## Terminology

- Execute (v) - To perform the work of a task or task management function.
- Complete (v) - To end a task and return a Command Complete response.
- Abort (v) - To end a task without returning a Command Complete response.
- End (v) - To abort or complete a task.
- Suspended Information - Information that is concealed from a task until the task enters the enabled state.

digital StorageWorks

## Task State Definitions:

- Dormant - The task is prevented from beginning execution. The conditions under which a dormant task becomes enabled depend on its task attribute.
- Enabled - The task may complete at any time. An enabled task that has been aborted may have altered the logical unit state.
- Blocked - A previously enabled task that is prevented from completing due to an ACA condition.

**digital** StorageWorks

## Task State Definitions (con't)

- Termination Pending - The state of a task previously in the Held or Blocked states after a TERMINATE TASK function has been issued. The task shall be completed when the ACA condition is cleared.
- Held - The state of all previously dormant tasks within a task set while an ACA is in effect.
- Aborted - The state of a task that has been aborted as the result of a task management abort function or an exception condition (e.g., bus reset or ACA with Qerr flag set in the mode page).
- Done - The state of a completed task.

digital StorageWorks

## Task Execution Model

- A task is executed through the following remote procedure call:

Service Response = Execute Command (Task Identifier, Command descriptor block, [Input arguments])| [Output arguments,] [Autosense data,] Status)

- Command execution begins when the task becomes enabled.
- The state of all outputs is undefined until the remote procedure completes and a service response is successfully received by the initiator.
- The state of all outputs is undefined if a task is aborted or fails to complete.

**digital** StorageWorks

## Suspended Information

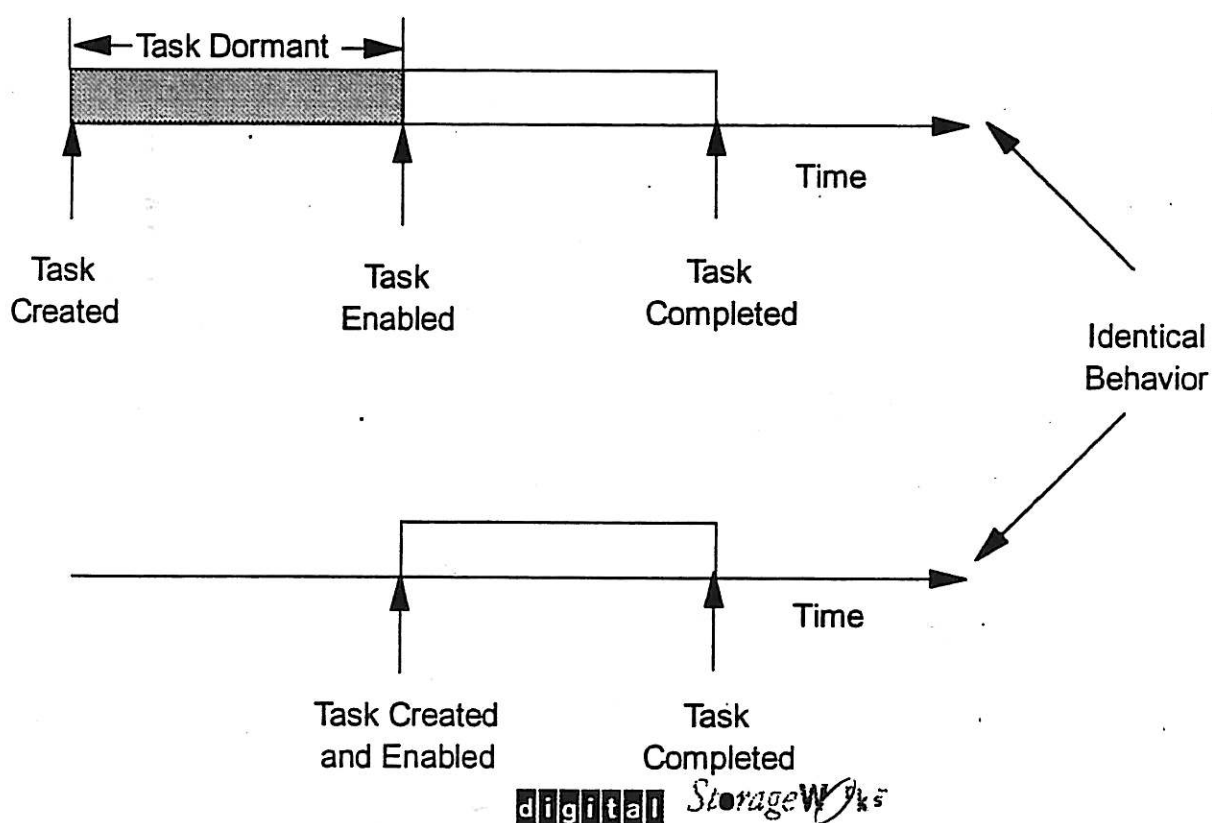

- While an ordered task is in the dormant or held state, any information the logical unit has or accepts for the task shall be suspended. (QM rev 7, section 7).
- While a simple task is in the Dormant or Held state , any information the target accepts for the task shall be suspended (QM rev. 7, sections 7 and 8).
- While a task is in the blocked state, any information the logical unit accepts for the task shall be suspended (QM rev 7, section 3.1.2).
- While a task is in the Termination Pending state, any information the logical unit has or accepts for the task shall be suspended.

82

## Litmus test

- All tasks shall behave as if they were created upon entering the enabled state.
- The results of task ~~execution~~ completion are independent of whether or not the task was in the dormant state.

# Task States - Simple, Ordered and Head of Queue Tasks

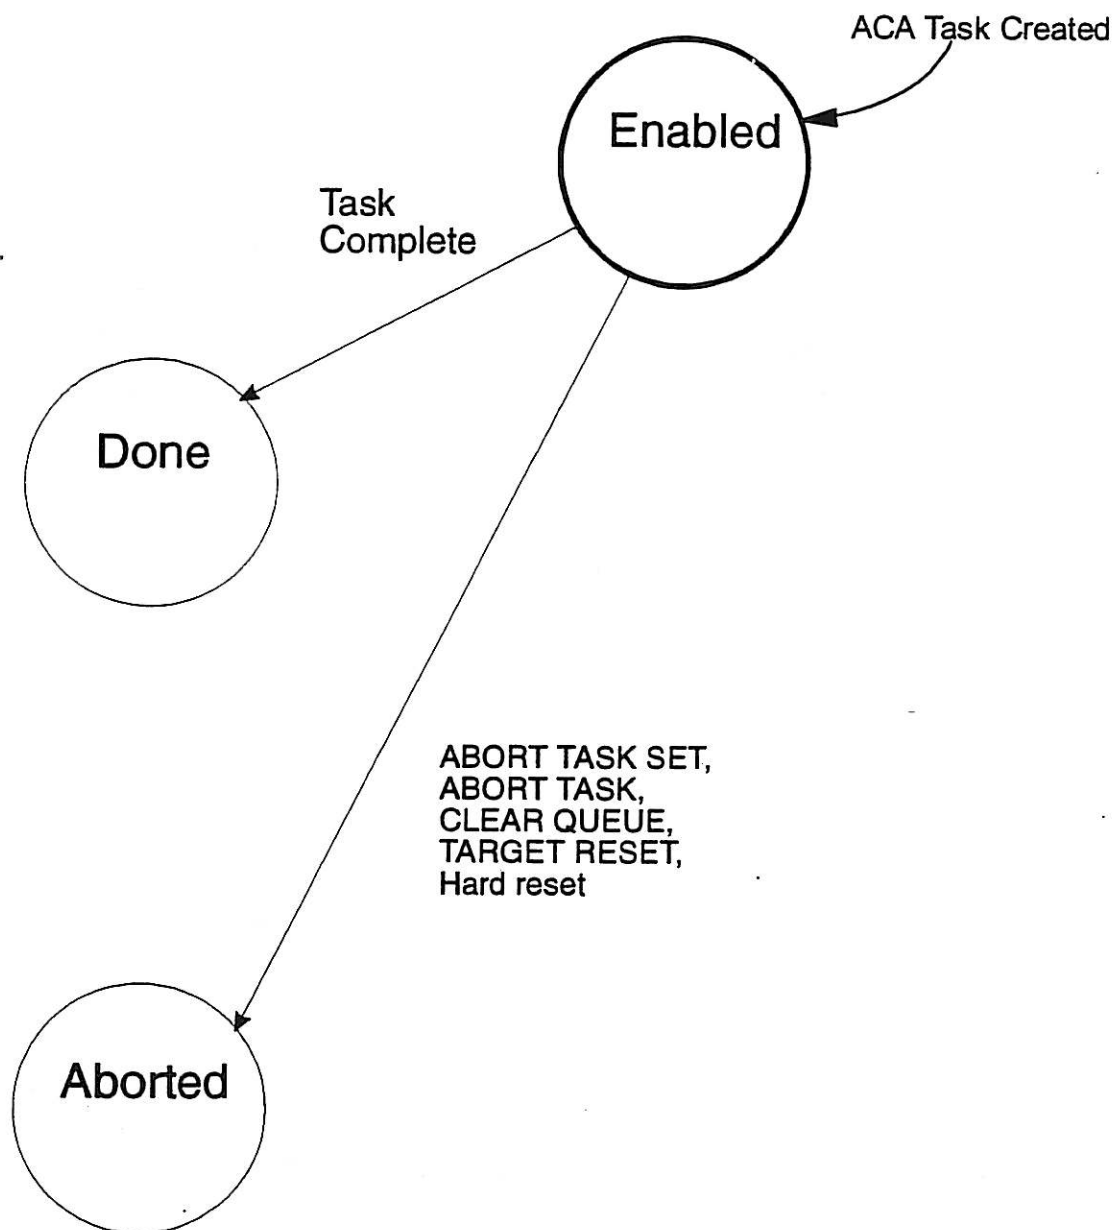

Note 1: ABORT TASK SET, ABORT TASK, CLEAR TASK SET, TARGET RESET, Hard Reset.

Note 2: Abort conditions from note 1 or ACA while Qerr flag is set.
