition and volume number. See 7.3.2 for a description of the attribute identifier values.

6.14.4 VOLUME LIST service action

The READ ATTRIBUTE command with VOLUME LIST service action returns parameter data (see table 115) identifying the supported number of volumes. The contents of VOLUME NUMBER, PARTITION NUMBER, and FIRST ATTRIBUTE IDENTIFIER fields in the CDB shall be ignored.

Table 115 — READ ATTRIBUTE with VOLUME LIST service action parameter list format

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB) _____							
1	AVAILABLE DATA (0002h) _____ (LSB)							
2	FIRST VOLUME NUMBER							
3	NUMBER OF VOLUMES AVAILABLE							

The AVAILABLE DATA field shall contain two.

The FIRST VOLUME NUMBER field indicates the first volume available. Volume numbering should start at zero.

The NUMBER OF VOLUMES AVAILABLE field indicates the number of volumes available.

6.14.5 PARTITION LIST service action

The READ ATTRIBUTE command with PARTITION LIST service action returns parameter data (see table 115) identifying the number of partitions supported in the specified volume number. The contents of PARTITION NUMBER and FIRST ATTRIBUTE IDENTIFIER fields in the CDB shall be ignored.

Table 116 — READ ATTRIBUTE with PARTITION LIST service action parameter list format

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB) _____							
1	AVAILABLE DATA (0002h) _____ (LSB)							
2	FIRST PARTITION NUMBER							
3	NUMBER OF PARTITIONS AVAILABLE							

The AVAILABLE DATA field shall contain two.

The FIRST PARTITION NUMBER field indicates the first partition available on the specified volume number. Partition numbering should start at zero.

The NUMBER OF PARTITIONS AVAILABLE field indicates the number of partitions available on the specified volume number.

6.15 READ BUFFER command

6.15.1 READ BUFFER command introduction

The READ BUFFER command (see table 117) is used in conjunction with the WRITE BUFFER command as a diagnostic function for testing memory in the SCSI device and the integrity of the service delivery subsystem. This command shall not alter the medium.

Table 117 — READ BUFFER command

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE (3Ch)							
1	Reserved			MODE				
2	BUFFER ID							
3	(MSB) _____ BUFFER OFFSET _____ (LSB)							
4								
5								
6	(MSB) _____ ALLOCATION LENGTH _____ (LSB)							
7								
8								
9	CONTROL							

The function of this command and the meaning of fields within the CDB depend on the contents of the MODE field. The MODE field is defined in table 118.

Table 118 — READ BUFFER MODE field

MODE	Description	Implementation requirements
00h	Combined header and data	Optional
01h	Vendor specific	Vendor specific
02h	Data	Optional
03h	Descriptor	Optional
0Ah	Echo buffer	Optional
0Bh	Echo buffer descriptor	Optional
1Ah	Enable expander communications protocol and Echo buffer	Optional
04h - 09h	Reserved	
0Ch - 19h	Reserved	
1Bh - 1Fh	Reserved	

6.15.2 Combined header and data mode (00h)

In this mode, a four-byte header followed by data bytes is returned to the application client in the Data-In Buffer. The BUFFER ID and the BUFFER OFFSET fields are reserved.

The four-byte READ BUFFER header (see table 119) is followed by data bytes from the buffer.

Table 119 — READ BUFFER header

Bit Byte	7	6	5	4	3	2	1	0
0	Reserved							
1	BUFFER CAPACITY							
3								

The BUFFER CAPACITY field specifies the total number of data bytes available in the buffer. This number is not reduced to reflect the allocation length; nor is it reduced to reflect the actual number of bytes written using the WRITE BUFFER command. Following the READ BUFFER header, the device server shall transfer data from the buffer. The device server shall terminate filling the Data-In Buffer when allocation length bytes of header plus data have been transferred or when all available header and buffer data have been transferred to the application client, whichever is less.

6.15.3 Vendor specific mode (01h)

In this mode, the meanings of the BUFFER ID, BUFFER OFFSET, and ALLOCATION LENGTH fields are not specified by this standard.

6.15.4 Data mode (02h)

In this mode, the Data-In Buffer is filled only with logical unit buffer data. The BUFFER ID field identifies a specific buffer within the logical unit from which data shall be transferred. The vendor assigns buffer ID codes to buffers within the logical unit. Buffer ID zero shall be supported. If more than one buffer is supported, additional buffer ID codes shall be assigned contiguously, beginning with one. Buffer ID code assignments for the READ BUFFER command shall be the same as for the WRITE BUFFER command. If an unsupported buffer ID code is selected, the device server shall return CHECK CONDITION status, shall set the sense key to ILLEGAL REQUEST, and set the additional sense code to INVALID FIELD IN CDB.

The device server shall terminate filling the Data-In Buffer when allocation length bytes have been transferred or when all the available data from the buffer has been transferred to the application client, whichever amount is less.

The BUFFER OFFSET field contains the byte offset within the specified buffer from which data shall be transferred. The application client should conform to the offset boundary requirements returned in the READ BUFFER descriptor (see 6.15.5). If the device server is unable to accept the specified buffer offset, it shall return CHECK CONDITION status, shall set the sense key to ILLEGAL REQUEST, and set the additional sense code to INVALID FIELD IN CDB.

6.15.5 Descriptor mode (03h)

In this mode, a maximum of four bytes of READ BUFFER descriptor information is returned. The device server shall return the descriptor information for the buffer specified by the BUFFER ID field (see the description of the buffer ID in 6.15.4). If there is no buffer associated with the specified buffer ID, the device server shall return all zeros in the READ BUFFER descriptor. The BUFFER OFFSET field is reserved in this mode. The allocation length should be

set to four or greater. The device server shall transfer the lesser of the allocation length or four bytes of READ BUFFER descriptor. The READ BUFFER descriptor is defined as shown in table 120.

Table 120 — READ BUFFER descriptor

Bit Byte	7	6	5	4	3	2	1	0
0	OFFSET BOUNDARY							
1	BUFFER CAPACITY							
3								

The OFFSET BOUNDARY field returns the boundary alignment within the selected buffer for subsequent WRITE BUFFER and READ BUFFER commands. The value contained in the OFFSET BOUNDARY field shall be interpreted as a power of two.

The value contained in the BUFFER OFFSET field of subsequent WRITE BUFFER and READ BUFFER commands should be a multiple of $2^{\text{offset boundary}}$ as shown in table 121.

Table 121 — Buffer offset boundary

Offset boundary	$2^{\text{Offset boundary}}$	Buffer offsets
0h	$2^0 = 1$	Byte boundaries
1h	$2^1 = 2$	Even-byte boundaries
2h	$2^2 = 4$	Four-byte boundaries
3h	$2^3 = 8$	Eight-byte boundaries
4h	$2^4 = 16$	16-byte boundaries
.	.	.
FFh	Not applicable	0 is the only supported buffer offset

The BUFFER CAPACITY field shall return the size of the selected buffer in bytes.

NOTE 32 - In a system employing multiple application clients, a buffer may be altered between the WRITE BUFFER and READ BUFFER commands by another application client. Buffer testing applications should insure that only a single application client is active. Use of reservations to all logical units on the device or linked commands may be helpful in avoiding buffer alteration between these two commands.

6.15.6 Read Data from echo buffer (0Ah)

In this mode the device server transfers data to the application client from the echo buffer. The echo buffer shall transfer the same data as when the WRITE BUFFER command with the mode field set to echo buffer was issued. The BUFFER ID and BUFFER OFFSET fields are ignored in this mode.

The READ BUFFER command shall return the same number of bytes of data as received in the prior echo buffer mode WRITE BUFFER command from the same initiator limited by the allocation length as described in 4.3.4.6. If a prior echo buffer mode WRITE BUFFER command was not successfully completed the echo buffer mode READ BUFFER command shall terminate with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST and the additional sense code to COMMAND SEQUENCE ERROR. If the data in the echo buffer has been overwritten by another initiator the target shall terminate the echo buffer mode READ BUFFER command with a CHECK CONDITION status, the sense key shall be set to ABORTED COMMAND and the additional sense code to ECHO BUFFER OVERWRITTEN.

The initiator may send a READ BUFFER command requesting the echo buffer descriptor prior to a WRITE BUFFER command.

If an echo buffer mode WRITE BUFFER command is successful then the initiator may send multiple echo buffer mode READ BUFFER commands to read the echo buffer data multiple times.

6.15.7 Echo buffer descriptor mode (0Bh)

In this mode, a maximum of four bytes of READ BUFFER descriptor information is returned. The device server shall return the descriptor information for the echo buffer. If there is no echo buffer implemented, the device server shall return all zeros in the READ BUFFER descriptor. The BUFFER OFFSET field is reserved in this mode. The allocation length should be set to four or greater. The device server shall transfer the lesser of the allocation length or four bytes of READ BUFFER descriptor. The READ BUFFER descriptor is defined as shown in table 122.

Table 122 — Echo buffer descriptor

Bit Byte	7	6	5	4	3	2	1	0
0	Reserved							EBOS
1	Reserved							
2	Reserved			(MSB)				
3	BUFFER CAPACITY							(LSB)

The BUFFER CAPACITY field shall return the size of the echo buffer in bytes aligned to a four-byte boundary. The maximum echo buffer size is 4096 bytes.

If the echo buffer is implemented then the echo buffer descriptor shall be implemented.

An echo buffer overwritten supported (EBOS) bit of one indicates either:

- The target returns the ECHO BUFFER OVERWRITTEN additional sense code if the data being read from the echo buffer is not the data previously written by the same initiator, or
- The target ensures echo buffer data from each initiator is the same as that previously written by the same initiator.

An EBOS bit of zero specifies that the echo buffer may be overwritten by other initiators or intervening commands.

6.15.8 Enable expander communications protocol and Echo buffer (1Ah)

Receipt of a READ BUFFER command with this mode (1Ah) causes a communicative expander (see SPI-4) to enter the expanded communications protocol mode. Device servers in SCSI target devices that receive a READ BUFFER command with this mode shall process it as if it were a READ BUFFER command with mode 0Ah (see 6.15.6).

6.16 READ MEDIA SERIAL NUMBER command

The READ MEDIA SERIAL NUMBER command (see table 123) reports the media serial number reported by the device and the currently mounted media.

Table 123 — READ MEDIA SERIAL NUMBER command

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE (ABh)							
1	Reserved			SERVICE ACTION (01h)				
2	Reserved							
3								
4								
5								
6								
7	ALLOCATION LENGTH							
8							(LSB)	
9	CONTROL							

The ALLOCATION LENGTH field specifies how many bytes have been allocated for the returned parameter data. If the length is not sufficient to contain the entire parameter data, the first portion of the data shall be returned (see 4.3.4.6). This shall not be considered an error.

The READ MEDIA SERIAL NUMBER parameter data format is shown in table 124.

Table 124 — READ MEDIA SERIAL NUMBER parameter data format

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB)	MEDIA SERIAL NUMBER LENGTH (4n-4)						
3								(LSB)
4		MEDIA SERIAL NUMBER						
4n-1								

The MEDIA SERIAL NUMBER LENGTH field shall contain the number of bytes in the MEDIA SERIAL NUMBER field. The media serial number length shall be a multiple of four. The media serial number length shall not be adjusted due to an insufficient allocation length.

The MEDIA SERIAL NUMBER field shall contain the vendor specific serial number of the media currently installed. If the number of bytes in the vendor specific serial number is not a multiple of four, up to three bytes containing zero shall be appended to the highest numbered bytes of the MEDIA SERIAL NUMBER field.

If the media serial number is not available (e.g., the currently installed media has no valid media serial number) zero shall be returned in the MEDIA SERIAL NUMBER LENGTH field.

If there is currently no media in the device, the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to NOT READY, and the additional sense code shall be set to MEDIUM NOT PRESENT.

6.17 RECEIVE COPY RESULTS command

6.17.1 RECEIVE COPY RESULTS command introduction

The RECEIVE COPY RESULTS command (see table 125) provides a means for the application client to receive information about the copy manager or the results of a previous or current EXTENDED COPY command (see 6.3).

Table 125 — RECEIVE COPY RESULTS command

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE (84h)							
1	Reserved			SERVICE ACTION				
2	LIST IDENTIFIER							
3	Reserved							
4	Reserved							
5	Reserved							
6	Reserved							
7	Reserved							
8	Reserved							
9	Reserved							
10	(MSB)							
11								
12	ALLOCATION LENGTH							
13								
14	Reserved							
15	CONTROL							

The service actions defined for the RECEIVE COPY RESULTS command are shown in table 126.

Table 126 — RECEIVE COPY RESULTS service action codes

Code	Name	Description	Returns Data While EXTENDED COPY Is In Progress
00h	COPY STATUS	Return the current copy status of the EXTENDED COPY command identified by the LIST IDENTIFIER field.	Yes
01h	RECEIVE DATA	Return the held data read by EXTENDED COPY command identified by the LIST IDENTIFIER field.	No
03h	OPERATING PARAMETERS	Return copy manager operating parameters.	Yes
04h	FAILED SEGMENT DETAILS	Return copy target device sense data and other information about the progress of processing a segment descriptor whose processing was not completed during processing of the EXTENDED COPY command identified by the LIST IDENTIFIER field.	No
05h-1Eh	Reserved		
1Fh	Vendor Specific		

The LIST IDENTIFIER field identifies the EXTENDED COPY command (see 6.3) about which information is desired. The RECEIVE COPY RESULTS command shall return information from the EXTENDED COPY command received from the same initiator with a list identifier that matches the list identifier specified in the RECEIVE COPY RESULTS CDB.

If the LIST IDENTIFIER field identifies the EXTENDED COPY command that had the NRCR bit set to 1 in the parameter data (see 6.3), the copy manager may respond to a RECEIVE COPY RESULTS command in the same manner it would if the EXTENDED COPY command had never been received.

The actual length of the RECEIVE COPY RESULTS parameter data is available in the AVAILABLE DATA parameter data field. The ALLOCATION LENGTH field in the CDB indicates how much space has been allocated for the returned parameter list. If the length is not sufficient to contain the entire parameter list, the first portion of the list shall be returned. This shall not be considered an error. If the remainder of the list is required, the application client should send a new RECEIVE COPY RESULTS command with a ALLOCATION LENGTH field large enough to contain the entire parameter list.

6.17.2 COPY STATUS service action

In response to the COPY STATUS service action, the copy manager shall return the current status of the EXTENDED COPY command (see 6.3) identified by the LIST IDENTIFIER field in the CDB. If no EXTENDED COPY command known to the copy manager has a matching list identifier, then the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST, and the additional sense code shall be set to INVALID FIELD IN CDB.

Table 127 shows the format of the information returned by the copy manager in response to the COPY STATUS service action. If a device server supports the EXTENDED COPY command, it shall also support the RECEIVE COPY RESULTS command with COPY STATUS service action.

Table 127 — Parameter data for the COPY STATUS service action

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB)							
3	AVAILABLE DATA (00000008h)							(LSB)
4	HDD	STATUS						
5	(MSB)							
6	SEGMENTS PROCESSED							(LSB)
7	TRANSFER COUNT UNITS							
8	(MSB)							
11	TRANSFER COUNT							(LSB)

After completion of an EXTENDED COPY command, the copy manager shall preserve all data returned by a COPY STATUS service action for a vendor specific period of time. The copy manager shall discard the COPY STATUS data when:

- A RECEIVE COPY RESULTS command with COPY STATUS service action is received from the same initiator with a matching list identifier;
- When another EXTENDED COPY command is received from the same initiator and the list identifier matches the list identifier associated with the data preserved for the COPY STATUS service action;
- When the copy manager detects a logical unit reset or I_T nexus loss; or
- When the copy manager requires the resources used to preserve the data.

The AVAILABLE DATA field shall contain the number of bytes present in the parameter data that follows.

The held data discarded (HDD) bit indicates whether held data has been discarded. If HDD is one, held data has been discarded as described in 6.17.4. If HDD is zero, held data has not been discarded.

The STATUS field contains the current status of the EXTENDED COPY command identified by the LIST IDENTIFIER field in the CDB as defined in table 128.

Table 128 — COPY STATUS STATUS values

STATUS value	Meaning
00h	Operation in progress
01h	Operation completed without errors
02h	Operation completed with errors
04h - 7Fh	Reserved

The SEGMENTS PROCESSED field contains the number of segments the copy manager has processed for the EXTENDED COPY command identified by the LIST IDENTIFIER field in the CDB including the segment currently being processed. This field shall be zero if the copy manager has not yet begun processing segment descriptors.

The TRANSFER COUNT UNITS field specifies the units for the TRANSFER COUNT field as defined in table 129.

Table 129 — COPY STATUS TRANSFER COUNT UNITS values

Value	Meaning	Binary Multiplier Name ^a	Multiplier to convert TRANSFER COUNT field to bytes
00h	Bytes		1
01h	Ki-bytes	Kilobinary	2^{10} or 1024
02h	Mi-bytes	Megabinary	2^{20}
03h	Gi-bytes	Gigabinary	2^{30}
04h	Ti-bytes	Terabinary	2^{40}
05h	Pi-bytes	Petabinary	2^{50}
06h	Ei-bytes	Exabinary	2^{60}
07h - FFh	Reserved		
^a This nomenclature is defined in ISO/IEC 60027-2-am2 (1999-01), Letter symbols to be used in electrical technology - Part 2: Telecommunications and electronics (Amendment 2).			

The TRANSFER COUNT field specifies the amount of data written to a destination device for the EXTENDED COPY command identified by the LIST IDENTIFIER field in the CDB prior to receiving the RECEIVE COPY RESULTS command with COPY STATUS service action.

6.17.3 RECEIVE DATA service action

If the copy manager supports those segment descriptors require data to be held for transfer to the application client, then the RECEIVE DATA service action causes the copy manager to return the held data using the format shown in table 130. If a copy manager supports any of the segment descriptor type codes that require data to be held for the application client (see 6.3.5), then it shall also support the RECEIVE COPY RESULTS command with RECEIVE DATA service action.

The EXTENDED COPY command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST, and the additional sense code shall be set to INVALID FIELD IN CDB if either of the following conditions exist:

- a) No EXTENDED COPY command known to the copy manager has a list identifier that matches the LIST IDENTIFIER field in the CDB; or
- b) If the LIST IDENTIFIER field in the CDB identifies an EXTENDED COPY command that still is being processed by the copy manager.

Table 130 — Parameter data for the RECEIVE DATA service action

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB)							
3	AVAILABLE DATA (n-4)							(LSB)
4								
n	HELD DATA							

Following completion of an EXTENDED COPY command, the copy manager shall preserve all data returned by a RECEIVE DATA service action for a vendor specific period of time. The application client should issue a RECEIVE COPY RESULTS command with RECEIVE DATA service action as soon as practical following completion of the EXTENDED COPY command to insure that the data is not discarded by the copy manager. The copy manager shall discard the buffered inline data:

- a) After all data held for a specific EXTENDED COPY command has been successfully transferred to the application client;
- b) When a RECEIVE COPY RESULTS command with RECEIVE DATA service action has been received from the same initiator with a matching list identifier, with the ALLOCATION LENGTH field set to zero;
- c) When another EXTENDED COPY command is received from the same initiator and the list identifier matches the list identifier associated with the data preserved for RECEIVE DATA service action;
- d) When the copy manager detects a logical unit reset or I_T nexus loss; or
- e) When the copy manager requires the resources used to preserve the data.

The AVAILABLE DATA field shall contain the number of bytes of held data available for delivery to the application client. If the amount of held data sent to the application client is reduced due to insufficient allocation length, the AVAILABLE DATA field shall not be altered and the held data shall not be discarded.

The HELD DATA field contains the data held by the copy manager for delivery to the application client as prescribed by several segment descriptor type codes. Unless the copy manager's held data limit (see 6.17.4) is exceeded, the first byte held in response to the first segment descriptor in the EXTENDED COPY parameter list prescribing the holding of data (called the oldest byte held) is returned in byte 4. The last byte held in response to the last segment descriptor in the EXTENDED COPY parameter list prescribing the holding of data (called the newest byte held) is returned in byte n.

6.17.4 OPERATING PARAMETERS service action

In response to the OPERATING PARAMETERS service action, the copy manager shall return its operating parameter information in the format shown in table 131. If a device server supports the EXTENDED COPY command (see 6.3), then it shall also support the RECEIVE COPY RESULTS command with OPERATING PARAMETERS service action.

Table 131 — Parameter data for the OPERATING PARAMETERS service action

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB)	AVAILABLE DATA (n-4)						(LSB)
3								
4		Reserved						
7								
8	(MSB)	MAXIMUM TARGET DESCRIPTOR COUNT						(LSB)
9								
10	(MSB)	MAXIMUM SEGMENT DESCRIPTOR COUNT						(LSB)
11								
12	(MSB)	MAXIMUM DESCRIPTOR LIST LENGTH						(LSB)
15								
16	(MSB)	MAXIMUM SEGMENT LENGTH						(LSB)
19								
20	(MSB)	MAXIMUM INLINE DATA LENGTH						(LSB)
23								
24	(MSB)	HELD DATA LIMIT						(LSB)
27								
28	(MSB)	MAXIMUM STREAM DEVICE TRANSFER SIZE						(LSB)
31								
32		Reserved						
35								
36		MAXIMUM CONCURRENT COPIES						
37		DATA SEGMENT GRANULARITY (log 2)						
38		INLINE DATA GRANULARITY (log 2)						
39		HELD DATA GRANULARITY (log 2)						
40		Reserved						
42								
43		IMPLEMENTED DESCRIPTOR LIST LENGTH (n-43)						
44		List of implemented descriptor type codes (ordered)						
n								

The AVAILABLE DATA field shall contain the number of bytes following the AVAILABLE DATA field in the parameter data (i.e., the total number of parameter data bytes minus 4).

The MAXIMUM TARGET COUNT field contains the maximum number of target descriptors that the copy manager allows in a single EXTENDED COPY target descriptor list.

The MAXIMUM SEGMENT COUNT field contains the maximum number of segment descriptors that the copy manager allows in a single EXTENDED COPY segment descriptor list.

The MAXIMUM DESCRIPTOR LIST LENGTH field contains the maximum length, in bytes, of the target descriptor list and segment descriptor list. This length includes the embedded data but excludes inline data that follows the descriptors.

The MAXIMUM SEGMENT LENGTH field indicates the length, in bytes, of the largest amount of data that the copy manager supports writing via a single segment. Bytes introduced as a result of the PAD bit being set to one (see 6.3.7) are not counted towards this limit. A value of zero indicates that the copy manager places no limits on the amount of data written by a single segment.

The MAXIMUM INLINE DATA LENGTH field indicates the length, in bytes, of the largest amount of inline data that the copy manager supports in the EXTENDED COPY parameter list. This does not include data included as embedded data within the segment descriptors. The MAXIMUM INLINE DATA LENGTH field applies only to segment descriptors containing the 04h descriptor type code (see 6.3.7.7). The field shall be set to zero when the 04h descriptor type code is not supported by the copy manager.

The HELD DATA LIMIT field indicates the length, in bytes, of the minimum amount of data the copy manager guarantees to hold for return to the application client via the RECEIVE COPY RESULTS command with RECEIVE DATA service action (see 6.17.3). If the processing of segment descriptors requires more data to be held, the copy manager may discard some of the held data in a vendor specific manner that retains the held bytes from the most recently processed segment descriptors. The discarding of held data bytes shall not be considered an error. If held data is discarded, the hdd bit shall be set as described in 6.17.2.

The MAXIMUM CONCURRENT COPIES field contains the maximum number of EXTENDED COPY commands supported for concurrent processing by the copy manager.

The DATA SEGMENT GRANULARITY field indicates the length of the smallest data block that copy manager permits in a non-inline segment descriptor (i.e., segment descriptors with type codes other than 04h). The amount of data transferred by a single segment descriptor shall be a multiple of the granularity. The DATA SEGMENT GRANULARITY value is expressed as a power of two. Bytes introduced as a result of the PAD bit being set to one (see 6.3.7) are not counted towards the data length granularity.

The INLINE DATA GRANULARITY field indicates the length of the of the smallest block of inline data that the copy manager permits being written by a segment descriptor containing the 04h descriptor type code (see 6.3.7.7). The amount of inline data written by a single segment descriptor shall be a multiple of the granularity. The INLINE DATA GRANULARITY value is expressed as a power of two. Bytes introduced as a result of the PAD bit being set to one (see 6.3.7) are not counted towards the length granularity.

If the copy manager encounters a data or inline segment descriptor that violates either the data segment granularity or the inline data granularity, the EXTENDED COPY command shall be terminated with a CHECK CONDITION status. The sense key shall be set to COPY ABORTED and the additional sense code shall be set to COPY SEGMENT GRANULARITY VIOLATION.

The HELD DATA GRANULARITY field indicates the length of the smallest block of held data that the copy manager shall transfer to the application client in response to a RECEIVE COPY RESULTS command with RECEIVE DATA

service action (see 6.17.3). The amount of data held by the copy manager in response to any one segment descriptor shall be a multiple of this granularity. The HELD DATA GRANULARITY value is expressed as a power of two.

The MAXIMUM STREAM DEVICE TRANSFER SIZE field indicates the maximum transfer size, in bytes, supported for stream devices.

The IMPLEMENTED DESCRIPTOR LIST LENGTH field contains the length, in bytes, of the list of implemented descriptor type codes.

The list of implemented descriptor type codes contains one byte for each segment or target DESCRIPTOR TYPE CODE value (see 6.3.5) supported by the copy manager, with a unique supported DESCRIPTOR TYPE CODE value in each byte. The DESCRIPTOR TYPE CODE values shall appear in the list in ascending numerical order.

6.17.5 FAILED SEGMENT DETAILS service action

In response to the FAILED SEGMENT DETAILS service action, the copy manager shall return details of the segment processing failure that caused termination of the EXTENDED COPY command (see 6.3) identified by the LIST IDENTIFIER field in the CDB. Table 132 shows the format of the information returned by the copy manager in response to a FAILED SEGMENT DETAILS service action. If a device server supports the EXTENDED COPY command (see 7.4), then it shall also support the RECEIVE COPY RESULTS command with FAILED SEGMENT DETAILS service action.

When processing of an EXTENDED COPY command is aborted and processing of a segment descriptor is incomplete, the copy manager shall preserve details about the progress in processing of that descriptor. These details enable the application client to obtain information it needs to determine the state in which target devices (in particular stream devices) have been left by incomplete processing.

The EXTENDED COPY command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST, and the additional sense code shall be set to INVALID FIELD IN CDB if either of the following conditions exist:

- a) No EXTENDED COPY command known to the copy manager has a list identifier that matches the LIST IDENTIFIER field in the CDB; or
- b) If the LIST IDENTIFIER field in the CDB identifies an EXTENDED COPY command that still is being processed by the copy manager.

Table 132 — Parameter data for the FAILED SEGMENT DETAILS service action

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB)							
3	AVAILABLE DATA (n-4)							(LSB)
4	Reserved							
55								
56	EXTENDED COPY COMMAND STATUS							
57	Reserved							
58	(MSB)							
59	SENSE DATA LENGTH (n-59)							(LSB)
60	SENSE DATA							
n								

The application client should issue a RECEIVE COPY RESULTS command with FAILED SEGMENT DETAILS service action immediately following failure of the EXTENDED COPY command to insure that the information is not discarded by the copy manager. The copy manager shall discard the failed segment details:

- a) After all failed segment details held for a specific EXTENDED COPY command have been successfully transferred to the application client;
- b) When a RECEIVE COPY RESULTS command with FAILED SEGMENT DETAILS service action has been received from the same initiator with a matching list identifier, with the ALLOCATION LENGTH field set to zero;
- c) When another EXTENDED COPY command is received from the same initiator using the same list identifier;
- d) When the copy manager detects a logical unit reset or I_T nexus loss; or

- e) When the copy manager requires the resources used to preserve the data.

The AVAILABLE DATA field shall contain the number of bytes of failed segment details available for delivery to the application client. If the amount of failed segment details data sent to the application client is reduced due to insufficient allocation length, the AVAILABLE DATA field shall not be altered and the failed segment details shall not be discarded. If no failed segment details data is available for the specified list identifier then the AVAILABLE DATA field shall be set to zero and no data beyond the AVAILABLE DATA field shall be returned.

The COPY COMMAND STATUS field contains the SCSI status value that was returned for the EXTENDED COPY command identified by the LIST IDENTIFIER field in the CDB.

The SENSE DATA LENGTH field indicates how many bytes of sense data are present in the SENSE DATA field.

The SENSE DATA field contains a copy of the sense data that the copy manager prepared as part of terminating the EXTENDED COPY command identified by the list identifier with a CHECK CONDITION status.

NOTE 33 - Specific uses of the reserved bytes 4 to 55 are under discussion for SPC-3.

6.18 RECEIVE DIAGNOSTIC RESULTS command

The RECEIVE DIAGNOSTIC RESULTS command (see table 133) requests that data be sent to the application client after completion of a SEND DIAGNOSTIC command (see 6.26). If optional diagnostic page formats are supported and the PCV bit is one, the PAGE CODE field specifies the format of the returned data, and there is no relationship to a previous SEND DIAGNOSTIC command.

Table 133 — RECEIVE DIAGNOSTIC RESULTS command

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE (1Ch)							
1	Reserved							PCV
2	PAGE CODE							
3	(MSB) _____							
4	ALLOCATION LENGTH							(LSB)
5	CONTROL							

A page code valid (PCV) bit of zero indicates that the most recent SEND DIAGNOSTIC command shall define the data returned by this command. Optionally, a PCV bit of one indicates that the contents of the PAGE CODE field shall define the data returned by this command. Page code values are defined in 7.1 or in another command set standard (see 3.1.17).

NOTES

- 34 To ensure that the diagnostic command information is not destroyed by a command sent from another initiator the logical unit should be reserved.
- 35 Although diagnostic software is generally device-specific, this command and the SEND DIAGNOSTIC command provide a means to isolate the operating system software from the device-specific diagnostic software. The operating system may remain device-independent.

See 7.1 for RECEIVE DIAGNOSTIC RESULTS diagnostic page format definitions.

6.19 REPORT ALIASES command

The REPORT ALIASES command (see table 134) requests that the device server return the alias list. The alias list is managed by the initiator using the CHANGE ALIASES command (see 6.2). If the CHANGE ALIASES command is supported then the REPORT ALIASES command shall also be supported.

The REPORT ALIASES command is a service action of the MAINTENANCE IN command. Additional MAINTENANCE IN service actions are defined in SCC-2 and in this standard. The MAINTENANCE IN service actions defined in SCC-2 apply only to logical units that return a device type of 0Ch or the SCCS bit equal to one in their standard INQUIRY data (see 6.4.2).

The ALLOCATION LENGTH field indicates the number of bytes that have been allocated for the returned parameter data. If the length is not sufficient to contain all the parameter data, the first portion of the data shall be returned. This shall not be considered an error. The actual length of the parameter data may be determined from the ADDITIONAL LENGTH field in the parameter data. If the remainder of the parameter data is required, the application client should send a new REPORT ALIASES command with an allocation length large enough to contain all the data.

Table 134 — REPORT ALIASES command

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE (A3h)							
1	Reserved			SERVICE ACTION (0Bh)				
2	Reserved							
3	Reserved							
4	Reserved							
5	Reserved							
6	(MSB)							
7	ALLOCATION LENGTH							
8								
9								
10								
11	(LSB)							
	Reserved							
	CONTROL							

The ALLOCATION LENGTH field is described in 4.3.4.6.

The parameter data for a REPORT ALIASES command (see table 135) contains zero or more alias entries.

Table 135 — REPORT ALIASES parameter data

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB)							
3	ADDITIONAL LENGTH (n-3)							(LSB)
4	Reserved							
5	Reserved							
6	NUMBER OF ALIASES (X)							
7								
	Alias entry (or entries)							
8	Alias entry 0 (see 6.2.2)							
	⋮							
	Alias entry x (see 6.2.2)							
n								

The ADDITIONAL LENGTH field indicates the number of bytes in the remaining parameter data. The ADDITIONAL LENGTH field shall contain the actual number of bytes available in the parameter data and shall not be changed if the CDB contains an insufficient allocation length.

The NUMBER OF ALIASES field indicates the number of alias entries in the alias list and shall not be changed if the CDB contains an insufficient allocation length.

The parameter data shall include one alias entry for each alias in the alias list. The format of an alias entry is described in 6.2.2.

6.20 REPORT DEVICE IDENTIFIER command

The REPORT DEVICE IDENTIFIER command (see table 136) requests that the device server send device identification information to the application client. As defined in the SCC-2 standard, the REPORT DEVICE IDENTIFIER command is the REPORT PERIPHERAL DEVICE/COMPONENT DEVICE IDENTIFIER service action of the MAINTENANCE IN command. Additional MAINTENANCE IN and MAINTENANCE OUT service actions are defined in SCC-2 and in this standard.

The MAINTENANCE IN service actions defined only in SCC-2 shall apply only to SCSI devices that return a device type of 0Ch or the sccs bit equal to one in their standard INQUIRY data. When a SCSI device returns a device type of 0Ch or the sccs bit equal to one in its standard INQUIRY data, the implementation requirements for the SCC-2 MAINTENANCE IN service actions shall be as specified in SCC-2. Otherwise the MAINTENANCE IN service action definitions and implementation requirements stated in this standard shall apply.

Table 136 — REPORT DEVICE IDENTIFIER command

Bit Byte	7	6	5	4	3	2	1	0	
0	OPERATION CODE (A3h)								
1	Reserved			SERVICE ACTION (05h)					
2	Reserved								
3	Reserved								
4	Restricted								
5									
6	(MSB)	ALLOCATION LENGTH							
7									
8									
9									
10	Reserved						Restricted	Reserved	
11	CONTROL								

SCC-2 defines specific usages for bytes 4 and 5, and bit 1 in byte 10, however these fields are reserved for the REPORT DEVICE IDENTIFIER command defined by this standard.

The ALLOCATION LENGTH field indicates how many bytes have been allocated for the returned parameter data. If the length is not sufficient to contain all the parameter data, the first portion of the data shall be returned. This shall not be considered an error. The actual length of the parameter data is available in the IDENTIFIER LENGTH field in the parameter data. If the remainder of the parameter data is required, the application client should send a new REPORT DEVICE IDENTIFIER command with an ALLOCATION LENGTH field large enough to contain all the data.

The REPORT DEVICE IDENTIFIER parameter data (see table 137) contains a four-byte field that contains the length in bytes of the parameter data and the logical unit's identifier.

Table 137 — REPORT DEVICE IDENTIFIER parameter data

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB)							
1	IDENTIFIER LENGTH (n-4)							
2								
3								(LSB)
4	IDENTIFIER							
n								

The IDENTIFIER LENGTH field specifies the length in bytes of the IDENTIFIER field. If the ALLOCATION LENGTH field in the CDB is too small to transfer all of the identifier, the length shall not be adjusted to reflect the truncation. The identifier length shall initially equal zero, and shall be changed only by a successful SET DEVICE IDENTIFIER command.

The IDENTIFIER field shall contain a vendor specific value. The value reported shall be the last value written by a successful SET DEVICE IDENTIFIER command. The value of the identifier shall be changed only by a SET DEVICE IDENTIFIER command. The identifier value shall persist through logical unit resets, I_T nexus losses, media format operations, and media replacement.

The logical unit shall return the same Identifier to all initiators.

Processing a REPORT DEVICE IDENTIFIER may require the enabling of a nonvolatile memory within the logical unit. If the nonvolatile memory is not ready, the device server shall return CHECK CONDITION status, rather than wait for the device to become ready. The sense key shall be set to NOT READY and the additional sense code shall be set as described in table 164 (see 6.27). This information should allow the application client to determine the action required to cause the device server to become ready.

6.21 REPORT LUNS command

The REPORT LUNS command (see table 138) requests that the peripheral device logical unit inventory accessible to the initiator via the addressed target port be sent to the application client. The logical unit inventory is a list that shall include the logical unit numbers of all logical units having a PERIPHERAL QUALIFIER value of 000b (see 6.4.2). Logical unit numbers for logical units with PERIPHERAL QUALIFIER values of 100b, 101b, 110b, or 111b may optionally be included in the logical unit inventory.

A SCSI device shall support a REPORT LUNS command that is addressed to logical unit zero. Support of the REPORT LUNS command by logical units other than logical unit zero is optional. Support of the REPORT LUNS command on devices having only a single logical unit with the logical unit number of zero is optional.

Table 138 — REPORT LUNS command

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE (A0h)							
1	Reserved							
2	SELECT REPORT							
3	Reserved							
4	Reserved							
5	Reserved							
6	(MSB)							
7								
8	ALLOCATION LENGTH							
9	(LSB)							
10	Reserved							
11	CONTROL							

The SELECT REPORT field (see table 139) specifies the types of logical unit addresses that shall be reported.

Table 139 — Select report code values

Code	Description
00h	The logical unit addresses reported shall be limited to the following addressing methods (see SAM-2): a) Logical unit addressing method, b) Peripheral device addressing method; and c) Flat space addressing method.
01h	The list of logical units shall only contain well known logical units, if any. If there are no well known logical units the LUN LIST LENGTH field shall be zero.
02h	All logical units accessible to the initiator via the addressed target port shall be reported.
03h - FFh	Reserved

The allocation length should be at least 16 bytes. If the allocation length is not sufficient to contain the entire logical unit inventory, the device server shall report as many logical unit number values as fit in the specified allocation length. This shall not be considered an error.

NOTE 36 - Devices compliant with SPC return CHECK CONDITION status with sense key ILLEGAL REQUEST and additional sense code set to INVALID FIELD IN CDB when the allocation length is less than 16 bytes.

The REPORT LUNS command shall return CHECK CONDITION status only when the device server is unable to return the requested report of the logical unit inventory.

If a REPORT LUNS command is received from an initiator with a pending unit attention condition (i.e., before the device server reports CHECK CONDITION status), the device server shall perform the REPORT LUNS command.

If the unit attention condition was established because of a change in the logical unit inventory, that unit attention condition shall be cleared for that initiator by the REPORT LUNS command. Unit attention conditions established for other reasons shall not be cleared by the REPORT LUNS command (see SAM-2).

The REPORT LUNS data should be returned even though the device server is not ready for other commands. The default report of the logical unit inventory should be available without incurring any media access delays. The default report of the logical unit inventory shall contain at least LUN 0.

If the logical unit inventory changes for any reason, including completion of initialization, removal of a logical unit, or creation of a logical unit, the device server shall generate a unit attention command for all initiators (see SAM-2). The device server shall set the additional sense code to REPORTED LUNS DATA HAS CHANGED.

The execution of a REPORT LUNS command to any valid and installed logical unit shall clear the REPORTED LUNS DATA HAS CHANGED unit attention condition for all logical units of that target with respect to the requesting initiator. A valid and installed logical unit is one having a PERIPHERAL QUALIFIER of 000b in the standard INQUIRY data (see 6.4.2).

The device server shall report those devices in the logical unit inventory using the format shown in table 140.

Table 140 — REPORT LUNS parameter data format

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB)							
3	LUN LIST LENGTH (N-7)							(LSB)
4	Reserved							
7								
	LUN list							
8	First LUN							
15								
	⋮							
n-7	Last LUN							
n								

The LUN LIST LENGTH field shall contain the length in bytes of the LUN list that is available to be transferred. The LUN list length is the number of logical unit numbers in the logical unit inventory multiplied by eight. If the allocation length in the CDB is too small to transfer information about the entire logical unit inventory, the LUN list length value shall not be adjusted to reflect the truncation.

6.22 REPORT SUPPORTED OPERATION CODES command

6.22.1 REPORT SUPPORTED OPERATION CODES command introduction

The REPORT SUPPORTED OPERATION CODES command (see table 141) requests information on commands the addressed logical unit supports. An application client may request a list of all operation codes and service actions supported by the logical unit or the command support data for a specific command.

The REPORT SUPPORTED OPERATION CODES command is a service action of the MAINTENANCE IN command. Additional MAINTENANCE IN service actions are defined in SCC-2 and in this standard. The MAINTENANCE IN service actions defined in SCC-2 apply only to logical units that return a device type of 0Ch or the sccs bit equal to one in their standard INQUIRY data (see 6.4.2).

Table 141 — REPORT SUPPORTED OPERATION CODES command

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE (A3h)							
1	Reserved			SERVICE ACTION (0Ch)				
2	Reserved				REPORTING OPTIONS			
3	REQUESTED OPERATION CODE							
4	(MSB) _____							
5	REQUESTED SERVICE ACTION _____ (LSB)							
6	(MSB) _____							
7	_____							
8	ALLOCATION LENGTH _____							
9	_____ (LSB)							
10	Reserved							
11	CONTROL							

The REPORTING OPTIONS field (see table 142) specifies the information to be returned in the parameter data.

Table 142 — REPORT SUPPORTED OPERATION CODES reporting options

Reporting Option	Description	Parameter Data Reference
000b	A list of all operation codes and service actions supported by the logical unit shall be returned in the all_commands parameter data format. The REQUESTED OPERATION CODE CDB field and REQUESTED SERVICE ACTION CDB field shall be ignored.	6.22.2
001b	The command support data for the operation code specified in the REQUESTED OPERATION CODE field shall be returned in the one_command parameter data format. The REQUESTED SERVICE ACTION CDB field shall be ignored. If the REQUESTED OPERATION CODE field specifies an operation code that has service actions the device server shall return CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to INVALID FIELD IN CDB.	6.22.3
010b	The command support data for the operation code and service action specified in the REQUESTED OPERATION CODE CDB field and REQUESTED SERVICE ACTION CDB field shall be returned in the one_command parameter data format. If the REQUESTED OPERATION CODE CDB field specifies an operation code that does not have service actions the device server shall return CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to INVALID FIELD IN CDB.	6.22.3
011b-111b	Reserved	

The REQUESTED OPERATION CODE field specifies the operation code of the command to be returned in the one_command parameter data format (see 6.22.3).

The REQUESTED SERVICE ACTION field specifies the service action of the command to be returned in the one_command parameter data format.

The ALLOCATION LENGTH field specifies the number of bytes that have been allocated for the returned parameter data. If the length is not sufficient to contain all the parameter data, the first portion of the data shall be returned. This shall not be considered an error. The actual length of the parameter data may be determined from the ADDITIONAL LENGTH field in the parameter data. If the remainder of the parameter data is required, the application client should send a new REPORT SUPPORTED OPERATION CODES command with an allocation length large enough to contain all the data.

6.22.2 All_commands parameter data format

The REPORT SUPPORTED OPERATION CODES all_commands parameter data format (see table 143) begins with a four-byte header that contains the length in bytes of the parameter data followed by a list of supported commands. Each command descriptor contains information about a single supported command CDB (i.e., one operation code and service action combination, or one non-service-action operation code). The list of command descriptors shall contain all commands supported by the logical unit.

Table 143 — All_commands parameter data

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB)							
3	COMMAND DATA LENGTH (n-3)							(LSB)
	Commands							
4	Command descriptor 0 (see table 144)							
	⋮							
n	Command descriptor x (see table 144)							

The COMMAND DATA LENGTH field specifies the length in bytes of the command descriptor list.

Each command descriptor (see table 144) contains information about a single supported command CDB.

Table 144 — Command descriptor format

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE							
1	Reserved							
2	(MSB)							
3	SERVICE ACTION							(LSB)
4	Reserved							
5	Reserved							SERVACTV
6	(MSB)							
7	CDB LENGTH							(LSB)

The OPERATION CODE field contains the operation code of a command supported by the logical unit.

The SERVICE ACTION field contains a supported service action of the supported operation code indicated by the OPERATION CODE field. If the operation code indicated in the OPERATION CODE field does not have a service actions, the SERVICE ACTION field shall be set to 00h.

A service action valid (SERVACTV) bit of zero indicates the operation code indicated by the OPERATION CODE field does not have service actions and the SERVICE ACTION field should be ignored. A SERVACTV bit of one indicates the

operation code indicated by the OPERATION CODE field has service actions and the contents of the SERVICE ACTION field are valid.

The CDB LENGTH field contains the length of the command CDB in bytes for the operation code indicated in the OPERATION CODE field, and if the SERVACTV bit is one the service action indicated by the SERVICE ACTION field.

6.22.3 One_command parameter data format

The REPORT SUPPORTED OPERATION CODES one_command parameter data format (see table 145) contains information about the CDB and a usage map for bits in the CDB for the command specified by the REPORTING OPTIONS, REQUESTED OPERATION CODE, and REQUESTED SERVICE ACTION fields in the REPORT SUPPORTED OPERATION CODES CDB.

Table 145 — One_command parameter data

Bit Byte	7	6	5	4	3	2	1	0
0	Reserved							
1	Reserved					SUPPORT		
2	(MSB) _____							
3	CDB SIZE (n-3)							(LSB)
4								
n	_____ CDB USAGE DATA _____							

The SUPPORT field is defined in table 146.

Table 146 — SUPPORT values

Support	Description
000b	Data about the requested SCSI command is not currently available. All data after byte 1 is not valid. A subsequent request for command support data may be successful.
001b	The device server does not support the requested command. All data after byte 1 is undefined.
010b	Reserved
011b	The device server supports the requested command in conformance with a SCSI standard. The parameter data format conforms to the definition in table 145.
100b	Reserved
101b	The device server supports the requested command in a vendor specific manner. The parameter data format conforms to the definition in table 145.
110b - 111b	Reserved

The CDB SIZE field contains the size of the CDB USAGE DATA field in the parameter data, and the number of bytes in the CDB for command being queried (i.e., the command specified by the REPORTING OPTIONS, REQUESTED OPERATION CODE, and REQUESTED SERVICE ACTION fields in the REPORT SUPPORTED OPERATION CODES CDB).

The CDB USAGE DATA field contains information about the CDB for the command being queried. The first byte of the CDB USAGE DATA field shall contain the operation code for the command being queried. If the command being

queried contains a service action, then that service action code shall be placed the CDB USAGE DATA field in the same location as the SERVICE ACTION field of the command CDB. All other bytes of the CDB USAGE DATA field shall contain a usage map for bits in the CDB for the command being queried.

The bits in the usage map shall have a one-for-one correspondence to the CDB for the command being queried. If the device server evaluates a bit in the CDB for the command being queried, the usage map shall contain a one in the corresponding bit position. If any bit representing part of a field is returned as one, all bits for the field shall be returned as one. If the device server ignores or treats as reserved a bit in the CDB for the command being queried, the usage map shall contain a zero in the corresponding bit position. The usage map bits for a given CDB field all shall have the same value.

For example, the CDB usage bit map for the REPORT SUPPORTED OPERATION CODES command is: A3h, 0Ch, 03h, FFh, FFh, FFh, FFh, FFh, FFh, FFh, 00h, 07h. This example assumes that the logical unit only supports the low-order three bits of the CONTROL byte. The first byte contains the operation code, and the second byte contains three reserved bits and the service action. The remaining bytes contain the usage map.

6.23 REPORT SUPPORTED TASK MANAGEMENT FUNCTIONS command

The REPORT SUPPORTED TASK MANAGEMENT FUNCTIONS command (see table 147) requests information on task management functions (see SAM-3) the addressed logical unit supports.

The REPORT SUPPORTED TASK MANAGEMENT FUNCTIONS command is a service action of the MAINTENANCE IN command. Additional MAINTENANCE IN service actions are defined in SCC-2 and in this standard. The MAINTENANCE IN service actions defined in SCC-2 apply only to logical units that return a device type of 0Ch or the sccs bit equal to one in their standard INQUIRY data (see 6.4.2).

Table 147 — REPORT SUPPORTED TASK MANAGEMENT FUNCTIONS command

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE (A3h)							
1	Reserved			SERVICE ACTION (0Dh)				
2	Reserved							
5								
6	(MSB)	ALLOCATION LENGTH (4h or larger)						
9								(LSB)
10	Reserved							
11	CONTROL							

The ALLOCATION LENGTH field indicates the number of bytes that have been allocated for the returned parameter data. The allocation length shall be at least four. If the allocation length is less than for the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST, and the additional sense code shall be set to INVALID FIELD IN CDB.

The format of the parameter data returned by the REPORT TASK MANAGEMENT FUNCTIONS command is shown in table 148.

Table 148 — REPORT SUPPORTED TASK MANAGEMENT FUNCTIONS parameter data

Bit Byte	7	6	5	4	3	2	1	0
0	ATS	ATSS	CACAS	CTSS	LURS	QTS	TRS	WAKES
1	Reserved							
3								

An ABORT TASK supported (ATS) bit of one indicates the ABORT TASK task management function is supported by the logical unit. An ATS bit of zero indicates the ABORT TASK task management function is not supported.

An ABORT TASK SET supported (ATSS) bit of one indicates the ABORT TASK SET task management function is supported by the logical unit. An ATSS bit of zero indicates the ABORT TASK SET task management function is not supported.

A CLEAR ACA supported (CACAS) bit of one indicates the CLEAR ACA task management function is supported by the logical unit. An CACAS bit of zero indicates the CLEAR ACA task management function is not supported.

A CLEAR TASK SET supported (CTSS) bit of one indicates the CLEAR TASK SET task management function is supported by the logical unit. An CTSS bit of zero indicates the CLEAR TASK SET task management function is not supported.

A LOGICAL UNIT RESET supported (LURS) bit of one indicates the LOGICAL UNIT RESET task management function is supported by the logical unit. An LURS bit of zero indicates the LOGICAL UNIT RESET task management function is not supported.

A QUERY TASK supported (QTS) bit of one indicates the QUERY TASK task management function is supported by the logical unit. An QTS bit of zero indicates the QUERY TASK task management function is not supported.

A TARGET RESET supported (TRS) bit of one indicates the TARGET RESET task management function (see SAM-2) is supported by the logical unit. An TRS bit of zero indicates the TARGET RESET task management function is not supported.

A WAKEUP supported (WAKES) bit of one indicates the WAKEUP task management function is supported by the logical unit. An WAKES bit of zero indicates the WAKEUP task management function is not supported.

6.24 REPORT TARGET PORT GROUPS command

The REPORT TARGET PORT GROUPS command (see table 149) requests that the device server send target port group information to the application client. This command shall be supported for all SCSI target devices that report in the standard INQUIRY data (see 6.4.2) that they support asymmetric logical unit access (i.e., return a non zero value in the ALUA field).

The REPORT TARGET PORT GROUPS command is a service action of the MAINTENANCE IN command. Additional MAINTENANCE IN service actions are defined in SCC-2 and in this standard. The MAINTENANCE IN service actions defined only in SCC-2 apply only to logical units that return a device type of 0Ch or the sccs bit equal to one in their standard INQUIRY data.

Table 149 — REPORT TARGET PORT GROUPS command

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE (A3h)							
1	Reserved			SERVICE ACTION (0Ah)				
2	Reserved							
3	Reserved							
4	Reserved							
5	Reserved							
6	(MSB)							
7								
8	ALLOCATION LENGTH							
9	(LSB)							
10	Reserved							
11	CONTROL							

The ALLOCATION LENGTH field indicates how much space has been allocated for the returned parameter data. If the length is not sufficient to contain all the parameter data, the first portion of the data shall be returned. This shall not be considered an error. The actual length of the parameter data is available in the RETURN DATA LENGTH field in the parameter data. If the remainder of the parameter data is required, the application client should send a new REPORT TARGET PORT GROUPS command with an ALLOCATION LENGTH field large enough to contain all the data.

Returning REPORT TARGET PORT GROUPS parameter data may require the enabling of a nonvolatile memory. If the nonvolatile memory is not ready, the device server shall return CHECK CONDITION status, rather than wait for the SCSI target device to become ready. The sense key shall be set to NOT READY and the additional sense code shall be set as described in table 164 (see 6.29).

The format for the parameter data returned by the REPORT TARGET PORT GROUPS command is shown in table 150.

Table 150 — REPORT TARGET PORT GROUPS parameter data format

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB)							
3	RETURN DATA LENGTH (n-4)							(LSB)
	Target port group descriptor(s)							
4	Target port group descriptor 0 (see table 151)							
	⋮							
n	Target port group descriptor x (see table 151)							

The RETURN DATA LENGTH field specifies the length in bytes of the list of target port groups. If the allocation length in the CDB is too small to transfer all of the descriptors, the RETURN DATA LENGTH field shall not be adjusted to reflect the truncation.

There shall be one target port group descriptor (see table 151) for each target port group.

Table 151 — Target port group descriptor parameter data

Bit Byte	7	6	5	4	3	2	1	0
0	Reserved				ASYMMETRIC ACCESS STATE			
1	Reserved							
2	(MSB) _____							
3	TARGET PORT GROUP				_____ (LSB)			
4	Reserved							
5	STATUS CODE							
6	Vendor unique							
7	TARGET PORT COUNT (x)							
	Relative target port(s)							
8	_____							
11	RELATIVE TARGET PORT 1 _____							
	⋮							
n-3	_____							
n	RELATIVE TARGET PORT x _____							

The ASYMMETRIC ACCESS STATE field (see table 152) contains the target port group's current asymmetric access state (see 5.7.4).

Table 152 — Asymmetric access state

Value	State
0h	Active/optimized
1h	Active/non-optimized
2h	Standby
3h	Unavailable
4h-Eh	Reserved
Fh	Transitioning between states

The TARGET PORT GROUP field contains an identification of the target port group described by this target port group descriptor.

The STATUS CODE field (see table 153) indicates why a target port group may be in a specific target port group asymmetric access state. It provides a mechanism to indicate error conditions.

Table 153 — STATUS CODE field

Value	Description
00h	No status available.
01h	Target port group asymmetric access state changed by SET TARGET PORT GROUPS command.
02h	Target port group asymmetric access state changed by implicit asymmetrical logical unit access behavior.
03h-FFh	Reserved

The TARGET PORT COUNT field indicates the number of target ports that are in that target port group. Every target port group shall contain at least one target port.

For each target port in the target port group one RELATIVE TARGET PORT field contains an identification of that target port using the value returned by identifier type 4h in the Device Identification VPD page (see 7.6.4). The target port descriptor shall include exactly one RELATIVE TARGET PORT field for each target port in the target port group.

6.25 REQUEST SENSE command

The REQUEST SENSE command (see table 154) requests that the device server transfer sense data to the application client.

Table 154 — REQUEST SENSE command

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE (03h)							
1	Reserved							DESC
2	Reserved							
3	Reserved							
4	ALLOCATION LENGTH							
5	CONTROL							

The DESC bit indicates which sense data format shall be returned. If DESC is set to zero, fixed format sense data (see 4.5.3) shall be returned. If DESC is set to one and descriptor format sense data (see 4.5.2) is supported, descriptor format sense data shall be returned.

The ALLOCATION LENGTH field specifies how many bytes have been allocated for the returned sense data. An allocation length that is not sufficient to contain all of the sense data shall not be considered an error. Application clients should request 252 bytes of sense data to ensure they retrieve all the sense data. If fewer than 252 bytes are requested, sense data may be lost since the REQUEST SENSE command clears the sense data.

Sense data shall be available and cleared under the conditions defined in SAM-3. If the device server has no other sense data available to return, it shall return a sense key of NO SENSE and an additional sense code of NO ADDITIONAL SENSE INFORMATION.

If the device server is in the standby power condition or idle power condition when a REQUEST SENSE command is received and there is no ACA condition, the device server shall return a sense key of NO SENSE and an additional sense code of LOW POWER CONDITION ON. On completion of the command the logical unit shall return to the same power condition that was active before the REQUEST SENSE command was received. A REQUEST SENSE command shall not reset any active power condition timers.

The device server shall return CHECK CONDITION status for a REQUEST SENSE command only to report exception conditions specific to the REQUEST SENSE command itself. For example:

- a) An invalid field value is detected in the CDB;
- b) An unrecovered error is detected by the service delivery subsystem; or
- c) A target malfunction prevents return of the sense data.

If a recovered error occurs during the processing of the REQUEST SENSE command, the device server shall return the sense data with GOOD status. If a device server returns CHECK CONDITION status for a REQUEST SENSE command, all sense data may be invalid.

NOTE 37 - The sense data appropriate to the selection of an invalid logical unit is defined in SAM-3.

Device servers shall return at least eighteen bytes of data in response to a REQUEST SENSE command if the allocation length is eighteen or greater and the DESC bit is set to zero. Application clients may determine how much sense data has been returned by examining the ALLOCATION LENGTH field in the CDB and the ADDITIONAL SENSE

LENGTH field in the sense data. Device servers shall not adjust the additional sense length to reflect truncation if the allocation length is less than the sense data available.

6.26 SEND DIAGNOSTIC command

The SEND DIAGNOSTIC command (see table 155) requests the device server to perform diagnostic operations on the target, on the logical unit, or on both. Targets that support this command shall implement, at a minimum, the default self-test feature (i.e., the SELFTEST bit equal to one and a parameter list length of zero). When the SELFTEST bit is zero and the SELF-TEST CODE field contains 000b, this command is usually followed by a RECEIVE DIAGNOSTIC RESULTS (see 6.18) command.

Table 155 — SEND DIAGNOSTIC command

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE (1Dh)							
1	SELF-TEST CODE			PF	Reserved	SELFTEST	DEVOFFL	UNITOFFL
2	Reserved							
3	(MSB) _____							
4	PARAMETER LIST LENGTH _____							
5	(LSB)							
	CONTROL							

When the SELFTEST bit is one the SELF-TEST CODE field shall contain 000b. When the SELFTEST bit is zero, the contents of SELF-TEST CODE field are specified in table 156.

Table 156 — SELF-TEST CODE field values

Value	Name	Description
000b		This value shall be used when the SELFTEST bit is set to one, or when the SELFTEST bit is set to zero and the PF bit is set to one invoking a page format SEND DIAGNOSTIC function such as enclosure services (see SES) or the Translate Address diagnostic page (see SBC).
001b	Background short self-test	The device server shall start its short self-test (see 5.4.2) in the background mode (see 5.4.3.2). The PARAMETER LIST LENGTH field shall contain zero.
010b	Background extended self-test	The device server shall start its extended self-test (see 5.4.2) in the background mode (see 5.4.3.2). The PARAMETER LIST LENGTH field shall contain zero.
011b	Reserved	
100b	Abort back-ground self-test	The device server shall abort the current self-test running in background mode. The PARAMETER LIST LENGTH field shall contain zero. This value is only valid if a previous SEND DIAGNOSTIC command specified a background self-test function and that self-test has not completed. If either of these conditions is not met, then the device server shall return a CHECK CONDITION status with a sense key of ILLEGAL REQUEST and an additional sense code of INVALID FIELD IN CDB.
101b	Foreground short self-test	The device server shall start its short self-test (see 5.4.2) in the foreground mode (see 5.4.3.1). The PARAMETER LIST LENGTH field shall contain zero.
110b	Foreground extended self-test	The device server shall start its extended self-test (see 5.4.2) in the foreground mode (see 5.4.3.1). The PARAMETER LIST LENGTH field shall contain zero.
111b	Reserved	

A page format (PF) bit of one specifies that the SEND DIAGNOSTIC parameters and any parameters returned by a following RECEIVE DIAGNOSTIC RESULTS command shall conform to the diagnostic page structure as specified in this standard. See 7.1 for the definition of diagnostic pages.

A PF bit of zero indicates that all SEND DIAGNOSTIC parameters are vendor specific. If the content of the PARAMETER LIST LENGTH field is zero and the SEND DIAGNOSTIC command will not be followed by a corresponding RECEIVE DIAGNOSTIC RESULTS command then the PF bit shall be zero. The implementation of the PF bit is optional.

A self-test (SELFTEST) bit of one directs the device server to complete the target's default self-test. If the self-test successfully passes, the command shall be terminated with GOOD status; otherwise, the command shall be terminated with a CHECK CONDITION status and the sense key shall be set to HARDWARE ERROR.

A SELFTEST bit of zero requests that the device server perform the diagnostic operation specified by the SELF-TEST CODE field or in the parameter list. The diagnostic operation might or might not require the device server to return parameter data that contains diagnostic results. If the return of parameter data is not required, the return of GOOD status indicates successful completion of the diagnostic operation. If the return of parameter data is required, the device server shall either:

- a) Perform the requested diagnostic operation, prepare the parameter data to be returned and indicate completion by returning GOOD status. The application client issues a RECEIVE DIAGNOSTIC RESULTS command to recover the parameter data; or
- b) Accept the parameter list, and if no errors are detected in the parameter list, return GOOD status. The requested diagnostic operation and the preparation of the parameter data to be returned are performed upon receipt of a RECEIVE DIAGNOSTIC RESULTS command.

A UNITOFFL bit of one grants permission to the device server to perform diagnostic operations that may affect the user accessible medium on the logical unit (e.g., write operations to the user accessible medium, or repositioning of the medium on sequential access devices). The implementation of the UNITOFFL bit is optional. A UNITOFFL bit of zero prohibits any diagnostic operations that may be detected by subsequent tasks. When the SELFTEST bit is zero, the UNITOFFL bit shall be ignored.

A DEVOFFL bit of one grants permission to the device server to perform diagnostic operations that may affect all the logical units on a target (e.g., alteration of reservations, log parameters, or sense data). The implementation of the DEVOFFL bit is optional. A DEVOFFL bit of zero prohibits diagnostic operations that may be detected by subsequent tasks. When the SELFTEST bit is zero, the DEVOFFL bit shall be ignored.

The PARAMETER LIST LENGTH field specifies the length in bytes of the parameter list that shall be transferred from the application client to the device server. A parameter list length of zero indicates that no data shall be transferred. This condition shall not be considered an error. If the specified parameter list length results in the truncation of one or more diagnostic pages (PF bit set to one) the device server shall return CHECK CONDITION status with a sense key of ILLEGAL REQUEST and an additional sense code of INVALID FIELD IN CDB.

NOTE 38 - To ensure that the diagnostic command information is not destroyed by a command sent from another initiator, either the SEND DIAGNOSTIC command should be linked to the RECEIVE DIAGNOSTIC RESULTS command or the logical unit should be reserved.

6.27 SET DEVICE IDENTIFIER command

The SET DEVICE IDENTIFIER command (see table 157) requests that the device identifier information in the logical unit be set to the value received in the SET DEVICE IDENTIFIER parameter list. As defined in the SCC-2 standard, the SET DEVICE IDENTIFIER command is the SET PERIPHERAL DEVICE/COMPONENT DEVICE IDENTIFIER service action of the MAINTENANCE OUT command. Additional MAINTENANCE IN and MAINTENANCE OUT service actions are defined in SCC-2 and in this standard.

The MAINTENANCE OUT service actions defined only in SCC-2 shall apply only to SCSI devices that return a device type of 0Ch or the sccs bit equal to one in their standard INQUIRY data. When a SCSI device returns a device type of 0Ch or the sccs bit equal to one in its standard INQUIRY data, the implementation requirements for the SCC-2 MAINTENANCE OUT service actions shall be as specified in SCC-2. Otherwise the MAINTENANCE OUT service action definitions and implementation requirements stated in this standard shall apply.

On successful completion of a SET DEVICE IDENTIFIER command that changes the device identifier saved by the device, a unit attention shall be generated for all initiators except the one that issued the service action. When reporting the unit attention condition the additional sense code shall be set to DEVICE IDENTIFIER CHANGED.

Table 157 — SET DEVICE IDENTIFIER command

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE (A4h)							
1	Reserved			SERVICE ACTION (06h)				
2	Reserved							
3	Reserved							
4	Restricted							
5								
6	(MSB)	PARAMETER LIST LENGTH						
7								
8								
9								(LSB)
10	Reserved						Restricted	Reserved
11	CONTROL							

SCC-2 defines specific usages for bytes 4 and 5, and bit 1 in byte 10, however these fields are reserved for the SET DEVICE IDENTIFIER command defined by this standard.

The PARAMETER LIST LENGTH field specifies the length in bytes of the identifier that shall be transferred from the application client to the device server. The maximum value for this field shall be 512 bytes. A parameter list length of zero indicates that no data shall be transferred, and that subsequent REPORT DEVICE IDENTIFIER commands shall return an Identifier length of zero. Logical units that implement this command shall be capable of accepting a parameter list length of 64 bytes or less. If the parameter list length exceeds 64 bytes and the logical unit is not capable of storing the requested number of bytes, then the device server shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and an additional sense code of INVALID FIELD IN CDB.

The SET DEVICE IDENTIFIER parameter list (see table 158) contains the identifier to be set by the addressed logical unit.

Table 158 — SET DEVICE IDENTIFIER parameter list

Bit Byte	7	6	5	4	3	2	1	0
0	IDENTIFIER							
n								

The IDENTIFIER field is a value selected by the application client using mechanisms outside the scope of this standard to be returned in subsequent REPORT DEVICE IDENTIFIER commands.

6.28 SET TARGET PORT GROUPS command

The SET TARGET PORT GROUPS command (see table 159) requests the device server to set the asymmetric access state of all of the target ports in the specified target port groups. See 5.7 for details regarding the transition between target port group asymmetric access states. This command is mandatory for all SCSI target devices that report in the standard INQUIRY data (see 6.4.2) that they support explicit asymmetric logical units access (i.e., the ALUA field contains either 10b or 11b).

The SET TARGET PORT GROUPS command is a service action of the MAINTENANCE OUT command. Additional MAINTENANCE OUT service actions are defined in SCC-2 and in this standard. The MAINTENANCE OUT service actions defined only in SCC-2 apply only to logical units that return a device type of 0Ch or the sccs bit equal to one in their standard INQUIRY data.

Table 159 — SET TARGET PORT GROUPS command

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE (A4h)							
1	Reserved			SERVICE ACTION (0Ah)				
2	Reserved							
3	Reserved							
4	Reserved							
5	Reserved							
6	(MSB)							
7	PARAMETER LIST LENGTH							
8								
9								
10	Reserved							
11	CONTROL							

The PARAMETER LIST LENGTH field specifies the length in bytes of the target port group management parameters that shall be transferred from the application client to the device server. A parameter list length of zero indicates that no data shall be transferred, and that no change shall be made in the asymmetric access state of any target

port groups. If the parameter list length violates the vendor specific length requirements, then the device server shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and an additional sense code of INVALID FIELD IN CDB.

The allowable values to which target port asymmetric access states may be set is vendor specific. Target port groups that are not specified in a parameter list may change asymmetric access states as a result of the SET TARGET PORT GROUPS command. This shall not be considered an implicit target port group asymmetric access state change.

If the SET TARGET PORT GROUPS attempts to establish an invalid combination of target port asymmetric access states, the device server shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and an additional sense code of INVALID FIELD IN PARAMETER LIST.

If the SET TARGET PORT GROUPS command has been performed the completion of the command depends upon which of the following conditions apply:

- a) If the transition is treated as a single indivisible event (see 5.7.5), then the SET TARGET PORT GROUPS command shall not complete until the transition to the requested state has completed; or
- b) If the transition is not treated as a single indivisible event (i.e., the device server supports other commands (see 5.7.5) when those commands are routed through a target port that is transitioning between asymmetric access states) then the SET TARGET PORT GROUPS command may complete before the transition into the requested state has completed.

If the SET TARGET PORT GROUPS command cannot be performed the completion of the command depends upon which of the following conditions apply:

- a) If the processing of a SET TARGET PORT GROUPS command requires the enabling of a nonvolatile memory and the nonvolatile memory is not ready, then the device server shall return CHECK CONDITION status, rather than wait for the logical unit to become ready. The sense key shall be set to NOT READY and the additional sense code shall be set as described in table 164 (see 6.29); or
- b) If a failure occurred before the transition was completed then the device server shall return CHECK CONDITION status. The sense key shall be set to HARDWARE ERROR and the additional sense code shall be set to SET TARGET PORT GROUPS COMMAND FAILED.

The target port group asymmetric access state change behavior if two SET TARGET PORT GROUPS commands are performed concurrently is vendor specific. A target should not process multiple SET TARGET PORT GROUPS concurrently.

The SET TARGET PORT GROUPS parameter data format is shown in table 160.

Table 160 — SET TARGET PORT GROUPS parameter list format

Bit Byte	7	6	5	4	3	2	1	0
0	Reserved							
3								
	Set target port group descriptor(s)							
4	Set target port group descriptor 0 (see table 161)							
7								
	⋮							
n-3	Set target port group descriptor x (see table 161)							
n								

The format of the set target port group descriptor is defined in table 161.

Table 161 — Set target port group descriptor parameter list

Bit Byte	7	6	5	4	3	2	1	0
0	Reserved				ASYMMETRIC ACCESS STATE			
1	Reserved							
2	(MSB) _____							
3	_____ (LSB)							

The ASYMMETRIC ACCESS STATE field (see table 162) specifies the asymmetric access state (see 5.7.4) to which all of the target ports in the specified target port group shall transition (see 5.7.5).

Table 162 — Asymmetric access state

Value	State
0h	Active/optimized
1h	Active/non-optimized
2h	Standby
3h	Unavailable
4h-Eh	Reserved
Fh	Illegal Request

The TARGET PORT GROUP field specifies a target port group for which the asymmetric access state shall be changed.

6.29 TEST UNIT READY command

The TEST UNIT READY command (see table 163) provides a means to check if the logical unit is ready. This is not a request for a self-test. If the logical unit is able to accept an appropriate medium-access command without returning CHECK CONDITION status, this command shall return a GOOD status. If the logical unit is unable to become operational or is in a state such that an application client action (e.g., START UNIT command) is required to make the unit ready, the device server shall return CHECK CONDITION status with a sense key of NOT READY.

Table 163 — TEST UNIT READY command

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE (00h)							
1	Reserved							
2	Reserved							
3	Reserved							
4	Reserved							
5	CONTROL							

Logical units shall return GOOD status if a reservation conflict is detected.

NOTE 39 - Logical units complying with previous versions of this standard (i.e., SPC-2) may return RESERVATION CONFLICT rather than GOOD status if a reservation conflict is detected.

Table 164 defines the suggested GOOD and CHECK CONDITION status responses to the TEST UNIT READY command. Other conditions, including deferred errors, may result in other responses (e.g., BUSY or RESERVATION CONFLICT status).

Table 164 — Preferred TEST UNIT READY responses

Status	Sense Key	Additional Sense Code
GOOD	NO SENSE	NO ADDITIONAL SENSE INFORMATION or other valid additional sense code.
CHECK CONDITION	ILLEGAL REQUEST	LOGICAL UNIT NOT SUPPORTED
CHECK CONDITION	NOT READY	LOGICAL UNIT DOES NOT RESPOND TO SELECTION
CHECK CONDITION	NOT READY	MEDIUM NOT PRESENT
CHECK CONDITION	NOT READY	LOGICAL UNIT NOT READY, CAUSE NOT REPORTABLE
CHECK CONDITION	NOT READY	LOGICAL UNIT IS IN PROCESS OF BECOMING READY
CHECK CONDITION	NOT READY	LOGICAL UNIT NOT READY, INITIALIZING COMMAND REQUIRED
CHECK CONDITION	NOT READY	LOGICAL UNIT NOT READY, MANUAL INTERVENTION REQUIRED
CHECK CONDITION	NOT READY	LOGICAL UNIT NOT READY, FORMAT IN PROGRESS

6.30 WRITE ATTRIBUTE command

The WRITE ATTRIBUTE command (see table 165) allows an application client to write attributes to medium auxiliary memory. Device servers that implement the WRITE ATTRIBUTE command shall also implement the READ ATTRIBUTE command (see 6.14). Application clients should issue READ ATTRIBUTE commands prior to using this command to discover device server support for medium auxiliary memory.

Table 165 — WRITE ATTRIBUTE command

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE (8Dh)							
1	Reserved							
2								
3	Restricted (see SMC-2)							
4								
5	VOLUME NUMBER							
6	Reserved							
7	PARTITION NUMBER							
8	Reserved							
9	Reserved							
10	(MSB)							
11								
12	PARAMETER LIST LENGTH							
13							(LSB)	
14	Reserved							
15	CONTROL							

The VOLUME NUMBER field specifies a volume (see SSC-2) within the medium auxiliary memory. The number of volumes of the medium auxiliary memory shall equal that of the attached medium. If the medium only has a single volume, then its volume number shall be zero.

The PARTITION NUMBER field specifies a partition (see SSC-2) within a volume. The number of partitions of the medium auxiliary memory shall equal that of the attached medium. If the medium only has a single partition, then its partition number shall be zero.

If the combination of volume number and partition number is not valid, the command shall be terminated with a CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to INVALID FIELD IN CDB.

The PARAMETER LIST LENGTH field specifies the length in bytes of the parameter list contained in the Data-Out Buffer. A parameter list length of zero indicates that no parameter data is present, this shall not be considered an error. If the parameter list length results in the truncation of an attribute, the WRITE ATTRIBUTE command shall be terminated with a CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to PARAMETER LIST LENGTH ERROR.

The parameter list shall have the format shown in table 166. Attributes should be sent in ascending numerical order. If the attributes are not in order, no attributes shall be changed and the WRITE ATTRIBUTE command shall be terminated with a CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to INVALID FIELD IN PARAMETER LIST.

Table 166 — WRITE ATTRIBUTE parameter list format

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB)							
3	PARAMETER DATA LENGTH (n-3) (LSB)							
	Attribute(s)							
4	Attribute 0 (see 7.3.1)							
	⋮							
n	Attribute x (see 7.3.1)							

The PARAMETER DATA LENGTH field should contain the number of bytes of attribute data and should be ignored by the device server.

The format of the attributes is described in 7.3.1.

If there is not enough space to write the attributes to the medium auxiliary memory, no attributes shall be changed and the WRITE ATTRIBUTE command shall be terminated with a CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to AUXILIARY MEMORY OUT OF SPACE.

If the medium auxiliary memory is not accessible because there is no medium present, no attributes shall be changed and the WRITE ATTRIBUTE command shall be terminated with a CHECK CONDITION status. The sense key shall be set to NOT READY and the additional sense code shall be set to MEDIUM NOT PRESENT.

If the medium is present but the medium auxiliary memory is not accessible, no attributes shall be changed and the WRITE ATTRIBUTE command shall be terminated with a CHECK CONDITION status. The sense key shall be set to MEDIUM ERROR and the additional sense code shall be set to LOGICAL UNIT NOT READY, AUXILIARY MEMORY NOT ACCESSIBLE.

If the medium auxiliary memory is not operational (e.g., bad checksum), the WRITE ATTRIBUTE command shall be terminated with a CHECK CONDITION status. The sense key shall be set to MEDIUM ERROR and the additional sense code shall be set to AUXILIARY MEMORY WRITE ERROR.

If the WRITE ATTRIBUTE command parameter data contains an attribute with an ATTRIBUTE LENGTH field (see 7.3.1) set to zero, then one of the following actions shall occur:

- a) If the attribute state is unsupported or read only (see 5.10), no attributes shall be changed and the WRITE ATTRIBUTE command shall be terminated with a CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to INVALID FIELD IN PARAMETER LIST;

- b) If the attribute state is read/write, the attribute shall be changed to the nonexistent state. This attribute shall not be returned in response to a READ ATTRIBUTE command and not be reported by the READ ATTRIBUTE command with ATTRIBUTE LIST service action; or
- c) If the attribute state is nonexistent, the attribute in the WRITE ATTRIBUTE command parameter list shall be ignored, this shall not be considered an error.

No attributes shall be changed, the WRITE ATTRIBUTE command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST, and the additional sense code shall be set to INVALID FIELD IN PARAMETER LIST if the parameter data contains any of the following:

- a) An attempt to change an attribute in the read only state (see 5.10);
- b) An attribute with incorrect ATTRIBUTE LENGTH field (see 7.3.1) contents; or
- c) An attribute with unsupported ATTRIBUTE VALUE field (see 7.3.1) contents.

6.31 WRITE BUFFER command

6.31.1 WRITE BUFFER command introduction

The WRITE BUFFER command (see table 167) is used in conjunction with the READ BUFFER command as a diagnostic function for testing logical unit memory in the target SCSI device and the integrity of the service delivery subsystem. Additional modes are provided for downloading microcode and for downloading and saving microcode.

Table 167 — WRITE BUFFER command

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE (3Bh)							
1	Reserved			MODE				
2	BUFFER ID							
3	(MSB) _____ BUFFER OFFSET _____ (LSB)							
4								
5								
6	(MSB) _____ PARAMETER LIST LENGTH _____ (LSB)							
7								
8								
9	CONTROL							

This command shall not alter any medium of the logical unit when the data mode or the combined header and data mode is specified.

The function of this command and the meaning of fields within the CDB depend on the contents of the MODE field. The MODE field is defined in table 77.

Table 168 — WRITE BUFFER MODE field

MODE	Description	Implementation requirements
00h	Write combined header and data	Optional
01h	Vendor specific	Vendor specific
02h	Write data	Optional
04h	Download microcode	Optional
05h	Download microcode and save	Optional
06h	Download microcode with offsets	Optional
07h	Download microcode with offsets and save	Optional
0Ah	Echo buffer	Optional
1Ah	Enable expander communications protocol and Echo buffer	Optional
1Bh	Disable expander communications protocol	Optional
03h	Reserved	
08h - 09h	Reserved	
0Bh - 19h	Reserved	
1Ch - 1Fh	Reserved	

NOTES

40 Modes 00h and 001h are not recommended.

41 When downloading microcode with buffer offsets, the WRITE BUFFER command mode should be 06h or 07h.

6.31.2 Combined header and data mode (00h)

In this mode, data to be transferred is preceded by a four-byte header. The four-byte header consists of all reserved bytes. The BUFFER ID and the BUFFER OFFSET fields shall be zero. The PARAMETER LIST LENGTH field specifies the maximum number of bytes that shall be transferred from the Data-Out Buffer. This number includes four bytes of header, so the data length to be stored in the device server's buffer is parameter list length minus four. The application client should attempt to ensure that the parameter list length is not greater than four plus the BUFFER CAPACITY field value (see 6.15.2) that is returned in the header of the READ BUFFER command (mode 0h). If the parameter list length exceeds the buffer capacity the device server shall return CHECK CONDITION status and shall set the sense key to ILLEGAL REQUEST.

6.31.3 Vendor specific mode (01h)

In this mode, the meaning of the BUFFER ID, BUFFER OFFSET, and PARAMETER LIST LENGTH fields are not specified by this standard.

6.31.4 Data mode (02h)

In this mode, the Data-Out Buffer contains buffer data destined for the logical unit. The BUFFER ID field identifies a specific buffer within the logical unit. The vendor assigns buffer ID codes to buffers within the logical unit. Buffer ID zero shall be supported. If more than one buffer is supported, additional buffer ID codes shall be assigned contiguously, beginning with one. If an unsupported buffer ID code is selected, the device server shall return CHECK CONDITION status and shall set the sense key to ILLEGAL REQUEST with an additional sense code of INVALID FIELD IN CDB.

Data are written to the logical unit buffer starting at the location specified by the BUFFER OFFSET field. The application client should conform to the offset boundary requirements returned in the READ BUFFER descriptor. If the device server is unable to accept the specified buffer offset, it shall return CHECK CONDITION status and it shall set the sense key to ILLEGAL REQUEST with an additional sense code of INVALID FIELD IN CDB.

The PARAMETER LIST LENGTH field specifies the maximum number of bytes that shall be transferred from the Data-Out Buffer to be stored in the specified buffer beginning at the buffer offset. The application client should attempt to ensure that the parameter list length plus the buffer offset does not exceed the capacity of the specified buffer. The capacity of the buffer may be determined by the BUFFER CAPACITY field in the READ BUFFER descriptor. If the BUFFER OFFSET and PARAMETER LIST LENGTH fields specify a transfer in excess of the buffer capacity, the device server shall return CHECK CONDITION status and shall set the sense key to ILLEGAL REQUEST with an additional sense code of INVALID FIELD IN CDB.

6.31.5 Download microcode mode (04h)

If the logical unit is unable to accept this command because of some device condition, the device server shall terminate each WRITE BUFFER command with this mode (04h) with a CHECK CONDITION status, a sense key of ILLEGAL REQUEST, and shall set the additional sense code to COMMAND SEQUENCE ERROR.

In this mode, vendor specific microcode or control information shall be transferred to the control memory space of the logical unit. After a hard reset, the device operation shall revert to a vendor specific condition. The meanings of the BUFFER ID, BUFFER OFFSET, and PARAMETER LIST LENGTH fields are not specified by this standard and are not required to be zero-filled. When the microcode download has completed successfully the device server shall generate a unit attention condition for all initiators except the one that issued the WRITE BUFFER command (see SAM-2). The additional sense code shall be set to MICROCODE HAS BEEN CHANGED.

6.31.6 Download microcode and save mode (05h)

If the logical unit is unable to accept this command because of some device condition, the device server shall terminate each WRITE BUFFER command with this mode (05h) with a CHECK CONDITION status, a sense key of ILLEGAL REQUEST, and shall set the additional sense code to COMMAND SEQUENCE ERROR.

In this mode, vendor specific microcode or control information shall be transferred to the logical unit and, if the WRITE BUFFER command is completed successfully, also shall be saved in a nonvolatile memory space (semiconductor, disk, or other). The downloaded code shall then be effective after each hard reset until it is supplanted in another download microcode and save operation or download microcode with offsets and save operation. The meanings of the BUFFER ID, BUFFER OFFSET, and PARAMETER LIST LENGTH fields are not specified by this standard and are not required to be zero-filled. When the download microcode and save command has completed successfully the device server shall generate a unit attention condition (see SAM-2) for all initiators except the one that issued the WRITE BUFFER command. When reporting the unit attention condition, the device server shall set the additional sense code to MICROCODE HAS BEEN CHANGED.

6.31.7 Download microcode with offsets (06h)

In this mode, the application client may split the transfer of the vendor specific microcode or control information over two or more WRITE BUFFER commands. If the logical unit is unable to accept this command because of some device condition, the device server shall terminate each WRITE BUFFER command with this mode (06h) with a CHECK CONDITION status, a sense key of ILLEGAL REQUEST, and shall set the additional sense code to COMMAND SEQUENCE ERROR.

If the last WRITE BUFFER command of a set of one or more commands completes successfully, the microcode or control information shall be transferred to the control memory space of the logical unit. After a hard reset, the device shall revert to a vendor specific condition. In this mode, the Data-Out Buffer contains vendor specific, self-describing microcode or control information.

Since the downloaded microcode or control information may be sent using several commands, when the logical unit detects the last download microcode with offsets and save mode WRITE BUFFER command has been received, the device server shall perform any logical unit required verification of the complete set of downloaded microcode or control information prior to returning GOOD status for the last command. After the last command completes successfully the device server shall generate a unit attention condition (see SAM-2) for all initiators except the one that issued the set of WRITE BUFFER commands. When reporting the unit attention condition, the device server shall set the additional sense code to MICROCODE HAS BEEN CHANGED.

If the complete set of WRITE BUFFER commands required to effect a microcode or control information change (one or more commands) are not received before a logical unit reset or I_T nexus loss occurs, the change shall not be effective and the new microcode or control information shall be discarded.

The BUFFER ID field identifies a specific buffer within the logical unit. The vendor assigns buffer ID codes to buffers within the logical unit. A buffer ID value of zero shall be supported. If more than one buffer is supported, additional buffer ID codes shall be assigned contiguously, beginning with one. If an unsupported buffer ID code is identified, the device server shall return CHECK CONDITION status and shall set the sense key to ILLEGAL REQUEST with an additional sense code of INVALID FIELD IN CDB.

The microcode or control information are written to the logical unit buffer starting at the location specified by the BUFFER OFFSET field. The application client shall send commands that conform to the offset boundary requirements (see 6.15.5). If the device server is unable to accept the specified buffer offset, it shall return CHECK CONDITION status and it shall set the sense key to ILLEGAL REQUEST with an additional sense code of INVALID FIELD IN CDB.

The PARAMETER LIST LENGTH field specifies the maximum number of bytes that shall be present in the Data-Out Buffer to be stored in the specified buffer beginning at the buffer offset. The application client should attempt to ensure that the parameter list length plus the buffer offset does not exceed the capacity of the specified buffer. The capacity of the buffer may be determined by the BUFFER CAPACITY field in the READ BUFFER descriptor. If the BUFFER OFFSET and PARAMETER LIST LENGTH fields specify a transfer in excess of the buffer capacity, the device server shall return CHECK CONDITION status and shall set the sense key to ILLEGAL REQUEST with an additional sense code of INVALID FIELD IN CDB.

6.31.8 Download microcode with offsets and save mode (07h)

In this mode, the initiator may split the transfer of the vendor specific microcode or control information over two or more WRITE BUFFER commands. If the logical unit is unable to accept this command because of some device condition, the device server shall terminate each mode 07h WRITE BUFFER command with a CHECK CONDITION status, a sense key of ILLEGAL REQUEST, and shall set the additional sense code to COMMAND SEQUENCE ERROR.

If the last WRITE BUFFER command of a set of one or more commands completes successfully, the microcode or control information shall be saved in a nonvolatile memory space (e.g., semiconductor, disk, or other). The saved downloaded microcode or control information shall then be effective after each hard reset until it is supplanted by another download microcode with save operation or download microcode with offsets and save operation. In this mode, the Data-Out Buffer contains vendor specific, self-describing microcode or control information.

Since the downloaded microcode or control information may be sent using several commands, when the logical unit detects the last download microcode with offsets and save mode WRITE BUFFER command has been received, the device server shall perform any logical unit required verification of the complete set of downloaded microcode or control information prior to returning GOOD status for the last command. After the last command completes successfully the device server shall generate a unit attention condition (see SAM-2) for all initiators except the one that issued the set of WRITE BUFFER commands. When reporting the unit attention condition, the device server shall set the additional sense code to MICROCODE HAS BEEN CHANGED.

If the complete set of WRITE BUFFER commands required to effect a microcode or control information change (one or more commands) are not received before a logical unit reset or I_T nexus loss occurs, the change shall not be effective and the new microcode or control information shall be discarded.

The BUFFER ID field identifies a specific buffer within the logical unit. The vendor assigns buffer ID codes to buffers within the logical unit. A buffer ID value of zero shall be supported. If more than one buffer is supported, additional buffer ID codes shall be assigned contiguously, beginning with one. If an unsupported buffer ID code is identified, the device server shall return CHECK CONDITION status and shall set the sense key to ILLEGAL REQUEST with an additional sense code of INVALID FIELD IN CDB.

The microcode or control information are written to the logical unit buffer starting at the location specified by the BUFFER OFFSET field. The application client shall conform to the offset boundary requirements. If the device server is unable to accept the specified buffer offset, it shall return CHECK CONDITION status and it shall set the sense key to ILLEGAL REQUEST with an additional sense code of INVALID FIELD IN CDB.

The PARAMETER LIST LENGTH field specifies the maximum number of bytes that shall be present in the Data-Out Buffer to be stored in the specified buffer beginning at the buffer offset. The application client should attempt to ensure that the parameter list length plus the buffer offset does not exceed the capacity of the specified buffer. The capacity of the buffer may be determined by the BUFFER CAPACITY field in the READ BUFFER descriptor. If the BUFFER OFFSET and PARAMETER LIST LENGTH fields specify a transfer in excess of the buffer capacity, the device server shall return CHECK CONDITION status and shall set the sense key to ILLEGAL REQUEST with an additional sense code of INVALID FIELD IN CDB.

6.31.9 Write data to echo buffer (0Ah)

In this mode the device server transfers data from the application client and stores it in an echo buffer. An echo buffer is assigned in the same manner by the target as it would for a write operation. Data shall be sent aligned on four-byte boundaries. The BUFFER ID and BUFFER OFFSET fields are ignored in this mode.

NOTE 42 - It is recommended that the target assign echo buffers on a per initiator basis to limit the number of exception conditions that may occur in a multi-initiator environment.

Upon successful completion of a WRITE BUFFER command the data shall be preserved in the echo buffer unless there is an intervening command to any logical unit in which case it may be changed.

The PARAMETER LIST LENGTH field specifies the maximum number of bytes that shall be transferred from the Data-Out Buffer to be stored in the echo buffer. The application client should attempt to ensure that the parameter list length does not exceed the capacity of the echo buffer. The capacity of the echo buffer may be determined by the BUFFER CAPACITY field in the READ BUFFER echo buffer descriptor. If the PARAMETER LIST LENGTH field specifies a transfer in excess of the buffer capacity, the device server shall return CHECK CONDITION status and shall set the sense key to ILLEGAL REQUEST with an additional sense code of INVALID FIELD IN CDB.

6.31.10 Enable expander communications protocol and Echo buffer (1Ah)

Receipt of a WRITE BUFFER command with this mode (1Ah) causes a communicative expander (see SPI-4) to enter the expanded communications protocol mode. Device servers in SCSI target devices that receive a WRITE BUFFER command with this mode shall process it as if it were a WRITE BUFFER command with mode 0Ah (see 6.31.9).

6.31.11 Disable expander communications protocol (1Bh)

Receipt of a WRITE BUFFER command with this mode (1Bh) causes a communicative expander (see SPI-4) to exit the expanded communications protocol mode and return to simple expander operation. Device servers in SCSI target devices that receive a WRITE BUFFER command with this mode shall terminate the command with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to INVALID FIELD IN CDB.

7 Parameters for all device types

7.1 Diagnostic parameters

7.1.1 Diagnostic page format and page codes for all device types

This subclause describes the diagnostic page structure and the diagnostic pages that are applicable to all SCSI devices. Diagnostic pages specific to each device type are described in the command standard (see 3.1.17) that applies to that device type.

A SEND DIAGNOSTIC command with a PF bit of one specifies that the SEND DIAGNOSTIC parameter list consists of zero or more diagnostic pages and that the data returned by the subsequent RECEIVE DIAGNOSTIC RESULTS command shall use the diagnostic page format defined in table 169. A RECEIVE DIAGNOSTIC RESULTS command with a PCV bit of one specifies that the device server return a diagnostic page using the format defined in table 169.

Table 169 — Diagnostic page format

Bit Byte	7	6	5	4	3	2	1	0
0	PAGE CODE							
1	Reserved							
2	(MSB)							
3	PAGE LENGTH (n-3)							
4	(LSB)							
n	Diagnostic parameters							

Each diagnostic page defines a function or operation that the device server shall perform as a result of a SEND DIAGNOSTIC command or the information being returned as a result of a RECEIVE DIAGNOSTIC RESULTS with the PCV bit equal to one. The diagnostic page contains a page header followed by the data that is formatted according to the page code specified.

Device servers that implement diagnostic pages are only required to accept a single diagnostic page per command.

The PAGE CODE field identifies which diagnostic page is being sent as a result of a SEND DIAGNOSTIC command, requested as a result of a RECEIVE DIAGNOSTIC RESULTS command with the PCV bit equal to one, or returned as a result of a RECEIVE DIAGNOSTIC RESULTS parameter data. The page codes are defined in table 170.

Table 170 — Diagnostic page codes

Page Code	Diagnostic Page Name	Reference
00h	Supported Diagnostic Pages	7.1.2
01h	Configuration	SES
02h	Enclosure Status/Control	SES
03h	Help Text	SES
04h	String In/Out	SES
05h	Threshold In/Out	SES
06h	Array Status/Control	SES
07h	Element Descriptor	SES
08h	Short Enclosure Status	SES
09h	Enclosure Busy	SES-2
0Ah	Device Element Status	SES-2
0Bh - 1Fh	Reserved for SES	SES-2
20h - 3Fh	Pages that apply to all device types	
40h - 7Fh	See specific device type for definition	
80h - FFh	Vendor specific	

The PAGE LENGTH field specifies the length in bytes of the diagnostic parameters that follow this field. If the application client sends a page length that results in the truncation of any parameter, the device server shall terminate the command with CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST with the additional sense code set to INVALID FIELD IN PARAMETER LIST.

The diagnostic parameters are defined for each diagnostic page code. The diagnostic parameters within a diagnostic page may be defined differently in a SEND DIAGNOSTIC command than in a RECEIVE DIAGNOSTIC RESULTS command.

7.1.2 Supported diagnostic pages

The Supported Diagnostic Pages diagnostic page (see table 171) returns the list of diagnostic pages implemented by the device server. This diagnostic page shall be implemented if the device server implements the diagnostic page format option of the SEND DIAGNOSTIC and RECEIVE DIAGNOSTIC RESULTS commands.

Table 171 — Supported diagnostic pages

Bit Byte	7	6	5	4	3	2	1	0
0	PAGE CODE (00h)							
1	Reserved							
2	(MSB)							
3	PAGE LENGTH (n-3)							(LSB)
4								
n	SUPPORTED PAGE LIST							

The definition of this diagnostic page for the SEND DIAGNOSTIC command includes only the first four bytes. If the PAGE LENGTH field is not zero, the device server shall terminate the SEND DIAGNOSTIC command with CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST with an additional sense code of INVALID FIELD IN PARAMETER LIST. This diagnostic page instructs the device server to make available the list of all supported diagnostic pages to be returned by a subsequent RECEIVE DIAGNOSTIC RESULTS command.

The definition of this diagnostic page for the RECEIVE DIAGNOSTIC RESULTS command includes the list of diagnostic pages supported by the device server.

The PAGE LENGTH field specifies the length in bytes of the following supported page list.

The SUPPORTED PAGE LIST field shall contain a list of all diagnostic page codes implemented by the device server in ascending order beginning with page code 00h.

7.2 Log parameters

7.2.1 Log page structure and page codes for all device types

This subclause describes the log page structure and the log pages that are applicable to all SCSI devices. Log pages specific to each device type are described in the command standard (see 3.1.17) that applies to that device type. The LOG SELECT command (see 6.5) supports the ability to send zero or more log pages. The LOG SENSE command (see 6.6) returns a single log page specified in the PAGE CODE field of the CDB.

Each log page begins with a four-byte page header followed by zero or more variable-length log parameters defined for that log page. The log page format is defined in table 172.

Table 172 — Log page format

Bit Byte	7	6	5	4	3	2	1	0
0	PAGE CODE							
1	Reserved							
2	(MSB)							
3	PAGE LENGTH (n-3)							(LSB)
	Log parameter(s)							
4	Log parameter (First)							
x+3	(Length x)							
	.							
	.							
n-y+1	Log parameter (Last)							
n	(Length y)							

The PAGE CODE field identifies which log page is being transferred.

The PAGE LENGTH field specifies the length in bytes of the following log parameters. If the application client sends a log page length that results in the truncation of any parameter, the device server shall terminate the command with CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST with the additional sense code set to INVALID FIELD IN PARAMETER LIST.

Most log pages contain one or more special data structures called log parameters (see table 173). Log parameters may be data counters of a particular event(s), the conditions under which certain operations were performed, or list parameters that contain a character string description of a particular event.

Table 173 — Log parameter

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB) _____							
1	PARAMETER CODE (LSB)							
2	DU	DS	TSD	ETC	TMC		LBIN	LP
3	PARAMETER LENGTH (n-3)							
4	_____							
n	PARAMETER VALUE _____							

Each log parameter begins with a four-byte parameter header followed by one or more bytes of PARAMETER VALUE data.

The PARAMETER CODE field identifies the log parameter being transferred for that log page.

The DU, DS, TSD, ETC, TMC, LBIN, and LP fields are collectively referred to as the PARAMETER CONTROL byte. These fields are described below in this subclause.

For cumulative log parameter values, indicated by the PC field of the LOG SELECT and LOG SENSE commands, the disable update (DU) bit is defined as follows:

- a) A zero value indicates that the device server shall update the log parameter value to reflect all events that should be noted by that parameter; or
- b) A one value indicates that the device server shall not update the log parameter value except in response to a LOG SELECT command that specifies a new value for the parameter.

NOTE 43 - When updating cumulative log parameter values, a device server may use volatile memory to hold these values until a LOG SELECT or LOG SENSE command is received with an SP bit of one or a target-defined event occurs. As a result the updated cumulative log parameter values may be lost if a power cycle occurs.

The DU bit is not defined for threshold values, indicated by the PC field of the LOG SENSE command, nor for list parameters as indicated by the LP bit. The device server shall ignore the value of the DU bit in any log parameters received with a LOG SELECT command.

A disable save (DS) bit of zero indicates that the target supports saving for that log parameter. The device server shall save the current cumulative or the current threshold parameter value, depending on the value in the PC field of the CDB, in response to a LOG SELECT or LOG SENSE command with an SP bit of one. A DS bit of one indicates that the target does not support saving that log parameter in response to a LOG SELECT or LOG SENSE command with an SP bit of one.

A target save disable (TSD) bit of zero indicates that the target provides a target-defined method for saving log parameters. This implicit saving operation shall be done frequently enough to insure that the cumulative parameter values retain statistical significance (i.e., across power cycles). A TSD bit of one indicates that either the target does not provide a target-defined method for saving log parameters or the target-defined method has been disabled individually by an application client setting the TSD bit to one. An application client may disable the target-defined

method for saving all log parameters without changing any TSD bits. See the GLTSD bit in the Control mode page (see 7.4.6).

An enable threshold comparison (ETC) bit of one indicates that a comparison to the threshold value is performed whenever the cumulative value is updated. An ETC bit of zero indicates that a comparison is not performed. The value of the ETC bit is the same for cumulative and threshold parameters.

The threshold met criteria (TMC) field (see table 174) defines the basis for comparison of the cumulative and threshold values. The TMC field is valid only if the ETC bit is one. The value of the TMC field is the same for cumulative and threshold parameters.

Table 174 — Threshold met criteria

Code	Basis for comparison
00b	Every update of the cumulative value
01b	Cumulative value equal threshold value
10b	Cumulative value not equal threshold value
11b	Cumulative value greater than threshold value

If the ETC bit is one and the result of the comparison is true, a unit attention condition shall be generated for all initiators. When reporting the unit attention condition, the device server shall set the sense key to UNIT ATTENTION and set the additional sense code to THRESHOLD CONDITION MET.

The LBIN bit is only valid if the LP bit is set to one. If the LP bit is one and the LBIN bit is zero then the list parameter is ASCII data (see 4.4.1). If the LP bit is one and the LBIN bit is one then the list parameter is a list of binary information.

The list parameter (LP) bit indicates the format of the log parameter. If an application client attempts to set the value of the LP bit to a value other than the one returned for the same parameter in the LOG SENSE command, the device server shall terminate the command with CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST with the additional sense code set to INVALID FIELD IN PARAMETER LIST.

An LP bit of zero indicates that the parameter is a data counter. Data counters are associated with one or more events; the data counter is updated whenever one of these events occurs by incrementing the counter value. If each data counter has associated with it a target-defined maximum value. Upon reaching this maximum value, the data counter shall not be incremented (i.e., it does not wrap). When a data counter reaches its maximum value, the device server shall set the associated DU bit to one. If the data counter is at or reaches its maximum value during the execution of a command, the device server shall complete the command. If the command completes correctly, except for the data counter being at its maximum value, and if the RLEC bit of the Control mode page (see 7.4.6) is set to one; then the device server shall terminate the command with CHECK CONDITION status and set the sense key to RECOVERED ERROR with the additional sense code set to LOG COUNTER AT MAXIMUM.

An LP bit of one indicates that the parameter is a list parameter. List parameters are not counters and thus the ETC and TMC fields shall be set to zero.

If more than one list parameter is defined in a single log page, the following rules apply to assigning parameter codes:

- a) The parameter updated last shall have a higher parameter code than the previous parameter, except as defined in rule b); and
- b) When the maximum parameter code value supported by the target is reached, the device server shall assign the lowest parameter code value to the next log parameter (i.e., wrap-around parameter codes). If the associated command completes correctly, except for the parameter code being at its maximum value,

and if the RLEC bit of the Control mode page (see 7.4.6) is set to one; then the device server shall terminate the command with CHECK CONDITION status and set the sense key to RECOVERED ERROR with the additional sense code set to LOG LIST CODES EXHAUSTED.

NOTE 44 - List parameters may be used to store the locations of defective blocks in the following manner. When a defective block is identified, a list parameter is updated to reflect the location and cause of the defect. When the next defect is encountered, the list parameter with the next higher parameter code is updated to record this defect. The size of the log page may be made vendor specific to accommodate memory limitations. It is recommended that one or more data counter parameters be defined for the log page to keep track of the number of valid list parameters and the parameter code of the parameter with the oldest recorded defect. This technique may be adapted to record other types of information.

The PARAMETER LENGTH field specifies the length in bytes of the following parameter value. If the application client sends a parameter length value that results in the truncation of the parameter value, the device server shall terminate the command with CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST with the additional sense code set to INVALID FIELD IN PARAMETER LIST.

If the application client sends a log parameter value that is outside the range supported by the target, and rounding is implemented for that parameter, the device server may either:

- a) Round to an acceptable value and terminate the command as described in 5.3; or
- b) Terminate the command with CHECK CONDITION status and set the sense key to ILLEGAL REQUEST with the additional sense code set to INVALID FIELD IN PARAMETER LIST.

When any counter in a log page reaches its maximum value, incrementing of all counters in that log page shall cease until reinitialized by the application client via a LOG SELECT command. If the RLEC bit of the Control mode page is one, then the device server shall report the exception condition.

The page code assignments for the log pages are listed in table 175.

Table 175 — Log page codes

Page Code	Log Page Name	Reference
0Fh	Application Client	7.2.2
01h	Buffer Over-Run/Under-Run	7.2.3
2Fh	Informational Exceptions	7.2.5
0Bh	Last <i>n</i> Deferred Errors or Asynchronous Events	7.2.6
07h	Last <i>n</i> Error Events	7.2.7
06h	Non-Medium Error	7.2.8
18h	Protocol Specific Port	7.2.9
03h	Read Error Counter	7.2.4
04h	Read Reverse Error Counter	7.2.4
10h	Self-Test Results	7.2.10
0Eh	Start-Stop Cycle Counter	7.2.11
00h	Supported Log Pages	7.2.12
0Dh	Temperature	7.2.13
05h	Verify Error Counter	7.2.4
02h	Write Error Counter	7.2.4
08h - 0Ah	Reserved (may be used by specific device types)	
0Ch	Reserved (may be used by specific device types)	
11h - 17h	Reserved (may be used by specific device types)	
19h - 2Fh	Reserved (may be used by specific device types)	
3Fh	Reserved	
30h - 3Eh	Vendor specific	

7.2.2 Application Client log page

The Application Client log page (see table 176) provides a place for application clients to store information. The page code for the application client page is 0Fh.

Table 176 — Application client log page

Bit Byte	7	6	5	4	3	2	1	0
0	PAGE CODE (0Fh)							
1	Reserved							
2	(MSB)	PAGE LENGTH (n-3)						
3								(LSB)
	Application client log parameters							
4	First application client log parameter							
	⋮							
	Last application client log parameter							
n								

The PAGE CODE and PAGE LENGTH fields are described in 7.2.1.

Parameter codes 0000h through 0FFFh are for general usage application client data. The intended use for this information is to aid in describing the system configuration and system problems, but the exact definition of the data is application client specific. The general usage application client data parameters all have the format shown in table 177.

Table 177 — General usage application client parameter data

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB) _____							
1	PARAMETER CODE _____ (LSB)							
2	DU	DS	TSD	ETC	TMC		LBIN	LP
3	PARAMETER LENGTH (FCh)							
4								
255	GENERAL USAGE PARAMETER BYTES _____							

For general usage application client data, the value in the PARAMETER CODE field shall be between 0000h and 0FFFh. The first supported general usage application client parameter code shall be 0000h and additional supported parameters shall be sequentially numbered. If any general usage parameter codes are implemented, the device shall support at least 64 general usage parameter descriptors and they shall be parameter codes 0000h through 003Fh.

For the general usage application client parameter, the PARAMETER LENGTH value for each parameter shall be FCh.

The state of the log parameter control bits for parameters 0000h through 0FFFh is specified in table 178.

Table 178 — Parameter control bits for general usage parameters (0000h through 0FFFh)

Bit	Value	Description
DU	1	Value provided by application client
DS	0	Device server supports saving of parameter
TSD	0	Device server manages saving of parameter
ETC	0	No threshold comparison is made on this value
TMC	xx	Ignored when ETC is 0
LBIN	1	The parameter is in binary format
LP	1	The parameter is a list parameter

The values stored in the GENERAL USAGE PARAMETER BYTES represent data sent to the device server in a previous LOG SELECT command. If a previous LOG SELECT command has not occurred, the data is vendor specific.

In the application client log page, parameter codes 1000h through FFFFh are reserved.

7.2.3 Buffer Over-Run/Under-Run log page

The Buffer Over-Run/Under-Run log page (page code 01h) defines 24 data counters that may be used to record the number of buffer over-runs or under-runs for the logical unit. A target that implements this log page may implement one or more of the defined data counters.

A buffer over-run or under-run may occur when an initiator does not transmit data to or from the target's buffer fast enough to keep up with reading or writing the media. The cause of this problem is protocol specific. A buffer over-run condition may occur during a read operation when a buffer full condition prevents continued transfer of data from the media to the buffer. A buffer under-run condition may occur during a write operation when a buffer empty condition prevents continued transfer of data to the media from the buffer. Most devices incur a delay at this point while the media is repositioned.

Table 179 defines the PARAMETER CODE field for the buffer over-run/under-run counters.

Table 179 — Parameter code field for buffer over-run/under-run counters

Bit Byte	7	6	5	4	3	2	1	0
0	Reserved							
1	COUNT BASIS			CAUSE				TYPE

The PARAMETER CODE field for buffer over-run/under-run counters is a 16-bit value comprised of eight reserved bits, a three-bit COUNT BASIS field (see table 180), a four-bit CAUSE field (see table 181), and a one-bit TYPE field. These are concatenated to determine the value of the parameter code for that log parameter. For example, a counter for parameter code value of 0023h specifies a count basis of 001b; a cause of 0001b; and a type of 1b; this counter is incremented once per command that experiences an over-run due to the SCSI bus being busy.

The COUNT BASIS field defines the criteria for incrementing the counter. The criteria are defined in table 180.

Table 180 — Count basis definition

Count basis	Description
000b	Undefined
001b	Per command
010b	Per failed reconnect
011b	Per unit of time
100b - 111b	Reserved

NOTE 45 - The per unit of time count basis is device type specific. Direct-access devices typically use a latency period (i.e., one revolution of the medium) as the unit of time.

The CAUSE field indicates the reason that the over-run or under-run occurred. The following causes are defined in table 181.

Table 181 — CAUSE field definition

Cause	Description
0h	Undefined
1h	Bus busy
2h	Transfer rate too slow
3h - Fh	Reserved

The TYPE field indicates whether the counter records under-runs or over-runs. A value of zero specifies a buffer under-run condition and a value of one specifies a buffer over-run condition.

The counters contain the total number of times buffer over-run or under-run conditions have occurred since the last time the counter was cleared. The counter shall be incremented for each occurrence of an under-run or over-run condition and may be incremented more than once for multiple occurrences during the execution of a single command.

7.2.4 Error counter log pages

This subclause defines the optional error counter log pages (see table 182).

Table 182 — Error counter log page codes

Page Code	Loge Page Name
03h	Read Error Counter
04h	Read Reverse Error Counter
05h	Verify Error Counter
02h	Write Error Counter

The log page format is defined in 7.2.1. A log page may return one or more log parameters that record events defined by the parameter codes. Table 183 defines the parameter codes for the error counter log pages. Support of each log parameter is optional.

Table 183 — Parameter codes for error counter log pages

Parameter code	Description
0000h	Errors corrected without substantial delay
0001h	Errors corrected with possible delays
0002h	Total (e.g., rewrites or rereads)
0003h	Total errors corrected
0004h	Total times correction algorithm processed
0005h	Total bytes processed
0006h	Total uncorrected errors
0007h - 7FFFh	Reserved
8000h - FFFFh	Vendor specific

NOTE 46 - The exact definition of the error counters is not part of this standard. These counters should not be used to compare products because the products may define errors differently.

7.2.5 Informational Exceptions log page

The Informational Exceptions log page (see table 184) provides a place for reporting detail about informational exceptions. The page code for the Informational Exceptions log page is 2Fh.

Table 184 — Informational Exceptions log page

Bit Byte	7	6	5	4	3	2	1	0
0	PAGE CODE (2Fh)							
1	Reserved							
2	(MSB) _____							
3	PAGE LENGTH (n-3) _____ (LSB)							
Informational exceptions log parameters								
4	First informational exceptions log parameter							
	⋮							
n	Last informational exceptions log parameter							

The PAGE CODE and PAGE LENGTH fields are described in 7.2.1.

Table 185 defines the parameter codes.

Table 185 — Informational exceptions parameter codes

Parameter code	Description
0000h	Informational exceptions general parameter data
0001h - FFFFh	Vendor specific

The informational exceptions general parameter data page has the format shown in table 186.

Table 186 — Informational exceptions general parameter data

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB) _____							
1	PARAMETER CODE (0000h) _____ (LSB)							
2	DU	DS	TSD	ETC	TMC	LBIN	LP	
3	PARAMETER LENGTH (n-3)							
4	INFORMATIONAL EXCEPTION ADDITIONAL SENSE CODE							
5	INFORMATIONAL EXCEPTION ADDITIONAL SENSE CODE QUALIFIER							
6	MOST RECENT TEMPERATURE READING							
7	_____							
n	Vendor specific _____							

The values of the log parameter control bits for self test results log parameters is specified in table 187.

Table 187 — Parameter control bits for Informational exceptions log parameter (0000h)

Bit	Value	Description
DU	0	Value provided by device server
DS	0	Device server supports saving of parameter
TSD	0	Device server manages saving of parameter
ETC	0	No threshold comparison is made on this value
TMC	xx	Ignored when ETC is 0
LBIN	1	The parameter is in binary format
LP	1	The parameter is a list parameter

The PARAMETER LENGTH field is described in 7.2.1. The parameter length shall be at least 04h.

If the INFORMATIONAL EXCEPTION ADDITIONAL SENSE CODE field contains zero, no informational exception condition is pending and contents of the INFORMATIONAL EXCEPTION ADDITIONAL SENSE CODE QUALIFIER field are unspecified. If the INFORMATIONAL EXCEPTION ADDITIONAL SENSE CODE field contains any value other than zero, an informational exception condition exists that has an ADDITIONAL SENSE CODE indicated by INFORMATIONAL EXCEPTION ADDITIONAL SENSE CODE field and an ADDITIONAL SENSE CODE QUALIFIER indicated by the INFORMATIONAL EXCEPTION ADDITIONAL SENSE CODE QUALIFIER field.

The MOST RECENT TEMPERATURE READING field indicates the temperature in degrees Celsius of the SCSI target device at the time the LOG SENSE command is performed. Temperatures equal to or less than zero degrees Celsius shall be indicated by a value of zero. If the device server is unable to detect a valid temperature because of a sensor failure or other condition, the value returned shall be FFh. The temperature should be reported with an accuracy of plus or minus three Celsius degrees while the device is operating at a steady state within the environmental limits specified for the device.

7.2.6 Last n Deferred Errors or Asynchronous Events log page

The Last n Deferred Errors or Asynchronous Events log page (page code 0Bh) provides for a number of deferred errors or asynchronous events sense data records using the list parameter format of the log page. The number of these deferred errors or asynchronous events records supported, n , is vendor specific. Each deferred error or asynchronous event record contains SCSI sense data for a deferred error or asynchronous event that has occurred. The parameter code associated with the record indicates the relative time at which the deferred error or asynchronous event occurred. A higher parameter code indicates that the deferred error or asynchronous event occurred later in time.

The content of the PARAMETER VALUE field of each log parameter is the SCSI sense data describing the deferred error.

The fields DU, TSD, ETC, and TMC are reserved and shall be set to zero. The LBIN bit shall be set to one to indicate binary information. The LP bit shall be set to one to indicate a list parameter.

7.2.7 Last n Error Events log page

The Last n Error Events log page (page code 07h) provides for a number of error-event records using the list parameter format of the log page. The number of these error-event records supported, n , is vendor specific. Each error-event record contains vendor specific diagnostic information for a single error encountered by the device. The parameter code associated with error-event record indicates the relative time at which the error occurred. A higher parameter code indicates that the error event occurred later in time.

The content of the **PARAMETER VALUE** field of each log parameter is an ASCII data (see 4.4.1) that may describe the error event. The exact contents of the character string is not defined by this standard.

When the last supported parameter code is used by an error-event record, the recording on this log page of all subsequent error information shall cease until one or more of the list parameters with the highest parameter codes have been reinitialized. If the **RLEC** bit of the Control mode page (see 7.4.6) is set to one, the device server shall return **CHECK CONDITION** status with the sense key set to **RECOVERED ERROR** and the additional sense code set to **LOG LIST CODES EXHAUSTED**.

7.2.8 Non-Medium Error log page

The Non-Medium Error log page (page code 06h) provides for summing the occurrences of recoverable error events other than write, read, or verify failures. No discrimination among the various types of events is provided by parameter code (see table 188). Vendor specific discrimination may be provided through the vendor specific parameter codes.

Table 188 — Non-medium error event parameter codes

Parameter code	Description
0000h	Non-medium error count
0001h - 7FFFh	Reserved
8000h - FFFFh	Vendor specific error counts

7.2.9 Protocol Specific Port log page

The Protocol Specific Port log page (see table 189) provides SCSI transport protocol specific parameters that are associated with the SCSI targets ports in the SCSI target device. This log page may be implemented in any logical unit, including the **TARGET LOG PAGES** well-known logical unit (see 8.4). See the SCSI transport protocol standard (see 3.1.75) for definitions of the protocol specific log parameters.

Table 189 — Protocol Specific Port log page

Bit Byte	7	6	5	4	3	2	1	0
0	PAGE CODE (18h)							
1	Reserved							
2	(MSB)							
3	PAGE LENGTH (n-3)							
	(LSB)							
Protocol specific port log parameters								
4	First protocol specific port log parameter							
	⋮							
n	Last protocol specific port log parameter							

Table 190 shows the format of a protocol specific port log parameter.

Table 190 — Protocol specific port log parameter format

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB) _____							
1	PARAMETER CODE _____ (LSB)							
2	DU	DS	TSD	ETC	TMC		LBIN	LP
3	PARAMETER LENGTH (x-3)							
4	Reserved				PROTOCOL IDENTIFIER			
5	SCSI transport protocol specific _____							
x								

The PARAMETER CODE field contains the relative target port identifier (see 7.6.4.6) of the target port for which the parameter data applies. Protocol specific log parameters for relative target ports numbered greater than 65 535 are not supported.

The contents of the DU, DS, TSD, ETC, LBIN, and LP bits and the TMC field are defined in 7.2.1.

The PARAMETER LENGTH field indicates the number of bytes remaining in the log parameter.

The PROTOCOL IDENTIFIER field contain one of the values shown in table 238 (see 7.5.1) to indicate the SCSI transport protocol that defines the SCSI transport protocol specific data in this log parameter. The SCSI transport protocol specific data is defined by the corresponding SCSI transport protocol standard.

7.2.10 Self-Test Results log page

The Self-Test Results log page (see table 191) provides the results from the twenty most recent self-tests (see 5.4). Results from the most recent self-test or the self-test currently in progress shall be reported in the first self-test log parameter; results from the second most recent self-test shall be reported in the second self-test log parameter; etc. If fewer than twenty self-tests have occurred, the unused self-test log parameter entries shall be zero filled.

Table 191 — Self-Test Results log page

Bit Byte	7	6	5	4	3	2	1	0
0	PAGE CODE (10h)							
1	Reserved							
2	(MSB)	PAGE LENGTH (190h)						
3								
Self-test results log parameters								
4	First self-test results log parameter							
23								
	⋮							
384	Twentieth self-test results log parameter							
403								

The PAGE CODE and PAGE LENGTH fields are described in 7.2.1.

Table 192 shows the format of one self-test log parameter.

Table 192 — Self-test results log parameter format

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB) _____							
1	PARAMETER CODE (0001h to 0014h) _____ (LSB)							
2	DU	DS	TSD	ETC	TMC		LBIN	LP
3	PARAMETER LENGTH (10h)							
4	SELF-TEST CODE			Reserved	SELF-TEST RESULTS			
5	SELF-TEST NUMBER							
6	(MSB) _____							
7	TIMESTAMP _____ (LSB)							
8	(MSB) _____							
15	ADDRESS OF FIRST FAILURE _____ (LSB)							
16	reserved				SENSE KEY			
17	ADDITIONAL SENSE CODE							
18	ADDITIONAL SENSE CODE QUALIFIER							
19	Vendor specific							

The PARAMETER CODE field identifies the log parameter being transferred. The PARAMETER CODE field for the results of the most recent self-test shall contain 0001h; the PARAMETER CODE field for the results of the second most recent test shall contain 0002h; etc.

The values of the log parameter control bits for self test results log parameters is specified in table 193.

Table 193 — Parameter control bits for self-test results log parameters

Bit	Value	Description
DU	0	Value provided by device server
DS	0	Device server supports saving of parameter
TSD	0	Device server manages saving of parameter
ETC	0	No threshold comparison is made on this value
TMC	xx	Ignored when ETC is 0
LBIN	1	The parameter is in binary format
LP	1	The parameter is a list parameter

The PARAMETER LENGTH field shall contain 10h.

The SELF-TEST CODE field contains the value in the SELF-TEST CODE field of the SEND DIAGNOSTICS command that initiated this self-test (see 6.26).

Table 194 defines the content of the SELF-TEST RESULTS field.

Table 194 — Self-test results values

Value	Description
0h	The self-test completed without error.
1h	The background self-test was aborted by the application client using a SEND DIAGNOSTICS command (see 6.26) with the SELF-TEST CODE field set to 100b (Abort background self-test).
2h	The self-test routine was aborted by an application client using a method other than a SEND DIAGNOSTICS command with the SELF-TEST CODE field set to 100b (e.g., by a task management function, or by issuing an exception command as defined in 5.4.3).
3h	An unknown error occurred while the device server was executing the self-test and the device server was unable to complete the self-test.
4h	The self-test completed with a failure in a test segment, and the test segment that failed is not known.
5h	The first segment of the self-test failed.
6h	The second segment of the self-test failed.
7h	Another segment of the self-test failed (see the SELF-TEST SEGMENT NUMBER field).
8h-Eh	Reserved
Fh	The self-test is in progress.

The SELF-TEST NUMBER field identifies the self-test that failed and consists of either:

- a) The number of the segment that failed during the self-test; or
- b) The number of the test that failed and the number of the segment in which the test was run, using a vendor specific method for placing the two values in the one field.

When the segment in which the failure occurred cannot or need not be identified, the SELF-TEST NUMBER field shall contain 00h.

The TIMESTAMP field contains the total accumulated power-on hours for the device server at the time the self-test was completed. If the test is still in progress, the content of the TIMESTAMP field shall be zero. If the power-on hours for the device server at the time the self-test was completed is greater than FFFFh then the content of the TIMESTAMP field shall be FFFFh.

The ADDRESS OF FIRST FAILURE field contains information that locates the failure on the media. If the logical unit implements logical blocks, the content of the ADDRESS OF FIRST FAILURE field is the first logical block address where a self-test error occurred. This implies nothing about the quality of any other logical block on the logical unit, since the testing during which the error occurred may not have been performed in a sequential manner. This value shall not change (e.g., as the result of block reassignment). The content of the ADDRESS OF FIRST FAILURE field shall be FFFF FFFF FFFF FFFFh if no errors occurred during the self-test or if the error that occurred is not related to an identifiable media address.

The sense key, ADDITIONAL SENSE CODE, and ADDITIONAL SENSE CODE QUALIFIER fields may contain a hierarchy of additional information relating to error or exception conditions that occurred during the self-test represented in the same format used by the sense data (see 4.5).

7.2.11 Start-Stop Cycle Counter log page

This subclause defines the optional Start-Stop Cycle Counter log page (page code 0Eh). A device server that implements the Start-Stop Cycle Counter log page shall implement one or more of the defined parameters. Table 195 shows the Start-Stop Cycle Counter log page with all parameters present.

Table 195 — Start-Stop Cycle Counter log page (part 1 of 2)

Bit Byte	7	6	5	4	3	2	1	0
0	PAGE CODE (0Eh)							
1	Reserved							
2	(MSB)	PAGE LENGTH (24h)						(LSB)

4	(MSB)	PARAMETER CODE 0001h Date of Manufacture						(LSB)
5								
6	DU	DS	TSD	ETC	TMC	LBIN	LP	
7	PARAMETER LENGTH (06h)							
8	(MSB)	YEAR OF MANUFACTURE (4 ASCII characters)						(LSB)
11								
12	(MSB)	WEEK OF MANUFACTURE (2 ASCII characters)						(LSB)
13								
14	(MSB)	PARAMETER CODE 0002h Accounting Date						(LSB)
15								
16	DU	DS	TSD	ETC	TMC	LBIN	LP	
17	PARAMETER LENGTH (06h)							
18	(MSB)	ACCOUNTING DATE YEAR (4 ASCII characters)						(LSB)
21								
22	(MSB)	ACCOUNTING DATE WEEK (2 ASCII characters)						(LSB)
23								
24	(MSB)	PARAMETER CODE 0003h Specified cycle count over device lifetime						(LSB)
25								
26	DU	DS	TSD	ETC	TMC	LBIN	LP	
27	PARAMETER LENGTH (04h)							
28	(MSB)	SPECIFIED CYCLE COUNT OVER DEVICE LIFETIME (4-byte binary number)						(LSB)
31								

Table 195 — Start-Stop Cycle Counter log page (part 2 of 2)

Bit Byte	7	6	5	4	3	2	1	0
32	(MSB) _____							_____ (LSB)
33	PARAMETER CODE 0004h							
34	Accumulated start-stop cycles							
35	DU	DS	TSD	ETC	TMC	LBIN	LP	
36	PARAMETER LENGTH (04h)							
37	(MSB) _____							_____ (LSB)
38	ACCUMULATED START-STOP CYCLES							
39	(4-byte binary number)							

The year and week in the year that the device was manufactured shall be set in the parameter field defined by parameter code 0001h. The date of manufacture shall not be saveable by the application client using the LOG SELECT command (i.e., the log parameter DS bit shall be one). The date is expressed in numeric ASCII characters (30h – 39h) in the form YYYYWW, as shown in table 195. The state of the parameter control bits for parameter 0001h is specified in table 196.

Table 196 — Parameter control bits for date of manufacture parameter (0001h)

Bit	Value	Description
DU	0	Value provided by device server
DS	1	Device server does not support saving of parameter
TSD	0	Device server manages saving of parameter
ETC	0	No threshold comparison is made on this value
TMC	xx	Ignored when ETC is 0
LBIN	0	The parameter is in ASCII format
LP	1	The parameter is a list parameter

The accounting date specified by parameter code 0002h may be saved using a LOG SELECT command to indicate when the device was placed in service. If the parameter is not yet set or is not settable, the default value placed in the parameter field shall be 6 ASCII space characters (20h). The field shall not be checked for validity by the device server. The state of the parameter control bits for parameter 0002h is specified in table 197.

Table 197 — Parameter control bits for accounting date parameter (0002h)

Bit	Value	Description
DU	0	Value provided by device server
DS	0 or 1	Device server optionally supports saving of parameter
TSD	0	Device server manages saving of parameter
ETC	0	No threshold comparison is made on this value
TMC	xx	Ignored when ETC is 0
LBIN	0	The parameter is in ASCII format
LP	1	The parameter is a list parameter

The specified cycle count over device lifetime (parameter code 0003h) is a parameter provided by the device server. The specified cycle count over device lifetime parameter shall not be saveable by the application client using the LOG SELECT command (i.e., the log parameter DS bit shall be one). The parameter value is a 4-byte binary number. The value indicates how many stop-start cycles may typically be executed over the lifetime of the

device without degrading the device's operation or reliability outside the limits specified by the manufacturer of the device. The state of the parameter control bits for parameter 0003h is specified in table 198.

Table 198 — Parameter control bits for start-stop cycle counter parameters (0003h and 0004h)

Bit	Value	Description
DU	0	Value provided by device server
DS	1	Device server does not support saving of parameter
TSD	0	Device server manages saving of parameter
ETC	0	No threshold comparison is made on this value
TMC	xx	Ignored when ETC is 0
LBIN	1	The parameter is in binary format
LP	1	The parameter is a list parameter

The accumulated start-stop cycles (parameter code 0004h) is a parameter provided by the device server. The accumulated start-stop cycles parameter shall not be saveable by the application client using the LOG SELECT command (i.e., the log parameter DS bit shall be one). The parameter value is a 4-byte binary number. The value indicates how many start-stop cycles the device has detected since its date of manufacture. The time at which the count is incremented during a start-stop cycle is vendor specific. For rotating magnetic storage devices, a single start-stop cycle is defined as an operational cycle that begins with the disk spindle at rest, continues while the disk accelerates to its normal operational rotational rate, continues during the entire period the disk is rotating, continues as the disk decelerates toward a resting state, and ends when the disk is no longer rotating. For devices without a spindle or with multiple spindles, the definition of a single start-stop cycle is vendor specific. The count is incremented by one for each complete start-stop cycle. No comparison with the value of parameter 0003h shall be performed by the device server. The state of the control bits for parameter 0004h is specified in table 198.

7.2.12 Supported Log Pages log page

The Supported Log Pages log page (see table 199) returns the list of log pages implemented by the target. Targets that implement the LOG SENSE command shall implement this log page.

Table 199 — Supported log pages

Bit Byte	7	6	5	4	3	2	1	0
0	PAGE CODE (00h)							
1	Reserved							
2	(MSB)							
3	PAGE LENGTH (n-3)							
4	(LSB)							
n	SUPPORTED PAGE LIST							

This log page is not defined for the LOG SELECT command. This log page returns the list of supported log pages for the specified logical unit.

The PAGE LENGTH field specifies the length in bytes of the following supported log page list.

The SUPPORTED PAGE LIST field shall contain a list of all log page codes implemented by the target in ascending order beginning with page code 00h.

7.2.13 Temperature log page

This subclause defines the optional Temperature log page (page code 0Dh). A device server that implements the Temperature log page shall implement parameter 0000h. Parameter 0001h is optional and may be either omitted or set to a value indicating that the parameter is not defined. Table 200 shows the Temperature log page with all parameters present.

Table 200 — Temperature log page

Bit Byte	7	6	5	4	3	2	1	0
0	PAGE CODE (0Dh)							
1	Reserved							
2	(MSB)	PAGE LENGTH (0Ch)						(LSB)
3								
4	(MSB)	PARAMETER CODE 0000h Temperature						(LSB)
5								
6	DU	DS	TSD	ETC	TMC		LBIN	LP
7	PARAMETER LENGTH (02h)							
8	Reserved							
9	TEMPERATURE (degrees Celsius)							
10	(MSB)	PARAMETER CODE 0001h Reference temperature						(LSB)
11								
12	DU	DS	TSD	ETC	TMC		LBIN	LP
13	PARAMETER LENGTH (02h)							
14	Reserved							
15	REFERENCE TEMPERATURE (degrees Celsius)							

The temperature sensed in the device at the time the LOG SENSE command is performed shall be returned in the parameter field defined by parameter code 0000h. The one byte binary value specifies the temperature of the device in degrees Celsius. Temperatures equal to or less than zero degrees Celsius shall be indicated by a value of zero. If the device server is unable to detect a valid temperature because of a sensor failure or other condition, the value returned shall be FFh. The temperature should be reported with an accuracy of plus or minus three Celsius degrees while the device is operating at a steady state within the environmental limits specified for the device. No comparison is performed between the temperature value specified in parameter 0000h and the reference temperature specified in parameter 0001h. The state of the parameter control bits for parameter 0000h is specified in table 201.

Table 201 — Parameter control bits for temperature parameters (0000h and 0001h)

Bit	Value	Description
DU	0	Value provided by device server
DS	1	Device server does not support saving of parameter
TSD	0	Device server manages saving of parameter
ETC	0	No threshold comparison is made on this value
TMC	xx	Ignored when ETC is 0
LBIN	1	The parameter is in binary format
LP	1	The parameter is a list parameter

A reference temperature for the device may optionally be provided by the device using parameter code 0001h. If no reference temperature is provided, the parameter may not be provided in the log page or alternatively, the reference temperature value may be set to the value of FFh. The one byte binary value should reflect the maximum reported sensor temperature in degrees Celsius at which the device is capable of operating continuously without degrading the device's operation or reliability beyond manufacturer accepted limits. The reference temperature may change for vendor specific reasons. The state of the parameter control bits for parameter 0001h is specified in table 201.

7.3 Medium auxiliary memory attributes

7.3.1 Attribute format

Each medium auxiliary memory attribute shall be communicated between the application client and device server in the format shown in table 202. This format shall be used in the parameter data for the WRITE ATTRIBUTE command (see 6.30) and the READ ATTRIBUTE command (see 6.14). The attribute format in this standard implies nothing about the physical representation of an attribute in the medium auxiliary memory.

Table 202 — MAM ATTRIBUTE format

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB) _____							
1	ATTRIBUTE IDENTIFIER _____ (LSB)							
2	READ ONLY	Reserved					FORMAT	
3	(MSB) _____							
4	ATTRIBUTE LENGTH (n-4) _____ (LSB)							
5	_____							
n	ATTRIBUTE VALUE _____							

The ATTRIBUTE IDENTIFIER field contains a code value identifying the attribute (see 7.3.2).

The READ ONLY bit indicates whether the attribute is in the read only state (see 5.10). If the READ ONLY bit is set to one, the attribute is in the read only state. If the READ ONLY bit is set to zero, the attribute is in the read/write state.

The FORMAT field (see table 203) specifies the format of the data in the ATTRIBUTE VALUE field.

Table 203 — MAM attribute formats

Format	Name	Description
00b	BINARY	The ATTRIBUTE VALUE field contains binary data.
01b	ASCII	The ATTRIBUTE VALUE field contains left-aligned ASCII data (see 4.4.1).
10b	TEXT	The attribute contains textual data. The character set is as described in the TEXT LOCALIZATION IDENTIFIER attribute (see 7.3.2.4.6).
11b		Reserved

The ATTRIBUTE LENGTH field specifies the length in bytes of the ATTRIBUTE VALUE field.

The ATTRIBUTE VALUE field contains the current (READ ATTRIBUTE) or desired (WRITE ATTRIBUTE) value of the attribute.

7.3.2 Attribute identifier values

7.3.2.1 Attribute identifier values overview

The values in the ATTRIBUTE IDENTIFIER field (see 7.3.1) are assigned according to the attribute type (see 5.10) and whether the attribute is standard or vendor unique (see table 204).

Table 204 — MAM attribute identifier range assignments

Attribute Identifiers	Attribute Type	Standardized	Subclause
0000h - 03FFh	Device	Yes	7.3.2.2
0400h - 07FFh	Medium	Yes	7.3.2.3
0800h - 0BFFh	Host	Yes	7.3.2.4
0C00h - 0FFFh	Device	Vendor Unique	
1000h - 13FFh	Medium	Vendor Unique	
1400h - 17FFh	Host	Vendor Unique	
1800h - FFFFh	Reserved		

Device servers may accept and process a WRITE ATTRIBUTE command containing standardized host type attribute identifier values (i.e., 0800h-0BFFh) or vendor unique host type attribute identifier values (i.e., 1400h-17FFh). Standardized host type attribute identifier values may be checked as described in 7.3.2.4.

7.3.2.2 Device type attributes

Device type attributes (see table 205) shall be maintained and updated by the device server when the medium and associated medium auxiliary memory are present. All supported medium type attributes shall have a status of read only (see 5.10).

Table 205 — Device type attributes

Attribute Identifier	Name	Attribute Length	Format	Subclause
0000h	REMAINING CAPACITY IN PARTITION	8	BINARY	7.3.2.2.1
0001h	MAXIMUM CAPACITY IN PARTITION	8	BINARY	7.3.2.2.1
0002h	Restricted			
0003h	LOAD COUNT	8	BINARY	7.3.2.2.2
0004h	MAM SPACE REMAINING	8	BINARY	7.3.2.2.3
0005h - 0006h	Restricted			
0007h	INITIALIZATION COUNT	2	BINARY	7.3.2.2.4
0008h - 020Ah	Reserved			
020Ah	DEVICE MAKE/SERIAL NUMBER AT LAST LOAD	40	ASCII	7.3.2.2.5
020Bh	DEVICE MAKE/SERIAL NUMBER AT LOAD-1	40	ASCII	7.3.2.2.5
020Ch	DEVICE MAKE/SERIAL NUMBER AT LOAD-2	40	ASCII	7.3.2.2.5
020Dh	DEVICE MAKE/SERIAL NUMBER AT LOAD-3	40	ASCII	7.3.2.2.5
020Eh - 021Fh	Reserved			
0220h	TOTAL MBYTES WRITTEN IN MEDIUM LIFE	8	BINARY	7.3.2.2.6
0221h	TOTAL MBYTES READ IN MEDIUM LIFE	8	BINARY	7.3.2.2.6
0222h	TOTAL MBYTES WRITTEN IN CURRENT/LAST LOAD	8	BINARY	7.3.2.2.7
0223h	TOTAL MBYTES READ IN CURRENT/LAST LOAD	8	BINARY	7.3.2.2.7
0224h - 033Fh	Reserved			
0340h	MEDIUM USAGE HISTORY	90	BINARY	7.3.2.2.8
0341h	PARTITION USAGE HISTORY	60	BINARY	7.3.2.2.8
0342h - 03FFh	Reserved			

7.3.2.2.1 REMAINING CAPACITY IN PARTITION and MAXIMUM CAPACITY IN PARTITION: Are native capacities (i.e., assuming no data compression for the specified medium partition). These values are expressed in increments of 1 048 576 bytes (e.g., a value of one means 1 048 576 bytes and a value of two means 2 097 152 bytes).

7.3.2.2.2 LOAD COUNT: Indicates how many times this medium has been fully loaded. This attribute should not be reset to zero by any action of the device server.

7.3.2.2.3 MAM SPACE REMAINING: Indicates the space currently available in the medium auxiliary memory. The total medium auxiliary memory capacity is reported in the MAM CAPACITY attribute (see 7.3.2.3.4).

NOTE 47 - It may not always be possible to utilize all of the available space in a given medium auxiliary memory implementation. Depending on the internal organization of the memory and the software that controls it, fragmentation issues may mean that certain attribute sizes may not be fully accommodated as the medium auxiliary memory nears its maximum capacity.

7.3.2.2.4 INITIALIZATION COUNT: Indicates the number of times that a device server has logically formatted the medium. This value is cumulative over the life of the medium and shall not be reset to zero.

7.3.2.2.5 DEVICE VENDOR/SERIAL NUMBER AT LAST LOAD, DEVICE VENDOR/SERIAL NUMBER AT LOAD –1, DEVICE VENDOR/SERIAL NUMBER AT LOAD –2 and DEVICE VENDOR/SERIAL NUMBER AT LOAD –3:

Give a history of the last four device servers in which the medium has been loaded. The format of the attributes is shown in table 206.

Table 206 — DEVICE VENDOR/SERIAL NUMBER attribute format

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB) _____							
7	VENDOR IDENTIFICATION _____ (LSB)							
8	(MSB) _____							
39	PRODUCT SERIAL NUMBER _____ (LSB)							

The VENDOR IDENTIFICATION field shall be the same value returned in the Standard INQUIRY data (see 6.4.2).

The PRODUCT SERIAL NUMBER field contains ASCII data (see 4.4.1) that is a vendor unique serial number. If the product serial number is not available, the PRODUCT SERIAL NUMBER field shall contain ASCII spaces (20h).

7.3.2.2.6 TOTAL MBYTES WRITTEN IN MEDIUM LIFE and TOTAL MBYTES READ IN MEDIUM LIFE: Indicate the total number of data bytes that are transferred to or from the medium, after any data compression has been applied, over the entire medium life. These values are cumulative and shall not be reset to zero. These values are expressed in increments of 1 048 576 bytes (e.g., a value of one means 1 048 576 bytes and a value of two means 2 097 152 bytes).

7.3.2.2.7 TOTAL MBYTES WRITTEN IN CURRENT/LAST LOAD and TOTAL MBYTES READ IN CURRENT/ LAST LOAD: Indicate the total number of data bytes that are transferred to or from the medium, after any data compression has been applied, during the current load if the medium is currently loaded, or the last load if the medium is currently unloaded. The device server should reset these attributes to zero when the medium is loaded. These values are expressed in increments of 1 048 576 bytes (e.g., a value of one means 1 048 576 bytes and a value of two means 2 097 152 bytes).

7.3.2.2.8 MEDIUM USAGE HISTORY: Provides counters (see table 207) for the entire medium. The value in each field is the sum for all partitions. If a field is not used it should be set to zero.

Table 207 — MEDIUM USAGE HISTORY attribute format

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB)	CURRENT AMOUNT OF DATA WRITTEN						(LSB)
5								
6	(MSB)	CURRENT WRITE RETRIES COUNT						(LSB)
11								
12	(MSB)	CURRENT AMOUNT OF DATA READ						(LSB)
17								
18	(MSB)	CURRENT READ RETRIES COUNT						(LSB)
23								
24	(MSB)	PREVIOUS AMOUNT OF DATA WRITTEN						(LSB)
29								
30	(MSB)	PREVIOUS WRITE RETRIES COUNT						(LSB)
35								
36	(MSB)	PREVIOUS AMOUNT OF DATA READ						(LSB)
41								
42	(MSB)	PREVIOUS READ RETRIES COUNT						(LSB)
47								
48	(MSB)	TOTAL AMOUNT OF DATA WRITTEN						(LSB)
53								
54	(MSB)	TOTAL WRITE RETRIES COUNT						(LSB)
59								
60	(MSB)	TOTAL AMOUNT OF DATA READ						(LSB)
65								
66	(MSB)	TOTAL READ RETRIES COUNT						(LSB)
71								
72	(MSB)	LOAD COUNT						(LSB)
77								
78	(MSB)	TOTAL CHANGE PARTITION COUNT						(LSB)
83								
84	(MSB)	TOTAL PARTITION INITIALIZE COUNT						(LSB)
89								

The CURRENT AMOUNT OF DATA WRITTEN field indicates the amount of data written to the medium during this load of the medium. This value is expressed in increments of 1 048 576 bytes (e.g., a value of one means 1 048 576 bytes and a value of two means 2 097 152 bytes).

The CURRENT WRITE RETRIES COUNT field indicates the total number of times a write retry occurred during this load of the medium.¹⁾

The CURRENT AMOUNT OF DATA READ field indicates the amount of data read from the medium during this load of the medium. This value is expressed in increments of 1 048 576 bytes (e.g., a value of one means 1 048 576 bytes and a value of two means 2 097 152 bytes).

The CURRENT READ RETRIES COUNT field indicates the number of times a read retry occurred during this load of the medium.¹⁾

The PREVIOUS AMOUNT OF DATA WRITTEN field indicates the amount of data written to the medium during the previous load of the medium. This value is expressed in increments of 1 048 576 bytes (e.g., a value of one means 1 048 576 bytes and a value of two means 2 097 152 bytes).

The PREVIOUS WRITE RETRIES COUNT field indicates the total number of times a write retry occurred during the previous load of the medium.¹⁾

The PREVIOUS AMOUNT OF DATA READ field indicates the amount of data read from the medium during the previous load of the medium. This value is expressed in increments of 1 048 576 bytes (e.g., a value of one means 1 048 576 bytes and a value of two means 2 097 152 bytes).

The PREVIOUS READ RETRIES COUNT field indicates the number of times a read retry occurred during the previous load of the medium.¹⁾

The TOTAL AMOUNT OF DATA WRITTEN field indicates the amount of data written to the medium since the last medium format. This value is expressed in increments of 1 048 576 bytes (e.g., a value of one means 1 048 576 bytes and a value of two means 2 097 152 bytes).

The TOTAL WRITE RETRIES COUNT field indicates the total number of times a write retry occurred since the last medium format.¹⁾

The TOTAL AMOUNT OF DATA READ field indicates the amount of data read from the medium since the last medium format. This value is expressed in increments of 1 048 576 bytes (e.g., a value of one means 1 048 576 bytes and a value of two means 2 097 152 bytes).

The TOTAL READ RETRIES COUNT field indicates the number of times a read retry occurred since the last medium format.¹⁾

The LOAD COUNT field indicates the number of loads since the last medium format. This count accumulates over the life of the medium but it is reset to zero after a medium format.

The TOTAL CHANGE PARTITION COUNT field indicates the number of times that switches between partitions have been performed on the medium. This count accumulates over the life of the medium but it is reset to zero after a medium format.

The TOTAL PARTITION INITIALIZE COUNT field indicates number of times that any of the partitions on the medium have been erased. This count accumulates over the life of the medium but it is reset to zero after a medium format.

1) The definition of one retry as counted by this attribute field is not part of this standard. This counter should not be used to compare products because the products may define errors differently.

7.3.2.2.9 PARTITION USAGE HISTORY: Provides counters (see table 208) for the partition specified by the PARTITION NUMBER field in the CDB. If a field is not used it should be set to zero.

Table 208 — PARTITION USAGE HISTORY attribute format

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB)	CURRENT AMOUNT OF DATA WRITTEN						(LSB)
3								
4	(MSB)	CURRENT WRITE RETRIES COUNT						(LSB)
7								
8	(MSB)	CURRENT AMOUNT OF DATA READ						(LSB)
11								
12	(MSB)	CURRENT READ RETRIES COUNT						(LSB)
15								
16	(MSB)	PREVIOUS AMOUNT OF DATA WRITTEN						(LSB)
19								
20	(MSB)	PREVIOUS WRITE RETRIES COUNT						(LSB)
23								
24	(MSB)	PREVIOUS AMOUNT OF DATA READ						(LSB)
27								
28	(MSB)	PREVIOUS READ RETRIES COUNT						(LSB)
31								
32	(MSB)	TOTAL AMOUNT OF DATA WRITTEN						(LSB)
35								
36	(MSB)	TOTAL WRITE RETRIES COUNT						(LSB)
39								
40	(MSB)	TOTAL AMOUNT OF DATA READ						(LSB)
43								
44	(MSB)	TOTAL READ RETRIES COUNT						(LSB)
47								
48	(MSB)	LOAD COUNT						(LSB)
51								
52	(MSB)	CHANGE PARTITION COUNT						(LSB)
55								
56	(MSB)	PARTITION INITIALIZE COUNT						(LSB)
59								

The CURRENT AMOUNT OF DATA WRITTEN field indicates the amount of data written to the medium in the partition specified by the PARTITION NUMBER field in the CDB during this load of the medium. This value is expressed in increments of 1 048 576 bytes (e.g., a value of one means 1 048 576 bytes and a value of two means 2 097 152 bytes).

The CURRENT WRITE RETRIES COUNT field indicates the total number of times a write retry occurred in the partition specified by the PARTITION NUMBER field in the CDB during this load of the medium.²⁾

The CURRENT AMOUNT OF DATA READ field indicates the amount of data read from the medium in the partition specified by the PARTITION NUMBER field in the CDB during this load of the medium. This value is expressed in increments of 1 048 576 bytes (e.g., a value of one means 1 048 576 bytes and a value of two means 2 097 152 bytes).

The CURRENT READ RETRIES COUNT field indicates the number of times a read retry occurred in the partition specified by the PARTITION NUMBER field in the CDB during this load of the medium.²⁾

The PREVIOUS AMOUNT OF DATA WRITTEN field indicates the amount of data written to the medium in the partition specified by the PARTITION NUMBER field in the CDB during the previous load of the medium. This value is expressed in increments of 1 048 576 bytes (e.g., a value of one means 1 048 576 bytes and a value of two means 2 097 152 bytes).

The PREVIOUS WRITE RETRIES COUNT field indicates the total number of times a write retry occurred in the partition specified by the PARTITION NUMBER field in the CDB during the previous load of the medium.²⁾

The PREVIOUS AMOUNT OF DATA READ field indicates the amount of data read from the medium in the partition specified by the PARTITION NUMBER field in the CDB during the previous load of the medium. This value is expressed in increments of 1 048 576 bytes (e.g., a value of one means 1 048 576 bytes and a value of two means 2 097 152 bytes).

The PREVIOUS READ RETRIES COUNT field indicates the number of times a read retry occurred in the partition specified by the PARTITION NUMBER field in the CDB during the previous load of the medium.²⁾

The TOTAL AMOUNT OF DATA WRITTEN field indicates the amount of data written to the medium in the partition specified by the PARTITION NUMBER field in the CDB since the last medium format. This value is expressed in increments of 1 048 576 bytes (e.g., a value of one means 1 048 576 bytes and a value of two means 2 097 152 bytes).

The TOTAL WRITE RETRIES COUNT field indicates the total number of times a write retry occurred in the partition specified by the PARTITION NUMBER field in the CDB since the last medium format.²⁾

The TOTAL AMOUNT OF DATA READ field indicates the amount of data read from the medium in the partition specified by the PARTITION NUMBER field in the CDB since the last medium format. This value is expressed in increments of 1 048 576 bytes (e.g., a value of one means 1 048 576 bytes and a value of two means 2 097 152 bytes).

The TOTAL READ RETRIES COUNT field indicates the number of times a read retry occurred in the partition specified by the PARTITION NUMBER field in the CDB since the last medium format.²⁾

The LOAD COUNT field indicates the number of loads in the partition specified by the PARTITION NUMBER field in the CDB since the last medium format. This count accumulates over the life of the medium but it is reset to zero after a medium format.

The TOTAL CHANGE PARTITION COUNT field indicates the number of times that switches to the partition specified by the PARTITION NUMBER field in the CDB have been performed on the medium. This count accumulates over the life of the medium but it is reset to zero after a medium format.

2) The definition of one retry as counted by this attribute field is not part of this standard. This counter should not be used to compare products because the products may define errors differently.

The TOTAL PARTITION INITIALIZE COUNT field indicates number of times that the partition specified by the PARTITION NUMBER field in the CDB has been initialized. This count accumulates over the life of the medium but it is reset to zero after a medium format.

7.3.2.3 Medium type attributes

Medium type attributes (see table 209) are stored in the medium auxiliary memory by the manufacturer. The device server shall not alter medium type attributes. All supported medium type attributes shall have a status of read only (see 5.10).

Table 209 — Medium type attributes

Attribute Identifier	Name	Attribute Length	Format	Subclause
0400h	MEDIUM MANUFACTURER	8	ASCII	7.3.2.3.1
0401h	MEDIUM SERIAL NUMBER	32	ASCII	7.3.2.3.2
0402h - 0405h	Reserved			
0406h	MEDIUM MANUFACTURE DATE	8	ASCII	7.3.2.3.3
0407h	MAM CAPACITY	8	BINARY	7.3.2.3.4
0408h	MEDIUM TYPE	1	BINARY	7.3.2.3.5
0409h	MEDIUM TYPE INFORMATION	2	BINARY	7.3.2.3.5
040Ah	NUMERIC MEDIUM SERIAL NUMBER	unspecified	unspecified	7.3.2.3.6
040Bh - 07FFh	Reserved			

7.3.2.3.1 MEDIUM MANUFACTURER: Contains eight bytes of left-aligned ASCII data (see 4.4.1) identifying the vendor of the media. The vendor identification shall be one assigned by INCITS. A list of assigned vendor identifications is in Annex D and on the T10 web site (www.T10.org).

NOTE 48 - The T10 web site (www.t10.org) provides a convenient means to request an identification code.

7.3.2.3.2 MEDIUM SERIAL NUMBER: Contains the manufacturer's serial number for the medium.

7.3.2.3.3 MEDIUM MANUFACTURE DATE: Contains the date of manufacture of the medium. The format is YYYYMMDD (i.e., four numeric ASCII characters for the year followed by two numeric ASCII characters for the month followed by two numeric ASCII characters for the day with no intervening spaces).

7.3.2.3.4 MAM CAPACITY: Is the total capacity of the medium auxiliary memory, in bytes, at manufacture time. It does not indicate the available space of an unused medium auxiliary memory because some of the medium auxiliary memory space may be reserved for device-specific use making it inaccessible to the application client.

7.3.2.3.5 MEDIUM TYPE and MEDIUM TYPE INFORMATION: Give information about non-data media and other types of media. The MEDIUM TYPE INFORMATION attribute is interpreted according to the type of medium indicated by the MEDIUM TYPE (see table 210).

Table 210 — MEDIUM TYPE and MEDIUM TYPE INFORMATION attributes

MEDIUM TYPE	Description	MEDIUM TYPE INFORMATION
00h	Data medium	Reserved
01h	Cleaning medium	Maximum number of cleaning cycles permitted
02h-7Fh	Reserved	Reserved

Table 210 — MEDIUM TYPE and MEDIUM TYPE INFORMATION attributes

MEDIUM TYPE	Description	MEDIUM TYPE INFORMATION
80h	Write-once medium	Reserved
81h-FFh	Reserved	Reserved

7.3.2.3.6 NUMERIC MEDIUM SERIAL NUMBER: Contains the manufacturer's serial number for the medium in a vendor specific format.

7.3.2.4 Host type attributes

Application clients may use the WRITE ATTRIBUTE and READ ATTRIBUTE commands to maintain the attributes shown in table 211. All existent host type attributes shall have a status of read/write (see 5.10).

Table 211 — Host type attributes

Attribute Identifier	Name	Attribute Length	Format	Subclause
0800h	APPLICATION VENDOR	8	ASCII	7.3.2.4.1
0801h	APPLICATION NAME	32	ASCII	7.3.2.4.2
0802h	APPLICATION VERSION	8	ASCII	7.3.2.4.3
0803h	USER MEDIUM TEXT LABEL	160	TEXT	7.3.2.4.4
0804h	DATE AND TIME LAST WRITTEN	12	ASCII	7.3.2.4.5
0805h	TEXT LOCALIZATION IDENTIFIER	1	BINARY	7.3.2.4.6
0806h	BARCODE	32	ASCII	7.3.2.4.7
0807h	OWNING HOST TEXTUAL NAME	80	TEXT	7.3.2.4.8
0808h	MEDIA POOL	160	TEXT	7.3.2.4.9
0809h	PARTITION USER TEXT LABEL	16	ASCII	7.3.2.4.10
080Ah	LOAD/UNLOAD AT PARTITION	1	BINARY	7.3.2.4.11
080Bh - BFFh	Reserved			

7.3.2.4.1 APPLICATION VENDOR: Contains eight bytes of left-aligned ASCII data (see 4.4.1) identifying the manufacturer of the application client (e.g., class driver or backup program) that last sent a WRITE ATTRIBUTE command to the device server while this medium auxiliary memory was accessible. The vendor identification shall be one assigned by INCITS. A list of assigned vendor identifications is in Annex D and on the T10 web site (www.T10.org).

NOTE 49 - The T10 web site (www.t10.org) provides a convenient means to request an identification code.

7.3.2.4.2 APPLICATION NAME: Contains the name of the application client.

7.3.2.4.3 APPLICATION VERSION: Contains the version of the application client.

7.3.2.4.4 USER MEDIUM TEXT LABEL: Is the user level identifier for the medium.

7.3.2.4.5 DATE & TIME LAST WRITTEN: Contains when the application client last wrote to the medium auxiliary memory. The format is YYYYMMDDHHMM (i.e., four numeric ASCII characters for the year followed by two numeric ASCII characters for the month followed by two numeric ASCII characters for the day followed by two numeric ASCII characters between 00 and 24 for the hour followed by two numeric ASCII characters for the minute with no intervening spaces).

7.3.2.4.6 TEXT LOCALIZATION IDENTIFIER: Defines the character set (see table 212) used for attributes with a TEXT format (see 7.3.1).

Table 212 — TEXT LOCALIZATION IDENTIFIER attribute values

Value	Meaning
00h	No code specified (ASCII)
01h	ISO/IEC 8859-1 (Europe, Latin America)
02h	ISO/IEC 8859-2 (Eastern Europe)
03h	ISO/IEC 8859-3 (SE Europe/miscellaneous)
04h	ISO/IEC 8859-4 (Scandinavia/Baltic)
05h	ISO/IEC 8859-5 (Cyrillic)
06h	ISO/IEC 8859-6 (Arabic)
07h	ISO/IEC 8859-7 (Greek)
08h	ISO/IEC 8859-8 (Hebrew)
09h	ISO/IEC 8859-9 (Latin 5)
0Ah	ISO/IEC 8859-10 (Latin 6)
0Bh - 7Fh	Reserved
80h	ISO/IEC 10646-1 (UCS-2BE)
81h	ISO/IEC 10646-1 (UTF-8)
82h - FFh	Reserved

7.3.2.4.7 BARCODE: Is contents of a barcode associated with the medium in the medium auxiliary memory.

7.3.2.4.8 OWNING HOST TEXTUAL NAME: Indicates the host from which that USER MEDIUM TEXT LABEL (see 7.3.2.4.4) originates.

7.3.2.4.9 MEDIA POOL: Indicates the media pool to which this medium belongs.

7.3.2.4.10 PARTITION USER TEXT LABEL: Is a user level identifier for the partition specified by the PARTITION NUMBER field in the CDB.

7.3.2.4.11 LOAD/UNLOAD AT PARTITION: Indicates whether the media is capable of being loaded or unloaded at the partition specified by the PARTITION NUMBER field in the CDB. If loads and unloads are enabled for the specified partition, the value of this attribute shall be one. If loads and unloads are not enabled for the specified partition, the value of this attribute shall be zero. All attribute values other than zero and one are reserved. If LOAD/UNLOAD AT PARTITION is disabled, then loads and unloads are performed at the beginning of the media instead of at the specified partition. If this attribute is in the nonexistent state (see 5.10) then the default action shall be to load and unload at the beginning of media.

7.4 Mode parameters

7.4.1 Mode parameters overview

This subclause describes the block descriptors and the mode pages and subpages used with MODE SELECT and MODE SENSE commands that are applicable to all SCSI devices. Subpages are identical to mode pages except that they include a SUBPAGE CODE field that further differentiates the mode page contents. Mode pages specific to each device type are described in the command standard (see 3.1.17) that applies to that device type.

7.4.2 Mode parameter list format

The mode parameter list shown in table 91 contains a header, followed by zero or more block descriptors, followed by zero or more variable-length mode pages. Parameter lists are defined for each device type.

Table 213 — Mode parameter list

Bit Byte	7	6	5	4	3	2	1	0
0 - n	Mode parameter header							
0 - n	Block descriptor(s)							
0 - n	Page(s)							

7.4.3 Mode parameter header formats

The six-byte CDB mode parameter header is defined in table 214.

Table 214 — Mode parameter header(6)

Bit Byte	7	6	5	4	3	2	1	0
0	MODE DATA LENGTH							
1	MEDIUM TYPE							
2	DEVICE-SPECIFIC PARAMETER							
3	BLOCK DESCRIPTOR LENGTH							

The ten-byte CDB mode parameter header is defined in table 215.

Table 215 — Mode parameter header(10)

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB) _____							
1	MODE DATA LENGTH _____ (LSB)							
2	MEDIUM TYPE							
3	DEVICE-SPECIFIC PARAMETER							
4	Reserved							LONGLBA
5	Reserved							
6	(MSB) _____							
7	BLOCK DESCRIPTOR LENGTH _____ (LSB)							

When using the MODE SENSE command, the MODE DATA LENGTH field specifies the length in bytes of the following data that is available to be transferred. The mode data length does not include the number of bytes in the MODE DATA LENGTH field. When using the MODE SELECT command, this field is reserved.

NOTE 50 - Targets that support more than 256 bytes of block descriptors and mode pages may need to implement ten-byte mode commands. The mode data length field in the six-byte CDB header limits the returned data to 256 bytes.

The contents of the MEDIUM TYPE field are unique for each device type. Refer to the mode parameters subclause of the specific device type command standard (see 3.1.17) for definition of these values. Some device types reserve this field.

The DEVICE-SPECIFIC PARAMETER field is unique for each device type. Refer to the mode parameters subclause of the specific device type command standard (see 3.1.17) for definition of this field. Some device types reserve all or part of this field.

The Long LBA (LONGLBA) bit of zero indicates the mode parameter block descriptors are eight bytes long and have the format described in 7.4.4.1 or 7.4.4.2. A LONGLBA bit of one indicates the mode parameter block descriptors are sixteen bytes long and have the format described in 7.4.4.3.

The BLOCK DESCRIPTOR LENGTH field specifies the length in bytes of all the block descriptors. It is equal to the number of block descriptors times eight if the LONGLBA bit is set to zero or times sixteen if the LONGLBA bit is set to one, and does not include mode pages or vendor specific parameters, if any, that may follow the last block descriptor. A block descriptor length of zero indicates that no block descriptors are included in the mode parameter list. This condition shall not be considered an error.

7.4.4 Mode parameter block descriptor formats

7.4.4.1 General block descriptor format

When the `LONGLBA` bit is set to zero (see 7.4.3), the mode parameter block descriptor format for all device types except direct-access is shown in table 216.

Table 216 — General mode parameter block descriptor

Bit Byte	7	6	5	4	3	2	1	0
0	DENSITY CODE							
1	(MSB)							
2	NUMBER OF BLOCKS							
3								(LSB)
4	Reserved							
5	(MSB)							
6	BLOCK LENGTH							
7								(LSB)

Block descriptors specify some of the medium characteristics for all or part of a logical unit. Support for block descriptors is optional. Each block descriptor contains a `DENSITY CODE` field, a `NUMBER OF BLOCKS` field, and a `BLOCK LENGTH` field. Block descriptor values are always current (i.e., saving is not supported). A unit attention condition (see 6.7 and SAM-2) shall be generated when any block descriptor values are changed.

The `DENSITY CODE` field is unique for each device type. Refer to the mode parameters subclause of the specific device type command standard (see 3.1.17) for definition of this field. Some device types reserve all or part of this field.

The `NUMBER OF BLOCKS` field specifies the number of logical blocks on the medium to which the `DENSITY CODE` and `BLOCK LENGTH` fields apply. A value of zero indicates that all of the remaining logical blocks of the logical unit shall have the medium characteristics specified.

If the number of logical blocks on the medium exceeds the maximum value that may be specified in the `NUMBER OF BLOCKS` field a value of `FF FF FFh` indicates that all of the remaining logical blocks of the logical unit shall have the medium characteristics specified.

NOTES

- 51 There may be implicit association between parameters defined in the mode pages and block descriptors. In this case, the target may change parameters not explicitly sent with the `MODE SELECT` command. A subsequent `MODE SENSE` command may be used to detect these changes.
- 52 The number of remaining logical blocks may be unknown for some device types.

The `BLOCK LENGTH` field specifies the length in bytes of each logical block described by the block descriptor. For sequential-access devices, a block length of zero indicates that the logical block size written to the medium is specified by the transfer length field in the CDB (see SSC).

7.4.4.2 Direct-access device block descriptor format for LONGLBA=0

When the LONGLBA bit is set to zero (see 7.4.3), the mode parameter block descriptor format for the direct-access device type is shown in table 217.

Table 217 — Direct-access device mode parameter block descriptor

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB)							
1	NUMBER OF BLOCKS							
2								
3								(LSB)
4	DENSITY CODE							
5	(MSB)							
6	BLOCK LENGTH							
7								(LSB)

This block descriptor format shall apply only to direct-access devices. When the LONGLBA bit is set to zero (see 7.4.3), all other device types shall use the block descriptor format described in 7.4.4.1.

Block descriptors specify some of the medium characteristics for a logical unit. Support for block descriptors is optional. Each block descriptor contains a DENSITY CODE field, a NUMBER OF BLOCKS field, and a BLOCK LENGTH field. A unit attention condition (see 6.7 and SAM-2) shall be generated when any block descriptor values are changed.

The NUMBER OF BLOCKS field specifies the number of logical blocks on the medium to which the DENSITY CODE and BLOCK LENGTH fields apply. A value of zero indicates that all of the remaining logical blocks of the logical unit shall have the medium characteristics specified.

If the number of logical blocks on the medium exceeds the maximum value that may be specified in the NUMBER OF BLOCKS field a value of FFFF FFFFh indicates that all of the remaining logical blocks of the logical unit shall have the medium characteristics specified.

If the SCSI device doesn't support changing its capacity by changing the NUMBER OF BLOCKS field using the MODE SELECT command, the value in the NUMBER OF BLOCKS field is ignored. If the device supports changing its capacity by changing the NUMBER OF BLOCKS field, then the NUMBER OF BLOCKS field is interpreted as follows:

- If the number of blocks is set to zero, the device shall retain its current capacity if the block size has not changed. If the number of blocks is set to zero and the block size has changed, the device shall be set to its maximum capacity when the new block size takes effect;
- If the number of blocks is greater than zero and less than or equal to its maximum capacity, the device shall be set to that number of blocks. If the block size has not changed, the device shall not become format corrupted. This capacity setting shall be retained through power cycles, hard resets, logical unit resets, and I_T nexus losses;
- If the number of blocks field is set to a value greater than the maximum capacity of the device and less than FFFF FFFFh, then the command is terminated with a CHECK CONDITION status. The sense key is set to ILLEGAL REQUEST. The device shall retain its previous block descriptor settings; or
- If the number of blocks is set to FFFF FFFFh, the device shall be set to its maximum capacity. If the block size has not changed, the device shall not become format corrupted. This capacity setting shall be retained through power cycles, hard resets, logical unit resets, and I_T nexus losses.

NOTE 53 - There may be implicit association between parameters defined in the mode pages and block descriptor. For direct-access devices, the block length affects the optimum values (i.e., the values that achieves the best performance) for the sectors per track, bytes per physical sector, track skew factor, and cylinder skew factor fields in the format parameters mode page. In this case, the target may change parameters not explicitly sent with the MODE SELECT command. A subsequent MODE SENSE command may be used to detect these changes.

The DENSITY CODE field is unique for each device type. Refer to the mode parameters subclause of the specific device type command standard (see 3.1.17) for the definition of this field. Some device types reserve all or part of this field.

The BLOCK LENGTH field specifies the length in bytes of each logical block described by the block descriptor.

7.4.4.3 Long LBA block descriptor format

When the LONGLBA bit is set to one (see 7.4.3), the mode parameter block descriptor format for all device types is shown in table 218.

Table 218 — Long LBA mode parameter block descriptor

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB) _____							
7	NUMBER OF BLOCKS _____ (LSB)							
8	DENSITY CODE							
9	Reserved							
10	Reserved							
11	Reserved							
12	(MSB) _____							
15	BLOCK LENGTH _____ (LSB)							

Block descriptors specify some of the medium characteristics for all or part of a logical unit. Support for block descriptors is optional. Each block descriptor contains a DENSITY CODE field, a NUMBER OF BLOCKS field, and a BLOCK LENGTH field. Block descriptor values are always current (i.e., saving is not supported). A unit attention condition (see 6.7 and SAM-2) shall be generated when any block descriptor values are changed.

The NUMBER OF BLOCKS field specifies the number of logical blocks on the medium to which the DENSITY CODE and BLOCK LENGTH fields apply. A value of zero indicates that all of the remaining logical blocks of the logical unit shall have the medium characteristics specified.

If the SCSI device doesn't support changing its capacity by changing the NUMBER OF BLOCKS field using the MODE SELECT command, the value in the NUMBER OF BLOCKS field is ignored. If the device supports changing its capacity by changing the NUMBER OF BLOCKS field, then the NUMBER OF BLOCKS field is interpreted as follows:

- a) If the number of blocks is set to zero, the device shall retain its current capacity if the block size has not changed. If the number of blocks is set to zero and the block size has changed, the device shall be set to its maximum capacity when the new block size takes effect;
- b) If the number of blocks is greater than zero and less than or equal to its maximum capacity, the device shall be set to that number of blocks. If the block size has not changed, the device shall not become format corrupted. This capacity setting shall be retained through power cycles, hard resets, logical unit resets, and I_T nexus losses;

- c) If the number of blocks field is set to a value greater than the maximum capacity of the device and less than FFFF FFFF FFFF FFFFh, then the command is terminated with a CHECK CONDITION status. The sense key is set to ILLEGAL REQUEST. The device shall retain its previous block descriptor settings; or
- d) If the number of blocks is set to FFFF FFFF FFFF FFFFh, the device shall be set to its maximum capacity. If the block size has not changed, the device shall not become format corrupted. This capacity setting shall be retained through power cycles, hard resets, logical unit resets, and I_T nexus losses.

NOTE 54 - There may be implicit association between parameters defined in the mode pages and block descriptor. For direct-access devices, the block length affects the optimum values (i.e., the values that achieves the best performance) for the sectors per track, bytes per physical sector, track skew factor, and cylinder skew factor fields in the format parameters mode page. In this case, the target may change parameters not explicitly sent with the MODE SELECT command. A subsequent MODE SENSE command may be used to detect these changes.

The DENSITY CODE field is unique for each device type. Refer to the mode parameters subclause of the specific device type command standard (see 3.1.17) for the definition of this field. Some device types reserve all or part of this field.

The BLOCK LENGTH field specifies the length in bytes of each logical block described by the block descriptor.

7.4.5 Mode page and subpage formats and page codes

The page_0 mode page format is defined in table 219.

Table 219 — Page_0 mode page format

Bit Byte	7	6	5	4	3	2	1	0
0	PS	SPF (0b)	PAGE CODE					
1	PAGE LENGTH (n-1)							
2	Mode parameters							
n								

The sub_page mode page format is defined in table 219.

Table 220 — Sub_page mode page format

Bit Byte	7	6	5	4	3	2	1	0
0	PS	SPF (1b)	PAGE CODE					
1	SUBPAGE CODE							
2	(MSB)	PAGE LENGTH (n-3)						
3								(LSB)
4	Mode parameters							
n								

A SubPage Format (SPF) bit of zero indicates that the page_0 mode page format is being used. A SPF bit of one indicates that the sub_page mode page format is being used.

Each mode page contains a PAGE CODE field, a PAGE LENGTH field, and a set of mode parameters. The page codes are defined in this subclause and in the mode parameter subclauses in the command standard (see 3.1.17) for the specific device type. Each mode page with a SPF bit equal to one contains a SUBPAGE CODE field.

When using the MODE SENSE command, a parameters saveable (PS) bit of one indicates that the mode page may be saved by the target in a nonvolatile, vendor specific location. A PS bit of zero indicates that the supported parameters cannot be saved. When using the MODE SELECT command, the PS bit is reserved.

The PAGE CODE and SUBPAGE CODE fields identify the format and parameters defined for that mode page. Some page codes are defined as applying to all device types and other page codes are defined for the specific device type. The page codes that apply to a specific device type are defined in the command standard (see 3.1.17) for that device type. The applicability of each subpage code matches that of the page code with which it is associated.

When using the MODE SENSE command, if page code 00h (vendor specific mode page) is implemented, the device server shall return that mode page last in response to a request to return all mode pages (page code 3Fh). When using the MODE SELECT command, this mode page should be sent last.

The PAGE LENGTH field specifies the length in bytes of the mode parameters that follow. If the application client does not set this value to the value that is returned for the mode page by the MODE SENSE command, the device server shall terminate the command with CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST with the additional sense code set to INVALID FIELD IN PARAMETER LIST. The target is permitted to implement a mode page that is less than the full mode page length defined in this standard, provided no field is truncated and the PAGE LENGTH field correctly specifies the actual length implemented.

The mode parameters for each mode page are defined in the following subclauses, or in the mode parameters subclause in the command standard (see 3.1.17) for the specific device type. Mode parameters not implemented by the target shall be set to zero.

Table 221 defines the mode pages that are applicable to all device types that implement the MODE SELECT and MODE SENSE commands.

Table 221 — Mode page codes

Page code	Mode Page Name	Reference
0Ah	Control	7.4.6
02h	Disconnect-Reconnect	7.4.7
15h	Extended	7.4.8
16h	Extended Device-Type Specific	7.4.9
1Ch	Informational Exceptions Control	7.4.10
09h	obsolete	3.3.7
1Ah	Power Condition	7.4.11
18h	Protocol Specific LUN	7.4.12
19h	Protocol Specific Port	7.4.13
17h	Reserved	
01h	(See specific device type)	
03h - 08h	(See specific device type)	
0Bh - 14h	(See specific device type)	
1Bh	(See specific device type)	
1Dh - 1Fh	(See specific device type)	
00h	Vendor specific (does not require page format)	
20h - 3Eh	(See specific device type)	
3Fh	Return all pages (valid only for the MODE SENSE command)	

7.4.6 Control mode page

The Control mode page (see table 222) provides controls over several SCSI features that are applicable to all device types such as tagged queuing and error logging.

Table 222 — Control mode page

Bit Byte	7	6	5	4	3	2	1	0
0	PS	SPF (0b)	PAGE CODE (0Ah)					
1	PAGE LENGTH (0Ah)							
2	TST			Reserved		D_SENSE	GLTSD	RLEC
3	QUEUE ALGORITHM MODIFIER				Reserved	QERR		DQUE
4	TAS	RAC	UA_INTLCK_CTRL		SWP	Obsolete		
5	Reserved					AUTOLOAD MODE		
6	Obsolete							
7								
8	(MSB)	BUSY TIMEOUT PERIOD						
9								(LSB)
10	(MSB)	EXTENDED SELF-TEST COMPLETION TIME						
11								(LSB)

A task set type field (TST) specifies the type of task set in the logical unit (see table 223).

Table 223 — Task set type

Value	Description
000b	The logical unit maintains one task set for all initiators
001b	The logical unit maintains separate task sets for each initiator
010b - 111b	Reserved

If the logical unit maintains separate mode pages for each initiator, the TST field, if changeable, shall reflect in all initiator mode pages the state selected by the most recent MODE SELECT from any initiator. If the most recent MODE SELECT changes the setting of this field the device server shall establish a unit attention condition for all initiators except the one that issued the MODE SELECT command (see SAM-2). The device server shall set the additional sense code to MODE PARAMETERS CHANGED.

A descriptor format sense data (D_SENSE) bit of zero indicates that the device server shall return the fixed format sense data (see 4.5.3) in the same I_T_L_Q nexus transaction (see 3.1.39) as a CHECK CONDITION status. A D_SENSE bit of one indicates that the device server shall return descriptor format sense data (see 4.5.2) in the same I_T_L_Q nexus transaction as a CHECK CONDITION status.

A global logging target save disable (GLTSD) bit of zero allows the target to provide a target-defined method for saving log parameters. A GLTSD bit of one indicates that either the target has disabled the target-defined method for saving log parameters or when set by the initiator specifies that the target-defined method shall be disabled.

A report log exception condition (RLEC) bit of one specifies that the device server shall report log exception conditions as described in 7.2.1. A RLEC bit of zero specifies that the device server shall not report log exception conditions.

The QUEUE ALGORITHM MODIFIER field (see table 224) specifies restrictions on the algorithm used for reordering tasks having the SIMPLE task attribute.

Table 224 — Queue algorithm modifier

Value	Description
0h	Restricted reordering
1h	Unrestricted reordering allowed
2h - 7h	Reserved
8h - Fh	Vendor specific

A value of zero in the QUEUE ALGORITHM MODIFIER field specifies that the device server shall order the processing sequence of tasks having the SIMPLE task attribute such that data integrity is maintained for that initiator. This means that, if the transmission of new service delivery requests is halted at any time, the final value of all data observable on the medium shall have exactly the same value as it would have if all the tasks had been given the ORDERED task attribute. The restricted reordering value shall be the default value.

A value of one in the QUEUE ALGORITHM MODIFIER field specifies that the device server may reorder the processing sequence of tasks having the SIMPLE task attribute in any manner. Any data integrity exposures related to task sequence order shall be explicitly handled by the application client through the selection of appropriate commands and task attributes.

The queue error management (QERR) field (see table 225) specifies how the device server shall handle other tasks when one task receives a CHECK CONDITION status (see SAM-3). The task set type (see the TST field definition above in this subclause) defines which other tasks are affected. If TST field equals 000b, then all tasks from all initiators are affected. If TST field equals 001b, then only tasks from the initiator that receives the CHECK CONDITION status are affected.

Table 225 — Queue error management (QERR) field

Value	Definition
00b	If an ACA condition is established, the affected tasks in the task set shall resume after the ACA condition is cleared (see SAM-3). Otherwise, all tasks shall be processed as if no error occurred.
01b	All the affected tasks in the task set shall be aborted when the CHECK CONDITION status is sent. If the TAS bit is zero, a unit attention condition (see SAM-2) shall be generated for each initiator that had tasks aborted except for the initiator to which the CHECK CONDITION status was sent. The device server shall set the additional sense code to COMMANDS CLEARED BY ANOTHER INITIATOR. If the TAS bit is one, all affected tasks for initiators other than the initiator for which the CHECK CONDITION status was sent shall be completed with a TASK ABORTED status and no unit attention shall be generated. For the initiator to which the CHECK CONDITION status is sent, no status shall be sent for the tasks that are aborted.
10b	Reserved
11b	Affected tasks in the task set belonging to the initiator to which a CHECK CONDITION status is sent shall be aborted when the status is sent.

A disable queuing (DQUE) bit of zero specifies that tagged queuing shall be enabled if the device server supports tagged queuing. A DQUE bit of one specifies that tagged queuing shall be disabled. Any queued commands received by the device server shall be aborted. The method used to abort queued commands is protocol specific.

A task aborted status (TAS) bit of zero specifies that aborted tasks shall be terminated by the device server without any response to the initiator. A TAS bit of one specifies that tasks aborted by the actions of another initiator shall be terminated with a TASK ABORTED status (see SAM-2).

The report a check (RAC) bit provides control of reporting long busy conditions or CHECK CONDITION status. A RAC bit of one specifies that a CHECK CONDITION status should be reported rather than a long busy condition (e.g., longer than the BUSY TIMEOUT PERIOD). A RAC bit of zero specifies that long busy conditions (e.g., busy condition during auto contingent allegiance) may be reported.

The unit attention interlocks control (UA_INTLCK_CTRL) field (see table 226) controls the clearing of unit attention conditions reported in the same I_T_L_Q nexus transaction (see 3.1.39) as a CHECK CONDITION status and whether returning a status of BUSY, TASK SET FULL or RESERVATION CONFLICT results in the establishment of a unit attention condition (see SAM-3).

Table 226 — Unit attention interlocks control (UA_INTLCK_CTRL) field

Value	Definition
00b	The logical unit shall clear any unit attention condition reported in the same I_T_L_Q nexus transaction as a CHECK CONDITION status and shall not establish a unit attention condition when a task is terminated with BUSY, TASK SET FULL, or RESERVATION CONFLICT status.
01b	Reserved
10b	The logical unit shall not clear any unit attention condition reported in the same I_T_L_Q nexus transaction as a CHECK CONDITION status and shall not establish a unit attention condition when a task is terminated with BUSY, TASK SET FULL, or RESERVATION CONFLICT status.
11b	The logical unit shall not clear any unit attention condition reported in the same I_T_L_Q nexus transaction as a CHECK CONDITION status and shall establish a unit attention condition for the initiator port that is the source of a task being terminated with BUSY, TASK SET FULL, or RESERVATION CONFLICT status. Depending on the status, the device server shall set the additional sense code to PREVIOUS BUSY STATUS, PREVIOUS TASK SET FULL STATUS, or PREVIOUS RESERVATION CONFLICT STATUS. Until it is cleared by a REQUEST SENSE command, a unit attention condition shall be established only once for a BUSY, TASK SET FULL, or RESERVATION CONFLICT status regardless to the number of commands terminated with one of those status values.
NOTE 1 Even when UA_INTLCK_CTRL equals 10b or 11b, a REQUEST SENSE command still clears any unit attention condition that it reports.	

A software write protect (SWP) bit of one specifies that the logical unit shall inhibit writing to the medium after writing all cached or buffered write data, if any. When SWP is one, all commands requiring writes to the medium shall return CHECK CONDITION status and shall set the sense key to DATA PROTECT and the additional sense code to WRITE PROTECTED. When SWP is one and the device model defines a write protect (WP) bit in the DEVICE-SPECIFIC PARAMETER field in the mode parameter header, the WP bit shall be set to one for subsequent MODE SENSE commands. A SWP bit of zero specifies that the logical unit may allow writing to the medium, depending on other write inhibit mechanisms implemented by the logical unit. When the SWP bit is zero, the value of the WP bit, if defined, is device model specific. For a list of commands affected by the SWP bit and details of the WP bit see the command standard (see 3.1.17) for the specific device type.

The AUTOLOAD MODE field specifies the action to be taken by a removable medium device server when a medium is inserted. For devices other than removable medium devices, this field is reserved. Table 227 shows the usage of the AUTOLOAD MODE field.

Table 227 — AUTOLOAD MODE field

Value	Definition
000b	Medium shall be loaded for full access.
001b	Medium shall be loaded for medium auxiliary memory access only.
010b	Medium shall not be loaded.
011b - 111b	Reserved

The BUSY TIMEOUT PERIOD field specifies the maximum time, in 100 milliseconds increments, that the initiator allows for the target to remain busy for unanticipated conditions that are not a routine part of commands from the initiator. This value may be rounded down as defined in 5.3. A 0000h value in this field is undefined by this standard. An FFFFh value in this field is defined as an unlimited period.

The EXTENDED SELF-TEST COMPLETION TIME field contains advisory data that an application client may use to determine the time in seconds that the device server requires to complete an extended self-test when the device server is not interrupted by subsequent commands and no errors occur during execution of the self-test. The application client should expect this time to increase significantly if other commands are sent to the logical unit while a self-test is in progress or if errors occur during execution of the self-test. Device servers supporting SELF-TEST CODE field values other than 000b for the SEND DIAGNOSTIC command (see 6.26), shall support the EXTENDED SELF-TEST COMPLETION TIME field.

Bits 0, 1, and 2 of byte 4 as well as bytes 6 and 7 provide controls for the obsolete asynchronous event reporting feature.

7.4.7 Disconnect-Reconnect mode page

The Disconnect-Reconnect mode page (see table 228) provides the application client the means to tune the performance of the service delivery subsystem. The name for this mode page, disconnect-reconnect, comes from the SCSI parallel interface.

Table 228 — Disconnect-Reconnect mode page

Bit Byte	7	6	5	4	3	2	1	0
0	PS	SPF (0b)	PAGE CODE (02h)					
1	PAGE LENGTH (0Eh)							
2	BUFFER FULL RATIO							
3	BUFFER EMPTY RATIO							
4	(MSB)	BUS INACTIVITY LIMIT						
5								(LSB)
6	(MSB)	DISCONNECT TIME LIMIT						
7								(LSB)
8	(MSB)	CONNECT TIME LIMIT						
9								(LSB)
10	(MSB)	MAXIMUM BURST SIZE						
11								(LSB)
12	EMDP	FAIR ARBITRATION			DIMM	DTDC		
13	Reserved							
14	(MSB)	FIRST BURST SIZE						
15								(LSB)

The Disconnect-Reconnect mode page controls parameters that affect one or more target ports. The parameters that may be implemented are specified in the SCSI transport protocol standard (see 3.1.75) for the target port. If a target device has multiple target ports, changes in the parameters for one target port should not affect other target ports.

The parameters for a target port affect its behavior regardless of which initiator port is forming an I_T nexus with the target port. The parameters may be accessed by MODE SENSE (see 6.9) and MODE SELECT (see 6.7) commands directed to any logical unit accessible through the target port. If a parameter value is changed, all logical units accessible through the target port shall establish a unit attention condition with an additional sense code of MODE PARAMETERS CHANGED for all initiator ports that form I_T_L nexuses through that target port except the initiator port which made the change.

If a parameter that is not appropriate for the specific SCSI protocol implemented by the target port is non-zero, the device server shall return CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST and the additional sense code set to ILLEGAL FIELD IN PARAMETER LIST.

An interconnect tenancy is a period of time during which a given pair of SCSI ports are accessing the interconnect layer to communicate with each other. For example, on arbitrated interconnects, a tenancy typically begins when a SCSI port successfully arbitrates for the interconnect and ends when the SCSI port releases the interconnect for use by other devices. Data and other information transfers take place during interconnect tenancies.

The BUFFER FULL RATIO field indicates to the target port, during read operations, how full the buffer should be prior to requesting an interconnect tenancy. target ports that do not implement the requested ratio should round down to the nearest implemented ratio as defined in 5.3.

The BUFFER EMPTY RATIO field indicates to the target port, during write operations, how empty the buffer should be prior to requesting an interconnect tenancy. target ports that do not implement the requested ratio should round down to the nearest implemented ratio as defined in 5.3.

The buffer full and buffer empty ratios are numerators of a fractional multiplier that has 256 as its denominator. A value of zero indicates that the target port determines when to request an interconnect tenancy consistent with the disconnect time limit parameter. These parameters are advisory to the target port.

NOTE 55 - As an example, consider a target port with ten 512-byte buffers and a specified buffer full ratio of 3Fh. The formula is: $\text{INTEGER}((\text{ratio}/256) * \text{number of buffers})$. Therefore in this example $\text{INTEGER}((3\text{Fh}/256) * 10) = 2$. During the read operations described in this example, the target port should request an interconnect tenancy whenever two or more buffers are full.

The BUS INACTIVITY LIMIT field indicates the maximum time that the target port is permitted to maintain an interconnect tenancy without data or information transfer. If the bus inactivity limit is exceeded the target port shall conclude the interconnect tenancy, within the restrictions placed on it by the applicable SCSI protocol. The contents of the DTDC field in this mode page also shall affect the duration of an interconnect tenancy. This value may be rounded as defined in 5.3. A value of zero indicates that there is no bus inactivity limit. Different SCSI protocols specify different units of measure for the bus inactivity limit.

The DISCONNECT TIME LIMIT field indicates the minimum time that the target port shall wait between interconnect tenancies. This value may be rounded as defined in 5.3. A value of zero indicates that there is no disconnect time limit. Different SCSI protocols specify different units of measure for the disconnect time limit.

The CONNECT TIME LIMIT field indicates the maximum duration of a single interconnect tenancy. If the connect time limit is exceeded the target port shall conclude the interconnect tenancy, within the restrictions placed on it by the applicable SCSI protocol. The contents of the DTDC field in this mode page also shall affect the duration of an interconnect tenancy. This value may be rounded as defined in 5.3. A value of zero indicates that there is no connect time limit. Different SCSI protocols specify different units of measure for the connect time limit.

The MAXIMUM BURST SIZE field indicates the maximum amount of data that the target port shall transfer during a single data transfer operation. This value is expressed in increments of 512 bytes (e.g., a value of one means 512 bytes, two means 1024 bytes, etc.). The relationship (if any) between data transfer operations and interconnect tenancies is specified in the individual SCSI protocol standards. A value of zero indicates there is no limit on the amount of data transferred per data transfer operation.

In terms of the SCSI protocol services (see SAM-3), the device server shall limit the Request Byte Count argument to the **Receive Data-Out** protocol service and the **Send Data-In** protocol service to the amount specified in the MAXIMUM BURST SIZE field.

The enable modify data pointers (EMDP) bit indicates whether or not the target port may transfer data out of order. If the EMDP bit is zero, the target port shall not transfer data out of order. If the EMDP bit is one, the target port is allowed to transfer data out of order.

The FAIR ARBITRATION field indicates whether the target port should use fair or unfair arbitration when requesting an interconnect tenancy. The field may be used to indicate different fairness methods as specified in the individual SCSI protocol standards.

A disconnect immediate (DIIM) bit of zero indicates that the target port may transfer data for a command during the same interconnect tenancy in which it receives the command. Whether or not the target port does so may depend

upon the target port's internal algorithms, the rules of the applicable SCSI protocol, and settings of the other parameters in this mode page. A disconnect immediate (DIIMM) bit of one indicates that the target port shall not transfer data for a command during the same interconnect tenancy in which it receives the command.

The data transfer disconnect control (DTDC) field (see table 229) defines other restrictions on when multiple interconnect tenancies are permitted. A non-zero value in the DTDC field shall take precedence over other interconnect tenancy controls represented by other fields in this mode page.

Table 229 — Data transfer disconnect control

DTDC	Description
000b	Data transfer disconnect control is not used. Interconnect tenancies are controlled by other fields in this mode page.
001b	A target shall transfer all data for a command within a single interconnect tenancy.
010b	Reserved
011b	A target shall transfer all data for a command and complete the command within a single interconnect tenancy.
100b - 111b	Reserved

The FIRST BURST SIZE field indicates the maximum amount of data that may be transferred to the target port for a command along with the command (i.e., the first burst). This value is expressed in increments of 512 bytes; a value of one means 512 bytes, two means 1024 bytes, etc. The meaning of a value of zero is SCSI transport protocol specific. SCSI transport protocols supporting this field shall provide an additional mechanism to enable and disable the first burst function.

In terms of the SCSI protocol services (see SAM-3), the **Receive Data-Out** protocol service shall retrieve the first FIRST BURST SIZE amount of data from the first burst.

7.4.8 Extended mode page

The Extended mode page (see table 230) provides a means to specify subpages that are defined for all device types. Subpage code 00h is reserved, therefore all Extended mode pages use the sub_page format.

Table 230 — Extended mode page

Bit Byte	7	6	5	4	3	2	1	0
0	PS	SPF (1b)	PAGE CODE (15h)					
1	SUBPAGE CODE							
2	(MSB)							
3	PAGE LENGTH (n-3)							(LSB)
4	Subpage specific mode parameters							
n								

7.4.9 Extended Device-Type Specific mode page

The Extended Device-Type Specific mode page (see table 231) provides a means to specify subpages that are defined differently for each device type. Subpage code 00h is reserved, therefore all Extended Device-Type Specific mode pages use the sub_page format.

Table 231 — Extended Device-Type Specific mode page

Bit Byte	7	6	5	4	3	2	1	0
0	PS	SPF (1b)	PAGE CODE (16h)					
1	SUBPAGE CODE							
2	PAGE LENGTH (n-3)							
3								
4	(LSB)							
n	Subpage specific mode parameters							

7.4.10 Informational Exceptions Control mode page

The Informational Exceptions Control mode page (see table 232) defines the methods used by the target to control the reporting and the operations of specific informational exception conditions. This page shall only apply to informational exceptions that report an additional sense code of FAILURE PREDICTION THRESHOLD EXCEEDED or WARNING to the application client.

Informational exception conditions occur as the result of vendor specific events within a target. An informational exception condition may occur asynchronous to any commands issued by an application client.

NOTE 56 - Storage devices that support SMART (Self-Monitoring Analysis and Reporting Technology) for predictive failure software should use informational exception conditions.

Table 232 — Informational Exceptions Control mode page

Bit Byte	7	6	5	4	3	2	1	0
0	PS	SPF (0b)	PAGE CODE (1Ch)					
1	PAGE LENGTH (0Ah)							
2	PERF	Reserved	EBF	EWASC	DEXCPT	TEST	Reserved	LOGERR
3	Reserved				MRIE			
4	INTERVAL TIMER							
7								
8	REPORT COUNT							
11								

The log errors bit (LOGERR) of zero indicates that the logging of informational exception conditions by a device server is vendor specific. A LOGERR bit of one indicates the device server shall log informational exception conditions.

A TEST bit of one shall create a test device failure at the next interval time, as specified by the INTERVAL TIMER field, if the DEXCPT bit is set to zero. When the TEST bit is one, the MRIE and REPORT COUNT fields shall apply as if the TEST bit were zero. The test device failure shall be reported with an additional sense code of FAILURE PREDICTION THRESHOLD EXCEEDED (FALSE). If both the TEST and the DEXCPT bits are one, the device server shall terminate the MODE SELECT command with CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST with the additional sense code set to INVALID FIELD IN PARAMETER LIST. A TEST bit of zero shall instruct the device server not to generate any test device failure notifications.

A disable exception control (DEXCPT) bit of zero indicates the failure prediction threshold exceeded reporting shall be enabled. The method for reporting the failure prediction threshold exceeded when the DEXCPT bit is set to zero is determined from the MRIE field. A DEXCPT bit of one indicates the target shall disable reporting of the failure prediction threshold exceeded. The MRIE field is ignored when DEXCPT is set to one and EWASC is set to zero.

An enable warning (EWASC) bit of zero indicates the target shall disable reporting of the warning. The MRIE field is ignored when DEXCPT is set to one and EWASC is set to zero. An EWASC bit of one indicates warning reporting shall be enabled. The method for reporting the warning when the EWASC bit is set to one is determined from the MRIE field.

If background functions are supported, an Enable Background Function (EBF) bit of one indicates the target shall enable background functions. An EBF bit of zero indicates the target shall disable the functions.

For the purposes of the EBF bit, background functions are defined as idle time functions that may impact performance that are performed by a target operating without errors but do not impact the reliability of the target (e.g., read scan).

A performance (PERF) bit of zero indicates that informational exception operations that are the cause of delays are acceptable. A PERF bit of one indicates the device server shall not cause delays while doing informational exception operations. A PERF bit set to one may cause the device server to disable some or all of the informational exceptions operations, thereby limiting the reporting of informational exception conditions.

The method of reporting informational exceptions field (MRIE) indicates the methods that shall be used by the device server to report informational exception conditions (see table 233). The priority of reporting multiple information exceptions is vendor specific.

Table 233 — Method of reporting informational exceptions (MRIE) field (part 1 of 2)

MRIE	Description
0h	No reporting of informational exception condition: This method instructs the device server to not report information exception conditions.
1h	Asynchronous event reporting: Obsolete
2h	<p>Generate unit attention: This method instructs the device server to report informational exception conditions by returning a CHECK CONDITION status. The sense key shall be set to UNIT ATTENTION and the additional sense code shall indicate the cause of the informational exception condition.</p> <p>The command that has the CHECK CONDITION shall not be executed before the informational exception condition is reported.</p>
^a The Read-Write Error Recovery mode page is described in the applicable command standard (see 3.1.17).	

Table 233 — Method of reporting informational exceptions (MRIE) field (part 2 of 2)

MRIE	Description
3h	<p>Conditionally generate recovered error: This method instructs the device server to report informational exception conditions, if the reporting of recovered errors is allowed, by returning a CHECK CONDITION status. If the TEST bit equals zero, the status may be returned after the informational exception condition occurs on any command for which GOOD status would have been returned. If the TEST bit equals one, the status shall be returned on the next command that is normally capable of returning an informational exception condition when the TEST bit equals zero. The sense key shall be set to RECOVERED ERROR and the additional sense code shall indicate the cause of the informational exception condition.</p> <p>The command that returns the CHECK CONDITION for the informational exception shall complete without error before any informational exception condition may be reported.</p>
4h	<p>Unconditionally generate recovered error: This method instructs the device server to report informational exception conditions, regardless of the value of the post error (PER) bit of the Read-Write Error Recovery mode page,^a by returning a CHECK CONDITION status. If the TEST bit equals zero, the status may be returned after the informational exception condition occurs on any command for which GOOD status would have been returned. If the TEST bit equals one, the status shall be returned on the next command that is normally capable of returning an informational exception condition when the TEST bit equals zero. The sense key shall be set to RECOVERED ERROR and the additional sense code shall indicate the cause of the informational exception condition.</p> <p>The command that returns the CHECK CONDITION for the informational exception shall complete without error before any informational exception condition may be reported.</p>
5h	<p>Generate no sense: This method instructs the device server to report informational exception conditions by returning a CHECK CONDITION status. If the TEST bit equals zero, the status may be returned after the informational exception condition occurs on any command for which GOOD status would have been returned. If the TEST bit equals one, the status shall be returned on the next command that is normally capable of returning an informational exception condition when the TEST bit equals zero. The sense key shall be set to NO SENSE and the additional sense code shall indicate the cause of the informational exception condition.</p> <p>The command that returns the CHECK CONDITION for the informational exception shall complete without error before any informational exception condition may be reported.</p>
6h	<p>Only report informational exception condition on request: This method instructs the device server to preserve the informational exception(s) information. To find out about information exception conditions the application client polls the device server by issuing a REQUEST SENSE command. The sense key shall be set to NO SENSE and the additional sense code shall indicate the cause of the informational exception condition.</p>
7h - Bh	Reserved
Ch - Fh	Vendor specific
<p>^a The Read-Write Error Recovery mode page is described in the applicable command standard (see 3.1.17).</p>	

The INTERVAL TIMER field indicates the period in 100 millisecond increments for reporting that an informational exception condition has occurred. The device server shall not report informational exception conditions more frequently than the time specified by the INTERVAL TIMER field and shall report them after the time specified by INTERVAL TIMER field has elapsed. After the informational exception condition has been reported the interval timer

shall be restarted. A value of zero or FFFF FFFFh in the INTERVAL TIMER field shall indicate that the period for reporting an informational exception condition is vendor specific.

The REPORT COUNT field indicates the number of times to report an informational exception condition to the application client. A value of zero in the REPORT COUNT field indicates there is no limit on the number of times the device server reports an informational exception condition.

The maintaining of the interval timer and the report counter across power cycles, hard resets, logical unit resets, and I_T nexus losses is vendor specific.

7.4.11 Power Condition mode page

The Power Condition mode page provides an application client the methods to control the power condition of a target port and/or logical unit (see 5.8). These methods include causing the target port and/or logical unit to transition to a specified power condition without delay and activating and setting of idle condition and standby condition timers to specify that the logical unit wait for a period of inactivity before transitioning to a specified power condition.

When a device server receives a command while in a power condition based on a setting in the Power Condition mode page, the logical unit shall transition to the power condition that allows the command to be processed. If either the idle condition timer or the standby condition timer has been set, they shall be reset on receipt of the command. On completion of the command, the timer(s) shall be started.

Logical units that contain cache memory shall write all cached data to the medium for the logical unit (e.g., as a logical unit would do in response to a SYNCHRONIZE CACHE command as described in SBC-2) prior to entering into any power condition that prevents accessing the media (e.g., before a hard drive stops its spindle motor during transition to the standby power condition).

The logical unit shall use the values in the Power Condition mode page to control its power condition after a power on or a hard reset until a START STOP UNIT command setting a power condition is received.

Table 234 defines the Power Condition mode page.

Table 234 — Power Condition mode page

Bit Byte	7	6	5	4	3	2	1	0
0	PS	SPF (0b)	PAGE CODE (1Ah)					
1	PAGE LENGTH (0Ah)							
2	Reserved							
3	Reserved						IDLE	STANDBY
4	(MSB) IDLE CONDITION TIMER (LSB)							
7								
8	(MSB) STANDBY CONDITION TIMER (LSB)							
11								

The IDLE and STANDBY bits specify which timers are active.

If the IDLE bit is set to one and the STANDBY bit is set to zero, then the idle condition timer is active and the device server shall transition to the idle power condition when the idle condition timer is zero.

If the IDLE bit is set to zero, then the device server shall ignore the idle condition timer.

If the STANDBY bit is set to one and the IDLE bit is set to zero, then the standby condition timer is active and the device server shall transition to the standby power condition when the standby condition timer is zero.

If the STANDBY bit is set to zero, then the device server shall ignore the standby condition timer.

If both the IDLE and STANDBY bits are set to one, then both timers are active and run concurrently. When the idle condition timer is zero the device server shall transition to the idle power condition. When the standby condition

timer is zero the device server shall transition to the standby power condition. If the standby condition timer is zero before the idle condition timer is zero, then the logical unit shall transition to the standby power condition.

The value in the IDLE CONDITION TIMER field specifies the inactivity time in 100 millisecond increments that the logical unit shall wait before transitioning to the idle power condition when the IDLE bit is set to one. The idle condition timer is expired when:

- a) The IDLE CONDITION TIMER field is set to zero; or
- b) The number of milliseconds specified by the value in the IDLE CONDITION TIMER field times 100 milliseconds has elapsed since the last activity.

The value in the STANDBY CONDITION TIMER field specifies the inactivity time in 100 millisecond increments that the logical unit shall wait before transitioning to the standby power condition when the STANDBY bit is set to one. The standby condition timer is expired when:

- a) The STANDBY CONDITION TIMER field is set to zero; or
- b) The number of milliseconds specified by the value in the STANDBY CONDITION TIMER field times 100 milliseconds has elapsed since the last activity.

7.4.12 Protocol Specific Logical Unit mode page

The Protocol Specific Logical Unit mode page (see table 235) provides protocol specific controls that are associated with a logical unit.

Table 235 — Protocol Specific Logical Unit mode page

Bit Byte	7	6	5	4	3	2	1	0
0	PS	SPF (0b)	PAGE CODE (18h)					
1	PAGE LENGTH (n-1)							
2	Reserved				PROTOCOL IDENTIFIER			
3	Protocol specific mode parameters							
n								

During an I_T_L nexus, the Protocol Specific Logical Unit mode page controls parameters that affect both:

- a) One or more target ports; and
- b) The logical unit.

The parameters that may be implemented are specified in the SCSI transport protocol standard (see 3.1.75) for the target port. If a logical unit is accessible through multiple target ports, changes in the parameters for one target port should not affect other target ports.

The parameters for a target port and logical unit affect their behavior regardless of which initiator port is forming an I_T_L nexus with the target port and logical unit. If a parameter value is changed, the logical unit shall establish a unit attention condition with an additional sense code of MODE PARAMETERS CHANGED for all initiator ports that form I_T_L nexuses through that target port other than the initiator port which made the change.

The PROTOCOL IDENTIFIER field (see 7.5.1) indicates the SCSI transport protocol to which the mode page applies. For a MODE SENSE command (see 6.9), the device server shall set the PROTOCOL IDENTIFIER field to one of the values shown in table 238 (see 7.5.1) to indicate the SCSI transport protocol used by the target port through which the MODE SENSE command is being processed. For a MODE SELECT command (see 6.7), the application client

shall set the PROTOCOL IDENTIFIER field to one of the values shown in table 238 indicating the SCSI transport protocol to which the protocol specific mode parameters apply. If a device server receives a mode page containing a transport protocol identifier value other than the one used by the target port through which the MODE SELECT command is being processed, it shall terminate the command with a CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to INVALID FIELD IN PARAMETER LIST.

7.4.13 Protocol Specific Port mode page

The Protocol Specific Port mode page provides protocol specific controls that are associated with a SCSI port. The page_0 format (see table 236) is used for subpage 00h and sub_page format (see table 237) is used for subpages 01h through FEh. See the SCSI protocol standard (see 3.1.75) for definition of the protocol specific mode parameters.

Table 236 — Page_0 format Protocol Specific Port mode page

Bit Byte	7	6	5	4	3	2	1	0
0	PS	SPF (0b)	PAGE CODE (19h)					
1	PAGE LENGTH (n-1)							
2	Reserved				PROTOCOL IDENTIFIER			
3	Protocol specific mode parameters							
n								

Table 237 — Sub_page format Protocol Specific Port mode page

Bit Byte	7	6	5	4	3	2	1	0
0	PS	SPF (1b)	PAGE CODE (19h)					
1	SUBPAGE CODE							
2	(MSB) _____							
3	PAGE LENGTH (n-3)						_____ (LSB)	
4	Reserved							
5	Reserved				PROTOCOL IDENTIFIER			
6	_____							
n	Protocol specific mode parameters _____							

The Protocol Specific Port mode page controls parameters that affect one or more target ports. The parameters that may be implemented are specified in the SCSI transport protocol standard (see 3.1.75) for the target port. If a target device has multiple target ports, changes in the parameters for one target port should not affect other target ports.

The parameters for a target port affect its behavior regardless of which initiator port is forming an I_T nexus with the target port. The parameters may be accessed by MODE SENSE (see 6.9) and MODE SELECT (see 6.7) commands directed to any logical unit accessible through the target port. If a parameter value is changed, all logical units accessible through the target port shall establish a unit attention condition with an additional sense code of MODE PARAMETERS CHANGED for all initiator ports that form I_T_L nexuses through that target port except the initiator port which made the change.

The PROTOCOL IDENTIFIER field (see 7.5.1) indicates the SCSI transport protocol to which the mode page applies. For a MODE SENSE command, the device server shall set the PROTOCOL IDENTIFIER field to one of the values shown in table 238 (see 7.5.1) to indicate the SCSI transport protocol used by the target port through which the MODE SENSE command is being processed. For a MODE SELECT command, the application client shall set the PROTOCOL IDENTIFIER field to one of the values shown in table 238 indicating the SCSI transport protocol to which the protocol specific mode parameters apply. If a device server receives a mode page containing a transport protocol identifier value other than the one used by the target port through which the MODE SELECT command is being processed, it shall terminate the command with a CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to INVALID FIELD IN PARAMETER LIST.

7.5 Protocol specific parameters

7.5.1 Protocol specific parameters introduction

Some commands use protocol specific information in their CDBs or parameter lists. This subclause describes those protocol specific parameters.

Protocol specific parameters may include a PROTOCOL IDENTIFIER field (see table 238) as a reference for the SCSI protocol to which the protocol specific parameter applies.

Table 238 — PROTOCOL IDENTIFIER values

Protocol Identifier	Description	Protocol Standard
0h	Fibre Channel	FCP-2
1h	Parallel SCSI	SPI-4
2h	SSA	SSA-S3P
3h	IEEE 1394	SBP-2
4h	Remote Direct Memory Access (RDMA)	SRP
5h	Internet SCSI	iSCSI
6h	SAS Serial SCSI Protocol	SAS
7h - Fh	Reserved	

7.5.2 Alias entry protocol specific designations

7.5.2.1 Introduction to alias entry protocol specific designations

The alias entries (see 6.2.2) in the parameter data for the CHANGE ALIASES command (see 6.2) and REPORT ALIASES command (see 6.19) include FORMAT CODE, DESIGNATION LENGTH and DESIGNATION fields whose contents and meaning are based on the SCSI protocol specified in a PROTOCOL IDENTIFIER field (see 7.5.1). This subclause defines the SCSI protocol specific format codes, designation lengths, and designations.

7.5.2.2 Fibre Channel specific alias entry designations

7.5.2.2.1 Introduction to Fibre Channel specific alias entry designations

When an alias entry PROTOCOL IDENTIFIER field specifies the Fibre Channel protocol (0h, see table 238), the FORMAT CODE, DESIGNATION LENGTH and DESIGNATION fields shall be as defined in table 239.

Table 239 — Fibre Channel alias entry format codes

Format Code	Description	Designation Length (bytes)	Designation Subclause
00h	World Wide Port Name	8	7.5.2.2.2
01h	World Wide Port Name with N_Port checking	12	7.5.2.2.3
02h - FFh	Reserved		

7.5.2.2.2 Fibre Channel world wide port name alias entry designation

When the PROTOCOL IDENTIFIER and FORMAT CODE fields specify a Fibre Channel world wide port name designation, the alias entry DESIGNATION field shall have the format shown in table 240.

Table 240 — Fibre Channel world wide port name alias entry designation

Bit Byte	7	6	5	4	3	2	1	0
16	FIBRE CHANNEL WORLD WIDE PORT NAME							
23								

The FIBRE CHANNEL WORLD WIDE PORT NAME field shall contain the port world wide name defined by the port login (PLOGI) extended link service (see FC-FS).

A Fibre Channel world wide port name designation is valid (see 6.2.3) if the device server has access to a SCSI domain formed by a Fibre Channel fabric and the fabric contains a port with the specified port world wide name.

7.5.2.2.3 Fibre Channel world wide port name with N_Port checking alias entry designation

When the PROTOCOL IDENTIFIER and FORMAT CODE fields specify a Fibre Channel world wide port name with N_Port checking designation, the alias entry DESIGNATION field shall have the format shown in table 241.

Table 241 — Fibre Channel world wide port name with N_Port checking alias entry designation

Bit Byte	7	6	5	4	3	2	1	0
16	FIBRE CHANNEL WORLD WIDE PORT NAME							
23								
24	Reserved							
25	(MSB)	N_PORT						(LSB)
27								

The FIBRE CHANNEL WORLD WIDE PORT NAME field shall contain the port world wide name defined by the port login (PLOGI) extended link service (see FC-FS).

The N_PORT field shall contain the FC_FS port D_ID to be used to transport frames including PLOGI and FCP-2 related frames.

A Fibre Channel world wide port name with N_Port checking designation is valid (see 6.2.3) if all of the following conditions are true:

- a) The device server has access to a SCSI domain formed by a Fibre Channel fabric;
- b) The fabric contains a port with the specified port World Wide Name; and
- c) The value in the N_PORT field is the N_Port identifier of a Fibre Channel port whose port world wide name matches that in the FIBRE CHANNEL WORLD WIDE PORT NAME field.

7.5.2.3 RDMA specific alias entry designations

7.5.2.3.1 Introduction to RDMA specific alias entry designations

When an alias entry **PROTOCOL IDENTIFIER** field specifies the SCSI RDMA protocol (4h, see table 238), the **FORMAT CODE**, **DESIGNATION LENGTH** and **DESIGNATION** fields shall be as defined in table 242.

Table 242 — RDMA alias entry format codes

Format Code	Description	Designation Length (bytes)	Designation Subclause
00h	Target Port Identifier	16	7.5.2.3.2
01h	InfiniBand Global Identifier with Target Port Identifier checking	32	7.5.2.3.3
02h - FFh	Reserved		

7.5.2.3.2 RDMA target port identifier alias entry designation

When the **PROTOCOL IDENTIFIER** and **FORMAT CODE** fields specify a SCSI RDMA target port identifier designation, the alias entry **DESIGNATION** field shall have the format shown in table 243.

Table 243 — RDMA target port identifier alias entry designation

Bit Byte	7	6	5	4	3	2	1	0
16	TARGET PORT IDENTIFIER							
31								

The **TARGET PORT IDENTIFIER** field shall contain an SRP target port identifier.

A SCSI RDMA target port identifier designation is valid (see 6.2.3) if the device server has access to an SRP SCSI domain containing the specified SRP target port identifier.

7.5.2.3.3 InfiniBand global identifier with target port identifier checking alias entry designation

When the **PROTOCOL IDENTIFIER** and **FORMAT CODE** fields specify an InfiniBand global identifier with target port identifier checking designation, the alias entry designation field shall have the format shown in table 244.

Table 244 — InfiniBand global identifier with target port identifier checking alias entry designation

Bit Byte	7	6	5	4	3	2	1	0
16	INFINIBAND GLOBAL IDENTIFIER							
31								
32	TARGET PORT IDENTIFIER							
47								

The **INFINIBAND GLOBAL IDENTIFIER** field contains an InfiniBand global identifier (GID) of an InfiniBand port connected to an SRP target port.

The TARGET PORT IDENTIFIER field shall contain an SRP target port identifier.

An InfiniBand global identifier with target port identifier checking designation is valid (see 6.2.3) if all of the following conditions are true:

- a) The device server has access to an SRP SCSI domain layered on InfiniBand;
- b) The device server has access to an SRP target port based on the InfiniBand global identifier specified in the INFINIBAND GLOBAL IDENTIFIER field; and
- c) The value in the TARGET PORT IDENTIFIER field is the SRP target port identifier for the SRP target port that is accessible via the InfiniBand global identifier contained in the INFINIBAND GLOBAL IDENTIFIER field.

7.5.2.4 Internet SCSI specific alias entry designations

7.5.2.4.1 Introduction to Internet SCSI specific alias entry designations

When an alias entry PROTOCOL IDENTIFIER field specifies the Internet SCSI protocol (5h, see table 238), the FORMAT CODE, DESIGNATION LENGTH and DESIGNATION fields shall be as defined in table 245.

Table 245 — Internet SCSI alias entry format codes

Format Code	Description	Designation Length (bytes, maximum)	Designation Subclause
00h	iSCSI Name	224	7.5.2.4.2
01h	iSCSI Name with binary IPv4 address	236	7.5.2.4.3
02h	iSCSI Name with IPName	488	7.5.2.4.4
03h	iSCSI Name with binary IPv6 address	248	7.5.2.4.5
04h - FFh	Reserved		

NOTE 57 - A designation that contains no IP addressing information or contains IP addressing information that does not address the named SCSI device may require a device server to have access to a name server or to other discovery protocols to resolve the given iSCSI Name to an IP address through which the device server may establish iSCSI Login. Access to such a service is protocol specific and vendor specific.

7.5.2.4.2 iSCSI name alias entry designation

When the PROTOCOL IDENTIFIER and FORMAT CODE fields specify iSCSI name designation, the alias entry DESIGNATION field shall have the format shown in table 246.

Table 246 — iSCSI name alias entry designation

Bit Byte	7	6	5	4	3	2	1	0
16	(MSB)							
4m-1	iSCSI NAME							(LSB)

The null-terminated, null-padded (see 4.4.2) iSCSI NAME field shall contain the iSCSI name of an iSCSI node (see RFC xxxx). The number of bytes in the iSCSI NAME field shall be a multiple of four.

An iSCSI name designation is valid if the device server has access to a SCSI domain containing an Internet protocol network and there exists an iSCSI node on that network with the specified iSCSI name.

7.5.2.4.3 iSCSI name with binary IPv4 address alias entry designation

When the PROTOCOL IDENTIFIER and FORMAT CODE fields specify iSCSI name with binary IPv4 address designation, the alias entry DESIGNATION field shall have the format shown in table 247.

Table 247 — iSCSI name with binary IPv4 address alias entry designation

Bit Byte	7	6	5	4	3	2	1	0
16	(MSB)							
4m-1	iSCSI NAME (LSB)							
4m	(MSB)							
4m+3	IPv4 ADDRESS (LSB)							
4m+4	Reserved							
4m+5	Reserved							
4m+6	(MSB)							
4m+7	PORT NUMBER (LSB)							
4m+8	Reserved							
4m+9	Reserved							
4m+10	(MSB)							
4m+11	INTERNET PROTOCOL NUMBER (LSB)							

The null-terminated, null-padded (see 4.4.2) iSCSI NAME field shall contain the iSCSI name of an iSCSI node (see RFC xxxx). The number of bytes in the iSCSI NAME field shall be a multiple of four.

The IPv4 ADDRESS field shall contain an IPv4 address (see RFC 791).

The PORT NUMBER field shall contain a port number (see RFC 790).

The INTERNET PROTOCOL NUMBER field shall contain an Internet protocol number (see RFC 790).

An iSCSI name designation is valid if the device server has access to a SCSI domain containing an Internet protocol network and there exists an iSCSI node on that network with the specified iSCSI name.

The IPv4 address, port number and Internet protocol number provided in the designation may be used by a device server for addressing to discover and establish communication with the named iSCSI node. Alternatively, the device server may use other protocol specific or vendor specific methods to discover and establish communication with the named iSCSI node.

7.5.2.4.4 iSCSI name with IPname alias entry designation

When the PROTOCOL IDENTIFIER and FORMAT CODE fields specify iSCSI name with IPname designation, the alias entry DESIGNATION field shall have the format shown in table 248.

Table 248 — iSCSI name with IPname alias entry designation

Bit Byte	7	6	5	4	3	2	1	0
16 k	(MSB) _____ ISCSI NAME _____ (LSB)							
k+1 n	(MSB) _____ IPNAME _____ (LSB)							
n+1 4m-1	_____ PAD (if needed) _____							
4m	Reserved							
4m+1	Reserved							
4m+2 4m+3	(MSB) _____ PORT NUMBER _____ (LSB)							
4m+4	Reserved							
4m+5	Reserved							
4m+6 4m+7	(MSB) _____ INTERNET PROTOCOL NUMBER _____ (LSB)							

- The null-terminated (see 4.4.2) ISCSI NAME field shall contain the iSCSI name of an iSCSI node (see RFC xxxx).
- The null-terminated (see 4.4.2) IPNAME field shall contain a Internet protocol domain name, IPname (see RFC 1035).
- Zero to three bytes set to zero shall form the PAD field such that the total length of the ISCSI NAME, IPNAME, and PAD fields is a multiple of four. Device servers shall ignore the PAD field.
- The PORT NUMBER field shall contain a port number (see RFC 790).
- The INTERNET PROTOCOL NUMBER field shall contain an Internet protocol number (see RFC 790).
- An iSCSI name designation is valid if the device server has access to a SCSI domain containing an Internet protocol network and there exists an iSCSI node on that network with the specified iSCSI name.
- The Internet protocol domain name, port number and Internet protocol number provided in the designation may be used by a device server for addressing to discover and establish communication with the named iSCSI node. Alternatively, the device server may use other protocol specific or vendor specific methods to discover and establish communication with the named iSCSI node.

7.5.2.4.5 iSCSI name with binary IPv6 address alias entry designation

When the PROTOCOL IDENTIFIER and FORMAT CODE fields specify iSCSI name with binary IPv6 address designation, the alias entry DESIGNATION field shall have the format shown in table 247.

Table 249 — iSCSI name with binary IPv6 address alias entry designation

Bit Byte	7	6	5	4	3	2	1	0
16	(MSB)							
n	iSCSI NAME							(LSB)
4m	(MSB)							
4m+15	IPv6 ADDRESS							(LSB)
4m+16	Reserved							
4m+17	Reserved							
4m+18	(MSB)							
4m+19	PORT NUMBER							(LSB)
4m+20	Reserved							
4m+21	Reserved							
4m+22	(MSB)							
4m+23	INTERNET PROTOCOL NUMBER							(LSB)

The null-terminated, null-padded (see 4.4.2) iSCSI NAME field shall contain the iSCSI name of an iSCSI node (see RFC xxxx).

The IPv6 ADDRESS field shall contain an IPv6 address (see RFC 2373).

The PORT NUMBER field shall contain a port number (see RFC 790).

The INTERNET PROTOCOL NUMBER field shall contain an Internet protocol number (see RFC 790).

An iSCSI name designation is valid if the device server has access to a SCSI domain containing an Internet protocol network and there exists an iSCSI node on that network with the specified iSCSI name.

The IPv6 address, port number and Internet protocol number provided in the designation may be used by a device server for addressing to discover and establish communication with the named iSCSI node. Alternatively, the device server may use other protocol specific or vendor specific methods to discover and establish communication with the named iSCSI node.

7.5.3 EXTENDED COPY protocol specific target descriptors

7.5.3.1 Introduction to EXTENDED COPY protocol specific target descriptors

The target descriptors present in the parameter data of the EXTENDED COPY command (see 6.3) may have protocol specific formats described in this subclause. An introduction to EXTENDED COPY target descriptors is provided in 6.3.6.1.

NOTE 58 - In the EXTENDED COPY command the target in target descriptor refers to the target (source or destination) of an EXTENDED COPY operation. EXTENDED COPY target descriptors may specify SCSI target devices, not SCSI target ports.

7.5.3.2 Fibre Channel world wide name EXTENDED COPY target descriptor format

The target descriptor format shown in table 250 is used to specify an EXTENDED COPY target using its Fibre Channel world wide name.

Table 250 — Fibre Channel world wide name EXTENDED COPY target descriptor format

Bit Byte	7	6	5	4	3	2	1	0
0	DESCRIPTOR TYPE CODE (E0h)							
1	LU ID TYPE		NUL	PERIPHERAL DEVICE TYPE				
2	Reserved							
3	Reserved							
4	LU IDENTIFIER							
11								
12	WORLD WIDE NAME							
19								
20	Reserved							
27								
28	Device type specific parameters							
31								

The DESCRIPTOR TYPE CODE, LU ID TYPE, PERIPHERAL DEVICE TYPE, NUL and LU IDENTIFIER fields and the device type specific parameters are described in 6.3.6.1.

The WORLD WIDE NAME field shall contain the port world wide name defined by the port login (PLOGI) extended link service (see FC-FS).

NOTE 59 - The world wide name target descriptor format burdens the copy manager with translating the world wide name to an N_Port identifier (see 7.5.3.3).

7.5.3.3 Fibre Channel N_Port EXTENDED COPY target descriptor format

The target descriptor format shown in table 251 is used to specify an EXTENDED COPY target using its Fibre Channel N_Port.

Table 251 — Fibre Channel N_Port EXTENDED COPY target descriptor format

Bit Byte	7	6	5	4	3	2	1	0
0	DESCRIPTOR TYPE CODE (E1h)							
1	LU ID TYPE		NUL	PERIPHERAL DEVICE TYPE				
2	Reserved							
3	Reserved							
4	LU IDENTIFIER							
11								
12	Reserved							
20								
21	(MSB)	N_PORT						
22								
23								(LSB)
24	Reserved							
27								
28	Device type specific parameters							
31								

The DESCRIPTOR TYPE CODE, LU ID TYPE, PERIPHERAL DEVICE TYPE, NUL and LU IDENTIFIER fields and the device type specific parameters are described in 6.3.6.1.

The N_PORT field shall contain the FC-FS port D_ID to be used to transport frames including PLOGI and FCP-2 related frames.

NOTE 60 - Use of N_PORT addressing restricts this target descriptor format to a single Fibre Channel fabric.

7.5.3.4 Fibre Channel N_Port with world wide name checking EXTENDED COPY target descriptor format

EXTENDED COPY targets addressed using their Fibre Channel N_Port with World Wide Name checking are specified using the target descriptor format shown in table 252.

Table 252 — Fibre Channel N_Port with world wide name checking target descriptor format

Bit Byte	7	6	5	4	3	2	1	0
0	DESCRIPTOR TYPE CODE (E2h)							
1	LU ID TYPE		NUL	PERIPHERAL DEVICE TYPE				
2	Reserved							
3	Reserved							
4	LU IDENTIFIER							
11								
12	WORLD WIDE NAME							
19								
20	Reserved							
21	(MSB)	N_PORT						
22								
23								(LSB)
24	Reserved							
27								
28	Device type specific parameters							
31								

The DESCRIPTOR TYPE CODE, LU ID TYPE, PERIPHERAL DEVICE TYPE, NUL and LU IDENTIFIER fields and the device type specific parameters are described in 6.3.6.1.

The WORLD WIDE NAME field shall contain the port world wide name defined by the port login (PLOGI) extended link service (see FC-FS).

The N_PORT field shall contain the FC-FS port D_ID to be used to transport frames including PLOGI and FCP-2 related frames.

NOTE 61 - Use of N_PORT addressing restricts this target descriptor format to a single fabric.

When the copy manager first processes a segment descriptor that references this target descriptor, it shall confirm that the D_ID in the N_PORT field is associated with the world wide name in the WORLD WIDE NAME field. If the association cannot be confirmed, the EXTENDED COPY command shall be terminated because the target is unavailable (see 6.3.3). The copy manager shall track configuration changes that affect the D_ID value for the duration of the EXTENDED COPY commands. An application client generating the EXTENDED COPY commands is responsible for tracking configuration changes between commands.

7.5.3.5 SCSI Parallel T_L EXTENDED COPY target descriptor format

EXTENDED COPY targets addressed using their SCSI parallel protocol SCSI bus target identifier, and logical unit number are specified using the target descriptor format shown in table 253.

Table 253 — SCSI Parallel T_L EXTENDED COPY target descriptor format

Bit Byte	7	6	5	4	3	2	1	0
0	DESCRIPTOR TYPE CODE (E3h)							
1	LU ID TYPE		NUL	PERIPHERAL DEVICE TYPE				
2	Reserved							
3	Reserved							
4	LU IDENTIFIER							
11								
12	Vendor unique							
13	TARGET IDENTIFIER							
14	Reserved							
27								
28	Device type specific parameters							
31								

The DESCRIPTOR TYPE CODE, LU ID TYPE, PERIPHERAL DEVICE TYPE, NUL and LU IDENTIFIER fields and the device type specific parameters are described in 6.3.6.1.

The TARGET IDENTIFIER field specifies the SCSI target identifier to be used when this target descriptor identifies the source or destination of an EXTENDED COPY operation.

7.5.3.6 IEEE 1394 EUI-64 EXTENDED COPY target descriptor format

The target descriptor format shown in table 254 is used to identify an EXTENDED COPY target using its IEEE 1394 Extended Unique Identifier, 64-bits (EUI-64) and configuration ROM (Read-Only Memory) directory identifier.

Table 254 — IEEE 1394 EUI-64 EXTENDED COPY target descriptor format

Bit Byte	7	6	5	4	3	2	1	0
0	DESCRIPTOR TYPE CODE (E8h)							
1	LU ID TYPE		NUL	PERIPHERAL DEVICE TYPE				
2	Reserved							
3	Reserved							
4	LU IDENTIFIER							
11								
12	EUI-64							
19								
20	DIRECTORY ID							
22								
23	Reserved							
27								
28	Device type specific parameters							
31								

The DESCRIPTOR TYPE CODE, LU ID TYPE, PERIPHERAL DEVICE TYPE, NUL and LU IDENTIFIER fields and the device type specific parameters are described in 6.3.6.1.

The EUI-64 field shall contain the node’s unique identifier (EUI-64) obtained from the configuration ROM bus information block, as specified by IEEE 1394a:2000.

NOTE 62 - IEEE 1394a-2000 separately labels the components of the EUI-64 as NODE_VENDOR_ID, CHIP_ID_HI and CHIP_ID_LO. Collectively these form the node’s EUI-64.

The DIRECTORY ID field shall contain the target’s directory identifier, as specified by ISO/IEC 13213:1994.

7.5.3.7 RDMA EXTENDED COPY target descriptor format

The target descriptor format shown in table 255 is used to identify an EXTENDED COPY target using its RDMA SRP target port identifier (see SRP).

Table 255 — RDMA EXTENDED COPY target descriptor format

Bit Byte	7	6	5	4	3	2	1	0
0	DESCRIPTOR TYPE CODE (E7h)							
1	LU ID TYPE		NUL	PERIPHERAL DEVICE TYPE				
2	Reserved							
3	Reserved							
4	LU IDENTIFIER							
11								
12	TARGET PORT IDENTIFIER							
27								
28	Device type specific parameters							
31								

The DESCRIPTOR TYPE CODE, LU ID TYPE, PERIPHERAL DEVICE TYPE, NUL and LU IDENTIFIER fields and the device type specific parameters are described in 6.3.6.1.

The TARGET PORT IDENTIFIER field contains the SRP target port identifier (see SRP).

7.5.3.8 iSCSI binary IPv4 address EXTENDED COPY target descriptor format

EXTENDED COPY targets addressed using their Internet protocol binary IPv4 address, and logical unit number are specified using the target descriptor format shown in table 256.

Table 256 — iSCSI binary IPv4 address EXTENDED COPY target descriptor format

Bit Byte	7	6	5	4	3	2	1	0
0	DESCRIPTOR TYPE CODE (E5h)							
1	LU ID TYPE		NUL	PERIPHERAL DEVICE TYPE				
2	Reserved							
3	Reserved							
4	LU IDENTIFIER							
11								
12	(MSB)	IPV4 ADDRESS						
15								(LSB)
16	Reserved							
21								
22	(MSB)	PORT NUMBER						
23								(LSB)
24	Reserved							
25	Reserved							
26	(MSB)	INTERNET PROTOCOL NUMBER						
27								(LSB)
28	Device type specific parameters							
31								

The DESCRIPTOR TYPE CODE, LU ID TYPE, PERIPHERAL DEVICE TYPE, NUL and LU IDENTIFIER fields and the device type specific parameters are described in 6.3.6.1.

The IPV4 ADDRESS field shall contain an IPv4 address (see RFC 791) to be used when this target descriptor specifies the source or destination of an EXTENDED COPY operation.

The PORT NUMBER field shall contain the port number (see RFC 790) to be used when this target descriptor specifies the source or destination of an EXTENDED COPY operation.

The INTERNET PROTOCOL NUMBER field shall contain an Internet protocol number (see RFC 790) to be used when this target descriptor specifies the source or destination of an EXTENDED COPY operation.

7.5.3.9 SAS serial SCSI protocol target descriptor format

The target descriptor format shown in table 255 is used to identify an EXTENDED COPY target using its SAS serial SCSI protocol (see SAS).

Table 257 — SAS serial SCSI protocol EXTENDED COPY target descriptor format

Bit Byte	7	6	5	4	3	2	1	0
0	DESCRIPTOR TYPE CODE (E9h)							
1	LU ID TYPE		NUL	PERIPHERAL DEVICE TYPE				
2	Reserved							
3	Reserved							
4	LU IDENTIFIER							
11								
12	SAS ADDRESS							
19								
20	Reserved							
27								
28	Device type specific parameters							
31								

The DESCRIPTOR TYPE CODE, LU ID TYPE, PERIPHERAL DEVICE TYPE, NUL and LU IDENTIFIER fields and the device type specific parameters are described in 6.3.6.1.

The SAS ADDRESS field contains the SAS address (see SAS) to be used when this target descriptor identifies the source or destination of an EXTENDED COPY operation.

7.5.4 TransportID identifiers

7.5.4.1 Overview of TransportID identifiers

An application client may use a TransportID to identify an initiator port other than the initiator port that is transporting the command and parameter data. ~~An initiator port is identified by a TransportID if that initiator port accesses the SCSI target device with that TransportID. At any given time, an initiator port may be identified or associated with at most one TransportID.~~

TransportIDs are initiator identifiers used as:

- Access identifiers (see 8.3.1.3.2) in ACL ACEs to allow access to a logical unit from an initiator port; and
- Initiator port identifiers in the additional parameter data (see 6.12.3) for the PERSISTENT RESERVE OUT command with REGISTER or REGISTER AND IGNORE EXISTING KEY service action when the SPEC_I_PT bit is set to one.

TransportIDs (see table 258) shall be at least 24 bytes long and shall be a multiple of four bytes in length.

Table 258 — TransportID format

Bit Byte	7	6	5	4	3	2	1	0
0	Reserved				PROTOCOL IDENTIFIER			
1	SCSI protocol specific data							
n								

The PROTOCOL IDENTIFIER field (see table 238 in 7.5.1) identifies the SCSI protocol to which the TransportID applies.

The format of the SCSI protocol specific data depends on the value in the PROTOCOL IDENTIFIER field. The SCSI protocol specific data in a TransportID shall only include initiator port identifiers, initiator port names, or initiator device names (see SAM-2) that persist across hard resets and I_T nexus losses. TransportID formats specific to SCSI protocols are listed in table 259.

Table 259 — TransportID formats for specific SCSI protocols

SCSI Protocol	Protocol Standard	Reference
Fibre Channel	FCP-2	7.5.4.2
Parallel SCSI	SPI-4	7.5.4.3
IEEE 1394	SBP-2	7.5.4.4
Remote Direct Memory Access (RDMA)	SRP	7.5.4.5
Internet SCSI	iSCSI	7.5.4.6
SAS Serial SCSI Protocol	SAS	7.5.4.7

7.5.4.2 TransportID for initiators using SCSI over Fibre Channel

A Fibre Channel TransportID (see table 260) identifies an FCP-2 initiator port based on the world wide unique initiator port name belonging to that initiator port.

Table 260 — Fibre Channel TransportID format

Bit Byte	7	6	5	4	3	2	1	0
0	Reserved				PROTOCOL IDENTIFIER (0h)			
1	Reserved							
7								
8	WORLD WIDE NAME							
15								
16	Reserved							
23								

The WORLD WIDE NAME field shall contain the port World Wide Name defined by the Physical Log In (PLOGI) extended link service, defined in FC-FS.

7.5.4.3 TransportID for initiators using a parallel SCSI bus

A parallel SCSI bus TransportIDs (see table 261) identifies a SPI-4 initiator port based on the SCSI address of an initiator port and the SCSI target device relative port through which the initiator accesses the SCSI target device.

Table 261 — Parallel SCSI bus TransportID format

Bit Byte	7	6	5	4	3	2	1	0
0	Reserved				PROTOCOL IDENTIFIER (1h)			
1	Reserved							
2	(MSB)							
3	SCSI ADDRESS							
4	(MSB)							
7	RELATIVE PORT IDENTIFIER							
8	(LSB)							
23	Reserved							

The SCSI ADDRESS field specifies the SCSI address (see SPI-4) of the initiator port.

The RELATIVE PORT IDENTIFIER field specifies the four-byte binary number identifying a specific target port in the SCSI target device relative to other target ports. The relative port identifier value shall be one of the values returned in the Device Identifier VPD page (see 7.6.4). If the RELATIVE PORT IDENTIFIER does not reference a port in the device, the TransportID is invalid.

7.5.4.4 TransportID for initiators using SCSI over IEEE 1394

An IEEE 1394 TransportID (see table 262) identifies an SBP-2 initiator port based on the EUI-64 initiator port name belonging to that initiator port.

Table 262 — IEEE 1394 TransportID format

Bit Byte	7	6	5	4	3	2	1	0
0	Reserved				PROTOCOL IDENTIFIER (3h)			
1	Reserved							
7								
8								
15	EUI-64 NAME							
16	Reserved							
23								

The EUI-64 NAME field shall contain the EUI-64 IEEE 1394 node unique identifier (see SBP-2) for an initiator port.

7.5.4.5 TransportID for initiators using SCSI over an RDMA interface

A RDMA TransportID (see table 263) identifies an SRP initiator port based on the world wide unique initiator port name belonging to that initiator port.

Table 263 — RDMA TransportID format

Bit Byte	7	6	5	4	3	2	1	0
0	Reserved				PROTOCOL IDENTIFIER (4h)			
1	Reserved							
7								
8	INITIATOR PORT IDENTIFIER							
23								

The INITIATOR PORT IDENTIFIER field shall contain an SRP initiator port identifier (see SRP).

7.5.4.6 TransportID for initiators using SCSI over Internet SCSI

A iSCSI TransportID (see table 264) identifies an iSCSI initiator based on its world wide unique initiator device name.

Table 264 — iSCSI TransportID format

Bit Byte	7	6	5	4	3	2	1	0
0	Reserved				PROTOCOL IDENTIFIER (5h)			
1	Reserved							
3								
4	(MSB)	ISCSI NAME						(LSB)
4m								
n+1	NULL/PAD							
m								

The null-terminated, null-padded (see 4.4.2) ISCSI NAME field shall contain the iSCSI name of an iSCSI initiator node (see iSCSI). The first ISCSI NAME field byte containing an ASCII null character terminates the ISCSI NAME field without regard for the specified length of the iSCSI TransportID.

NOTE 63 - The maximum length of the iSCSI TransportID is 228 bytes because the iSCSI name length does not exceed 223 bytes.

7.5.4.7 TransportID for initiators using SCSI over SAS serial SCSI protocol

A SAS serial SCSI protocol TransportID (see table 265) identifies an SAS SCSI initiator that is communicating via the SAS serial SCSI protocol (SSP) using the SAS address belonging to that initiator port.

Table 265 — SAS Serial SCSI Protocol TransportID format

Bit Byte	7	6	5	4	3	2	1	0
0	Reserved				PROTOCOL IDENTIFIER (6h)			
1	Reserved							
3								
4	SAS ADDRESS							
11								
12	Reserved							
23								

The SAS ADDRESS field specifies the SAS address of the initiator device.

7.6 Vital product data parameters

7.6.1 Vital product data parameters overview and page codes

This subclause describes the vital product data (VPD) page structure and the VPD pages (see table 266) that are applicable to all SCSI devices. These VPD pages are optionally returned by the INQUIRY command (see 6.4) and contain vendor specific product information about a target or logical unit. The vital product data may include vendor identification, product identification, unit serial numbers, device operating definitions, manufacturing data, field replaceable unit information, and other vendor specific information. This standard defines the structure of the vital product data, but not the contents.

Table 266 — Vital product data page codes

Page code	VPD Page Name	Reference	Support Requirements
82h	ASCII Implemented Operating Definition	7.6.2	Optional
01h - 7Fh	ASCII Information	7.6.3	Optional
83h	Device Identification	7.6.4	Mandatory
81h	Obsolete	3.3.7	
84h	Software Interface Identification	7.6.5	Optional
00h	Supported VPD Pages	7.6.6	Mandatory
80h	Unit Serial Number	7.6.7	Optional
85h - AFh	Reserved		
B0h - BFh	(See specific device type)		
C0h - FFh	Vendor specific		

7.6.2 ASCII Implemented Operating Definition VPD page

The ASCII Implemented Operation Definition VPD page (see table 267) contains operating definition description data for all operating definitions implemented by the target.

Table 267 — ASCII Implemented Operating Definition VPD page

Bit Byte	7	6	5	4	3	2	1	0
0	PERIPHERAL QUALIFIER			PERIPHERAL DEVICE TYPE				
1	PAGE CODE (82h)							
2	Reserved							
3	PAGE LENGTH (n-3)							
4	ASCII OPERATING DEFINITION DESCRIPTION LENGTH (m-4)							
5	(MSB)							
m	ASCII OPERATING DEFINITION DESCRIPTION DATA							(LSB)
m+1								
n	Vendor specific description data							

The PERIPHERAL QUALIFIER field and the PERIPHERAL DEVICE TYPE field are as defined in 6.4.2.

The PAGE LENGTH field specifies the length of the following VPD page data. If the allocation length is less than the length of the data to be returned, the page length shall not be adjusted to reflect the truncation.

The ASCII OPERATING DEFINITION DESCRIPTION LENGTH field specifies the length in bytes of the ASCII OPERATING DEFINITION DESCRIPTION DATA field that follows. If the allocation length is less than the length of data to be returned, the ASCII operating definition description length shall not be adjusted to reflect the truncation. A value of zero in this field indicates that no ASCII operating definition description data is available.

The ASCII OPERATING DEFINITION DESCRIPTION DATA field contains the ASCII operating definition description data for the device server. The data in this field shall be formatted in lines (or character strings). Each line shall contain only graphic codes (i.e., code values 20h through 7Eh) and shall be terminated with a NULL (00h) character. The text is vendor specific.

7.6.3 ASCII Information VPD page

The ASCII Information VPD page (see table 268) contains information for the field replaceable unit code returned in the sense data (see 4.5).

Table 268 — ASCII Information VPD page

Bit Byte	7	6	5	4	3	2	1	0
0	PERIPHERAL QUALIFIER			PERIPHERAL DEVICE TYPE				
1	PAGE CODE (01h - 7Fh)							
2	Reserved							
3	PAGE LENGTH (n-3)							
4	ASCII LENGTH (m-4)							
5	(MSB)							
m	ASCII INFORMATION							(LSB)
m+1	Vendor specific information							
n								

The PERIPHERAL QUALIFIER field and the PERIPHERAL DEVICE TYPE field are defined in 6.4.2.

The PAGE CODE field contains the same value as in the PAGE OR OPERATION CODE field of the INQUIRY CDB (see 6.4) and is associated with the FIELD REPLACEABLE UNIT CODE field returned in the sense data.

NOTE 64 - The FIELD REPLACEABLE UNIT CODE field in the sense data provides for 255 possible codes, while the PAGE CODE field provides for only 127 possible codes. For that reason it is not possible to return ASCII Information VPD pages for the upper code values.

The PAGE LENGTH field specifies the length of the following VPD page data. If the allocation length of the CDB is too small to transfer all of the VPD page, the page length shall not be adjusted to reflect the truncation.

The ASCII LENGTH field specifies the length in bytes of the ASCII INFORMATION field that follows. If the allocation length is less than the length of the data to be returned, the ASCII length shall not be adjusted to reflect the truncation. A value of zero in this field indicates that no ASCII information is available for the specified page code.

The ASCII INFORMATION field contains ASCII information concerning the field replaceable unit identified by the page code. The data in this field shall be formatted in one or more character string lines. Each line shall contain only graphic codes (i.e., code values 20h through 7Eh) and shall be terminated with a NULL (00h) character.

The contents of the vendor specific information field is not defined in this standard.

7.6.4 Device Identification VPD page

7.6.4.1 Device Identification VPD page overview

The Device Identification VPD page (see table 269) provides the means to retrieve identification descriptors applying to the logical unit. Logical units may have more than one identification descriptor (e.g., if several types or associations of identifier are supported).

Device identifiers shall be assigned to the peripheral device (e.g., a disk drive) and not to the currently mounted media, in the case of removable media devices. Media identification is outside the scope of this standard. Operating systems are expected to use the device identifiers during system configuration activities to determine whether alternate paths exist for the same peripheral device.

NOTE 65 - In the case of virtual logical units (e.g., volume sets as defined by SCC-2), the IDENTIFIER field (see table 270) should be in the NAA IEEE Registered Extended name format as defined in 7.6.4.5.4.

A SCSI target device may have more than one SCSI target device name if the SCSI target device supports multiple SCSI transport protocols. If the returned Device Identification VPD page contains any SCSI target device names it shall contain all the SCSI target device names.

Table 269 — Device Identification VPD page

Bit Byte	7	6	5	4	3	2	1	0
0	PERIPHERAL QUALIFIER			PERIPHERAL DEVICE TYPE				
1	PAGE CODE (83h)							
2	(MSB)							
3	PAGE LENGTH (n-3)							
	(LSB)							
	Identification descriptor list							
4	Identification descriptor (first)							
	⋮							
	Identification descriptor (last)							
n								

The PERIPHERAL QUALIFIER field and the PERIPHERAL DEVICE TYPE field in table 269 are as defined in 6.4.2.

Each Identification descriptor (see table 270) contains information identifying the logical unit, physical device, or access path used by the command and returned parameter data.

Table 270 — Identification descriptor

Bit Byte	7	6	5	4	3	2	1	0
0	PROTOCOL IDENTIFIER				CODE SET			
1	PIV	Reserved	ASSOCIATION		IDENTIFIER TYPE			
2	Reserved							
3	IDENTIFIER LENGTH (n-3)							
4	IDENTIFIER							
n								

The PROTOCOL IDENTIFIER field may indicate the SCSI transport protocol to which identification descriptor applies. If the ASSOCIATION field contains a value other than 1h or 2h or the PIV bit is set to zero, then the PROTOCOL IDENTIFIER field should be ignored. If the ASSOCIATION field contains a value of 1h or 2h and the PIV bit is set to one, then the PROTOCOL IDENTIFIER field shall contain one of the values shown in table 238 (see 7.5.1) to indicate the SCSI transport protocol to which identification descriptor applies.

The CODE SET field indicates the code set used for the IDENTIFIER field, as described in table 271. This field is intended to be an aid to software that displays the IDENTIFIER field.

Table 271 — Code set

Value	Description
0h	Reserved
1h	The IDENTIFIER field shall contain binary values.
2h	The IDENTIFIER field shall contain ASCII graphic codes (i.e., code values 20h through 7Eh)
3h - Fh	Reserved

A protocol identifier valid (PIV) bit of zero indicates the PROTOCOL IDENTIFIER field should be ignored. If the ASSOCIATION field contains a value of 1h or 2h then a PIV bit set to one indicates the PROTOCOL IDENTIFIER field contains a valid protocol identifier selected from the values shown in table 238 (see 7.5.1). If the ASSOCIATION field contains a value other than 1h or 2h then the PIV bit should be ignored.

The ASSOCIATION field specifies the entity with which the IDENTIFIER field is associated, as described in table 272. If a logical unit returns an Identification descriptor with the ASSOCIATION field set to 0h, it shall return the same descriptor when it is accessed through any other path.

Table 272 — Association

Value	Description
0h	The IDENTIFIER field is associated with the addressed logical unit.
1h	The IDENTIFIER field is associated with the port that received the request.
2h	The IDENTIFIER field is associated with the SCSI target device that contains the addressed logical unit.
3h	Reserved

The IDENTIFIER TYPE field (see table 273) specifies the format and assignment authority for the identifier.

Table 273 — Identifier type

Value	Description	Reference
0h	Vendor specific	7.6.4.2
1h	T10 vendor identification	7.6.4.3
2h	EUI-64	7.6.4.4
3h	NAA	7.6.4.5
4h	Relative target port	7.6.4.6
5h	Target port group	7.6.4.7
6h	Logical unit group	7.6.4.8
7h	MD5 logical unit identifier	7.6.4.9
8h - Fh	Reserved	

For logical units that are not well known logical units (see clause 8) at least one identification descriptor shall contain 1h, 2h, or 3h in the IDENTIFIER TYPE field and 0h in the ASSOCIATION field. At least one identification descriptor should contain 2h or 3h in the IDENTIFIER TYPE field and 0h in the ASSOCIATION field.

For well known logical units at least one identification descriptor shall contain 2h, or 3h in the IDENTIFIER TYPE field and shall contain a 2h in the ASSOCIATION field.

The IDENTIFIER LENGTH field specifies the length in bytes of the IDENTIFIER field. If the allocation length field of the CDB is too small to transfer all of the identifier, the identifier length shall not be adjusted to reflect the truncation.

The IDENTIFIER field contains the identifier as described by the ASSOCIATION, IDENTIFIER TYPE, CODE SET, and IDENTIFIER LENGTH fields.

7.6.4.2 Vendor specific identifier format

If the identifier type is vendor specific (0h), no assignment authority was used and consequently there is no guarantee that the identifier is globally unique (i.e., the identifier is vendor specific). Table 274 defines the IDENTIFIER field format.

Table 274 — Vendor specific IDENTIFIER field format

Bit Byte	7	6	5	4	3	2	1	0
0	VENDOR SPECIFIC IDENTIFIER							
n								

7.6.4.3 T10 vendor identification format

If the identifier type is T10 vendor identification (1h), the identifier field has the format shown in table 275.

Table 275 — T10 vendor IDENTIFIER field format

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB) _____							
7	VENDOR IDENTIFICATION _____ (LSB)							
8	_____							
n	VENDOR SPECIFIC IDENTIFIER _____							

The VENDOR IDENTIFICATION field contains eight bytes of left-aligned ASCII data (see 4.4.1) identifying the vendor of the product. The data shall be left aligned within this field. The vendor identification shall be one assigned by INCITS. A list of assigned vendor identifications is in Annex D and on the T10 web site (www.T10.org).

NOTE 66 - The T10 web site (www.t10.org) provides a convenient means to request an identification code.

The organization associated with the vendor identification is responsible for ensuring that the VENDOR SPECIFIC IDENTIFIER field is unique in a way that makes the entire IDENTIFIER field unique. A recommended method of constructing a unique IDENTIFIER field is to concatenate the PRODUCT IDENTIFICATION field from the standard INQUIRY data (see 6.4.2) and the product serial number field from the Unit Serial Number VPD page (see 7.6.7).

7.6.4.4 EUI-64 identifier format

If the identifier type is EUI-64 identifier (2h), the eight byte fixed length IDENTIFIER field has the format shown in table 276. The CODE SET field shall be set to 1h and the IDENTIFIER LENGTH field shall be set to 8h.

Table 276 — EUI-64 IDENTIFIER field format

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB) _____							
2	IEEE COMPANY_ID _____ (LSB)							
3	(MSB) _____							
7	VENDOR SPECIFIC EXTENSION IDENTIFIER _____ (LSB)							

The IEEE COMPANY_ID field contains a 24 bit OUI (see 3.1.66) assigned by the IEEE.

The VENDOR SPECIFIC EXTENSION IDENTIFIER a 40 bit numeric value that is uniquely assigned by the organization associated with the IEEE company_id as required by the IEEE definition of EUI-64 (see E.2).

7.6.4.5 NAA identifier format

7.6.4.5.1 NAA identifier basic format

If the identifier type is NAA identifier (3h), the IDENTIFIER field has the format shown in table 277. This format is compatible with the Name_Identifier format defined in FC-FS.

Table 277 — NAA IDENTIFIER field format

Bit Byte	7	6	5	4	3	2	1	0				
0	NAA											
1	NAA specific data											
n												

The Name Address Authority (NAA) field (see table 278) defines the format of the NAA specific data in the identifier.

Table 278 — Name Address Authority values

Value	Description	Reference
2h	IEEE Extended	7.6.4.5.3
5h	IEEE Registered	7.6.4.5.3
6h	IEEE Registered Extended	7.6.4.5.4
0h - 1h	Reserved	
3h - 4h	Reserved	
7h - Fh	Reserved	

7.6.4.5.2 NAA IEEE Extended identifier format

When NAA is IEEE Extended (2h), the eight byte fixed length IDENTIFIER field shall have the format shown in table 279. The CODE SET field shall be set to 1h and the IDENTIFIER LENGTH field shall be set to 8h.

Table 279 — NAA IEEE Extended IDENTIFIER field format

Bit Byte	7	6	5	4	3	2	1	0
0	NAA (2h)				(MSB)			
1	VENDOR SPECIFIC IDENTIFIER A							(LSB)
2	(MSB)	IEEE COMPANY_ID						
3								(LSB)
4	VENDOR SPECIFIC IDENTIFIER B							
7								(LSB)

The IEEE COMPANY_ID field contains a 24 bit canonical form OUI (see 3.1.66) assigned by the IEEE.

The VENDOR SPECIFIC IDENTIFIER A contains a 12 bit numeric value that is uniquely assigned by the organization associated with the IEEE company_id.

The VENDOR SPECIFIC IDENTIFIER B contains a 24 bit numeric value that is uniquely assigned by the organization associated with the IEEE company_id.

NOTE 67 - The EUI-64 identifier format includes a 40 bit vendor specific identifier. The IEEE Extended identifier format includes 36 bits vendor specific identifier in two fields.

7.6.4.5.3 NAA IEEE Registered identifier format

When NAA is IEEE Registered (5h), the eight byte fixed length IDENTIFIER field shall have the format shown in table 280. The CODE SET field shall be set to 1h and the IDENTIFIER LENGTH field shall be set to 8h.

Table 280 — NAA IEEE Registered IDENTIFIER field format

Bit Byte	7	6	5	4	3	2	1	0
0	NAA (5h)				(MSB)			
1	IEEE COMPANY_ID							
2								
3								
4	(LSB)				(MSB)			
7	VENDOR SPECIFIC IDENTIFIER							
	(LSB)							

The IEEE COMPANY_ID field contains a 24 bit canonical form OUI (see 3.1.66) assigned by the IEEE.

The VENDOR SPECIFIC IDENTIFIER a 36 bit numeric value that is uniquely assigned by the organization associated with the IEEE company_id.

NOTE 68 - The EUI-64 identifier format includes a 40 bit vendor specific identifier. The IEEE Registered identifier format includes a 36 bit vendor specific identifier.

7.6.4.5.4 NAA IEEE Registered Extended identifier format

When NAA is IEEE Registered Extended (6h), the sixteen byte fixed length IDENTIFIER field shall have the format shown in table 281. The CODE SET field shall be set to 1h and the IDENTIFIER LENGTH field shall be set to 10h.

Table 281 — NAA IEEE Registered Extended IDENTIFIER field format

Bit Byte	7	6	5	4	3	2	1	0
0	NAA (6h)				(MSB)			
1	IEEE COMPANY_ID							
2								
3								
4	(LSB)				(MSB)			
7	VENDOR SPECIFIC IDENTIFIER							
8	(MSB)							
15	VENDOR SPECIFIC IDENTIFIER EXTENSION							

The IEEE COMPANY_ID field contains a 24 bit canonical form OUI (see 3.1.66) assigned by the IEEE.

The VENDOR SPECIFIC IDENTIFIER a 36 bit numeric value that is uniquely assigned by the organization associated with the IEEE company_id.

NOTE 69 - The EUI-64 identifier format includes a 40 bit vendor specific identifier. The IEEE Registered Extended identifier format includes a 36 bit vendor specific identifier.

The VENDOR SPECIFIC IDENTIFIER EXTENSION a 64 bit numeric value that is assigned to make the IDENTIFIER field unique.

7.6.4.6 Relative target port identifier format

If the identifier type is relative target port (4h) and the ASSOCIATION field contains 1h, the four byte fixed length IDENTIFIER field shall have the format shown in table 282. The CODE SET field shall be set to 1h and the IDENTIFIER LENGTH field shall be set to 4h. If the ASSOCIATION field does not contain 1h, use of this identifier type is reserved.

Table 282 — Relative target port IDENTIFIER field format

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB) _____							
3	_____ (LSB)							

The relative target port field (see table 283) identifies the target port relative to other target ports in the device.

Table 283 — Relative target port identifier values

Value	Description
0h	Reserved
1h	Relative port 1, historically known as port A
2h	Relative port 2, historically known as port B
3h - 7FFF FFFFh	Relative port 3 through 2 147 483 647
8000 0000h - FFFF FFFFh	Reserved

7.6.4.7 Target port group identifier format

If the identifier type is target port group (5h) and the ASSOCIATION value is 1h, the four byte fixed length IDENTIFIER field shall have the format shown in table 284. The CODE SET field shall be set to 1h and the IDENTIFIER LENGTH field shall be set to 4h. If the ASSOCIATION field does not contain 1h, use of this identifier type is reserved.

Table 284 — Target port group IDENTIFIER field format

Bit Byte	7	6	5	4	3	2	1	0
0	Reserved							
1								
2	(MSB)	TARGET PORT GROUP						
3								(LSB)

The TARGET PORT GROUP field contains the identifier for the target port group to which the target port is a member (see 5.7).

7.6.4.8 Logical unit group identifier format

A logical unit group is a group of logical units that share the same target port group (see 5.7) definitions. The target port groups maintain the same target port group asymmetric access states for all logical units in the same logical unit group. A logical unit shall be in no more than one logical unit group.

If the identifier type is logical unit group (6h) and the ASSOCIATION value is 0h, the four byte fixed length IDENTIFIER field shall have the format shown in table 285. The CODE SET field shall be set to 1h and the IDENTIFIER LENGTH field shall be set to 4h. If the ASSOCIATION field does not contain 0h, use of this identifier type is reserved.

Table 285 — Logical unit group IDENTIFIER field format

Bit Byte	7	6	5	4	3	2	1	0
0	Reserved							
1								
2	(MSB)	LOGICAL UNIT GROUP						
3								(LSB)

The LOGICAL UNIT GROUP field contains the identifier for the logical unit group to which the logical unit is a member.

7.6.4.9 MD5 logical unit identifier format

If the identifier type is MD5 logical unit identifier (7h), the IDENTIFIER field has the format shown in table 286. The MD5 logical unit identifier shall not be used if a logical unit provides unique identification using identifier types 2h or 3h (see table 273). A bridge device may return a MD5 logical unit identifier type for that logical unit that does not support the Device Identification VPD page (see 7.6.4).

Table 286 — MD5 logical unit IDENTIFIER field format

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB)							
15	MD5 LOGICAL UNIT IDENTIFIER (LSB)							

The MD5 LOGICAL UNIT IDENTIFIER field contains the message digest of the supplied message input. The message digest shall be generated using the MD5 message-digest algorithm as specified in RFC 1321 (see 2.4) with the following information as message input:

- 1) The contents of the VENDOR IDENTIFICATION field in the standard INQUIRY data (see 6.4.2);
- 2) The contents of the PRODUCT IDENTIFICATION field in the standard INQUIRY data;
- 3) The contents of the PRODUCT SERIAL NUMBER field in the Unit Serial Number VPD page (see 7.6.7);
- 4) The contents of a vendor specific IDENTIFIER field (type 0h) from the Device Identification VPD page; and
- 5) The contents of a T10 vendor identification IDENTIFIER field (type 1h) from the Device Identification VPD page.

If a field or page is not available, the message input for that field or page shall be 8 bytes of ASCII space characters (i.e., 20h).

The uniqueness of the MD5 logical unit identifier is dependent upon the relative degree of randomness (i.e., the entropy) of the message input. If it is found that two or more logical units have the same MD5 logical unit identifier, the application client should determine in a vendor specific manner whether the logical units are the same entities.

The MD5 logical unit identifier example described in this paragraph and shown in table 287 and table 288 is not a normative part of this standard. The data available for input to the MD5 algorithm for this example is shown in table 287.

Table 287 — MD5 logical unit identifier example available data

MD5 message input	Available	Contents
VENDOR IDENTIFICATION field	Yes	T10
PRODUCT IDENTIFICATION field	Yes	MD5 Logical Unit
PRODUCT SERIAL NUMBER field	Yes	00100203 04050607h
vendor specific IDENTIFIER field	No	
T10 vendor identification IDENTIFIER field	No	

The concatenation of the fields in table 287 to form input to the MD5 algorithm is shown in table 289.

Table 288 — Example MD5 input for computation of a logical unit identifier

Bytes	Hexadecimal values				ASCII values
00 – 15	54 31 30 20	20 20 20 20	4D 44 35 20	4C 6F 67 69	T10 MD5 Logi
16 – 31	63 61 6C 20	55 6E 69 74	00 01 02 03	04 05 06 07	cal Unit.....
32 – 47	20 20 20 20	20 20 20 20	20 20 20 20	20 20 20 20	
NOTE 1 Non-printing ASCII characters are shown as '.'.					

Based on the example inputs shown in table 287 and the concatenation of the inputs shown in table 289, the MD5 base 16 algorithm described in RFC 1321 will produce the value 2BE1 9EB2 306A F5A9 F616 9402 FBED DBD0h.

7.6.4.10 Device Identification VPD page example

The example described in this paragraph and shown in table 289 is not a normative part of this standard. This example of a complete Device Identification VPD page assumes that the product is a direct-access device with an T10 Vendor ID of “XYZ_Corp”, a product identification of “Super Turbo Disk”, and a product serial number of “2034589345”. Furthermore, it is assumed that the manufacturer has been assigned a 24-bit IEEE company_id of 01ABCDh by the IEEE Registration Authority Committee and that the manufacturer has assigned a 40-bit vendor specific extension identifier of FFFF234567h to this logical unit. The combined identifier is reported in the 64-bit format as defined by the EUI-64 standard. The data returned in the Device Identification VPD page for this logical unit is shown in table 289.

Table 289 — Device Identification VPD page example

Bytes	Hexadecimal values				ASCII values
00 – 15	00 83 00 32	02 01 00 22	58 59 5A 5F	43 6F 72 70	...2..."XYZ_Corp
16 – 31	53 75 70 65	72 20 54 75	72 62 6F 20	44 69 73 6B	Super Turbo Disk
32 – 47	32 30 33 34	35 38 39 33	34 35 01 02	00 08 01 AB	2034589345.....
48 – 53	CD FF FF 23	45 67		
NOTE 1 Non-printing ASCII characters are shown as '.'.					
NOTE 2 Byte 00 is the beginning of the VPD page (see table 269).					
NOTE 3 Byte 04 is the beginning of the Identification descriptor for the Vendor ID based identifier (Identifier type 1, see table 273).					
NOTE 4 Byte 42 is the beginning of the Identification descriptor for the EUI-64 identifier (Identifier type 2, see table 273).					

7.6.5 Software Interface Identification page

The Software Interface Identification VPD page (see table 290) provides identification of software interfaces applicable to the logical unit. Logical units may have more than one associated software interface identifier.

NOTE 70 - Application clients may use the software IDs to differentiate peripheral device function in cases where the command set (e.g., processor devices) is too generic to distinguish different software interfaces implemented.

Table 290 — Software Interface Identification VPD page

Bit Byte	7	6	5	4	3	2	1	0
0	PERIPHERAL QUALIFIER			PERIPHERAL DEVICE TYPE				
1	PAGE CODE (84h)							
2	Reserved							
3	PAGE LENGTH (n-3)							
	Software interface identifier list							
4	Software interface identifier (first)							
	⋮							
	Software interface identifier (last)							
n								

The PERIPHERAL QUALIFIER field and the PERIPHERAL DEVICE TYPE field are defined in 6.4.2.

The PAGE LENGTH field specifies the length of the software interface identifier list. If the allocation length is too small to transfer all of the VPD page, the page length shall not be adjusted to reflect the truncation.

Each software interface identifier (see table 291) is a six-byte, fixed-length field that contains information identifying a software interface implemented by the logical unit. The contents of software interface identifier are in EUI-48 format (see E.2).

Table 291 — Software interface identifier format

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB) _____							
2	OUI _____ (LSB)							
3	(MSB) _____							
5	VENDOR SPECIFIC EXTENSION IDENTIFIER _____ (LSB)							

The OUI field contains a 24 bit OUI (see 3.1.66) assigned by the IEEE.

The VENDOR SPECIFIC EXTENSION IDENTIFIER a 24 bit numeric value that is uniquely assigned by the organization associated with the OUI as required by the IEEE definition of EUI-48 (see E.1). The combination of OUI and vendor specific extension identifier shall uniquely identify the document or documents that specify the supported software interface.

7.6.6 Supported VPD pages

This VPD page contains a list of the VPD page codes supported by the target or logical unit (see table 292). If a device server supports any VPD pages, it also shall support this vital product data page.

Table 292 — Supported VPD pages

Bit Byte	7	6	5	4	3	2	1	0
0	PERIPHERAL QUALIFIER			PERIPHERAL DEVICE TYPE				
1	PAGE CODE (00h)							
2	Reserved							
3	PAGE LENGTH (n-3)							
4	supported VPD page list							
n								

The PERIPHERAL QUALIFIER field and the PERIPHERAL DEVICE TYPE field are defined in 6.4.2.

The PAGE LENGTH field specifies the length of the supported VPD page list. If the allocation length is too small to transfer all of the VPD page, the page length shall not be adjusted to reflect the truncation.

The supported VPD page list shall contain a list of all VPD page codes (see 7.6) implemented for the target or logical unit in ascending order beginning with page code 00h.

7.6.7 Unit Serial Number VPD page

This VPD page (see table 293) provides a product serial number for the target or logical unit.

Table 293 — Unit Serial Number VPD page

Bit Byte	7	6	5	4	3	2	1	0
0	PERIPHERAL QUALIFIER			PERIPHERAL DEVICE TYPE				
1	PAGE CODE (80h)							
2	Reserved							
3	PAGE LENGTH (n-3)							
4	(MSB)							
n	PRODUCT SERIAL NUMBER							
	(LSB)							

The PERIPHERAL QUALIFIER field and the PERIPHERAL DEVICE TYPE field are defined in 6.4.2.

The PAGE LENGTH field specifies the length of the product serial number. If the allocation length is too small to transfer all of the VPD page, the page length shall not be adjusted to reflect the truncation.

The PRODUCT SERIAL NUMBER field contains right-aligned ASCII data (see 4.4.1) that is vendor-assigned serial number. If the product serial number is not available, the device server shall return ASCII spaces (20h) in this field.

8 Well known logical units

8.1 Model for well known logical units

Well known logical units are addressed using the well known logical unit addressing method of extended logical unit addressing (see SAM-2). Each well known logical unit has a well known logical unit number (W-LUN) as shown in table 294.

Table 294 — Well known logical unit numbers

W-LUN	Description	Reference
00h	Reserved	
01h	REPORT LUNS well known logical unit	8.2
02h	ACCESS CONTROLS well known logical unit	8.3
03h	TARGET LOG PAGES well known logical unit	8.3
04h-FFh	Reserved	

If a well known logical unit is supported within a SCSI target device then that logical unit shall support all the commands defined for it.

Access to well known logical units shall not be affected by access controls.

The SCSI target device name of the well known logical unit may be determined by issuing an INQUIRY command (see 6.4) requesting the Device Identification VPD page (see 7.6.4).

All well known logical units shall support the INQUIRY command's Device Identification VPD page and, at a minimum, shall support the identify descriptor with the identifier type set to the NAA identifier (i.e., 3h) or the EUI-64 identifier (i.e., 2h). The contents of the IDENTIFIER field shall be equal to one of the SCSI target device's names. The returned Device Identification VPD page shall contain all the SCSI target device names for all the SCSI transport protocols supported by the SCSI target device. All well known logical units within a SCSI target device shall return the same list of SCSI target device names.

8.2 REPORT LUNS well known logical unit

The REPORT LUNS well known logical unit shall only process the commands listed in table 295. If a command is received by the REPORT LUNS well know logical unit that is not listed in table 295 the device server shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and an additional sense code of INVALID COMMAND OPERATION CODE.

Table 295 — Commands for the REPORT LUNS well known logical unit

Command name	Operation code	Type	Reference
INQUIRY	12h	M	6.4
REPORT LUNS	A0h	M	6.21
REQUEST SENSE	03h	M	6.25
TEST UNIT READY	00h	M	6.27
Key: M = Command implementation is mandatory.			

8.3 ACCESS CONTROLS well known logical unit

8.3.1 Access controls model

8.3.1.1 Access controls commands

The ACCESS CONTROLS well known logical unit shall only process the commands listed in table 296. If a command is received by the ACCESS CONTROLS well known logical unit that is not listed in table 296 the device server shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and an additional sense code of INVALID COMMAND OPERATION CODE.

Table 296 — Commands for the ACCESS CONTROLS well known logical unit

Command name	Operation code	Type	Reference
ACCESS CONTROL IN	86h	M	8.3.2
ACCESS CONTROL OUT	87h	M	8.3.3
INQUIRY	12h	M	7.3
REQUEST SENSE	03h	M	7.20
TEST UNIT READY	00h	M	7.24
Key: M = Command implementation is mandatory.			

8.3.1.2 Access controls overview

Access controls are ~~an optional~~ a SCSI target device feature that application clients may use to restrict logical unit access to specified initiator ~~ports~~ or groups of initiator ~~ports~~.

~~Access controls shall not allow restrictions to be placed on access to well known logical units. Access controls shall not cause new well known logical units to be defined.~~

Access controls are handled in the SCSI target device by an access controls coordinator located at the ACCESS CONTROLS well known logical unit. The access controls coordinator also may be accessible via LUN 0. The access controls coordinator associates a specific LUN to a specific logical unit depending on which initiator ~~port~~ accesses the SCSI target device and whether the initiator ~~port~~ has ~~access~~ rights to the logical unit.

Access rights to a logical unit affects whether the logical unit appears in the parameter data returned by a REPORT LUNS command and how the logical unit responds to INQUIRY commands.

The access controls coordinator maintains the ~~access control list (ACL)~~ ACL as described in 8.3.1.3 to supply information about:

- Which initiator ~~ports~~ are allowed access to which logical units; and
- Which LUN value is used by a ~~given specific~~ initiator ~~port~~ when accessing a ~~given specific~~ logical unit.

The format of the ACL is vendor specific.

To support third party commands ~~such as (e.g., EXTENDED COPY)~~, the access controls coordinator may provide proxy tokens (see 8.3.1.6.2) to allow ~~one initiator~~ an application client to pass its access capabilities to ~~the application client for~~ another initiator ~~port~~.

~~An application client manages the access controls state of the SCSI target device using the ACCESS CONTROL IN command (see 8.3.2) and the ACCESS CONTROL OUT command (see 8.3.3).~~

An application client manages the access controls state of the SCSI target device using the following commands:

- a) ACCESS CONTROL IN
 - A) To request information from the access controls coordinator; or
 - B) To request a proxy token; and
- b) ACCESS CONTROL OUT
 - A) To grant, change or revoke logical unit access;
 - B) To revoke a proxy token; and
 - C) Otherwise to manage the access controls coordinator.

A SCSI target device has access controls disabled when it is manufactured shipped from the factory and after successful completion of the ACCESS CONTROL OUT command with DISABLE ACCESS CONTROLS service action (see 8.3.3.3). In this state When access controls are disabled, the ACL contains no entries and the management identifier key (see 8.3.1.8) is zero.

The first successful ACCESS CONTROL OUT command with MANAGE ACL service action (see 8.3.3.2) shall enable access controls. When access controls are enabled, all logical units shall be inaccessible to all initiator ports unless the ACL (see 8.3.1.3) allows access.

The ACL allows an initiator port access to a logical unit if the ACL contains an ACE (see 8.3.1.3) with an access identifier (see 8.3.1.3.2) associated with the initiator port and that ACE contains a LUACD (see 8.3.1.3.3) that references the logical unit.

When the ACL allows access to a logical unit, the REPORT LUNS command parameter data bytes representing that logical unit shall contain the LUN value found in the LUACD that references that logical unit and the application client for the initiator port shall use the same LUN value when sending commands to the logical unit.

An initiator port also may be allowed access to a logical unit through the use of a proxy token (see 8.3.1.6.2).

Once access controls are enabled, they shall remain enabled until:

- a) Successful completion of an ACCESS CONTROL OUT command with DISABLE ACCESS CONTROLS service action; or
- b) Vendor specific physical intervention.

Successful downloading of microcode (see 6.31) may result in access controls being disabled.

Once access controls are enabled, power cycles, hard resets, logical unit resets, and I_T nexus losses shall not disable them.

8.3.1.3 The access control list (ACL)

8.3.1.3.1 ACL overview

The specific access controls for a SCSI target device are instantiated by the access controls coordinator using data in an access control list (ACL). The ACL contains zero or more access control list entries (ACEs) ACEs and zero or more proxy tokens (see 8.3.1.6.2.1). Each ACE contains the following:

Each ACE contains the following:

- a) One access identifier (see 8.3.1.3.2) that identifies the initiator port(s) to which the ACE applies; and
- b) A list of logical unit access control descriptors (LUACDs) LUACDs (see 8.3.1.3.3) that identify the logical units to which the identified initiator port(s) have access rights and the LUNs used to access those logical units by the via those initiator port(s). Each LUACD contains the following:

- A) A vendor specific [reference for a logical unit reference that is not a well known logical unit](#); and
- B) A LUN value.

Figure 6 shows the [logical](#) structure of an ACL.

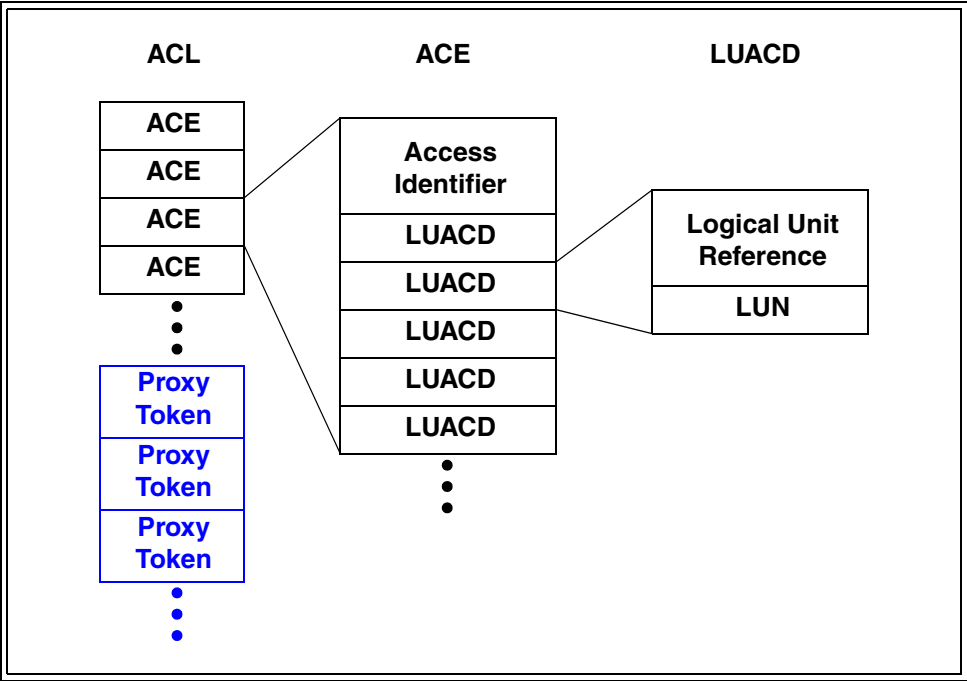

Figure 6 — ACL Structure

8.3.1.3.2 Access identifiers

8.3.1.3.2.1 Access identifiers overview

Initiator [ports](#) are identified in an ACE using one of the following types of access identifiers:

- a) AccessID - based on initiator [port](#) enrollment [as described in 8.3.1.3.2.2](#);
- b) TransportID - based on protocol specific identification of initiator [ports as described in 8.3.1.3.2.3](#); or
- c) Vendor specific access identifiers.

8.3.1.3.2.2 AccessID access identifiers

[AccessID access identifiers shall have the format shown in table 297.](#)

Table 297 — AccessID access identifier format

Bit Byte	7	6	5	4	3	2	1	0
0	AccessID							
15								
16	Reserved							
23								

~~The ACCESSID field contains a value that uniquely identifies the AccessID type ACE in which the AccessID access identifier appears.~~

An initiator **port** is allowed access to the logical units in an ACE containing an AccessID type access identifier when that initiator **port** is enrolled as described in 8.3.1.5. An initiator **port** that has not previously enrolled uses the ACCESS CONTROL OUT command with ACCESS ID ENROLL service action to enroll including the AccessID in parameter data as specified in 8.3.3.4.

An initiator **port** is ~~identified by or~~ associated with an AccessID type access identifier if that initiator **port** is in the enrolled **state** or pending-enrolled state with respect to that AccessID (see 8.3.1.5). At any **given instant in** time, an initiator **port** may be ~~identified or~~ associated with at most one AccessID. All initiator **ports** enrolled using a **given specific** AccessID share the same ACE and access to all the logical units its LUACDs describe.

8.3.1.3.2.3 TransportID access type identifiers

~~An initiator port is identified by a TransportID if that initiator port accesses the target device with that TransportID. Use of the TransportIDs (see 7.5.4) as access identifiers is SCSI protocol specific.~~

TransportID access identifiers are SCSI transport protocol specific as described in 7.5.4.

An initiator port is allowed access to the logical units in an ACE containing a TransportID type access identifier when the identification for the initiator port matches that found in the TransportID in a way that is consistent with the TransportID definition (see 7.5.4). There is no need to process any command to obtain logical unit access based on a Transport ID because the needed information is provided by the SCSI transport protocol layer.

The formats of access identifiers are defined in 8.3.1.13.

8.3.1.3.3 Logical unit access control descriptors

Each LUACD in an ACE identifies one logical unit to which the initiator **ports** associated with the access identifier are allowed access and specifies the LUN value ~~these initiators use used~~ when accessing the logical unit ~~via those initiator ports~~. The format of a LUACD is vendor specific.

The identification of a logical unit in a LUACD is vendor specific. The logical unit identified by a LUACD shall not be a well known logical unit. A logical unit shall be referenced in no more than one LUACD per ACE.

The LUN value shall conform to the requirements specified in SAM-2. A **given specific** LUN value shall appear in no more than one LUACD per ACE.

8.3.1.4 Managing the ACL

8.3.1.4.1 ACL management overview

The contents of the ACL are managed by an application client using the ACCESS CONTROL OUT command with MANAGE ACL and DISABLE ACCESS CONTROLS service actions. The ACCESS CONTROL OUT command with MANAGE ACL service action (see 8.3.3.2) is used to add, remove, or modify ACEs thus adding, revoking, or changing the allowed access of initiator **ports** to logical units. The ACCESS CONTROL OUT command with DISABLE ACCESS CONTROLS service action (see 8.3.3.3) disables access controls and discards the ACL.

8.3.1.4.2 Authorizing ACL management

To reduce the possibility of applications other than authorized ACL managers changing the ACL, successful completion of **specific access controls service actions** ~~the~~ (e.g., ACCESS CONTROL OUT command with MANAGE ACL or DISABLE ACCESS CONTROLS service action) requires delivery of the correct management

identifier key value (see 8.3.1.8) in the ACCESS CONTROL OUT parameter data. ~~For similar reasons other ACCESS CONTROL OUT and ACCESS CONTROL IN service actions~~ The service actions that require the correct management identifier key ~~as summarized are shown~~ in table 298 and table 299.

Table 298 — ACCESS CONTROL OUT management identifier key requirements

Service action name	Management Identifier Key Required	Reference
ACCESS ID ENROLL	No	8.3.3.4
ASSIGN PROXY LUN	No	8.3.3.11
CANCEL ENROLLMENT	No	8.3.3.5
CLEAR ACCESS CONTROLS LOG	Yes	8.3.3.6
DISABLE ACCESS CONTROLS	Yes	8.3.3.3
MANAGE ACL	Yes	8.3.3.2
MANAGE OVERRIDE LOCKOUT TIMER	Yes/No	8.3.3.7
OVERRIDE MGMT ID KEY	No	8.3.3.8
RELEASE PROXY LUN	No	8.3.3.12
REVOKE ALL PROXY TOKENS	No	8.3.3.10
REVOKE PROXY TOKEN	No	8.3.3.9

Table 299 — ACCESS CONTROL IN management identifier key requirements

Service action name	Management Identifier Key Required	Reference
REPORT ACCESS CONTROLS LOG	Yes	8.3.2.4
REPORT ACL	Yes	8.3.2.2
REPORT LU DESCRIPTORS	Yes	8.3.2.3
REPORT OVERRIDE LOCKOUT TIMER	Yes	8.3.2.5
REQUEST PROXY TOKEN	No	8.3.2.6

Table 300—ACCESS CONTROL OUT management identifier key requirements

Service Action	Name	Management Identifier Key Required	Reference
00h	MANAGE ACL	Yes	8.3.3.2
01h	DISABLE ACCESS CONTROLS	Yes	8.3.3.3
02h	ACCESS ID ENROLL	No	8.3.3.4
03h	CANCEL ENROLLMENT	No	8.3.3.5
04h	CLEAR ACCESS CONTROLS LOG	Yes	8.3.3.6
05h	MANAGE OVERRIDE LOCKOUT TIMER	Yes/No	8.3.3.7
06h	OVERRIDE MGMT ID KEY	No	8.3.3.8
07h	REVOKE PROXY TOKEN	No	8.3.3.9
08h	REVOKE ALL PROXY TOKENS	No	8.3.3.10
09h	ASSIGN PROXY LUN	No	8.3.3.11
0Ah	RELEASE PROXY LUN	No	8.3.3.12
0Bh-17h	Reserved		
18h-1Fh	Vendor specific		

Table 301—ACCESS CONTROL IN management identifier key requirements

Service Action	Name	Management Identifier Key Required	Reference
00h	REPORT ACL	Yes	8.3.2.2
01h	REPORT LU DESCRIPTORS	Yes	8.3.2.3
02h	REPORT ACCESS CONTROLS LOG	Yes	8.3.2.4
03h	REPORT OVERRIDE LOCKOUT TIMER	Yes	8.3.2.5
04h	REQUEST PROXY TOKEN	No	8.3.2.6
05h-17h	Reserved		
18h-1Fh	Vendor specific		

8.3.1.4.3 Identifying logical units during ACL management

Although the identification of logical units in the ACL is vendor specific (see 8.3.1.3.3), the ACCESS CONTROL OUT command with MANAGE ACL service action (see 8.3.3.2) needs a mechanism for identifying logical units that is independent of LUN value and suitable for exchanges between the access controls coordinator and application clients. To serve the needs of the ACCESS CONTROL OUT command with MANAGE ACL service action the The access controls coordinator shall identify every logical unit of a SCSI target device with a unique default LUN value. The default LUN values used by the access controls coordinator shall be the LUN values that would be reported by the REPORTS LUNS command if access controls were disabled.

An application client discovers the default LUN values using the ACCESS CONTROL IN command with REPORT LU DESCRIPTORS (see 8.3.2.3) or REPORT ACL (see 8.3.2.2) service action and subsequently then supplies those default LUN values to the access controls coordinator using the ACCESS CONTROL OUT command with MANAGE ACL service action.

The association between default LUN values and logical units is managed by the access controls coordinator and may change due to circumstances that are beyond the scope of this standard. To track ~~such changes in the association between default LUN values and logical units~~, the access controls coordinator shall maintain ~~the a generation counter value called~~ DLgeneration ~~(Default LUNs Generation) value~~ as described in 8.3.1.4.4.

8.3.1.4.4 Tracking changes in logical unit identification

The access controls coordinator shall maintain ~~the a generation counter value called~~ DLgeneration ~~(Default LUNs Generation) value~~ to track changes in the association between default LUN values and logical units.

When access controls are disabled DLgeneration shall be zero. When access controls are first enabled (see 8.3.1.2) DLgeneration shall be set to one. While access controls are enabled, the access controls coordinator shall ~~increase increment~~ DLgeneration by one every time the association between default LUN values and logical units changes ~~for any reason, including but not limited to (e.g., following the creation of a new logical unit, deletion of an existing logical unit, or a change (delete and recreate) removal and recreation of an existing logical unit).~~

The access controls coordinator shall include the current DLgeneration in the parameter data returned by an ACCESS CONTROL IN command with REPORT LU DESCRIPTORS (see 8.3.2.3) or REPORT ACL (see 8.3.2.2) service action. The application client shall supply the DLgeneration for the default LUN values it is using in the parameter data for an ACCESS CONTROL OUT command with MANAGE ACL service action (see 8.3.3.2).

Before processing the ACL change information in the parameter list provided by an ACCESS CONTROL OUT command with MANAGE ACL service action, the access controls coordinator shall verify that the DLgeneration in the parameter data matches the DLgeneration currently in use. If the DLgeneration verification finds a mismatch, the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to INVALID FIELD IN PARAMETER LIST.

8.3.1.5 Enrolling AccessIDs

8.3.1.5.1 Enrollment states

8.3.1.5.1.1 Summary of enrollment states

~~Application clients enroll an initiator port~~ ~~Initiators enroll an~~ AccessID with ~~an the~~ access controls coordinator ~~in order to be allowed to access to~~ logical units listed in the ACE having the same AccessID type access identifier. ~~Enrolling an AccessID is accomplished using the~~ The ACCESS CONTROL OUT command with ACCESS ID ENROLL service action (see 8.3.3.4) ~~is used to enroll an AccessID~~. An initiator ~~port~~ shall be in one of three states with respect to such an enrollment:

- a) **Not-enrolled:** The state for an initiator ~~port~~ before ~~it sends~~ the first ACCESS CONTROL OUT command with ACCESS ID ENROLL service action ~~is sent~~ to the access controls coordinator. Also the state for an initiator ~~port~~ following successful completion of an ACCESS CONTROL OUT command with CANCEL ENROLLMENT service action (see 8.3.3.5);
- b) **Enrolled:** The state for an initiator ~~port~~ following successful completion of an ACCESS CONTROL OUT command with ACCESS ID ENROLL service action; or
- c) **Pending-enrolled:** The state for an enrolled initiator ~~port~~ following:
 - A) Events in the service delivery subsystem described in 8.3.1.12; or
 - B) Successful completion of an ACCESS CONTROL OUT command with MANAGE ACL service action from any initiator ~~port~~ with the ~~flush~~ FLUSH bit set to one (see 8.3.3.2).

8.3.1.5.1.2 Not-enrolled state

The access controls coordinator shall place an initiator port in the not-enrolled state when it first detects the receipt of a SCSI command or task management function from that initiator port. The initiator port shall remain in the not-enrolled state until successful completion of an ACCESS CONTROL OUT command with ACCESS ID ENROLL service action (see 8.3.3.5).

When in the not-enrolled state, an initiator port shall only have access to logical units on the basis of a TransportID (see 8.3.1.3.2.3) or on the basis of proxy tokens (see 8.3.1.6.2.1).

The access controls coordinator shall change an initiator port from the enrolled state or pending-enrolled state to the not-enrolled state in response to the following events:

- a) Successful completion of the ACCESS CONTROL OUT command with CANCEL ENROLLMENT service action (see 8.3.3.5) shall change the state to not-enrolled; or
- b) Successful completion of an ACCESS CONTROL OUT command with MANAGE ACL service action (see 8.3.3.2) that replaces the ACL entry for the enrolled AccessID as follows:
 - A) If the NOCNCL bit (see 8.3.3.2.2) is set to zero in the ACCESS CONTROL OUT command with MANAGE ACL service action parameter data, the state shall change to not-enrolled; or
 - B) If the NOCNCL bit is set to one, the state may change to not-enrolled based on vendor specific criteria.

An application client for an enrolled initiator port may find itself discover that the initiator port has transitioned to the not-enrolled state as a result of actions taken by a third-party (e.g., an ACCESS CONTROL OUT command with MANAGE ACL service action performed by another initiator port or a logical unit reset). ~~The purpose of placing an enrolled initiator in the not-enrolled state in response to these events is to give initiator an indication~~ Placing an enrolled initiator in the not-enrolled state indicates that the ACE defining its that initiator port's logical unit access has changed. ~~One consequence of changes in an ACE is that (e.g., previous relationships between logical units and LUN values may no longer apply).~~

If an application client initiator detects this loss of enrollment on an initiator port, it may take recovery actions. However, such actions may be disruptive for the SCSI initiator device and may not always be required. Use of the not-enrolled state ~~and the resulting disruptive recovery actions are~~ is avoidable if the application client that sends the ACCESS CONTROL OUT command with MANAGE ACL service action ~~is able to determine~~ determines that its requested changes to the ACL do not alter the existing relationships between logical units and LUN values in any existing ACEs with AccessID type access identifiers and sets the NOCNCL bit to one, recommending that initiator ports be left in their current enrollment state.

~~If the application client that sends the ACCESS CONTROL OUT command with MANAGE ACL service action is able to determine that ACE logical unit relationships are not be altered as a result of processing the command, then it should set the NOCNCL bit to one, recommending to the access controls coordinator that initiators be left in their current enrollment states.~~

The access controls coordinator ~~has at least three vendor specific selects from the following~~ options for responding to a NOCNCL bit ~~value of set to one in a vendor specific manner:~~

- a) Honor the recommendation. ~~This is least disruptive for (results in the minimum effects on the SCSI initiator devices and requires no extra actions on the part of the access controls coordinator);~~
- b) Ignore the recommendation and always place the initiator ports in the non-enrolled state. ~~This may disrupt an (results in the maximum disruption for SCSI initiator devices unnecessarily, but requires no extra resources on the part of the access controls coordinator);~~ or
- c) Ignore the recommendation and instead examine the current and new ACEs to determine if the an initiator port should be placed in the non-enrolled state.

If the application client that sends the ACCESS CONTROL OUT command with MANAGE ACL service action is unable to determine whether the ACE logical unit relationships are altered as a result of processing the command, then it should set the NOCNCL bit to zero and it should coordinate the ACL change with the application clients for affected initiator ports to ensure proper data integrity. Such coordination is beyond the scope of this standard.

8.3.1.5.1.3 Enrolled state

The access controls coordinator shall place an initiator port in the enrolled state (i.e., enroll the initiator port) following successful completion of the ACCESS CONTROL OUT command with ACCESS ID ENROLL service action (see 8.3.3.4). The ACCESS CONTROL OUT command with ACCESS ID ENROLL service action is successful only under the following conditions if:

- a) ~~If the~~ The initiator port was in the not-enrolled state and the AccessID in the ACCESS CONTROL OUT command with ACCESS ID ENROLL service action parameter data matches the access identifier in an ACE. ~~The initiator thus enrolled is~~ This results in the initiator port being enrolled and allowed access to the logical units specified in the LUACDs in the ACE (see 8.3.1.3); or
- b) ~~If the~~ The initiator port was in the enrolled state or pending-enrolled state and the AccessID in the ACCESS CONTROL OUT command with ACCESS ID ENROLL service action parameter data matches the current enrolled AccessID for the initiator port.

If the initiator port was in the enrolled state or pending-enrolled state and the AccessID in the ACCESS CONTROL OUT command with ACCESS ID ENROLL service action parameter data does not match the current enrolled AccessID for the initiator port, then the command shall be terminated with CHECK CONDITION status, ~~the~~ The sense key shall be set to ILLEGAL REQUEST, and the additional sense code shall be set to ACCESS DENIED - ENROLLMENT CONFLICT, ~~and the access controls coordinator shall transition an enrolled initiator~~ If the initiator port was in the enrolled state it shall be transitioned to the pending-enrolled state.

Transitions from the enrolled state to the not-enrolled state are described in 8.3.1.5.1.2. Transitions from the enrolled state to the pending-enrolled state are described in 8.3.1.5.1.4.

NOTE 71 - This standard does not preclude implicit enrollments through mechanisms in the service delivery subsystem. Such mechanisms should perform implicit enrollments after identification by TransportID and should fail in the case where there are ACL conflicts as described in 8.3.1.5.2.

8.3.1.5.1.4 Pending-enrolled state

The access controls coordinator shall place an initiator port in the pending-enrolled state ~~only~~ if that initiator port currently is in the enrolled state, and in response to the following:

- a) A logical unit reset;
- b) An I_T nexus loss involving that initiator port; or
- ~~c) Any event in the service delivery subsystem that causes the access controls coordinator to question whether an initiator in the enrolled state has changed its AccessID; or~~
- d) Successful completion of an ACCESS CONTROL OUT command with MANAGE ACL service action where the FLUSH bit is set to one in the parameter data.

While in the pending-enrolled state, the initiator port's access to logical units is limited as described in 8.3.1.7.

8.3.1.5.2 ACL LUN conflict resolution

ACL LUN conflicts may occur ~~when if~~:

- a) An ~~application client for an~~ initiator ~~port~~ in the not-enrolled state attempts to enroll an AccessID using the ACCESS CONTROL OUT command with ACCESS ID ENROLL service action (see 8.3.3.4); or
- b) An ACCESS CONTROL OUT command with MANAGE ACL service action (see 8.3.3.2) attempts to change the ACL ~~in ways that conflict with the result that it conflicts~~ with existing enrollments (see 8.3.1.5) or proxy LUN assignments (see 8.3.1.6.2.2).

Three types of ACL LUN conflicts may occur:

- a) The TransportID ACE (see 8.3.1.3) and the AccessID ACE for the initiator ~~port~~ each contain a LUACD with the same LUN value but with ~~references to different logical units~~ ~~different logical unit references~~;
- b) The TransportID ACE and the AccessID ACE for the initiator ~~port~~ each contain a LUACD with the different LUN values but with ~~references to the same logical unit~~ ~~the same logical unit references~~; or
- c) The enrolling initiator ~~port~~ has proxy access rights to a logical unit addressed with a LUN value that equals a LUN value in a LUACD in the AccessID ACE for the initiator ~~port~~.

If an ACL LUN conflict occurs during the processing of an ACCESS CONTROL OUT command with MANAGE ACL service action the command shall be terminated with a CHECK CONDITION status (see 8.3.3.2.2).

If an ACL LUN conflict occurs during the processing of an ACCESS CONTROL OUT command with ACCESS ID ENROLL service action, the following actions shall be taken as part of the handling of the enrollment function:

- a) The ACCESS CONTROL OUT command with ACCESS ID ENROLL service action shall be terminated with CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST, the additional sense code shall be set to ACCESS DENIED - ACL LUN CONFLICT;
- b) The initiator ~~port~~ shall remain in the not-enrolled state; and
- c) ~~When If~~ the ACL LUN conflict is not the result of proxy access rights, the access controls coordinator shall record the event in the access controls log as described in 8.3.1.10.

8.3.1.6 Granting and revoking access rights

8.3.1.6.1 Non-proxy access rights

The ACCESS CONTROL OUT command with MANAGE ACL service action (see 8.3.3.2) adds or replaces ACEs in the ACL (see 8.3.1.3). One ACE describes the logical unit access allowed ~~to by~~ one access identifier (see 8.3.1.3.2) and the LUN values to be used in addressing the accessible logical units. The access identifier ~~specifies designates~~ the initiator ~~port(s) that may be permitted the logical unit access described by the ACE permitted access to the logical units described by the ACE~~.

With the exception of proxy access rights (see 8.3.1.6.2), ~~logical unit~~ access rights are granted by:

- a) Adding a new ACE to the ACL ~~allowing logical unit access to a new access identifier~~; or
- b) Replacing an existing ACE ~~with an ACE that so that the revised ACE~~ includes additional LUACDs.

With the exception of proxy access rights, access rights are revoked by:

- a) Removing an ACE from the ACL; or
- b) Replacing an existing ACE ~~with an ACE that so that the revised ACE~~ removes one or more LUACDs.

When an ACE is added or replaced the requirements stated in 8.3.1.5.1.2 and 8.3.1.11 apply.

8.3.1.6.2 Proxy access

8.3.1.6.2.1 Proxy tokens

An ~~initiator~~ application client with access rights to a logical unit via an initiator port on the basis of an ACE in the ACL (see 8.3.1.6.1) may temporarily share that access with third parties using the proxy access mechanism. The ~~initiator~~ application client uses the ACCESS CONTROL IN command with REQUEST PROXY TOKEN service action (see 8.3.2.6) to request that the access control coordinator generate a proxy token for the logical unit specified by the LUN value in the ~~parameter data~~ CDB.

The access controls coordinator generates the proxy token in a vendor specific manner. For a given specific SCSI target device, all active proxy token values should be unique. Proxy token values ~~should not be reused any more frequently than is necessary. This prevents~~ should be reused as infrequently as possible to prevent proxy tokens that have been used and ~~then~~ released from being given unintended meaning.

Power cycles, hard resets, logical unit resets, and I_T nexus losses shall not affect the validity and proxy access rights of proxy tokens (see 8.3.1.12). A proxy token shall remain valid and retain the same proxy access rights until one of the following occurs:

- a) An ~~initiator~~ application client with access rights to a logical unit via an initiator port based on an ACE in the ACL revokes the proxy token using:
 - A) The ACCESS CONTROL OUT command with REVOKE PROXY TOKEN service action (see 8.3.3.9) ~~supplying the specific proxy token in the parameter data~~; or
 - B) The ACCESS CONTROL OUT command with REVOKE ALL PROXY TOKENS service action (see 8.3.3.10); ~~or~~
- b) An application client issues the ACCESS CONTROL OUT command with MANAGE ACL service action (see 8.3.3.2) with parameter data containing the Revoke Proxy Token ACE page (see 8.3.3.2.4) or Revoke All Proxy Tokens ACE page (see 8.3.3.2.5).

8.3.1.6.2.2 Proxy LUNs

To extend proxy access rights to a third party, an ~~initiator~~ application client forwards a proxy token (see 8.3.1.6.2.2) to the third party (e.g., in a target descriptor in the parameter data of the EXTENDED COPY command).

The third party sends the access controls coordinator an ACCESS CONTROL OUT command with ASSIGN PROXY LUN service action (see 8.3.3.11) ~~containing specifying~~ the proxy token to request creation of a proxy access right to the referenced logical unit. The access controls coordinator determines the referenced logical unit from the proxy token ~~value. value; the~~ The third party is unaware of the exact logical unit to which it is requesting access.

The parameter data for the ACCESS CONTROL OUT command with ASSIGN PROXY LUN service action includes the LUN value that the third party intends to use when accessing the referenced logical unit. The ~~resulting~~ LUN value ~~thus assigned~~ is called a proxy LUN. If the ACCESS CONTROL OUT command with ASSIGN PROXY LUN service action is successful, the proxy LUN becomes the third party's mechanism for accessing the logical unit by proxy.

Once assigned, a proxy LUN shall remain valid until one of the following occurs:

- a) The third party releases the proxy LUN value using the ACCESS CONTROL OUT command with RELEASE PROXY LUN service action (see 8.3.3.12);
- b) The proxy token is made invalid as described in 8.3.1.6.2.1; ~~or~~
- c) A logical unit reset or I_T nexus loss of the I_T nexus used to ~~create assign~~ the proxy LUN (see 8.3.1.12). ~~or~~

- d) ~~An event in the service delivery subsystem causes the access controls coordinator to question whether the third party initiator that created the proxy LUN value has changed and may no longer be in possession of the proxy token).~~

~~If the third party believes that the invalidation of a proxy LUN value is temporary, it~~ The third party may reissue the ACCESS CONTROL OUT command with ASSIGN PROXY LUN service action in an attempt to re-establish its proxy access rights. ~~If the cause of the proxy token becoming invalid was temporary, the reissued command should succeed.~~ The access controls coordinator shall process the request as described in 8.3.1.6.2.1 without reference to any previous assignment of the proxy LUN value.

8.3.1.7 Verifying access rights

When access controls are enabled (see 8.3.1.2), access rights for an initiator **port** shall be validated as described in this subclause.

All the linked commands in a single task shall be processed based on the ACL that is in effect when the task first enters the task enabled state. Relationships between access controls and tasks in a task set are described in 8.3.1.11.1.

All commands shall be processed as if access controls were not present if the ACL (see 8.3.1.3) allows the initiator **port** access to the addressed logical unit **by virtue as a result** of one of the following conditions:

- a) The ACL contains an ACE containing a TransportID type access identifier (see 8.3.1.3.2.3) for the initiator **port** and that ACE includes a LUACD with LUN value matching the addressed LUN;
- b) The initiator **port** is in the enrolled state (see 8.3.1.5.1.3) under an AccessID, the ACL contains an ACE containing that AccessID as an access identifier, and that ACE includes a LUACD with LUN value matching the addressed LUN; or
- c) The addressed LUN matches a proxy LUN value (see 8.3.1.6.2.2) assigned using the ACCESS CONTROL OUT command with ASSIGN PROXY LUN service action (see 8.3.3.11) and the proxy token (see 8.3.1.6.2.1) used to assign the proxy LUN value is still valid.

If the initiator **port** is in the pending-enrolled state (see 8.3.1.5.1.4) under an AccessID, the ACL contains an ACE containing that AccessID as an access identifier, and that ACE includes a LUACD with LUN value matching the addressed LUN, then commands shall be processed as follows:

- a) INQUIRY, ~~REQUEST SENSE~~, REPORT LUNS, ACCESS CONTROL OUT and ACCESS CONTROL IN commands shall be processed as if access controls were not present;
- b) ~~Except if there are exception conditions specific to the command itself, a REQUEST SENSE command shall be terminated with GOOD status. If sense data is available, it shall be reported; otherwise, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to A REQUEST SENSE command shall be processed as if access controls were not present as described in 6.25, except in the case where a sense key of NO SENSE would be returned. In this case, the REQUEST SENSE command shall return a sense key of ILLEGAL REQUEST and the additional sense code of ACCESS DENIED - INITIATOR PENDING-ENROLLED; and~~
- c) Any other command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to ACCESS DENIED - INITIATOR PENDING-ENROLLED.

An ~~initiator~~ application client should respond to the ACCESS DENIED - INITIATOR PENDING-ENROLLED additional sense code by sending an ACCESS CONTROL OUT command with ACCESS ID ENROLL service action. If the command succeeds, the ~~initiator~~ application client may retry the failed command.

If an INQUIRY command is addressed to a LUN for which there is no matching LUN value in any LUACD in any ACE allowing the initiator **port** logical unit access rights, the standard INQUIRY data (see 6.4.2) PERIPHERAL DEVICE TYPE field shall be set to 1Fh and the PERIPHERAL QUALIFIER field shall be set to 011b (i.e., the device server is not capable of supporting a device at this logical unit).

The parameter data returned in response to a REPORT LUNS command addressed to LUN 0 or to the REPORT LUNS well known logical unit shall return only the list of LUN values that are associated to accessible logical units according to the following criteria:

- a) If the initiator **port** is in the enrolled **state** or pending-enrolled state, the REPORT LUNS parameter data shall include any LUN values found in LUACDs in the ACE containing the AccessID enrolled by the initiator **port**;
- b) If the initiator **port** (in any enrollment state) has a TransportID found in the access identifier of an ACE, the REPORT LUNS parameter data shall include any LUN values found in LUACDs in that ACE; and
- c) If the initiator **port** (in any enrollment state) has access to any proxy LUNs (see 8.3.1.6.2.2), those LUN values shall be included in the REPORT LUNS parameter data.

The parameter data returned in response to a REPORT LUNS command that describes well known logical units shall not be affected by access controls.

If the initiator **port** is in the not-enrolled state and is not allowed access to any logical unit as result of its TransportID or as a result of a proxy LUN assignment, then the REPORT LUNS parameter data shall include only LUN 0 and well known logical units, as specified in 6.21.

Except when access controls are disabled, all cases not described previously in this subclause shall result in termination of the command with CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to LOGICAL UNIT NOT SUPPORTED.

8.3.1.8 The management identifier key

8.3.1.8.1 Management identifier key usage

~~The purpose of the management identifier key is to identify~~ The management identifier key identifies the application that is responsible for managing access controls for a SCSI target device. This identification ~~is accomplished by allowing the application client to specify~~ occurs when the application client specifies a new management identifier key value in ~~the parameter data of~~ each ACCESS CONTROL OUT command with the MANAGE ACL service action (see 8.3.3.2), and ~~by requiring the most recently when the last~~ specified management identifier key value ~~to appear in many~~ appears in ACCESS CONTROL IN and ACCESS CONTROL OUT service actions ~~(see 8.3.1.4.2) as required in 8.3.1.4.2.~~

To allow for failure scenarios where the management identifier key value has been lost, an override procedure involving a timer is ~~provided as~~ described in 8.3.1.8.2.

Use of the management identifier key has the following features:

- a) Management of access controls is associated with those application clients that ~~are able to~~ provide the correct management identifier key ~~without regard for the initiator port from which the command was received and not with a single initiator port identifier (see SAM-2);~~ and
- b) Only an application client that has knowledge of the management identifier key may ~~(in most cases)~~ change the ACL, ~~allowing the for the SCSI target device with the result that~~ management of access controls ~~may to~~ be limited to specific applications and application clients.

8.3.1.8.2 Overriding the management identifier key

8.3.1.8.2.1 The OVERRIDE MGMT ID KEY service action

~~Conditions may arise when~~ If the management identifier key needs to be replaced and the current management identifier key is not available. ~~When this occurs, then~~ the ACCESS CONTROL OUT command with OVERRIDE MGMT ID KEY service action (see 8.3.3.8) may be used to force the management identifier key to a known value.

The ACCESS CONTROL OUT command with OVERRIDE MGMT ID KEY service action ~~should be used only for failure recovery is intended only for failure scenarios. The~~ If failure recovery is not required, the ACCESS CONTROL OUT command with MANAGE ACL service action should be used ~~in all other circumstances.~~

To protect the management identifier key from unauthorized overrides, the access controls coordinator shall restrict use of the ACCESS CONTROL OUT command with OVERRIDE MGMT ID KEY service action based on the value of the override lockout timer (see 8.3.1.8.2.2).

When the override lockout timer is not zero, an ACCESS CONTROL OUT command with OVERRIDE MGMT ID KEY service action shall be terminated with CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to INVALID FIELD IN CDB.

When the override lockout timer is zero, an ACCESS CONTROL OUT command with OVERRIDE MGMT ID KEY service action shall be processed as described in 8.3.3.8.

The access controls coordinator shall log the receipt of ~~all each~~ ACCESS CONTROL OUT ~~commands command~~ with OVERRIDE MGMT ID KEY service action and ~~their its~~ success or failure as described in 8.3.1.10.

8.3.1.8.2.2 The override lockout timer

The access controls coordinator shall maintain the override lockout timer ~~as a 16-bit unsigned integer capable of counting up to 65 535 seconds.~~ When the override lockout timer is not zero it shall be decreased by one ~~approximately nominally~~ once per second but no more frequently than once every 800 milliseconds until the value reaches zero. When the override lockout timer is zero, it shall not be changed except as the result of commands sent by an application client initiator.

The ACCESS CONTROL OUT command with MANAGE OVERRIDE LOCKOUT TIMER service action manages the state of the override lockout timer (see 8.3.3.7), performing one of ~~two the following~~ functions: ~~depending on whether the correct management identifier key is supplied in the parameter data.~~

- a) If the incorrect management identifier key is supplied or if no parameter data is sent, the access controls coordinator shall reset the override lockout timer to the ~~most recently last~~ received initial override lockout timer value; or
- b) If the correct management identifier key is supplied, then the access controls coordinator shall do the following:
 - 1) Save the initial override lockout timer value supplied in the parameter data; and
 - 2) Reset the override lockout timer to the new initial value.

~~NOTE 72—Setting the initial override lockout timer value to zero disables the override lockout timer and allows the ACCESS CONTROL OUT command with OVERRIDE MGMT KEY service action to succeed at any time.~~

Setting the initial override lockout timer value to zero disables the override lockout timer and allows the ACCESS CONTROL OUT command with OVERRIDE MGMT KEY service action to succeed at any time.

~~Overloading the management key identifier to have a function selection usage is an unusual operational specification, however, it offers significant advantages for the ACCESS CONTROL OUT command with MANAGE OVERRIDE LOCKOUT TIMER service action.~~ Any application that knows the management identifier key may establish an initial override lockout timer value of sufficient duration (up to about **23 18** hours). Maintaining a non-zero override lockout timer value may be accomplished without knowing the management identifier key or transporting the management identifier key on the service delivery subsystem. Attempts to establish a zero initial override lockout timer value that are not accompanied by the correct management identifier key result in decreasing the probability that a subsequent ACCESS CONTROL OUT command with OVERRIDE MGMT ID KEY service action is able to succeed by resetting the override lockout timer ~~to the most recently specified initial value that was accompanied by the correct management identifier key.~~

After a logical unit reset, the override lock timer shall be set to the initial override lockout timer value within ten seconds of the non-volatile memory containing the initial override lockout timer value becoming available.

The ACCESS CONTROL IN command with REPORT OVERRIDE LOCKOUT TIMER may be used to discover the state of the override lockout timer.

8.3.1.9 Reporting access control information

Specific service actions of the ACCESS CONTROL IN command may be used by an application client to request a report from the access controls coordinator about its access controls data and state.

The ACCESS CONTROL IN command with REPORT ACL service action (see 8.3.2.2) returns the ACL (see 8.3.1.3). The information reported includes the following:

- a) The list of access identifiers (see 8.3.1.3.2) and the associated LUACDs (see 8.3.1.3.3) currently in effect; and
- b) The list of proxy tokens (see 8.3.1.6.2.1) currently in effect.

The ACCESS CONTROL IN command with REPORT ACCESS CONTROLS LOG service action (see 8.3.2.4) returns the contents of the access controls log (see 8.3.1.10).

The ACCESS CONTROL IN command with REPORT OVERRIDE LOCKOUT TIMER service action (see 8.3.2.5) reports on the state of the override lockout timer (see 8.3.1.8.2.2).

8.3.1.10 Access controls log

The access controls log is a record of events maintained by the access controls coordinator.

The access controls log has three portions, **each** recording **a** different **class classes** of events:

- a) **invalid key events:** mismatches between the management identifier key (see 8.3.1.8) **specified by a service action in a CDB or parameter data** and the current value maintained by the access controls coordinator;
- b) **key override events:** attempts to override the management identifier key (see 8.3.1.8.2.1), whether the attempt fails or succeeds; and
- c) **ACL LUN conflict events events:** (see 8.3.1.5.2).

Each portion of the log is required to contain a counter of the events. When a **SCSI target device is manufactured ships from the factory, the all** counters shall be **set to** zero. When access controls are disabled, **the all** counters except the key override events counter shall be **set to** zero. ~~The counters~~ **Each counter** shall be ~~increased~~ **incremented** by one whenever the relevant event occurs.

~~Optionally, each~~ Each log portion may contain additional records with more specific information about each event. When the resources for additional log records are exhausted, the access controls coordinator shall preserve the most recently added log records in preference to older log records.

Log records contain a TIME STAMP field whose contents are vendor specific. If the access controls coordinator has no time stamp resources the TIME STAMP field shall be set to zero. If time stamp values are provided, the same timing clock and time stamp format shall be used for all access controls log entries.

Invalid key events occur whenever an access controls command requires the checking of an ~~application client initiator~~ supplied management identifier key ~~either in the CDB or parameter data~~ against the current management identifier key saved by the access controls coordinator and the two values fail to match. When such an event occurs, the access controls coordinator shall ~~increase increment~~ the invalid keys counter by one. If the log has additional resources to record event details, the access controls coordinator shall add an invalid keys log record (containing the information defined in 8.3.2.4.2.3) describing the event.

Key override events occur when the access controls coordinator receives the ACCESS CONTROL OUT command with OVERRIDE MGMT KEY service action (see 8.3.3.8). When such an event occurs, the access controls coordinator shall ~~increase increment~~ the key overrides counter by one without regard for whether the command succeeds or fails. If the log has additional resources to record event details, the access controls coordinator shall add an key overrides log record (containing the information defined in 8.3.2.4.2.2) describing the event.

ACL LUN conflict events occur as specified in 8.3.1.5.2. When such an event occurs, the access controls coordinator shall ~~increase increment~~ the ACL LUN conflicts counter by one. If the log has additional resources to record event details, the access controls coordinator shall add an ACL LUN conflicts log record (containing the information defined in 8.3.2.4.2.4) describing the event.

Selected portions of the access controls log may be requested by an application client using the ACCESS CONTROL IN command with REPORT ACCESS CONTROLS LOG service action (see 8.3.2.4). With the exception of the key overrides portion, selected portions of the log may be cleared and the counters reset to zero using the ACCESS CONTROL OUT command with CLEAR ACCESS CONTROLS LOG service action (see 8.3.3.6).

8.3.1.11 Interactions of access controls and other features

8.3.1.11.1 ~~Queuing relationships~~ Task set management and access controls

Upon successful completion of an ACCESS CONTROL OUT command with MANAGE ACL service action (see 8.3.3.2), the ~~specified~~ ACL (see 8.3.1.3) ~~defined by that command~~ shall apply to all tasks that subsequently enter the task enabled state. Tasks that have modified ~~the SCSI target device state information (e.g., media, mode pages, and log pages) or equivalent SCSI target device elements~~ shall not be affected by an ACCESS CONTROL OUT command that subsequently enters the task enabled state. Tasks in the task enabled state that have not modified ~~SCSI target device state information the media, mode pages or equivalent SCSI target device elements~~ may or may not be affected by an ACCESS CONTROL OUT command that subsequently enters the task enabled state. The ACL in effect prior to when the ACCESS CONTROL OUT command with MANAGE ACL or DISABLE ACCESS CONTROLS service action entered the task enabled state shall apply to all tasks that are not affected by the ACCESS CONTROL OUT command.

~~A task shall complete all its media modifications etc.~~ All the operations performed by a task shall complete under the control of a single ACL, either the state in effect prior to processing of the ACCESS CONTROL OUT command or the state in effect following processing of the ACCESS CONTROL OUT command. After a task ~~has begun its media modifications etc.,~~ enters the task enabled state for the first time changing the access control state from disabled to enabled (see 8.3.1.2) shall have no effect on the task.

Multiple access control commands, both ACCESS CONTROL IN and ACCESS CONTROL OUT, may be ~~queued in the task set~~ concurrently. The order of processing of such commands is defined by the ~~tagged-queuing-restrictions task set management requirements~~ (see SAM-2), ~~if any~~, but each command shall be processed as a single indivisible command without any interleaving of actions that may be required by other access control commands.

8.3.1.11.2 Existing reservations and ACL changes

If a logical unit is reserved by one ~~initiator I_T nexus~~ and that logical unit becomes accessible to another ~~initiator I_T nexus~~ as a result of an access control command, there shall be no changes in the reservation ~~state~~ of that logical unit.

If a logical unit is reserved by an ~~initiator I_T nexus~~ and that logical unit becomes inaccessible to that ~~initiator I_T nexus~~ as a result of an access control command or other access control related event, there shall be no changes in the reservation. Existing persistent reservations mechanisms allow for other ~~SCSI initiator devices~~ with access to that logical unit to clear the reservation.

8.3.1.12 Access controls information persistence and memory usage requirements

If a SCSI target device supports access controls, then the SCSI target device shall contain an access controls coordinator that shall maintain the following information in nonvolatile memory:

- a) Whether access controls are enabled or disabled; and
- b) The access controls data that ~~table 300 and table 301 require to is described as~~ persistent across power cycles, hard resets, and logical unit resets ~~in table 300 and table 301~~.

If the access control coordinator's nonvolatile memory is not ready and the access controls coordinator is unable to determine that access controls are disabled, the device servers for all logical units shall terminate all commands except INQUIRY and REQUEST SENSE commands with a CHECK CONDITION status, the sense key shall be set to NOT READY and additional sense data shall be set as described in table 164 (see 6.29).

Following an I_T nexus loss, a previously enrolled initiator ~~port~~ shall be placed in the pending-enrolled state, ~~if that initiator port was associated with the lost I_T nexus~~. Following a logical unit reset, all previously enrolled initiator ~~ports~~ shall be placed in the pending-enrolled state.

The information shown in table 300 shall be maintained by the access controls coordinator.

Table 300 — Mandatory access controls resources

Information Description	Size (in bits)	Persistent Across Power Cycles, Hard Resets, and Logical Unit Resets
One ACL (see 8.3.1.3) containing at least one ACE containing one access identifier (see 8.3.1.3.2); and at least one LUACD (see 8.3.1.3.3) One ACL (see 8.3.1.3) containing at least one ACE contain- ing one access identifier (see 8.3.1.3.2), and at least one LUACD (see 8.3.1.3.3)	VS	Yes
The Enrollment State for each initiator port (see 8.3.1.5.1)	VS	Yes
Management Identifier Key (see 8.3.1.8)	64	Yes
Default LUNs Generation (DLgeneration, see 8.3.1.4.4)	32	Yes
Override Lockout Timer (see 8.3.1.8.2.2)	16	No
Initial Override Lockout Timer value (see 8.3.1.8.2.2)	16	Yes
Access Controls Log Event Counters (see 8.3.1.10) containing at least the following:		Yes
Key Overrides Counter	16	Yes
Invalid Keys Counter	16	Yes
ACL LUN Conflicts Counter	16	Yes
Access Controls Log Event Counters (see 8.3.1.10) contain- ing at least the following:		Yes
a) Key Overrides Counter;	16	Yes
b) Invalid Keys Counter; and	16	Yes
c) ACL LUN Conflicts Counter	16	Yes

Optionally, the access controls coordinator may maintain the information shown in table 301.

Table 301 — Optional access controls resources

Information Description	Size (in bits)	Persistent Across Power Cycles, Hard Resets, and Logical Unit Resets
One or more proxy tokens (see 8.3.1.6.2.1)	64	Yes
One or more proxy LUNs (see 8.3.1.6.2.2)	64	No
Access controls log event records (see 8.3.1.10) for:		
a) Key Overrides events;	(see 8.3.2.4.2.2)	Yes
b) Invalid Keys events; and	(see 8.3.2.4.2.3)	Yes
c) ACL LUN Conflicts events	(see 8.3.2.4.2.4)	Yes
Key Overrides events		
Invalid Keys events		
ACL LUN Conflicts events		

~~When shipped from the factory~~ At the time of manufacturer, the ACL shall be empty, all values shown in table 300 shall be zero, additional access control log structures shall be empty and there shall be no valid proxy tokens.

8.3.1.13 Access identifier formats

8.3.1.13.1 Access identifier type

The ACCESS IDENTIFIER TYPE field (see table 302) indicates the format and usage of the access identifier.

Table 302 — Access Identifier types

Access Identifier Type	Access Identifier Name	Access Identifier Format Reference
00h	AccessID	8.3.1.13.2
01h	TransportID	7.5.4
02h-7Fh	Reserved	
80h-FFh	Vendor specific	

8.3.1.13.2 AccessID access identifiers

AccessID access identifiers shall have the format shown in table 303.

Table 303 — AccessID access identifier format

Bit Byte	7	6	5	4	3	2	1	0
0	ACCESSID							
15								
16	Reserved							
23								

The ACCESSID field contains a value that uniquely identifies the AccessID type ACE in which the AccessID access identifier appears. Within the ACL, no two ACEs shall contain the same AccessID.

8.3.2 ACCESS CONTROL IN command

8.3.2.1 ACCESS CONTROL IN introduction

The service actions of the ACCESS CONTROL IN command (see table 295) are used to obtain information about the access controls that are active within the access controls coordinator and to ~~facilitate~~ ~~perform~~ other access control functions (see 8.3.1). If the ACCESS CONTROL IN command is implemented, the ACCESS CONTROL OUT command also shall be implemented. The ACCESS CONTROL IN command shall not be affected by access controls.

Table 304 — ACCESS CONTROL IN service actions

Service Action	Command name Name	Type	Reference
00h	REPORT ACL	m M	8.3.2.2
01h	REPORT LU DESCRIPTORS	m M	8.3.2.3
02h	REPORT ACCESS CONTROLS LOG	m M	8.3.2.4
03h	REPORT OVERRIDE LOCKOUT TIMER	m M	8.3.2.5
04h	REQUEST PROXY TOKEN	e O	8.3.2.6
05h - 17h	Reserved		
18h - 1Fh	Vendor specific		
Key: m M = Service action implementation is mandatory if ACCESS CONTROL IN is implemented. e O = Service action implementation is optional.			

The ACCESS CONTROL IN command may be addressed to ~~LUN 0 and~~ any ~~other~~ LUN value whose standard INQUIRY data (see 6.4.2) has the ACC bit set to one (~~e.g., LUN 0~~), in which case it shall be processed in the same manner as if the command had been addressed to the ACCESS CONTROLS well known logical unit. If an ACCESS CONTROL IN command is received by a device server whose standard INQUIRY data has the ACC bit set to zero, the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to INVALID COMMAND OPERATION CODE.

8.3.2.2 REPORT ACL service action

8.3.2.2.1 REPORT ACL introduction

The ACCESS CONTROL IN command with REPORT ACL service action (see table 305) is used to query the ACL (see 8.3.1.3) maintained by the access controls coordinator. If the ACCESS CONTROL IN command is implemented, the REPORT ACL service action shall be implemented.

Table 305 — ACCESS CONTROL IN command with REPORT ACL service action

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE (86h)							
1	Reserved			SERVICE ACTION (00h)				
2	(MSB) _____							
9	MANAGEMENT IDENTIFIER KEY							(LSB)
10	(MSB) _____							
13	ALLOCATION LENGTH							(LSB)
14	Reserved							
15	CONTROL							

If access controls are disabled, the device server shall ignore the MANAGEMENT IDENTIFIER KEY field and shall respond with GOOD status returning ~~only~~ the eight byte parameter list header specified in 8.3.2.2.2 subject to the allocation length limitation described in 4.3.4.6.

If access controls are enabled and the contents of the MANAGEMENT IDENTIFIER KEY field do not match the current management identifier key (see 8.3.1.4.2) maintained by the access controls coordinator, ~~then~~ parameter data shall not be returned, ~~and~~ the command shall be terminated with a CHECK CONDITION status, ~~the~~ The sense key shall be set to ILLEGAL REQUEST, ~~and~~ the additional sense code shall be set to ACCESS DENIED - INVALID MGMT ID KEY, ~~and the~~ The event shall be recorded in the invalid keys portion of the access controls log (see 8.3.1.10).

The ALLOCATION LENGTH field is described in 4.3.4.6. The ALLOCATION LENGTH field value should be at least eight.

8.3.2.2.2 REPORT ACL parameter data format

8.3.2.2.2.1 REPORT ACL parameter data introduction

The format of the parameter data returned in response to an ACCESS CONTROL IN command with REPORT ACL service actions is shown in table 306.

Table 306 — ACCESS CONTROL IN with REPORT ACL parameter data format

Bit Byte	7	6	5	4	3	2	1	0
	Parameter list header							
0	(MSB)	ACL DATA LENGTH (n-3)						(LSB)
3								
4	(MSB)	DLGENERATION						(LSB)
7								
	ACL data pages							
8		ACL data page 0						
		⋮						
		ACL data page x						
n								

The ACL DATA LENGTH field shall contain a count of the number of bytes in the remaining parameter data. ~~If the allocation length is too small to transfer all of the REPORT ACL parameter data, the ACL data length shall not be adjusted to reflect the truncation. The value in the ACL DATA LENGTH field shall be the actual number of bytes available without consideration for insufficient allocation length in the CDB.~~ If access controls are disabled, the ACL DATA LENGTH field shall be set to four.

The DLGENERATION field shall contain the current DLgeneration value (see 8.3.1.4.4).

The ACL data pages contain a description of the ACL (see 8.3.1.3) maintained by the access controls coordinator. Each ACL data page describes one ACE in the ACL or one proxy token (see 8.3.1.6.2). Every ACE and every proxy token managed by the access controls coordinator shall have an ACL data page in the parameter data. The content and format of an ACL data page is indicated by a page code ~~(see table 307).~~ [Table 307 lists the ACL data page codes.](#)

Table 307 — ACL data page codes

Page Code	ACL Data Page Name	Reference
00h	Granted	8.3.2.2.2.2
01h	Granted All	8.3.2.2.2.3
02h	Proxy Tokens	8.3.2.2.2.4
03h-EFh	Reserved	
F0h-FFh	Vendor specific	

8.3.2.2.2.2 Granted ACL data page format

The Granted ACL data page (see table 308) describes an ACE that allows access to a specific set of logical units via a list of LUACDs (see 8.3.1.3.3).

Table 308 — Granted ACL data page format

Bit Byte	7	6	5	4	3	2	1	0
0	PAGE CODE (00h)							
1	Reserved							
2	(MSB)	PAGE LENGTH (n-3)						(LSB)
3								
4	Reserved							
5	ACCESS IDENTIFIER TYPE							
6	(MSB)	ACCESS IDENTIFIER LENGTH (m-7)						(LSB)
7								
8	ACCESS IDENTIFIER							
m								
	LUACD Descriptors							
m+1	LUACD descriptor 0							
m+20								
	⋮							
n-19	LUACD descriptor x							
n								

The PAGE LENGTH field shall indicate the number of additional bytes required for this ACL data page and shall not be adjusted to reflect any truncation caused by insufficient allocation length.

The ACCESS IDENTIFIER TYPE field (see table 309) (see 8.3.1.13) indicates the format and usage of the access identifier.

Table 309 — Access Identifier types

Access- Identifier- Type	Access Identifier Name	Access- Identifier- Format- Reference
00h	AccessID	8.3.1.3.2.2
01h	TransportID	8.3.1.3.2.3
02h-7Fh	Reserved	
80h-FFh	Vendor-specific	

The ACCESS IDENTIFIER LENGTH field indicates the number of bytes following taken up by the ACCESS IDENTIFIER field. The access identifier length shall be at least 24 and shall be a multiple of four.

The ACCESS IDENTIFIER field contains the identifier that the access controls coordinator uses to select the initiator port(s) that are allowed access to the logical units named by the LUACD descriptors in this ACL data page. The format of the ACCESS IDENTIFIER field is specified in table 309. One ~~and only one~~ Granted or Granted All (see 8.3.2.2.3) ACL data page shall be returned for a ~~given specific~~ pair of values in the ACCESS IDENTIFIER TYPE and ACCESS IDENTIFIER fields.

Each LUACD descriptor (see table 310) describes the access allowed to one logical unit based on the access identifier. There shall be one LUACD descriptor for each logical unit to which the access identifier allows access.

Table 310 — Granted ACL data page LUACD descriptor format

Bit Byte	7	6	5	4	3	2	1	0
0	ACCESS MODE							
1	Reserved							
3								
4	LUN VALUE							
11								
12	DEFAULT LUN							
19								

The ACCESS MODE field (see table 311) indicates the type of access allowed to the logical unit referenced by the DEFAULT LUN field and addressable at the specified LUN value.

Table 311 — Access mode values

Access Mode	Description
00h	Normal access
01h-EFh	Reserved
F0h-FFh	Vendor-specific

The LUN VALUE field indicates the LUN value an accessing ~~initiator~~ application client ~~would use~~ uses to access the logical unit ~~via the initiator port~~ to which the LUACD descriptor applies.

The DEFAULT LUN field identifies the logical unit to which access is allowed using the default LUN value described in 8.3.1.4.3. The value in the DEFAULT LUN field shall be consistent with the DLGENERATION field contents returned in the parameter list header (see 8.3.2.2.2).

~~NOTE 73—It is acceptable for the LUN VALUE and DEFAULT LUN fields to contain the same value.~~

The LUN VALUE and DEFAULT LUN fields may contain the same value.

8.3.2.2.2.3 Granted All ACL data page format

The Granted All ACL data page (see table 312) describes an ACE that allows access to all the SCSI target device's logical units with the default LUN values being used as the accessing LUN values. Initiator ports that have access via the access identifier in a Granted All ACL data page are allowed to access the SCSI target device as if access controls were disabled.

Table 312 — Granted All ACL data page format

Bit Byte	7	6	5	4	3	2	1	0
0	PAGE CODE (01h)							
1	Reserved							
2	(MSB)	PAGE LENGTH (m-3)						
3								(LSB)
4	Reserved							
5	ACCESS IDENTIFIER TYPE							
6	(MSB)	ACCESS IDENTIFIER LENGTH (m-7)						
7								(LSB)
8	ACCESS IDENTIFIER							
m								

The PAGE LENGTH, ACCESS IDENTIFIER TYPE, and ACCESS IDENTIFIER LENGTH, are described in 8.3.2.2.2.2.

The ACCESS IDENTIFIER field contains the identifier that the access controls coordinator uses to select the initiator port(s) that are allowed access to all the SCSI target device's logical units with the default LUN values being used as the accessing LUN values. The format of the access identifier field is specified in table 309 (see 8.3.2.2.2.2). One ~~and only one~~ Granted (see 8.3.2.2.2.2) or Granted All ACL data page shall be returned for a ~~given~~ specific pair of values in the ACCESS IDENTIFIER TYPE and ACCESS IDENTIFIER fields.

8.3.2.2.2.4 Proxy Tokens ACL data page format

The Proxy Tokens ACL data page (see table 313) describes the proxy tokens (see 8.3.1.6.2) maintained by the access controls coordinator.

Table 313 — Proxy Tokens ACL data page format

Bit Byte	7	6	5	4	3	2	1	0
0	PAGE CODE (02h)							
1	Reserved							
2	(MSB)							
3	PAGE LENGTH (n-3)							
	(LSB)							
	Proxy token descriptors							
4	Proxy token descriptor 0							
23								
	⋮							
n-19	Proxy token descriptor x							
n								

The PAGE LENGTH field shall indicate the number of additional bytes required for this ACL data page and shall not be adjusted to reflect any truncation caused by insufficient allocation length.

If there are no active proxy tokens, the access controls coordinator may either not include the Proxy Tokens ACL data page in the parameter data or may include one such ACL data page containing no proxy token descriptors.

At most No more than one Proxy Tokens ACL data page shall be included in the parameter data.

Each proxy token descriptor (see table 314) describes the access allowed to one logical unit based on one proxy token. There shall be one proxy token descriptor for each active proxy token maintained by the access controls coordinator.

Table 314 — Proxy token descriptor format

Bit Byte	7	6	5	4	3	2	1	0
0	Reserved							
3								
4	PROXY TOKEN							
11								
12	DEFAULT LUN							
19								

The PROXY TOKEN field indicates the proxy token to which this proxy token descriptor applies.

The DEFAULT LUN field identifies the logical unit to which this proxy token allows access using the default LUN value described in 8.3.1.4.3. The value in the DEFAULT LUN field shall be consistent with the DLGENERATION value returned in the parameter list header (see 8.3.2.2.2).

~~NOTE 74 — The same default LUN value may appear in multiple proxy token descriptors, if multiple proxy tokens are valid for the same logical unit.~~

The same default LUN value may appear in multiple proxy token descriptors, if multiple proxy tokens are valid for the same logical unit.

8.3.2.3 REPORT LU DESCRIPTORS service action

8.3.2.3.1 REPORT LU DESCRIPTORS introduction

The ACCESS CONTROL IN command with REPORT LU DESCRIPTORS service action (see table 315) ~~is used to obtain reports~~ the inventory of logical units for which access controls may be established. If the ACCESS CONTROL IN command is implemented, the REPORT LU DESCRIPTORS service action shall be implemented.

Table 315 — ACCESS CONTROL IN command with REPORT LU DESCRIPTORS service action

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE (86h)							
1	Reserved			SERVICE ACTION (01h)				
2	(MSB)							
9	MANAGEMENT IDENTIFIER KEY (LSB)							
10	(MSB)							
13	ALLOCATION LENGTH (LSB)							
14	Reserved							
15	CONTROL							

If access controls are disabled, the device server shall ignore the MANAGEMENT IDENTIFIER KEY field and shall respond with GOOD status returning ~~only~~ the twenty byte parameter list header as specified in 8.3.2.3.2 subject to the ALLOCATION LENGTH limitation described in 4.3.4.6.

NOTE 75 - When access controls are disabled, the logical unit inventory may be obtained using commands such as REPORT LUNS (see 6.21). To facilitate access controls management, the ACCESS CONTROL IN command with REPORT LU DESCRIPTORS service action returns more information than the REPORT LUNS command. When access controls are disabled additional commands such as INQUIRY (see 6.4) are required to obtain all the information provided by the ACCESS CONTROL IN command with REPORT LU DESCRIPTORS service action.

If access controls are enabled and the contents of the MANAGEMENT IDENTIFIER KEY field do not match the current management identifier key (see 8.3.1.4.2) maintained by the access controls coordinator, ~~then~~ parameter data shall not be returned, ~~and~~ the command shall be terminated with a CHECK CONDITION status, ~~the~~ The sense key shall be set to ILLEGAL REQUEST, ~~and~~ the additional sense code shall be set to ACCESS DENIED - INVALID MGMT ID KEY, ~~and the~~ The event shall be recorded in the invalid keys portion of the access controls log (see 8.3.1.10).

The ALLOCATION LENGTH field is described in 4.3.4.6. The ALLOCATION LENGTH field value should be at least 20.

8.3.2.3.2 REPORT LU DESCRIPTORS parameter data format

The format of the parameter data returned in response to an ACCESS CONTROL IN command with REPORT LU DESCRIPTORS service actions is shown in table 316.

Table 316 — ACCESS CONTROL IN with REPORT LU DESCRIPTORS parameter data format

Bit Byte	7	6	5	4	3	2	1	0
	Parameter list header							
0	(MSB)	LU INVENTORY LENGTH (n-3)						(LSB)
3								
4	(MSB)	NUMBER OF LOGICAL UNITS						(LSB)
7								
8		SUPPORTED LUN MASK LUN MASK FORMAT						
15								
16	(MSB)	DLGENERATION						(LSB)
19								
	Logical Unit descriptors							
20		Logical Unit descriptor 0						
		⋮						
n		Logical Unit descriptor x						

The LU INVENTORY LENGTH field shall contain a count of the number of bytes in the remaining parameter data. ~~If the allocation length is too small to transfer all of the REPORT LU DESCRIPTORS parameter data, the LU inventory length shall not be adjusted to reflect the truncation. The value in the LU INVENTORY LENGTH field shall be the actual number of bytes available without consideration for insufficient allocation length in the CDB.~~ If access controls are disabled, the LU INVENTORY LENGTH field shall be set to ~~sixteen~~ 16.

The NUMBER OF LOGICAL UNITS field shall contain a count of the number of logical units managed by the access controls coordinator. The value in NUMBER OF LOGICAL UNITS field shall be the same as the number of Logical Unit descriptors that follow in the parameter data.

The SUPPORTED ~~LUN MASK~~ LUN MASK FORMAT field (see table 317) contains a summary of the LUN values (see 8.3.1.3.3) that the access controls coordinator supports. LUN values are exchanged between application clients and the access controls coordinator by several service actions (e.g., the ACCESS CONTROL IN command with REPORT ACL service action described in 8.3.2.2 and the ACCESS CONTROL OUT command with MANAGE ACL service action described in 8.3.3.2). The format of the SUPPORTED ~~LUN MASK~~ LUN MASK FORMAT field follows the eight byte LUN structure defined for dependent logical units by SAM-2.

Table 317 — SUPPORTED ~~LUN MASK~~ LUN MASK FORMAT field format

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB)	FIRST LEVEL LUN MASK						(LSB)
1								
2	(MSB)	SECOND LEVEL LUN MASK						(LSB)
3								
4	(MSB)	THIRD LEVEL LUN MASK						(LSB)
5								
6	(MSB)	FOURTH LEVEL LUN MASK						(LSB)
7								

The LUN MASK at each level indicates ~~approximately the approximate range of~~ the logical unit number values the access controls coordinator supports. A bit ~~value of set to~~ zero in a LUN MASK field indicates that the access controls coordinator prohibits setting that bit to one in a LUN value. A bit ~~value of set to~~ one in a LUN MASK field indicates that the access controls coordinator may allow setting that bit to one in a LUN value.

For example, if the access controls coordinator only supports level one LUN values ~~and up to 256 LUN values with~~ LUN values ranging from 0 to 256, then the SUPPORTED ~~LUN MASK~~ LUN MASK FORMAT field shall contain 00FF 0000 0000 0000h. If only ~~200 LUN values~~ LUN values ranging from 0 to 200 were supported, the SUPPORTED ~~LUN MASK~~ LUN MASK FORMAT field still would contain 00FF 0000 0000 0000h.

The value in the SUPPORT ~~LUN MASK~~ LUN MASK FORMAT field only summarizes the supported LUN values and is not a complete description. The value in the SUPPORT ~~LUN MASK~~ LUN MASK FORMAT field should be used as a guideline for specifying LUN values in service actions ~~such as the~~ (e.g., ACCESS CONTROL OUT command with MANAGE ACL service action). ~~it should not be viewed as a guarantee against rejection of requested LUN values.~~ LUN values that appear valid based on the contents of the SUPPORT LUN MASK FORMAT field may still be rejected.

The DLGENERATION field shall contain the current DLgeneration value (see 8.3.1.4.4).

Each Logical Unit descriptor (see table 318) contains information about one logical unit managed by the access controls coordinator. There shall be one Logical Unit descriptor for every logical unit managed by the access controls coordinator.

Table 318 — Logical Unit descriptor format

Bit Byte	7	6	5	4	3	2	1	0
0	Reserved			PERIPHERAL DEVICE TYPE				
1	Reserved							
2	(MSB)	DESCRIPTOR LENGTH (n-3)						
3							(LSB)	
4	DEFAULT LUN							
11								
12	Reserved							
13	EVPD IDENTIFICATION DESCRIPTOR LENGTH							
14	Reserved							
15	DEVICE IDENTIFIER LENGTH							
16	(MSB)	EVPD IDENTIFICATION DESCRIPTOR						
47							(LSB)	
48	(MSB)	DEVICE IDENTIFIER						
79							(LSB)	
80	(MSB)	DEVICE TYPE DEVICE TYPE SPECIFIC DATA						
n							(LSB)	

The PERIPHERAL DEVICE TYPE field is as defined in 6.4.2.

The DESCRIPTOR LENGTH field indicates the total number of bytes remaining in the descriptor and shall not reflect any truncation of the parameter data as a result of insufficient allocation length. If the PERIPHERAL DEVICE TYPE field contains 0h, 4h, or 7h, the DESCRIPTOR LENGTH field shall contain 92 if the descriptor includes the ~~DEVICE TYPE~~ DEVICE TYPE SPECIFIC DATA field and 80 if it does not. If the PERIPHERAL DEVICE TYPE field contains any value other than 0h, 4h, or 7h, the DESCRIPTOR LENGTH field shall contain ~~80~~ 76.

The DEFAULT LUN field contains the default LUN value (see 8.3.1.4.3) for the logical unit described by this logical unit descriptor. The value in the DEFAULT LUN field shall be consistent with the DLGENERATION value returned in the parameter list header (see 8.3.2.3.2). The value in the DEFAULT LUN field shall not identify a well known logical unit.

The EVPD IDENTIFICATION DESCRIPTOR LENGTH field indicates the number of non pad bytes in the EVPD IDENTIFICATION DESCRIPTOR field.

The DEVICE IDENTIFIER LENGTH field indicated the number of non pad bytes in the DEVICE IDENTIFIER field.

The EVPD IDENTIFICATION DESCRIPTOR field shall be derived from one of the Device Identification VPD page (see 7.6.4) identification descriptors having 0h in the ASSOCIATION field as follows:

- a) If the identification descriptor has a length less than 32 bytes, then the EVPD IDENTIFICATION DESCRIPTOR field shall be set to the zero-padded (see 4.4.2) identification descriptor value. The EVPD IDENTIFICATION DESCRIPTOR LENGTH field shall be set to the length of the identification descriptor not including pad bytes; or
- b) If the identification descriptor has a length greater than or equal to 32 bytes, then the EVPD IDENTIFICATION DESCRIPTOR field shall be set to the first 32 bytes of the identification descriptor. The EVPD IDENTIFICATION DESCRIPTOR LENGTH field shall be set to 32.

If there are several identification descriptors having 0h in the ASSOCIATION field, the choice of which descriptor to copy to the EVPD IDENTIFICATION DESCRIPTOR field is vendor specific, however, all ACCESS CONTROL IN commands with REPORT LU DESCRIPTORS service action shall return the same EVPD IDENTIFICATION DESCRIPTOR field contents for a ~~given specific~~ logical unit.

If a device identifier has been set for the logical unit using the SET DEVICE IDENTIFIER command (see 6.27), the DEVICE IDENTIFIER field shall contain that device identifier subject to the following considerations:

- a) If the device identifier has length less than 32 bytes, then the DEVICE IDENTIFIER field shall be set to the zero-padded (see 4.4.2) device identifier value. The DEVICE IDENTIFIER LENGTH field shall be set to the length of the device identifier not including pad bytes; or
- b) If the device identifier has length greater than or equal to 32 bytes, then the DEVICE IDENTIFIER field shall be set to the first 32 bytes of the identifier. The DEVICE IDENTIFIER LENGTH field shall be set to 32.

If no device identifier has been established by a SET DEVICE IDENTIFIER command, then the DEVICE IDENTIFIER LENGTH field shall be set to zero and the DEVICE IDENTIFIER field shall ~~have all bytes be~~ set to zero.

If the PERIPHERAL DEVICE TYPE field contains any value other than 0h, 4h, or 7h, the ~~DEVICE TYPE~~ DEVICE TYPE SPECIFIC DATA field shall not be present in the Logical Unit descriptor.

The Logical Unit descriptor shall include the ~~DEVICE TYPE~~ DEVICE TYPE SPECIFIC DATA field if:

- a) The PERIPHERAL DEVICE TYPE field contains 0h, 4h, or 7h;
- b) The logical unit supports the READ CAPACITY command (see SBC-2) with:
 - A) The RELADR bit set to zero; and
 - B) The PMI bit set to zero; ~~and~~
and
- c) The logical unit standard INQUIRY data (see 6.4.2) has the RMB bit set to zero.

If the Logical Unit descriptor includes the ~~DEVICE TYPE~~ DEVICE TYPE SPECIFIC DATA field, then the size of the ~~DEVICE TYPE~~ DEVICE TYPE SPECIFIC DATA field shall be 12 bytes and the field shall contain the same ~~as the~~ data that would ~~be have been~~ returned by a successful READ CAPACITY command with LONGLBA bit set to one, and the RELADR and PMI bits set to zero.

8.3.2.4 REPORT ACCESS CONTROLS LOG service action

8.3.2.4.1 REPORT ACCESS CONTROLS LOG introduction

The ACCESS CONTROL IN command with REPORT ACCESS CONTROLS LOG service action (see table 319) is used to obtain the access controls log (see 8.3.1.10). If the ACCESS CONTROL IN command is implemented, the REPORT ACCESS CONTROLS LOG service action shall be implemented.

Table 319 — ACCESS CONTROL IN command with REPORT ACCESS CONTROLS LOG service action

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE (86h)							
1	Reserved			SERVICE ACTION (02h)				
2	(MSB)							
9	MANAGEMENT IDENTIFIER KEY (LSB)							
10	Reserved					LOG PORTION		
11	Reserved							
12	(MSB)							
13	ALLOCATION LENGTH (LSB)							
14	Reserved							
15	CONTROL							

If access controls are disabled, the device server shall ignore the MANAGEMENT IDENTIFIER KEY field and shall respond with GOOD status returning ~~only~~ the eight byte parameter list header as specified in 8.3.2.4.2.1 subject to the ALLOCATION LENGTH limitation described in 4.3.4.6.

~~NOTE 76 — The Key Overrides portion of the log is maintained while access controls are disabled and may be retrieved by enabling access controls and issuing an ACCESS CONTROL IN command with REPORT ACCESS CONTROLS LOG service action.~~

Since the Key Overrides portion of the log is maintained while access controls are disabled (see 8.3.3.3), it may be retrieved by enabling access controls and issuing an ACCESS CONTROL IN command with REPORT ACCESS CONTROLS LOG service action.

If access controls are enabled and table 320 specifies that the management identifier key is not required then the device server shall ignore the contents of the MANAGEMENT IDENTIFIER KEY field.

If access controls are enabled, table 320 specifies that the management key identifier is required, and the contents of the MANAGEMENT IDENTIFIER KEY field do not match the current management identifier key (see 8.3.1.4.2) maintained by the access controls coordinator, ~~then the~~ parameter data shall not be returned, and the command shall be terminated with a CHECK CONDITION status, ~~the~~ The sense key shall be set to ILLEGAL REQUEST, and the additional sense code shall be set to ACCESS DENIED - INVALID MGMT ID KEY, ~~and the~~ The event shall be recorded in the invalid keys portion of the access controls log (see 8.3.1.10).

The LOG PORTION field (see table 320) specifies the access controls log portion being requested.

Table 320 — CDB LOG PORTION field values

Log Portion	Description	Management Identifier Key Required
00b	Key Overrides portion	No
01b	Invalid Keys portion	Yes
10b	ACL LUN Conflicts portion	Yes
11b	Reserved	

The ALLOCATION LENGTH field is described in 4.3.4.6. The ALLOCATION LENGTH field value should be at least eight.

8.3.2.4.2 REPORT ACCESS CONTROLS LOG parameter data format

8.3.2.4.2.1 REPORT ACCESS CONTROLS LOG parameter data introduction

The format of the parameter data returned in response to an ACCESS CONTROL IN command with REPORT ACCESS CONTROLS LOG service actions is shown in table 321.

Table 321 — ACCESS CONTROL IN with REPORT ACCESS CONTROLS LOG parameter data format

Bit Byte	7	6	5	4	3	2	1	0
	Parameter list header							
0	(MSB)	LOG LIST LENGTH (n-3)						(LSB)
3								
4		Reserved						
5		Reserved				LOG PORTION		
6	(MSB)	COUNTER						(LSB)
7								
	Access Controls Log portion pages							
8		Access Controls Log portion page 0						
		⋮						
		Access Controls Log portion page x						
n								

The LOG LIST LENGTH field shall contain a count of the number of bytes in the remaining parameter data. ~~If the allocation length is too small to transfer all of the REPORT ACCESS CONTROLS LOG parameter data, the log list length shall not be adjusted to reflect the truncation. The value in the LOG LIST LENGTH field shall be the actual number of bytes available without consideration for insufficient allocation length in the CDB.~~ If access controls are disabled, the LOG LIST LENGTH field shall be set to ~~eight~~ four.

The LOG PORTION field (see table 322) indicates the access controls log portion being returned, the contents of the COUNTER field, and the type of access controls log [portion](#) pages being returned.

Table 322 — Parameter data LOG PORTION field values

Log Portion	Access Controls Log Portion Being Returned	COUNTER Field Contents	Access Controls Log Page Format Reference
00 h	Key Overrides portion	Key Overrides counter	8.3.2.4.2.2
01 h	Invalid Keys portion	Invalid Keys counter	8.3.2.4.2.3
02 h 11 b	ACL LUN Conflicts portion	ACL LUN Conflicts counter	8.3.2.4.2.4
11 b	Reserved		

The COUNTER field contains the events counter value (see 8.3.1.10) for the access controls log portion indicated by the LOG PORTION field (see table 322).

The format of the access controls log [portion](#) pages is indicated by the value in the LOG PORTION field (see table 322). All the access controls log [portion](#) pages returned in a single parameter list shall have the same format. If the access controls coordinator does not support access controls log [portion](#) pages in the portion of the access controls log indicated by the LOG PORTION field, the parameter data shall only contain the parameter list header.

8.3.2.4.2.2 Key Overrides access controls log [portion](#) page format

The Key Overrides access controls log [portion](#) page (see table 323) contains details of ~~recently-recorded~~ logged attempts to override the management identifier key (see 8.3.1.10) using the ACCESS CONTROL OUT command with OVERRIDE MGMT ID KEY service action (see 8.3.3.8), whether those attempts were successful or not.

Table 323 — Key Overrides access controls log [portion](#) page format

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB)							
1	TRANSPORTID ADDITIONAL LENGTH (m-32)							
2	Reserved							
3	Reserved							SUCCESS
4	(MSB)							
7	TIME STAMP							
8								(LSB)
m-1	TRANSPORTID							
m	(MSB)							
m+1	INITIAL OVERRIDE LOCKOUT TIMER							
m+2								(LSB)
m+3	(MSB)							
m+3	OVERRIDE LOCKOUT TIMER							
m+3								(LSB)

The TRANSPORTID ADDITIONAL LENGTH field indicates the additional length of the TRANSPORTID field beyond the minimum length of 24 bytes. The TransportID additional length shall be a multiple of four.

A SUCCESS bit ~~of set to~~ one indicates that the specific ACCESS CONTROL OUT command with OVERRIDE MGMT ID KEY service action event recorded in the access controls log successfully overrode the management identifier key. A ~~value of SUCCESS bit set to~~ zero indicates that the command did not succeed.

The TIME STAMP field shall contain zero or an indication of the time at which the ACCESS CONTROL OUT command with OVERRIDE MGMT ID KEY service action was processed as described in 8.3.1.10.

The TRANSPORTID field shall contain the TransportID of the initiator ~~port that issued the command from which the command was received~~.

The INITIAL OVERRIDE LOCKOUT TIMER field shall contain the access controls coordinator's initial override lockout timer value (see 8.3.1.8.2.2) at ~~the time when the key override was logged. at which the ACCESS CONTROL OUT command with OVERRIDE MGMT ID KEY service action was processed.~~

The OVERRIDE LOCKOUT TIMER field shall contain the access controls coordinator's override lockout timer value (see 8.3.1.8.2.2) at ~~the time when the key override was logged. at which the ACCESS CONTROL OUT command with OVERRIDE MGMT ID KEY service action was processed.~~

8.3.2.4.2.3 Invalid Keys access controls log ~~portion~~ page format

The Invalid Keys access controls log ~~portion~~ page (see table 324) contains details of ~~recently recorded logged~~ receipts of ACCESS CONTROL IN or ACCESS CONTROL OUT commands specifying an incorrect management identifier key (see 8.3.1.10).

Table 324 — Invalid Keys access controls log ~~portion~~ page format

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB) _____							
1	TRANSPORTID ADDITIONAL LENGTH (m-32)							(LSB)
3	OPERATION CODE							
4	Reserved			SERVICE ACTION				
5	(MSB) _____							
7	TIME STAMP							(LSB)
8								
m-1	TRANSPORTID							_____
m	(MSB) _____							
m+7	INVALID MANAGEMENT IDENTIFIER KEY							(LSB)

The TRANSPORTID ADDITIONAL LENGTH field indicates the additional length of the TRANSPORTID field beyond the minimum length of 24 bytes. The TransportID additional length shall be a multiple of four.

The OPERATION CODE and SERVICE ACTION fields shall be set to the respective values from the CDB of the access controls command that specified the invalid management identifier key.

The TIME STAMP field shall contain zero or an indication of the time at which the ACCESS CONTROL IN or ACCESS CONTROL OUT command was processed as described in 8.3.1.10.

The TRANSPORTID field shall contain the TransportID of the initiator ~~port that issued the command from which the command was received~~.

The INVALID MANAGEMENT IDENTIFIER KEY field shall be set to the value of the invalid management identifier key detected by the access controls coordinator ~~in the command or associated parameter data~~.

NOTE 77 - The management identifier key is typically in the CDB for ACCESS CONTROL IN commands and in the parameter data for ACCESS CONTROL OUT commands.

8.3.2.4.2.4 ACL LUN Conflicts access controls log ~~portion~~ page format

The ACL LUN Conflicts access controls log ~~portion~~ page (see table 325) contains details of ~~recently recorded logged~~ ACL LUN conflicts (see 8.3.1.10) encountered by the access controls coordinator when a previously not-enrolled initiator ~~port~~ sends an ACCESS CONTROL OUT command with ACCESS ID ENROLL service action (see 8.3.3.4).

Table 325 — ACL LUN Conflicts access controls log ~~portion~~ page format

Bit Byte	7	6	5	4	3	2	1	0
0	(MSB)	TRANSPORTID ADDITIONAL LENGTH (m-32)						(LSB)
1								
2		Reserved						
3								
4	(MSB)	TIME STAMP						(LSB)
7								
8		TRANSPORTID						
m-1								
m	(MSB)	ACCESSID						(LSB)
m+23								

The TRANSPORTID ADDITIONAL LENGTH field indicates the additional length of the TRANSPORTID field beyond the minimum length of 24 bytes. The TransportID additional length shall be a multiple of four.

The TIME STAMP field shall contain zero or an indication of the time at which the ACCESS CONTROL OUT command with ACCESS ID ENROLL service action was processed as described in 8.3.1.10.

The TRANSPORTID field shall contain the TransportID of the initiator ~~port that issued the command from which the command was received~~ that resulted in the ACL LUN conflict.

The ACCESSID field shall be set to the AccessID that the initiator ~~port~~ attempted to enroll. This shall correspond to an access identifier in ACL entry at the time the ACL LUN conflict event occurred.

8.3.2.5 REPORT OVERRIDE LOCKOUT TIMER service action

The ACCESS CONTROL IN command with REPORT OVERRIDE LOCKOUT TIMER service action (see table 326) is used query the [state value](#) of the override lockout timer (see 8.3.1.8.2.2). If the ACCESS CONTROL IN command is implemented, the REPORT OVERRIDE LOCKOUT TIMER service action shall be implemented.

Table 326 — ACCESS CONTROL IN command with REPORT OVERRIDE LOCKOUT TIMER service action

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE (86h)							
1	Reserved			SERVICE ACTION (03h)				
2	(MSB)							
9	MANAGEMENT IDENTIFIER KEY							(LSB)
10	(MSB)							
13	ALLOCATION LENGTH							(LSB)
14	Reserved							
15	CONTROL							

If access controls are disabled, eight bytes of zeros shall be returned subject to the allocation length limitations described in 4.3.4.6 and GOOD status shall be returned.

If access controls are enabled and the contents of the MANAGEMENT IDENTIFIER KEY field do not match the current management identifier key (see 8.3.1.4.2) maintained by the access controls coordinator, [then](#) parameter data shall not be returned, the command shall be terminated with a CHECK CONDITION status, ~~the~~ [The](#) sense key shall be set to ILLEGAL REQUEST, [and](#) the additional sense code shall be set to ACCESS DENIED - INVALID MGMT ID KEY, ~~and the~~ [The](#) event shall be recorded in the invalid keys portion of the access controls log (see 8.3.1.10).

The ALLOCATION LENGTH field is described in 4.3.4.6. The ALLOCATION LENGTH field value should be at least eight.

If access controls are enabled, the parameter data returned by the ACCESS CONTROL IN command with REPORT OVERRIDE LOCKOUT TIMER service action shall have the format shown in table 327.

Table 327 — ACCESS CONTROL IN with REPORT OVERRIDE LOCKOUT TIMER parameter data

Bit Byte	7	6	5	4	3	2	1	0
0	Reserved							
1	Reserved							
2	(MSB)							
3	CURRENT OVERRIDE LOCKOUT TIMER							(LSB)
4	(MSB)							
5	INITIAL OVERRIDE LOCKOUT TIMER							(LSB)
6	(MSB)							
7	KEY OVERRIDES COUNTER							(LSB)

The CURRENT OVERRIDE LOCKOUT TIMER field shall be set to the current value of the override lockout timer (see 8.3.1.8.2.2).

The INITIAL OVERRIDE LOCKOUT TIMER field shall be set to ~~the value of~~ the initial override lockout timer ~~value~~ (see 8.3.1.8.2.2) ~~as~~ established by the last successful ACCESS CONTROL OUT command with MANAGE OVERRIDE LOCKOUT TIMER service action (see 8.3.3.7).

The KEY OVERRIDES COUNTER field shall be set to the value of the key overrides counter in the access controls log (see 8.3.1.10).

8.3.2.6 REQUEST PROXY TOKEN service action

The ACCESS CONTROL IN command with REQUEST PROXY TOKEN service action (see table 328) is used to obtain a proxy token (see 8.3.1.6.2) for a logical unit to which that initiator ~~port~~ has non-proxy access rights. The ~~returned~~ proxy token ~~thus obtained~~ may be used to pass temporary access to the logical unit to a third party ~~who~~ ~~that~~ may use other proxy related service actions of the ACCESS CONTROL IN and ACCESS CONTROL OUT commands to gain access to the logical unit. If the ACCESS CONTROL IN command with REQUEST PROXY TOKEN service action is not supported, the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to INVALID FIELD IN CDB.

Table 328 — ACCESS CONTROL IN command with REQUEST PROXY TOKEN service action

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE (86h)							
1	Reserved			SERVICE ACTION (04h)				
2	LUN VALUE							
9								
10	(MSB)	ALLOCATION LENGTH						(LSB)
13								
14	Reserved							
15	CONTROL							

If access controls are disabled, the command shall be terminated with a CHECK CONDITION status, with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID FIELD IN CDB.

NOTE 78 - If access controls are disabled, all logical units are accessible and all initiator ~~ports~~ share the same LUN values for addressing. A proxy token is not needed because sharing LUN values is sufficient.

The LUN VALUE field shall contain the LUN value the ~~initiator~~ application client uses to access the logical unit ~~via the initiator port over for~~ which the proxy token is requested.

If the LUN value corresponds to a logical unit that is accessible to the requesting initiator ~~port~~ either through a TransportID or through the AccessID under which the initiator ~~port~~ is currently in the enrolled state (see 8.3.1.5.1), and the access controls coordinator has sufficient resources to create and manage a new proxy token, then the parameter data shown in table 329 shall be returned.

If the LUN value does not correspond to an accessible logical unit, parameter data shall not be returned and the command shall be terminated as follows:

- a) If the LUN value:
 - A) Does not correspond to an accessible logical unit; or
 - B) Corresponds to a logical unit accessible only through a proxy token;Then the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to ACCESS DENIED—INVALID LU IDENTIFIER; or
- b) If the LUN value corresponds to a logical unit accessible only through an enrolled AccessID and the initiator is in the pending-enrolled state, then the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to ACCESS DENIED—INITIATOR PENDING-ENROLLED.

If the LUN value does not correspond to an accessible logical unit or corresponds to a logical unit accessible only through a proxy token, then the parameter data shall not be returned and the command shall be terminated with a CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to ACCESS DENIED - INVALID LU IDENTIFIER.

If the LUN value corresponds to a logical unit accessible only through an enrolled AccessID and the initiator port is in the pending-enrolled state, then the parameter data shall not be returned and the command shall be terminated with a CHECK CONDITION status. The sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to ACCESS DENIED - INITIATOR PENDING-ENROLLED.

If the access controls coordinator does not have enough resources to create and manage a new proxy token, the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to INSUFFICIENT ACCESS CONTROL RESOURCES.

The ALLOCATION LENGTH field is described in 4.3.4.6. The ALLOCATION LENGTH field value should be at least eight.

The format of the parameter data returned by the ACCESS CONTROL IN command with REQUEST PROXY TOKEN service action is shown in table 329.

Table 329 — ACCESS CONTROL IN with REQUEST PROXY TOKEN parameter data

Bit Byte	7	6	5	4	3	2	1	0
0	PROXY TOKEN							
7								

8.3.3 ACCESS CONTROL OUT Command

8.3.3.1 ACCESS CONTROL OUT introduction

The service actions of the ACCESS CONTROL OUT command (see Table 25) are used to request service actions by the access controls coordinator to limit or grant access to the logical units to initiator ports. If the ACCESS CONTROL OUT command is implemented, the ACCESS CONTROL IN command also shall be implemented. The ACCESS CONTROL OUT command shall not be affected access controls.

Table 330 — ACCESS CONTROL OUT service actions

Service Action	Command-name Name	Type	Reference
00h	MANAGE ACL	\mathfrak{mM}	8.3.3.2
01h	DISABLE ACCESS CONTROLS	\mathfrak{mM}	8.3.3.3
02h	ACCESS ID ENROLL	\mathfrak{mM}	8.3.3.4
03h	CANCEL ENROLLMENT	\mathfrak{mM}	8.3.3.5
04h	CLEAR ACCESS CONTROLS LOG	\mathfrak{mM}	8.3.3.6
05h	MANAGE OVERRIDE LOCKOUT TIMER	\mathfrak{mM}	8.3.3.7
06h	OVERRIDE MGMT ID KEY	\mathfrak{mM}	8.3.3.8
07h	REVOKE PROXY TOKEN	\mathfrak{eO}	8.3.3.9
08h	REVOKE ALL PROXY TOKENS	\mathfrak{eO}	8.3.3.10
09h	ASSIGN PROXY LUN	\mathfrak{eO}	8.3.3.11
0Ah	RELEASE PROXY LUN	\mathfrak{eO}	8.3.3.12
0Bh - 17h	Reserved		
18h - 1Fh	Vendor specific		
Key: \mathfrak{mM} = Service action implementation is mandatory if ACCESS CONTROL OUT is implemented.			
\mathfrak{eO} = Service action implementation is optional.			

The ACCESS CONTROL OUT command may be addressed to ~~LUN 0~~ and any other LUN value whose standard INQUIRY data (see 6.4.2) has the ACC bit set to one (e.g., LUN 0), in which case it shall be processed in the same manner as if the command had been addressed to the ACCESS CONTROLS well known logical unit. If an ACCESS CONTROL OUT command is received by a device server whose standard INQUIRY data has the ACC bit set to zero, the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to INVALID COMMAND OPERATION CODE.

The CDB format used by all ACCESS CONTROL OUT service actions is shown in table 331.

Table 331 — ACCESS CONTROL OUT command format

Bit Byte	7	6	5	4	3	2	1	0
0	OPERATION CODE (87h)							
1	Reserved			SERVICE ACTION (see table 330)				
2	Reserved							
9								
10	(MSB)	PARAMETER LIST LENGTH						(LSB)
13								
14	Reserved							
15	CONTROL							

The PARAMETER LIST LENGTH field indicates the amount of data that the [application client initiator](#) shall send to the access controls coordinator in the Data-Out Buffer. The format of the parameter list is specific to each service action.

8.3.3.2 MANAGE ACL service action

8.3.3.2.1 MANAGE ACL introduction

The ACCESS CONTROL OUT command with MANAGE ACL service action is used to authorize access or revoke access to a logical unit or logical units by initiator [ports](#). The ACCESS CONTROL OUT command with MANAGE ACL service action adds, changes or removes an entry or multiple entries in the access controls coordinator's ACL (see 8.3.1.3). If the ACCESS CONTROL OUT command is implemented, the MANAGE ACL service action shall be implemented.

The format of the CDB for the ACCESS CONTROL OUT command with MANAGE ACL service action is shown in table 331 (see 8.3.3.1).

If the PARAMETER LIST LENGTH field in the CDB is zero, the access controls coordinator shall take no action and the command shall be completed with a GOOD status.

If the value in the PARAMETER LIST LENGTH field is less than 20 or results in truncation of any ACE page (see table 333), then the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to PARAMETER LIST LENGTH ERROR.

If the access controls coordinator cannot complete the ACCESS CONTROL OUT command with MANAGE ACL service action because it has insufficient resources, the access controls coordinator shall take no action and not change any of its state and the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to INSUFFICIENT ACCESS CONTROL RESOURCES.

The format of the parameter data for the ACCESS CONTROL OUT command with MANAGE ACL service action is shown in table 332.

Table 332 — ACCESS CONTROL OUT with MANAGE ACL parameter data format

Bit Byte	7	6	5	4	3	2	1	0
	Parameter list header							
0	Reserved							
3								
4	(MSB)	MANAGEMENT IDENTIFIER KEY						(LSB)
11								
12	(MSB)	NEW MANAGEMENT IDENTIFIER KEY						(LSB)
19								
20	Reserved							
21	FLUSH	Reserved						
22	Reserved							
23	Reserved							
24	(MSB)	DLGENERATION						(LSB)
27								
	ACE pages							
28	ACE page 0							
	⋮							
	ACE page x							
n								

If access controls are enabled and the contents of the MANAGEMENT IDENTIFIER KEY field do not match the current management identifier key (see 8.3.1.4.2) maintained by the access controls coordinator, **then** the access controls coordinator's state shall not be altered, the command shall be terminated with a CHECK CONDITION status, **the** sense key shall be set to ILLEGAL REQUEST, **and** the additional sense code shall be set to ACCESS DENIED - INVALID MGMT ID KEY, **and the** The event shall be recorded in the invalid keys portion of the access controls log (see 8.3.1.10).

If the contents of the MANAGEMENT IDENTIFIER KEY field match the current management identifier key maintained by the access controls coordinator, the access controls coordinator shall set its management identifier key to the value specified in the NEW MANAGEMENT IDENTIFIER KEY field and if access controls are disabled it shall enable them.

The FLUSH bit **if set to one** instructs the access controls coordinator to place every initiator **port** in the enrolled state into the pending-enrolled state (see 8.3.1.5.1.4).

The DLGENERATION field specifies the DLgeneration value associated with the default LUN values in the Grant/Revoke ACE pages in the parameter data.

The ACE pages that may follow the parameter list header provide additional changes to the ACL. Each ACE page describes one ACE in the ACL that is to be added, modified, or removed. The content and format of an ACE page is indicated by a page code (see table 333).

Table 333 — ACE page codes

Page Code	ACE Page Name	Reference
00h	Grant/Revoke	8.3.3.2.2
01h	Grant All	8.3.3.2.3
02h	Revoke Proxy Token	8.3.3.2.4
03h	Revoke All Proxy Tokens	8.3.3.2.5
04h-EFh	Reserved	
F0h-FFh	Vendor-specific	

The following requirements apply to the processing of changes to the access control state:

- a) No change to the access control state shall occur if the ACCESS CONTROL OUT command with MANAGE ACL service action terminates with a status other than GOOD status; and
- b) If the ACCESS CONTROL OUT command with MANAGE ACL service action completes with a GOOD status, the following shall have been performed as a single indivisible event:
 - 1) Changes resulting from the contents of fields in the parameter list header shall be processed; and
 - 2) Changes resulting from the contents of ACE pages shall be processed;
 - a) Multiple ACE pages shall be processed sequentially;
 - b) If an ACE page contains conflicting instructions in LUACD descriptors, the instructions in the last LUACD descriptor within the ACE page shall take precedence; and
 - c) If an ACE containing an AccessID type access identifier (see 8.3.1.3.2.2) is replaced and the ACE page that caused the change has the NOCNCL bit (see 8.3.3.2.2) set to zero, then any initiator [port](#) in the enrolled [state](#) or pending-enrolled state under the AccessID in that ACE shall be placed in the not-enrolled state (see 8.3.1.5.1.2).

An ACE page contains conflicting instructions if either of the following is true:

- a) Two LUACD descriptors are present with the same LUN value and different default LUN values; or
- b) Two LUACD descriptors are present with different LUN values and the same default LUN value.

8.3.3.2.2 The Grant/Revoke ACE page

The Grant/Revoke ACE page (see table 334) is used to add, modify, or remove an ACE from the ACL (see 8.3.1.3).

Table 334 — Grant/Revoke ACE page format

Bit Byte	7	6	5	4	3	2	1	0
0	PAGE CODE (00h)							
1	Reserved							
2	(MSB)	PAGE LENGTH (n-3)						(LSB)
3								
4	NOCNCL	Reserved						
5	ACCESS IDENTIFIER TYPE							
6	(MSB)	ACCESS IDENTIFIER LENGTH (m-7)						(LSB)
7								
8	ACCESS IDENTIFIER							
m								
LUACD Descriptors								
m+1	LUACD descriptor 0							
m+20								
⋮								
n-19	LUACD descriptor x							
n								

The PAGE LENGTH field specifies the number of additional bytes present in this ACE page.

A NOCNCL (no changes to current logical unit access) bit **ef set to one** specifies that the application client believes that this ACE page makes no changes to the existing logical unit access conditions in the ACL. A NOCNCL bit **ef set to zero** specifies that the ACE page may or may not change existing logical unit access conditions. If the ACCESS IDENTIFIER TYPE specifies a TransportID (see 8.3.2.2.2.2), the NOCNCL bit shall be ignored.

The ACCESS IDENTIFIER TYPE and ACCESS IDENTIFIER LENGTH fields are described in 8.3.2.2.2.2.

The ACCESS IDENTIFIER field contains the identifier that the access controls coordinator uses to select the ACE that is to be added, modified, or removed. The format of the ACCESS IDENTIFIER field is specified in table 309 (see 8.3.2.2.2.2).

Any of the following conditions in the parameter header or any Grant/Revoke ACE page or Grant All ACE page shall cause the access coordinator to not change its state and shall cause the command to be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST, and the additional sense code shall be set to INVALID FIELD IN PARAMETER LIST:

- The contents of the DLGENERATION field in the parameter list header (see 8.3.3.2.1) do not match the current DLgeneration value (see 8.3.1.4.4) maintained by the access controls coordinator;
- An ACCESS IDENTIFIER TYPE field specifies an unsupported value;

- c) An ACCESS IDENTIFIER TYPE field contains 01h (see 8.3.1.3.2) with an ACCESS IDENTIFIER field that contains an invalid TransportID (see 8.3.1.3.2.3) as defined for the applicable protocol standard;
- d) Two ACE pages that have the same values in the ACCESS IDENTIFIER TYPE and ACCESS IDENTIFIER fields; or
- e) Changes in the ACL that result in an ACL LUN conflict (see 8.3.1.5.2).

NOTE 79 - The application client is responsible for obtaining the current association of default LUN values to logical units (and the DLgeneration value for that association) prior to issuing this service action. The ACCESS CONTROL IN command with REPORT LU DESCRIPTORS service action (see 8.3.2.3) returns the necessary information.

Each LUACD descriptor (see table 335) describes the access to be allowed to one logical unit based on the access identifier in the ACE page. An ACE page may contain zero or more LUACD descriptors.

Table 335 — ACE page LUACD descriptor format

Bit Byte	7	6	5	4	3	2	1	0
0	ACCESS MODE							
1	Reserved							
3								
4	LUN VALUE							
11								
12	DEFAULT LUN							
19								

The ACCESS MODE field is described in 8.3.2.2.2.2.

The LUN VALUE field specifies the LUN value an accessing [application client initiator](#) uses to access the logical unit via the initiator port to which the LUACD descriptor applies.

The DEFAULT LUN field specifies the logical unit to which the value in the LUN VALUE allows access. The DEFAULT LUN field shall contain a default LUN value (see 8.3.1.4.3). The value in the DEFAULT LUN field shall be consistent with the DLGENERATION field contents specified in the parameter list header (see 8.3.3.2.1). If the DEFAULT LUN field references a well known logical unit, the access controls coordinator's state shall not be modified and the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST, the additional sense code shall be set to INVALID FIELD IN PARAMETER LIST.

If the specified access mode is not supported or if the DEFAULT LUN field contains value that is not valid or the LUN VALUE field contains a value that the access controls coordinator does not support as a valid LUN, the access controls coordinator's state shall not be modified and the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST, the additional sense code shall be set to ACCESS DENIED - INVALID LU IDENTIFIER, and the SENSE-KEY SPECIFIC field shall be set as described for the ILLEGAL REQUEST sense key in 4.5.2.4.2. If the error is an unsupported value in the LUN VALUE field, the access controls coordinator should determine a suggested LUN value that will not produce an error while also minimizing the absolute value of the difference of the erroneous default LUN value and the suggested LUN value. If a suggested LUN value is determined, the first four bytes of the suggested LUN value shall be placed in the INFORMATION field and the last four bytes shall be placed in the COMMAND-SPECIFIC INFORMATION field of the sense data (see 4.5).

Based on the access identifier and the presence or absence of LUACD descriptors, the access controls coordinator shall add, modify, or remove an ACE in the ACL as shown in table 336.

Table 336 — Access Coordinator Grant/Revoke ACE page actions

		ACL already contains an ACE with the access identifier matching the one in the ACE page?	
		Yes	No
ACE page includes LUCAD descriptors?	Yes	Modify the existing ACE in the ACL.	Add a new ACE to the ACL.
	No	Remove the existing ACE from the ACL.	Take no action, this shall not be considered a error.

If the ACCESS IDENTIFIER TYPE indicates type AccessID, the enrollment state (see 8.3.1.5.1) of any initiator **port** that is enrolled under the specified AccessID, shall be affected as follows:

- a) If the ACE containing the AccessID is removed, the initiator **port** shall be placed in the not-enrolled state; or
- b) If the ACE containing the AccessID is modified by a Grant/Revoke ACE page or a Grant All ACE page, then;
 - A) If the NOCNCL bit is zero in that ACE page, the initiator **port** shall be placed in the not-enrolled state; or
 - B) If the NOCNCL bit is one in that ACE page, the enrollment state of the initiator **port** may be left unchanged or the initiator **port** may be placed in the not-enrolled state (see 8.3.1.5.1.2) based on vendor specific considerations.

8.3.3.2.3 The Grant All ACE page

The Grant All ACE page (see table 337) is used to add or modify an ACE from the ACL (see 8.3.1.3). An ACE added or modified using the Grant All ACE page allows initiator **ports** with the specified access identifier to access the SCSI target device as if access controls were disabled.

Table 337 — Grant All ACE page format

Bit Byte	7	6	5	4	3	2	1	0	
0	PAGE CODE (01h)								
1	Reserved								
2	(MSB)		PAGE LENGTH (n-3)						(LSB)
3									
4	NOCNCL	Reserved							
5	ACCESS IDENTIFIER TYPE								
6	(MSB)		ACCESS IDENTIFIER LENGTH (m-7)						(LSB)
7									
8	ACCESS IDENTIFIER								
n									

The PAGE LENGTH, NOCNCL, ACCESS IDENTIFIER TYPE, ACCESS IDENTIFIER LENGTH, and ACCESS IDENTIFIER fields are defined in 8.3.3.2.3.

The Grant All ACE page shall be processed as if it is a Grant/Revoke ACE page (see 8.3.3.2.2) with one LUACD descriptor for every logical unit managed by the access controls coordinator with the fields in each LUACD containing:

- a) An access mode of 00h (see 8.3.2.2.2.2);
- b) A LUN VALUE field whose contents match the contents of the DEFAULT LUN field; and
- c) A DEFAULT LUN field whose contents reference the logical unit appropriate to the DLgeneration value (see 8.3.1.4.3).

8.3.3.2.4 The Revoke Proxy Token ACE page

The Revoke Proxy Token ACE page (see table 338) is used to revoke one or more proxy tokens (see 8.3.1.6.2).

Table 338 — Revoke Proxy Token ACE page format

Bit Byte	7	6	5	4	3	2	1	0
0	PAGE CODE (02h)							
1	Reserved							
2	(MSB)	PAGE LENGTH (n-3)						
3							(LSB)	
4	PROXY TOKEN 0							
11								
	⋮							
n-7	PROXY TOKEN x							
n								

The PAGE LENGTH field specifies the number of additional bytes present in this ACE page.

The one or more PROXY TOKEN field(s) specify the proxy tokens to be revoked. The access controls coordinator shall revoke each proxy token listed in a PROXY TOKEN field. If the contents of a PROXY TOKEN field do not identify a valid proxy token the field shall be ignored, this shall not be considered an error.

Multiple Revoke Proxy Token ACE pages may be included in the parameter data.

8.3.3.2.5 The Revoke All Proxy Tokens ACE page

The Revoke All Proxy Tokens ACE page (see table 338) is used to revoke all currently valid proxy tokens (see 8.3.1.6.2).

Table 339 — Revoke All Proxy Tokens ACE page format

Bit Byte	7	6	5	4	3	2	1	0
0	PAGE CODE (03h)							
1	Reserved							
2	(MSB)	PAGE LENGTH (0000h)						
3								(LSB)

Multiple Revoke ALL Proxy Tokens ACE pages may be included in the parameter data.

8.3.3.3 DISABLE ACCESS CONTROLS service action

The ACCESS CONTROL OUT command with DISABLE ACCESS CONTROLS service action is used to place the access controls coordinator in access controls disabled state. If the ACCESS CONTROL OUT command is implemented, the DISABLE ACCESS CONTROLS service action shall be implemented.

The format of the CDB for the ACCESS CONTROL OUT command with DISABLE ACCESS CONTROLS service action is shown in table 331 (see 8.3.3.1).

If access controls are disabled or if the PARAMETER LIST LENGTH field in the CDB is zero, the access controls coordinator shall take no action and the command shall be completed with a GOOD status.

If the value in the PARAMETER LIST LENGTH field is neither zero nor 12, the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to PARAMETER LIST LENGTH ERROR.

If the value in the PARAMETER LIST LENGTH field is 12, the parameter list shall have the format shown in table 340.

Table 340 — ACCESS CONTROL OUT with DISABLE ACCESS CONTROLS parameter data format

Bit Byte	7	6	5	4	3	2	1	0
0	Reserved							
3								
4	(MSB)	MANAGEMENT IDENTIFIER KEY						
11								(LSB)

If access controls are enabled and the contents of the MANAGEMENT IDENTIFIER KEY field do not match the current management identifier key (see 8.3.1.4.2) maintained by the access controls coordinator, ~~then~~ the access controls coordinator's states shall not be altered, the command shall be terminated with a CHECK CONDITION status, ~~the~~ **The** sense key shall be set to ILLEGAL REQUEST, ~~and~~ the additional sense code shall be set to ACCESS DENIED - INVALID MGMT ID KEY, ~~and the~~ **The** event shall be recorded in the invalid keys portion of the access controls log (see 8.3.1.10).

In response to a ACCESS CONTROL OUT command with DISABLE ACCESS CONTROLS service action with correct management identifier key value the access controls coordinator shall:

- a) Disable access controls;
- b) Clear the ACL (see 8.3.1.3);
- c) Place all initiator ports into the not-enrolled state (see 8.3.1.5.1);
- d) Set the management identifier key to zero (see 8.3.1.8);
- e) Set the override lockout timer to zero (see 8.3.1.8.2.2);
- f) Set the initial override lockout timer value to zero (see 8.3.1.8.2.2);
- g) Clear the access controls log (including resetting counters to zero) with the exception of the key overrides portion of the access controls log (see 8.3.1.10);
- h) Allow all initiator port's access to all logical units at their default LUN value;
- i) Optionally, reset the DLgeneration value to zero (see 8.3.1.4.4); and
- j) Establish a unit attention condition for all initiator ports with an additional sense code of REPORTED LUNS DATA HAS CHANGED.

8.3.3.4 ACCESS ID ENROLL service action

The ACCESS ID ENROLL service action of the ACCESS CONTROL OUT command is used by an application client initiator to enroll an AccessID for an initiator port with the access controls coordinator. If the ACCESS CONTROL OUT command is implemented, the ACCESS ID ENROLL service action shall be implemented.

The format of the CDB for the ACCESS CONTROL OUT command with ACCESS ID ENROLL service action is shown in table 331 (see 8.3.3.1).

If access controls are disabled or if the PARAMETER LIST LENGTH field in the CDB is zero, the access controls coordinator shall take no action and the command shall be completed with a GOOD status.

If the value in the PARAMETER LIST LENGTH field is neither zero nor 24, the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to PARAMETER LIST LENGTH ERROR.

If the value in the PARAMETER LIST LENGTH field is 24, the parameter list shall have the format shown in table 341.

Table 341 — ACCESS CONTROL OUT with ACCESS ID ENROLL parameter data format

Bit Byte	7	6	5	4	3	2	1	0
0	ACCESSID							
15								
16	Reserved							
23								

The ACCESSID field is described in 8.3.1.3.2.2.

If the initiator port is in the enrolled state or pending-enrolled state (see 8.3.1.5.1) under a given specific AccessID and the ACCESSID field contains a different AccessID, the access controls coordinator shall place the initiator port in the pending-enrolled state, the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to ACCESS DENIED - ENROLLMENT CONFLICT.

If the initiator **port** is in the enrolled **state** or pending-enrolled state under a **given specific** AccessID and the ACCESSID field contains a matching AccessID, the access controls coordinator shall place the initiator **port** in the enrolled state and make no other changes.

If the initiator **port** is in the not-enrolled state and the ACCESSID field contents do not match the AccessID in any ACE in the ACL (see 8.3.1.3), the initiator **port** shall remain in the not-enrolled state and the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to ACCESS DENIED - NO ACCESS RIGHTS.

If the initiator **port** is in the not-enrolled state and the ACCESSID field contents matches the AccessID in an ACE in the ACL the actions taken depend on whether enrolling the initiator **port** would create an ACL LUN conflict (see 8.3.1.5.2). If there is no ACL LUN conflict, the initiator **port** shall be placed in the enrolled state (see 8.3.1.5.1.3). If there is an ACL LUN conflict, **then** the initiator **port** shall remain in the not-enrolled state and the command shall be terminated with a CHECK CONDITION status, ~~the~~ **The** sense key shall be set to ILLEGAL REQUEST, **and** the additional sense code shall be set to ACCESS DENIED - ACL LUN CONFLICT. ~~and the~~ **The** event shall be recorded in the ACL LUN conflicts portion of the access controls log (see 8.3.1.10).

NOTE 80 - An **application client initiator** that receives the ACCESS DENIED - ACL LUN CONFLICT additional sense code should remove any proxy access rights it has acquired using the ACCESS CONTROL OUT command with RELEASE PROXY LUN service action and retry the enrollment request. If the ACL LUN conflict resulted from proxy access, the retried enrollment succeeds. Otherwise, the mechanisms for resolving ACL LUN conflicts are outside the scope of this standard.

8.3.3.5 CANCEL ENROLLMENT service action

The ACCESS CONTROL OUT command with CANCEL ENROLLMENT service action is used to remove an initiator **port**'s enrollment with the access controls coordinator (see 8.3.1.5). Successful completion of this command changes the state of the initiator **port** to the not-enrolled state. If the ACCESS CONTROL OUT command is implemented, the CANCEL ENROLLMENT service action shall be implemented.

The ACCESS CONTROL OUT command with CANCEL ENROLLMENT service action should be used by an **application client initiator** prior to any period where use of its accessible logical units may be suspended for a lengthy period of time (e.g., when a host is preparing to shutdown). This allows the access controls coordinator to free any resources allocated to manage the enrollment for ~~that~~ **the** initiator **port**.

The format of the CDB for the ACCESS CONTROL OUT command with ACCESS ID ENROLL service action is shown in table 331 (see 8.3.3.1).

If access controls are disabled, the access controls coordinator shall take no action and the command shall be completed with a GOOD status.

There is no parameter data for the ACCESS CONTROL OUT command with CANCEL ENROLLMENT service action. If the PARAMETER LIST LENGTH field in the CDB is not set to zero, the initiator **port**'s enrollment shall not be changed and the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to PARAMETER LIST LENGTH ERROR.

If the PARAMETER LIST LENGTH field in the CDB is set to zero, the initiator **port** shall be placed in the not-enrolled state (see 8.3.1.5.1.2) Any subsequent commands addressed to the logical units no longer accessible are handled according to the **rule requirements** stated in 8.3.1.7.

8.3.3.6 CLEAR ACCESS CONTROLS LOG service action

The ACCESS CONTROL OUT command with CLEAR ACCESS CONTROLS LOG service action is used to instruct the access controls coordinator to reset a specific access control log counter to zero and to clear a portion of the access controls log (see 8.3.1.10). If the ACCESS CONTROL OUT command is implemented, the CLEAR ACCESS CONTROLS LOG service action shall be implemented.

The format of the CDB for the ACCESS CONTROL OUT command with CLEAR ACCESS CONTROLS LOG service action is shown in table 331 (see 8.3.3.1).

If access controls are disabled or if the PARAMETER LIST LENGTH field in the CDB is zero, the access controls coordinator shall take no action and the command shall be completed with a GOOD status.

If the value in the PARAMETER LIST LENGTH field is neither zero nor 12, the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to PARAMETER LIST LENGTH ERROR.

If the value in the PARAMETER LIST LENGTH field is 12, the parameter list shall have the format shown in table 342.

Table 342 — ACCESS CONTROL OUT with CLEAR ACCESS CONTROLS LOG parameter data format

Bit Byte	7	6	5	4	3	2	1	0
0	Reserved							
2								
3	Reserved						LOG PORTION	
4	MANAGEMENT IDENTIFIER KEY							
11								

The LOG PORTION field (see table 343) specifies the access controls log portion to be cleared.

Table 343 — CLEAR ACCESS CONTROLS LOG LOG PORTION field values

Log Portion	Description
00b	Reserved
01b	Invalid Keys portion
10b	ACL LUN Conflicts portion
11b	Reserved

If access controls are enabled and the contents of the MANAGEMENT IDENTIFIER KEY field do not match the current management identifier key (see 8.3.1.4.2) maintained by the access controls coordinator, then the access controls coordinator's states shall not be altered, the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST, and the additional sense code shall be set to ACCESS DENIED - INVALID MGMT ID KEY, and the event shall be recorded in the invalid keys portion of the access controls log (see 8.3.1.10).

In response to a ACCESS CONTROL OUT command with CLEAR ACCESS CONTROLS LOG service action with correct management identifier key value the access controls coordinator shall perform the following to clear the portion of the access controls log identified by the LOG PORTION field (see table 343) in the parameter data:

- a) Set the counter for the specified log portion to zero; and
- b) If the specified log portion contains details records, remove the detail records from the specified log portion.

8.3.3.7 MANAGE OVERRIDE LOCKOUT TIMER service action

The ACCESS CONTROL OUT command with MANAGE OVERRIDE LOCKOUT TIMER service action is used to manage the override lockout timer (see 8.3.1.8.2.2). If the ACCESS CONTROL OUT command is implemented, the MANAGE OVERRIDE LOCKOUT TIMER service action shall be implemented.

If access controls are disabled, the access controls coordinator shall take no action and the command shall be completed with a GOOD status.

The format of the CDB for the ACCESS CONTROL OUT command with MANAGE OVERRIDE LOCKOUT TIMER service action is shown in table 331 (see 8.3.3.1).

If the PARAMETER LIST LENGTH field in the CDB is zero, the access controls coordinator shall reset the override lockout timer to the current initial override lockout timer value maintained by the access controls coordinator.

If the value in the PARAMETER LIST LENGTH field is neither zero nor 12, the device server shall respond with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to PARAMETER LIST LENGTH ERROR.

If the value in the PARAMETER LIST LENGTH field is 12, the parameter list shall have the format shown in table 344.

Table 344 — ACCESS CONTROL OUT with MANAGE OVERRIDE LOCKOUT TIMER parameter data format

Bit Byte	7	6	5	4	3	2	1	0
0	Reserved							
1								
2	(MSB)	NEW INITIAL OVERRIDE LOCKOUT TIMER						
3								(LSB)
4	(MSB)	MANAGEMENT IDENTIFIER KEY						
11								(LSB)

The NEW INITIAL OVERRIDE LOCKOUT TIMER field specifies the value that access controls coordinator shall maintain for initial override lockout timer if the specified management identifier key is correct.

If access controls are enabled and the contents of the MANAGEMENT IDENTIFIER KEY field do not match the current management identifier key (see 8.3.1.4.2) maintained by the access controls coordinator, then the access controls coordinator shall not change the initial override lockout timer value but shall set the override lockout timer to the unaltered current initial override lockout timer value. The command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST, and the additional sense code shall be set to ACCESS DENIED - INVALID MGMT ID KEY, and the event shall be recorded in the invalid keys portion of the access controls log (see 8.3.1.10).

In response to a ACCESS CONTROL OUT command with MANAGE OVERRIDE LOCKOUT TIMER service action with correct management identifier key value the access controls coordinator shall:

- a) Replace the currently saved initial override lockout timer with the value in the NEW INITIAL OVERRIDE LOCKOUT TIMER field; and
- b) Set the override lockout timer to the new initial value.

8.3.3.8 OVERRIDE MGMT ID KEY service action

The ACCESS CONTROL OUT command with OVERRIDE MGMT ID KEY service action is used to override the current management identifier key (see 8.3.1.4.2) maintained by the access controls coordinator. The ACCESS CONTROL OUT command with OVERRIDE MGMT ID KEY service action is intended to be used in a failure situation where the application client no longer has access to its copy of the current management identifier key.

Successful use of the ACCESS CONTROL OUT command with OVERRIDE MGMT ID KEY service action is restricted by the override lockout timer (see 8.3.1.8.2.2).

If the ACCESS CONTROL OUT command is implemented, the OVERRIDE MGMT ID KEY service action shall be implemented.

The format of the CDB for the ACCESS CONTROL OUT command with OVERRIDE MGMT ID KEY service action is shown in table 331 (see 8.3.3.1).

If access controls are disabled or if the PARAMETER LIST LENGTH field in the CDB is zero, the access controls coordinator shall take no action and the command shall be completed with a GOOD status.

If access controls are enabled, the access controls coordinator shall log every ACCESS CONTROL OUT command with OVERRIDE MGMT ID KEY service action processed whether successful or not in the access controls log as specified in 8.3.1.10.

If the value in the PARAMETER LIST LENGTH field is neither zero nor 12, the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to PARAMETER LIST LENGTH ERROR.

If the value in the PARAMETER LIST LENGTH field is 12, the parameter data shall have the format shown in table 345.

Table 345 — ACCESS CONTROL OUT with OVERRIDE MGMT ID KEY parameter data format

Bit Byte	7	6	5	4	3	2	1	0
0	Reserved							
3								
4	(MSB)	NEW MANAGEMENT IDENTIFIER KEY						
11								(LSB)

The NEW MANAGEMENT IDENTIFIER KEY field specifies a new management identifier key.

If the override lockout timer managed by the access controls coordinator is not zero, the access controls coordinator's states shall not be altered, the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to INVALID FIELD IN CDB.

If the override lockout timer managed by the access controls coordinator is zero, then the access controls coordinator shall replace the current management identifier key with the value in the to the NEW MANAGEMENT IDENTIFIER KEY field.

8.3.3.9 REVOKE PROXY TOKEN service action

The ACCESS CONTROL OUT command with REVOKE PROXY TOKEN service action is used to cancel all proxy access rights to a logical unit that were granted to third parties under the specified proxy token (see 8.3.1.6.2). If this service action is not supported, the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to INVALID FIELD IN CDB.

The format of the CDB for the ACCESS CONTROL OUT command with REVOKE PROXY TOKEN service action is shown in table 331 (see 8.3.3.1).

If access controls are disabled or if the PARAMETER LIST LENGTH field in the CDB is zero, the access controls coordinator shall take no action and the command shall be completed with a GOOD status.

If the value in the PARAMETER LIST LENGTH field is neither zero nor eight, the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to PARAMETER LIST LENGTH ERROR.

If the value in the PARAMETER LIST LENGTH field is eight, the parameter data shall have the format shown in table 346.

Table 346 — ACCESS CONTROL OUT with REVOKE PROXY TOKEN parameter data format

Bit Byte	7	6	5	4	3	2	1	0
0	PROXY TOKEN							
7								

If the PROXY TOKEN field does not contain a valid proxy token previously obtained via the initiator port associated with any logical unit at the access controls coordinator, no further action is taken by the access controls coordinator. This shall not be considered an error.

If the proxy token is valid, the access controls coordinator shall take the following actions:

- a) Invalidate the proxy token; and
- b) Deny access to the associated logical unit by any initiator port whose rights were granted under that proxy token via an ACCESS CONTROL OUT command with ASSIGN PROXY LUN service action (see 8.3.3.11) according to the rule requirements stated in 8.3.1.7.

8.3.3.10 REVOKE ALL PROXY TOKENS service action

The ACCESS CONTROL OUT command with REVOKE ALL PROXY TOKENS service action is used to cancel all proxy access rights to a specified logical unit that were granted to third parties under any applicable proxy tokens. An application client for an initiator port uses the ACCESS CONTROL OUT command with REVOKE ALL PROXY TOKENS service action to cancel all proxy access rights to a specified logical unit that it obtained with zero or more proxy tokens (see 8.3.1.6.2). If this service action is not supported, the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to INVALID FIELD IN CDB.

The format of the CDB for the ACCESS CONTROL OUT command with REVOKE ALL PROXY TOKENS service action is shown in table 331 (see 8.3.3.1).

If access controls are disabled or if the PARAMETER LIST LENGTH field in the CDB is zero, the access controls coordinator shall take no action and the command shall be completed with a GOOD status.

If the value in the PARAMETER LIST LENGTH field is neither zero nor eight, the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to PARAMETER LIST LENGTH ERROR.

If the value in the PARAMETER LIST LENGTH field is eight, the parameter data shall have the format shown in table 347.

Table 347 — ACCESS CONTROL OUT with REVOKE ALL PROXY TOKENS parameter data format

Bit Byte	7	6	5	4	3	2	1	0
0	LUN VALUE							
7								

If the LUN in the LUN VALUE field is not associated to a logical unit to which the requesting initiator port has non-proxy access rights based on the contents of an ACE (see 8.3.1.3) or if the LUN value is based on a proxy token (see 8.3.1.6.2), no further action is taken by the access controls coordinator. This shall not be considered an error.

If the LUN value is associated to a logical unit to which the requesting initiator port has non-proxy access rights, the access controls coordinator shall take the following additional actions:

- a) Invalidate all proxy tokens associated to the initiator port for the logical unit specified by the LUN VALUE field;
- b) Deny access to that logical unit by any initiator port whose rights were granted under any of the invalidated proxy tokens via an ACCESS CONTROL OUT command with ASSIGN PROXY LUN service action (see 8.3.3.11) according to the rule requirements stated in 8.3.1.7.

8.3.3.11 ASSIGN PROXY LUN service action

The ACCESS CONTROL OUT command with ASSIGN PROXY LUN service action is used to request access to a logical unit under the rights of a proxy token (see 8.3.1.6.2) and to assign that logical unit a particular LUN value for addressing by the requesting initiator port. If this service action is not supported, the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to INVALID FIELD IN CDB.

The format of the CDB for the ACCESS CONTROL OUT command with ASSIGN PROXY LUN service action is shown in table 331 (see 8.3.3.1).

If the PARAMETER LIST LENGTH field in the CDB is zero, the access controls coordinator shall take no action and the command shall be completed with a GOOD status.

If the value in the PARAMETER LIST LENGTH field is neither zero nor 16, the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to PARAMETER LIST LENGTH ERROR.

If the value in the PARAMETER LIST LENGTH field is 16, the parameter data shall have the format shown in table 348.

Table 348 — ACCESS CONTROL OUT with ASSIGN PROXY LUN parameter data format

Bit Byte	7	6	5	4	3	2	1	0
0	PROXY TOKEN							
7								
8	LUN VALUE							
15								

The PROXY TOKEN field contains a proxy token. If the contents of the PROXY TOKEN field are not valid, then the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to ACCESS DENIED - INVALID PROXY TOKEN.

NOTE 81 - If access controls are disabled, there are no valid proxy tokens and the device server always responds with the specified error information. This differs from the behavior of many other ACCESS CONTROL OUT service actions where the response is GOOD status when access controls are disabled. The difference in behavior is intended to inform the application client that its request for the new LUN assignment failed.

The LUN VALUE field specifies the LUN value the application client intends to use when accessing the logical unit described by the proxy token.

If the proxy token is valid but the access controls coordinator cannot assign the requested LUN value to the associated logical unit (e.g., because the LUN value already is associated with a logical unit for the initiator port, or because the LUN value is not a supported logical unit address), access rights shall not be granted, the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to ACCESS DENIED - INVALID LU IDENTIFIER, and the SENSE-KEY SPECIFIC field shall be set as described for the ILLEGAL REQUEST sense key in 4.5.2.4.2. The access controls coordinator should determine a suggested LUN value that will not produce an error while also minimizing the absolute value of the difference of the erroneous default LUN value and the suggested LUN value. If a suggested LUN value is determined, the first four bytes of the suggested LUN value shall be placed in the INFORMATION field and the last four bytes shall be placed in the COMMAND-SPECIFIC INFORMATION field of the sense data (see 4.5).

If the proxy token is valid but the access controls coordinator has insufficient resources to manage proxy logical unit access, the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to INSUFFICIENT ACCESS CONTROL RESOURCES.

If the proxy token is valid and the access controls coordinator has sufficient resources, the initiator port shall be allowed proxy access to the referenced logical unit at the specified LUN value.

8.3.3.12 RELEASE PROXY LUN service action

The ACCESS CONTROL OUT command with RELEASE PROXY LUN service action is used to release proxy access to a logical unit created with a proxy token (see 8.3.1.6.2) and the ACCESS CONTROL OUT command with ASSIGN PROXY LUN service action (see 8.3.3.11). If this service action is not supported, the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to INVALID FIELD IN CDB.

The ACCESS CONTROL OUT command with RELEASE PROXY LUN service action should be used when an initiator application client no longer requires the logical unit access rights granted to an initiator port under a proxy token (e.g., when a copy manager has completed a specific third party copy operation under a proxy token). This allows the access controls coordinator to free any resources allocated to manage the proxy access.

The format of the CDB for the ACCESS CONTROL OUT command with RELEASE PROXY LUN service action is shown in table 331 (see 8.3.3.1).

If the PARAMETER LIST LENGTH field in the CDB is zero, the access controls coordinator shall take no action and the command shall be completed with a GOOD status.

If the value in the PARAMETER LIST LENGTH field is neither zero nor eight, the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to PARAMETER LIST LENGTH ERROR.

If the value in the PARAMETER LIST LENGTH field is eight, the parameter data shall have the format shown in table 349.

Table 349 — ACCESS CONTROL OUT with RELEASE PROXY LUN parameter data format

Bit Byte	7	6	5	4	3	2	1	0
0	LUN VALUE							
7								

The LUN VALUE field specifies a LUN value that was associated with a logical unit based on a proxy token using a ACCESS CONTROL OUT command with ASSIGN PROXY LUN service action. If the LUN value was not assigned to a logical unit by an ACCESS CONTROL OUT command with ASSIGN PROXY LUN service action, the command shall be terminated with a CHECK CONDITION status, the sense key shall be set to ILLEGAL REQUEST and the additional sense code shall be set to INVALID FIELD IN PARAMETER LIST.

NOTE 82 - If access controls are disabled, there are no valid proxy tokens and therefore no LUN value could be assigned to a logical unit by an ACCESS CONTROL OUT command with ASSIGN PROXY LUN service action so the device server always responds with the specified error information. This differs from the behavior of many other ACCESS CONTROL OUT service actions where the response is GOOD status when access controls are disabled. The difference in behavior is intended to inform the application client that the LUN value remains as a valid address for the logical unit.

If the LUN value was assigned to a logical unit by an ACCESS CONTROL OUT command with ASSIGN PROXY LUN service action, the access controls coordinator shall disallow access to the logical unit at the specified LUN value.

8.4 TARGET LOG PAGES well known logical unit

The TARGET LOG PAGES well known logical unit shall only process the commands listed in table 350. If a command is received by the TARGET LOG PAGES well known logical unit that is not listed in table 350 the device server shall return CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and an additional sense code of INVALID COMMAND OPERATION CODE.

Table 350 — Commands for the TARGET LOG PAGES well known logical unit

Command name	Operation code	Type	Reference
INQUIRY	12h	M	6.4
LOG SELECT	4Ch	M	6.5
LOG SENSE	4Dh	M	6.6
REQUEST SENSE	03h	M	6.25
TEST UNIT READY	00h	M	6.27
Key: M = Command implementation is mandatory.			

The TARGET LOG PAGES well known logical unit shall support the Protocol Specific Port log page (see 7.2.9) and may support other log pages with parameters that apply to the target device.

Annex A

(informative)

Terminology mapping

The introduction of a model for SCSI devices with multiple ports resulted in changes in terminology between SPC-2 and SPC-3 (see table A.1).

Table A.1 — SPC-3 to SPC-2 terminology mapping

SPC-3 equivalent term	SPC-2 term
initiator port identifier	initiator identifier
SCSI initiator port	initiator
SCSI port	port
SCSI port identifier	device identifier
SCSI port identifier	SCSI identifier
SCSI target port	target
target port identifier	target identifier

Annex B

(Informative)

Procedures for logging operations in SCSI

B.1 Procedures for logging operations in SCSI introduction

This annex provides guidance in the use of the LOG SELECT and LOG SENSE commands defined in clause 6. This annex does not replace the descriptions in clause 6 and is not intended to conflict with clause 6. The purpose of this annex is to provide more information to gain a more uniform implementation of the SCSI logging functions.

B.2 Logging operations terminology

B.2.1 list parameter: A parameter value that consists of a string of ASCII data (see 4.4.1) or a binary value.

B.2.2 log page: A page made up of one or more log parameters.

B.2.3 log parameter: Log information that is made up of a parameter code, a parameter control byte, and a parameter value.

B.2.4 parameter code: A unique identifier that is used to distinguish between the different log parameters within a single log page.

B.2.5 parameter control byte: Used to tell the device server how to update, save, use thresholds, determine format, etc. of the parameter value.

B.2.6 parameter pointer field: Contains a parameter code.

B.2.7 parameter value: A counter, cumulative, threshold, or ASCII value.

B.2.8 GT: Greater Than

B.2.9 NV: Not Valid

B.3 LOG SENSE command

The LOG SENSE command may be used to do two functions. One is to allow the device server to save the log parameters in a log page to nonvolatile storage. The other is to allow an application client to receive the value of the current log parameters for a given log page.

Table B.1 lists the definitions of the LOG SENSE CDB fields.

Table B.1 — LOG SENSE Command CDB fields

LOG SENSE CDB Values			Description
PPC bit	SP bit	PC field	
0	-	--	Indicates that the log parameter requested from the device server begin with the parameter code specified by the PARAMETER POINTER field in ascending order of parameter codes from the specified log page.
1	-	--	Indicates that the device server returns a log page consisting only of the log parameters in which a log parameter value has changed since the last LOG SELECT or LOG SENSE command. The device server returns only those log parameters with a parameter code greater than or equal to the parameter code specified by the PARAMETER POINTER field.
-	0	--	Indicates that the device server performs the specified LOG SENSE command and does not save any log parameters.
-	1	--	Indicates that the device server performs the specified LOG SENSE command and saves all log parameters identified as saveable by the DS bit to a nonvolatile vendor specific location if allowed. See the table B.3 to determine the interaction between the SP and DS bits to see what 'allowed' means.
-	-	00	Indicates that the device server returns current threshold values.
-	-	01	Indicates that the device server returns current cumulative values.
-	-	10	Indicates that the device server returns default threshold values.
-	-	11	Indicates that the device server returns default cumulative values.

Table B.2 lists all possible parameter values that may be returned by a LOG SENSE command.

Table B.2 — LOG SENSE returned parameter values

LOG SENSE CDB Values		Log Page Parameter Control Byte Value		Device Server Action
PPC bit	PC field	LP bit	LBIN bit	Parameter values returned to the application client
0	00	0	x	Returns all current threshold values starting with the parameter code specified in the PARAMETER POINTER field.
0	01	0	x	Returns all current cumulative values starting with the parameter code specified in the PARAMETER POINTER field.
0	10	0	x	Returns all default threshold values starting with the parameter code specified in the PARAMETER POINTER field.
0	11	0	x	Returns all default cumulative values starting with the parameter code specified in the PARAMETER POINTER field.
1	00	0	x	Returns only the current threshold values that have changed, starting with the parameter code specified in the PARAMETER POINTER field.
1	01	0	x	Returns only the current cumulative values that have changed, starting with the parameter code specified in the PARAMETER POINTER field.
1	10	0	x	Returns only the default threshold values that have changed, starting with the parameter code specified in the PARAMETER POINTER field.
1	11	0	x	Returns only the default cumulative values that have changed, starting with the parameter code specified in the PARAMETER POINTER field.
0	xx	1	0	Returns all the list parameters starting with the parameter code specified in the PARAMETER POINTER field. The list parameters returned are formatted as ASCII data (see 4.4.1).
1	xx	1	0	Returns only the list parameters that have changed, starting with the parameter code specified in the PARAMETER POINTER field. The list parameters returned are formatted as ASCII data (see 4.4.1).
0	xx	1	1	Returns all the list parameters starting with the parameter code specified in the PARAMETER POINTER field. The list parameters returned are formatted in binary.
1	xx	1	1	Returns only the list parameters that have changed, starting with the parameter code specified in the PARAMETER POINTER field. The list parameters returned are formatted in binary.

Table B.3 lists all possible save options for the LOG SENSE command.

The listed options define the save operations that occur as a direct result of the LOG SENSE command. Further save operations are a function of the TSD bit in the log parameter control byte.

Table B.3 — LOG SENSE save options

LOG SENSE CDB Values		Log Page Parameter Control Byte Value			Device Server Action
SP bit	PC field	DS bit	LP bit	LBIN bit	
0	xx	x	x	x	Do not save any of the log parameters into nonvolatile storage.
1	00	0	0	x	Save all the current threshold values of the selected log page into nonvolatile storage.
1	01	0	0	x	Save all the current cumulative values of the selected log page into nonvolatile storage.
1	10	0	0	x	Save all the default threshold values of the selected log page into nonvolatile storage.
1	11	0	0	x	Save all the default cumulative values of the selected log page into nonvolatile storage.
1	xx	0	1	0	Save all the current list parameter values of the selected log page into nonvolatile storage. The list parameters are formatted as ASCII data (see 4.4.1).
1	xx	0	1	1	Save all the current list parameter values of the selected log page into nonvolatile storage. The list parameters are formatted in binary.
1	xx	1	x	x	Do not save any of the log parameters into nonvolatile storage.

B.4 LOG SELECT command

The function of the LOG SELECT command is to allow an application client a method of sending parameter values to the device server.

Table B.4 lists the definitions of the LOG SELECT CDB fields.

Table B.4 — LOG SELECT CDB fields

LOG SELECT CDB Values				Description
PCR bit	SP bit	PC field	Parameter List Length	
0	-	--	-	Indicates that the log parameters are not reset.
1	x	xx	0000h	Indicates that the device server sets all implemented parameter values to the target-defined default values.
1	x	xx	GT 0	This is an illegal condition.
-	0	--	-	Indicates that the device server does not save any of the log parameters.
-	1	--	-	Indicates that, after performing the specified LOG SELECT operation, the device server saves to nonvolatile memory all saveable log parameters. See table B.5 to determine the interaction between the SP and DS bits to see what 'saveable' means.
-	-	00	-	Indicates that the application client sends threshold values.
-	-	01	-	Indicates that the application client sends cumulative values.
-	-	10	-	Indicates that the application client sends default threshold values.
-	-	11	-	Indicates that the application client sends default cumulative values.

Table A.5 lists all possible save options for the LOG SELECT command.

All the log parameters that are selected for saving are saved to nonvolatile storage after the device server performs the specified LOG SELECT operation. Further save operations are a function of the TSD bit in the log parameter control byte.

Table B.5 — LOG SELECT save options

LOG SELECT CDB Values		Log Page Parameter Control Byte Value			Device Server Action
SP bit	PC field	DS bit	LP bit	LBIN bit	
0	xx	x	x	x	Do not save any of the log parameters into nonvolatile storage.
1	00	0	0	x	Save all the threshold values of the selected log page into nonvolatile storage.
1	01	0	0	x	Save all the cumulative values of the selected log page into nonvolatile storage.
1	10	0	0	x	Save all the default threshold values of the selected log page into nonvolatile storage.
1	11	0	0	x	Save all the default cumulative values of the selected log page into nonvolatile storage.
1	xx	0	1	0	Save all the list parameter values of the selected log page into nonvolatile storage. The list parameters are formatted as ASCII data (see 4.4.1).
1	xx	0	1	1	Save all the list parameter values of the selected log page into nonvolatile storage. The list parameters are formatted in binary.
1	xx	1	x	x	Do not save any of the log parameters into nonvolatile storage.

Table A.6 lists all possible parameter values that may be controlled by a LOG SELECT command.

Table B.6 — LOG SELECT controller parameter values

LOG SELECT CDB Values	Log Page Parameter Control Byte Value		Device Server Action
	PC field	LP bit LBIN bit	
			Updated parameter value usage
00	0	x	The parameter values for all the log parameters in the log page(s) sent to the device server are used as threshold values, unless the LP bit is set.
01	0	x	The parameter values for all the log parameters in the log page(s) sent to the device server are used as cumulative values, unless the LP bit is set.
10	0	x	The device server sets the current threshold values to the default threshold values for all the log parameters specified in the log page(s) sent during a LOG SELECT command, unless the LP bit is set.
11	0	x	The device server sets the current cumulative values to the default cumulative values for all the log parameters specified in the log page(s) sent during a LOG SELECT command, unless the LP bit is set.
xx	1	0	The device server replaces the current list parameter with the list parameter sent to the device server. The list parameters are formatted as ASCII data (see 4.4.1).
xx	1	1	The device server replaces the current list parameter with the list parameter sent to the device server. The list parameters are formatted in binary.

B.5 Exception conditions during logging

B.5.1 Overview of exception conditions during logging

The logging operations may be setup to keep track of many different vendor specific items. This subclause describes how a device server informs an application client when a log reaches a critical point, thereby creating an exception condition.

Table B.7 and table B.8 list the definitions of the parameter control byte of the log parameter. Table B.7 lists parameter control byte values that affect parameter saving. Table B.8 lists parameter control byte values that affect parameter updating and reporting.

Table B.7 — Log Parameter Control Byte saving definitions

Parameter Control Byte Values		Control Mode Page (0Ah)	Description
DS bit	TSD bit	GLTSD bit	
0	-	-	Indicates that the device server supports saving of the log parameter.
1	-	-	Indicates that the device server does not support saving of the log parameter in response to a LOG SELECT or LOG SENSE command.
-	0	0	Indicates that the device server provides a target-defined method of saving log parameters.
-	1	0	Indicates that either the device server does not provide a target-defined method for saving log parameters or the target-defined method has been disabled by an application client.
-	x	1	Indicates that either the device server does not provide a target-defined method for saving log parameters or the target-defined method has been disabled by an application client.

Table B.8 — Log Parameter Control Byte updating definitions

Parameter Control Byte Values					Description
DU bit	ETC bit	TMC field	LP bit	LBIN bit	
0	-	--	-	-	Indicates that the device server updates the log parameter value to reflect all events that should be noted by that log parameter.
1	-	--	-	-	Indicates that the device server does not update the log parameter value except in response to a LOG SELECT command that specifies a new value the log parameter.
-	0	--	-	-	Indicates that a comparison between the threshold value and the cumulative value is not performed.
-	1	--	-	-	Indicates that a comparison to the threshold value is performed whenever the cumulative value is updated.
-	-	00	-	-	Indicates that device server informs the application client on every update to the cumulative value.
-	-	01	-	-	Indicates that device server informs the application client on every time the cumulative value is equal to the threshold value.
-	-	10	-	-	Indicates that device server informs the application client on every time the cumulative value is not equal to the threshold value.
-	-	11	-	-	Indicates that device server informs the application client on every time the cumulative value is greater than the threshold value.
-	-	--	0	x	Indicates that the log parameter is a data counter.
-	-	--	1	0	Indicates that the log parameter is a list parameter and the list parameter is formatted as ASCII data (see 4.4.1).
-	-	--	1	1	Indicates that the log parameter is a list parameter and the list parameter is formatted in binary.

Table B.9 describes the device server actions associated with logging exception conditions.

Table B.9 — Logging exception conditions

Log Page Parameter Control Byte Values				Control Mode Page (0Ah)	Device Server Action
DU bit	ETC bit	TMC field	LP bit	RECL bit	
x	x	xx	x	0	Logging activities do not cause an ACA condition or a Unit Attention condition.
x	0	GT 0	1	x	This is an illegal condition
x	1	xx	1	x	This is an illegal condition
0	1	xx	0	1	Follow pseudocode 1 (see B.5.2)
0	0	NV	0	1	Follow pseudocode 2 (see B.5.3)
0	0	00	1	1	Follow pseudocode 3 (see B.5.4)

The pseudocode in B.5.2 through B.5.4 assumes that ACA is implemented and requested in the CDB CONTROL byte (see SAM-2).

B.5.2 Pseudocode 1

IF the threshold condition as defined by the TMC field is met:

- 1) IF there is an active task
 - 1) Complete the active task
 - 2) If an ACA condition exists wait for it to be cleared
 END
- 2) Issue a unit attention condition to all initiators that have set the RLEC bit to one
- 3) IF the unit attention condition is ignored
 - 1) Continue normal operations until the threshold condition is met again
 END

B.5.3 Pseudocode 2

IF a log counter reaches its maximum value:

- 1) Set DU to 1
 - 2) IF there is no active task
 - 1) Wait until there is an active task
 END
 - 3) Complete the active task
 - 4) IF no ACA condition exists
 - 1) Create an ACA condition with a sense key of RECOVERED ERROR and additional sense code of LOG EXCEPTION, COUNT AT MAXIMUM
 END
 - 5) Wait for the ACA condition to be cleared
 - 6) IF the cause of the counter reaching maximum is not cleared by the application client
 - 1) Do not create an ACA condition and do not increment the counter
 END
- END

B.5.4 Pseudocode 3

IF the log of parameters is full:

- 1) Place the new log parameter code value into the lowest parameter code value position (wrap-around the parameter codes)
 - 2) IF there is no active task
 - 1) Wait until there is an active task
 END
 - 3) Complete the active task
 - 4) IF no ACA condition exists
 - 1) Create an ACA condition with a sense key of RECOVERED ERROR and additional sense code of LOG EXCEPTION, LIST CODES EXHAUSTED
 END
 - 5) Wait for the ACA condition to be cleared
 - 6) IF the cause of the log of parameters filling is not cleared by the application client
 - 1) Create an ACA condition every time an entry is placed into the log of parameters
 END
- END

Annex C

(informative)

Numeric order codes

C.1 Numeric order codes introduction

This annex contains SCSI additional sense codes, operation codes, log page codes, and mode page codes in numeric order as a reference. In the event of a conflict with between the codes in this annex and the codes in the body of this standard, the codes in the body are correct.

The information in this annex was complete and accurate at the time of publication. However, the information is subject to change. Technical Committee T10 of INCITS maintains an electronic copy of this information on its world wide web site (<http://www.t10.org/>). In the event that the T10 world wide web site is no longer active, access may be possible via the INCITS world wide web site (<http://www.incits.org/>), the ANSI world wide web site (<http://www.ansi.org/>), the IEC site (<http://www.iec.ch/>), the ISO site (<http://www.iso.ch/>), or the ISO/IEC JTC 1 web site (<http://www.jtc1.org/>).

C.2 Additional Sense Codes

Table C.1 is a numerical order listing of the additional sense codes and the additional sense code qualifiers.

Table C.1 — ASC and ASCQ assignments (part 1 of 15)

D - DIRECT ACCESS BLOCK DEVICE (SBC-2)																Device Column key
. T - SEQUENTIAL ACCESS DEVICE (SSC-2)																blank = code not used
. L - PRINTER DEVICE (SSC)																not blank = code used

C.3.2 Additional operation codes for devices with the MCHNGR bit set

Table C.3 is a numerical order listing of the additional command operation codes used by devices that have the MChngr bit set in their standard INQUIRY data. The operation codes listed in table C.3 are in addition to the operation codes listed in C.3.1 for the device type indicated by the standard INQUIRY data having the MCHNGR bit set.

Table C.3 — Additional operation codes for devices with the MCHNGR bit set

D - DIRECT ACCESS BLOCK DEVICE (SBC-2)													<u>Device Column key</u>		
. T - SEQUENTIAL ACCESS DEVICE (SSC-2)													M = Mandatory		
. L - PRINTER DEVICE (SSC)													O = Optional

OP	D	T	L	P	W	R	S	O	M	C	A	B	K	Description
1C	M	M	M	M	M	M	M	M	M	M	M	M	M	RECEIVE DIAGNOSTIC RESULTS
1D	M	M	M	M	M	M	M	M	M	M	M	M	M	SEND DIAGNOSTIC

C.3.4 MAINTENANCE (IN) and MAINTENANCE (OUT) service actions

The assignment of service action codes for the MAINTENANCE (IN) and MAINTENANCE (OUT) operation codes by this standard is shown in table C.5. The MAINTENANCE (IN) and MAINTENANCE (OUT) service actions that may be assigned by other command set standards are noted as restricted but their specific usage is not described.

Table C.5 — MAINTENANCE (IN) and MAINTENANCE (OUT) service actions

Service Action	Description
MAINTENANCE (IN) [operation code A3h]	
00h - 04h	Restricted
05h	REPORT DEVICE IDENTIFIER
06h - 09h	Restricted
0Ah	REPORT TARGET PORT GROUPS
0Bh	REPORT ALIASES
0Ch	REPORT SUPPORTED OPERATION CODES
0Dh	REPORT SUPPORTED TASK MANAGEMENT FUNCTIONS
0Eh - 1Fh	Reserved
MAINTENANCE (OUT) [operation code A4h]	
00h - 05h	Restricted
06h	SET DEVICE IDENTIFIER
07h - 09h	Restricted
0Ah	SET TARGET PORT GROUPS
0Bh	CHANGE ALIASES
0Ch - 1Fh	Reserved

C.3.5 SERVICE ACTION IN and SERVICE ACTION OUT service actions

The assignment of service action codes for the SERVICE ACTION IN(12) and SERVICE ACTION OUT(12) operation codes by this standard is shown in table C.6.

Table C.6 — SERVICE ACTION IN(12) and SERVICE ACTION OUT(12) service actions

Service Action	Description
SERVICE ACTION IN(12) [operation code ABh]	
00h	Reserved
01h	READ MEDIA SERIAL NUMBER
02h - 1Fh	Reserved
SERVICE ACTION OUT(12) [operation code A9h]	
00h - 1Eh	Reserved
1Fh	Restricted

The assignment of service action codes for the SERVICE ACTION IN(16) and SERVICE ACTION OUT(16) operation codes by this standard is shown in table C.6. The SERVICE ACTION IN(16) and SERVICE ACTION OUT(16) service actions that may be assigned by other command set standards are noted as restricted but their specific usage is not described.

Table C.7 — SERVICE ACTION IN(16) and SERVICE ACTION OUT(16) service actions

Service Action	Description
SERVICE ACTION IN(16) [operation code 9Eh]	
00h - 0Fh	Reserved
10h - 1Fh	Restricted
SERVICE ACTION OUT(16) [operation code 9Fh]	
00h - 0Fh	Reserved
10h - 1Fh	Restricted

C.3.6 Variable Length CDB Service Action Codes

Only one operation code is assigned to the variable length CDB (see 4.3.3). Therefore, the service action code is effectively the operation code for variable length CDB uses. To allow command set standards to assign uses of the variable length CDB without consulting this standard, ranges of service action codes are assigned to command sets as shown in table C.8.

Table C.8 — Variable Length CDB Service Action Code Ranges

Service Action Code Range	Doc.	Description
0000h - 07FFh	SBC-2	Direct-access device (e.g., magnetic disk)
0800h - 0FFFh	SSC	Sequential-access device (e.g., magnetic tape)
1000h - 17FFh	SSC	Printer device
1800h - 1FFFh	this standard	Commands for all device types (see table C.9)
2000h - 27FFh	SBC-2	Write-once device (e.g., some optical disks)
2800h - 2FFFh	MMC-2	CD-ROM device
3800h - 3FFFh	SBC-2	Optical memory device (e.g., some optical disks)
4000h - 47FFh	SMC-2	Medium changer device (e.g., jukeboxes)
5000h - 5FFFh		Defined by ASC IT8 (Graphic arts pre-press devices)
6000h - 67FFh	SCC-2	Storage array controller device (e.g., RAID)
7000h - 77FFh	RBC	Simplified direct-access device (e.g., magnetic disk)
7800h - 7FFFh	OCRW	Optical card reader/writer device
8800h - 8FFFh	OSD	Object-based Storage Device
3000h - 37FFh		Reserved
4800h - 4FFFh		Reserved
6800h - 6FFFh		Reserved
8000h - 87FFh		Reserved
9000h - F7FFh		Reserved
F800h - FFFFh		Vendor specific

The variable length CDB service action codes assigned by this standard are shown in table C.9.

Table C.9 — Variable Length CDB Service Action Codes Used by All Device Types

Service Action Code	Description
1800h - 1FFFh	Reserved

C.4 Log Page Codes

Table C.10 is a numerical order listing of the log page codes.

Table C.10 — Log Page Codes

C.7 Version Descriptor Values

Table C.13 is a numerical order listing of the version descriptor values used in the standard INQUIRY data. Each version descriptor value is computed from a coded value identifying the standard and a coded value representing the revision of the standard. The formula is ((standard*32)+revision). Table C.13 shows all three code values and the associated standard name. The version descriptor code is shown in both decimal and hexadecimal.

Table C.13 — Version descriptor assignments (part 1 of 7)

Standard Code	Revision Code	Version Descriptor Code (decimal hex)	Standard
0	0	0 0000h	Version Descriptor Not Supported or No Standard Identified
1	0	32 0020h	SAM (no version claimed)
1	27	59 003Bh	SAM T10/0994-D revision 18

Standard Code	Standard or standards family
167	IEEE 1394b
185 - 224	Networking
225 - 244	ATM
245 - 2047	Reserved for Expansion

Table C.15 shows the guidelines used by T10 when selecting a coded value for a revision.

Table C.15 — Revision code value guidelines

Revision Code	Revision
0	No revision specified
1 - 20	Revisions accepted as T10 committee drafts or stabilized drafts
20 - 29	Revisions for letter ballot, forwarded to INCITS or ANSI approved
30 - 32	Revisions approved as international standards

C.8 T10 IEEE binary identifiers

The IEEE binary identifiers assigned to T10 standards are shown in table C.16.

Table C.16 — IEEE binary identifiers assigned by T10

IEEE Binary Identifier	T10 Standard
0060 9E01 03E0h	SBP (obsolete)
0060 9E01 0483h	SBP-2
0060 9E01 04D8h	SPC-2
0060 9E01 05BBh	SBP-3
0060 9E01 0800h	SRP revision 10
0060 9E01 0801h	ANSI SRP

Annex D

(informative)

Vendor identification

This annex contains the list of SCSI vendor identifications (see table D.1) as of the date of this document. The purpose of this list is to help avoid redundant usage of vendor identifications. Technical Committee T10 of Accredited Standards Committee INCITS maintains an informal list of vendor identifications currently in use. The T10 web site, www.t10.org, provides a convenient means to request an identification code. If problems are encountered using the T10 web site, please contact the chairman of T10 prior to using a new vendor identification to avoid conflicts.

The information in this annex was complete and accurate at the time of publication. However, the information is subject to change. Technical Committee T10 of INCITS maintains an electronic copy of this information on its world wide web site (<http://www.t10.org/>). In the event that the T10 world wide web site is no longer active, access may be possible via the INCITS world wide web site (<http://www.incits.org>), the ANSI world wide web site (<http://www.ansi.org>), the IEC site (<http://www.iec.ch/>), the ISO site (<http://www.iso.ch/>), or the ISO/IEC JTC 1 web site (<http://www.jtc1.org/>).

Table D.1 — Vendor identification list (part 1 of 9)

ID	Organization
2AI	2AI (Automatisme et Avenir Informatique)
3M	3M Company
3PARdata	3PARdata, Inc.
A-Max	A-Max Technology Co., Ltd
ACL	Automated Cartridge Libraries, Inc.
Acuid	Acuid Corporation Ltd.
AcuLab	AcuLab, Inc. (Tulsa, OK)
ADAPTEC	Adaptec
ADIC	Advanced Digital Information Corporation
ADSI	Adaptive Data Systems, Inc. (a Western Digital subsidiary)
ADTX	ADTX Co., Ltd.
ADVA	ADVA Optical Networking AG
AERONICS	Aeronics, Inc.
AGFA	AGFA
AIPTEK	AIPTEK International Inc.
AMCODYNE	Amcodyne
Amphenol	Amphenol
ANAMATIC	Anamartic Limited (England)
Ancor	Ancor Communications, Inc.
ANCOT	ANCOT Corp.
ANDATACO	Andataco (now nStor)
andiamo	Andiamo Systems, Inc.
ANRITSU	Anritsu Corporation
APPLE	Apple Computer, Inc.
ARCHIVE	Archive
ARISTOS	Aristos Logic Corp.
ARK	ARK Research Corporation
ARTECON	Artecon Inc. (Obs. - now Dot Hill)
